In considering the objections against the inspiration of the scriptures, this writer makes distinct replies to those arguments which are adduced from the sufficiency of the light of Nature, from the partial communication of the scriptures, from their divine authority being incapable of proof, from their supposed contradictions, from their containing doctrines mysterious and contrary to reason, from their relating things unworthy of God, and from their style not being so dignified, so elegant, and so conformable to rule, as we might expect to find it in divine writings.

We have given this summary of the procedure in Mr. Dick's Essay, because we think it suggests to the candid mind a train of argumentation, by pursuing which, perfect satisfaction may be obtained as to the divine origin of the received christian scriptures from a careful examination of them, independent of all treatises on the subject. Those, however, who are desirous to read the most valuable pieces which have been written on the point may turn to Mr. Dick's Essay; Tillotson's Sermons, vol. ii. p. 16, &c.; Chandler on Joel, p. 108, &c.; Doddridge's Lectures, Lect. 137, &c. and his Family Expositor, vol. iii. Appendix, No. 2, in which latter place there is a most ex-

INS

cellent dissertation on the inspiration of the New Testament, as proved from the facts recorded in its historical books.

To INSPIRE. *v. n.* (*inspiro*, Latin.) To draw in the breath (*Walton*).

To INSPIRE. *v. a.* 1. To breathe into (*Pope*). 2. To infuse by breathing (*Wisd.*). 3. To infuse into the mind; to impress upon the fancy (*Shakspeare*). 4. To animate by supernatural infusion (*Addison*). 5. To draw in with the breath (*Harvey*).

INSPIRER. *s.* (from *inspire*.) He that inspires (*Derham*).

To INSPIRIT. *v. a.* (*in and spirit*.) To animate; to actuate; to fill with life and vigour; to enliven; to invigorate (*Pope*).

To INSPISSATE. *v. a.* (*in and spissus*, Lat.) To thicken; to make thick (*Arbuthn*).

INSPISSATION. *s.* (from *inspiro*.) The act of making any liquid thick (*Arbuthn*).

INSPRUC. a populous town of Germany, in the Tyrol, capital of the district of Innthal, with a strong castle. It is seated on the river Inn. Lat. 47 10 N. Lon. 11. 27 E.

INSTABILITY. *s.* (*instabilité*, French; *instabilitas*, Latin.) Inconstancy; fickleness; mutability of opinion or conduct (*Addison*).

INSTABLE. *ad.* (*instabilis*, Lat.) Inconstant; changing.

To INSTALL. *v. a.* (*installer*, French.) To advance to any rank or office, by placing in the seat or stall proper to that condition (*Wotton*).

INSTALLATION. *s.* (*installation*, Fr.) The act of giving visible possession of a rank or office, by placing in the proper seat (*Ayliffe*).

INSTALLMENT. *s.* (from *install*.) 1. The act of installing (*Shakspeare*). 2. The seat in which one is installed (*Shakspeare*).

INSTANCE. *s.* (*instance*, French.) 1. Importunity; urgency; solicitation (*Hooker*). 2. Motive; influence; pressing argument: not in use (*Shakspeare*). 3. Prosecution or process of a suit (*Ayliffe*). 4. Example, document (*Add*). 5. State of any thing (*Hale*). 6. Occasion; act (*Rogers*).

To INSTANCE. *v. n.* (from the noun.) To give or offer an example (*Tillotson*).

INSTANT. *a.* (*instans*, Latin.) 1. Pressing; urgent; importunate; earnest (*Luke Romans*). 2. Immediate; without any time intervening; present (*Prior*). 3. Quick; making no delay (*Pope*).

INSTANT. *s.* (*instant*, French.) 1. *Instant* is such a part of duration wherein we perceive no succession (*Locke*). 2. A particular time (*Shakspeare*). 3. The present or current month (*Addison*).

INSTANTANEOUS. *a.* (*instantaneus*, Lat.) Done in an instant; acting at once without any perceptible succession (*Burnet*).

INSTANTANEOUSLY. *ad.* In an indivisible point of time (*Derham*).

INSTANTLY. *ad.* (*instante*, Latin.) 1. Immediately; without any perceptible intervention of time (*Bacon*). 2. With urgent importunity.

INS

To INSTATE. *v. a.* (*in and state*.) 1. To place in a certain rank or condition. (*Atterb.*). 2. To invest: obsolete (*Shakspeare*).

INSTAURATION. *s.* (*instauratio*, Lat.) Restoration; reparation; renewal.

INSTEAD *of.* prep. (of *in and stead*, place.) 1. In room of; in place of (*Swift*). 2. Equal to (*Tillotson*).

To INSTEEP. *v. a.* (*in and steep*.) 1. To soak, to macerate in moisture (*Shakspeare*). 2. Lying under water (*Shakspeare*).

INSTEP. *s.* (*in and step*.) The upper part of the foot where it joins to the leg (*Arbuthn*).

INSTERBURG. a town of Prussian Lithuania, containing about 3000 inhabitants. Lat. 54 40 N. Lon. 21. 40 E.

To INSTIGATE. *v. a.* (*instiguer*, French.) To urge to ill, to provoke or incite to a crime.

INSTIGATION. *s.* (*instigation*, Fr.) Incitement to a crime; encouragement; impulse to ill (*South*).

INSTIGATOR. *s.* (*instigateur*, Fr.) Inciter to ill (*Decay of Pity*).

To INSTILL. *v. a.* (*instillo*, Latin) 1. To infuse by drops (*Milton*). 2. To insinuate any thing imperceptibly into the mind; to infuse (*Calamy*).

INSTILLATION. *s.* (*instillatio*, Latin.) 1. The act of pouring in by drops. 2. The act of infusing slowly into the mind. 3. The thing infused (*Rambler*).

INSTILMENT. *s.* (from *instil*.) Any thing instilled (*Shakspeare*).

INSTINCT. *a.* (*instinctus*, Latin) Moved; animated: not in use (*Milton*).

INSTINCT. (*instinctus*, Lat. from *instinguo*, to stir up or stimulate.) The operation of the principle of animal or vegetable life, by the exercise of certain innate powers, directed to definite ends, and productive of definite effects. Under which definition it is opposed to reason as being the operation of the principle of intellectual life, by the exercise of observation and experience, directed to definite ends and productive of definite effects.

We hazard of ourselves this definition of instinct, and this distinction between the two principles of instinct and reason, because we have not hitherto been able to obtain from any writer whatever a definition and distinction that we have altogether felt satisfactory: in consequence of which, the two principles have been perpetually confounded, and whatever definition has been offered concerning the one has insensibly run into the other. It was hence that many of the ancient philosophers ascribed to brutes an understanding, differing only in degree from that of man, and attributed their inferiority to the want of proper and sufficient bodily organs. This system was at one time very strenuously supported by Helvetius (*De l'Esprit*, tom. 1. p. 2, &c.): while on the other hand, the learned Cadworth endeavoured to explain the instinct of animals, by means of a certain plastic nature. Des Cartes thought that all the actions of brute animals might be explained by the simple laws of me-

I N S T I N C T.

chanism, and considered^d them as machines totally devoid of life and sentiment, but so curiously constructed by the Creator, that the mere impressions of light, sound, and other external agents, on their organs, produced a series of motions in them, and caused them to execute those various operations which had before been ascribed to an internal principle of life and spontaneity; and the Anti-Lucretius of the cardinal Polignac (one of the most classical poems of modern times), was composed in a very considerable degree to maintain this idea. But the actions and manners of animals, which are totally incompatible with the mere principles and laws of mechanism, evince the absurdity of such an opinion. M. Buffon adopts the opinion of Des Cartes in part, but grants them life, and the faculty of distinguishing between pleasure and pain, together with a strong inclination to the former, and aversion from the latter. By these inclinations and aversions he endeavours to account for all, even the most striking, operations of animals; affirming, that, in consequence of impressions made on the brain, by means of the sensitive organs, and by the re-action of the brain and nerves on the muscles, these machines acquire a motion conformable to the nature of the animal, and of the impressions of the different objects which act upon their organs, and excite desire or aversion.

The pre-established harmony of Leibnitz has also been applied to explain the actions of brute animals. Others have considered the actions of animals as produced by the constant and immediate influence of the divine energy, directing all their inclinations and motion: such seems to have been the opinion of Mr. Addison in the second volume of the *Spectator*, and of Andrew Baxter in his *Matho*, vol. i. p. 387. The late ingenious Hermann Samuel Reimar, professor of philosophy at Hamburgh, has enumerated and exposed these and other opinions with regard to the instinct of animals, in his *Observations Physiques*, &c. published in 2 vols, 12mo. at Amsterdam and Paris, 1770; and, defining instinct to be every natural inclination, accompanied with a power, in animals, to perform certain actions, he considers the subject under three heads. The first, which he calls mechanical instincts, belong to the body, considered as an organized substance, and are exercised blindly and independently of the will of the animal. Such are those which produce the motion of the heart and lungs, the contraction and dilatation of the pupil, digestion, &c. This class of instincts is possessed in common both by men and brutes, and in some measure even by vegetables. The second class comprehends those which he terms representative instincts, which consist partly in the power of perceiving external objects by their present impression on the senses, and partly in the faculty of rendering the ideas of these objects present to the mind by the powers of imagination, or of memory, in a lax sense of the word. These are common to men and other animals, excepting that brutes possess only the faculty of ima-

gination in common with us, and not that of memory, in the strict and proper sense of the word. Indeed, this author endeavours to prove, that the knowledge of brutes does not merely differ in degree from that of man, but that it is of a kind entirely different from it, and that they are incapable both of memory and reasoning; the faculty of imagination serving to give them a confused idea of events that are past, by the view or other impressions of objects that are present. The third and principal class of instincts, is that which comprehends all those which M. Reimar calls spontaneous. This species of instinct is not attended with any power of reflection, determining the animal to decide freely between two different modes of action present to his imagination; nor is it merely corporeal or mechanical. It is put into action by the natural and primitive principle of self-love, implanted in all animated beings; or by a love of pleasure and aversion from pain, producing a voluntary inclination to perform certain actions which tend to their well-being and preservation. To the performance of these actions they are particularly prompted by their present sensations, by imagination supplying the place of memory, and by other causes. The wonderful effects produced by these instinctive appetites are farther to be attributed to the exquisite mechanism in their bodily conformation, particularly in the structure of the various organs with which they execute their operations, and to the superior perfection and acuteness of their external senses, by which they are quickly and distinctly informed of those qualities of objects which most materially concern them. In order to account for the more curious and surprising operations of brute animals, M. Reimar adds two other principles, viz. 1st, an internal distinct perception of the precise power and proper use of their various bodily organs, together with an innate knowledge of the qualities of those objects around them in which they are interested; and 2dly, certain innate and determinate powers and inclinations, impressed by the Author of Nature, *à priori*, on the soul itself, by which they are arbitrarily, and without their own knowledge or consciousness, directed and irresistibly impelled to the performance of these various operations which they execute with such unremitting industry and art. These determinate forces, which constitute the principal part of M. Reimar's system, are no where so visible and distinguishable as in that numerous set of instincts which he classes under the title of the industrious instincts of animals.

M. Dupont de Nemours, in a paper read a few years ago before the French National Institute, endeavours to resolve the instinctive into the reasoning principle; asserting that the former like the latter is alone exercised and perfected by experience, imitation or habit. He endeavours to explain physically how these animals, and children themselves, learn to suck. He shows, that several species of animals are capable of uttering sounds sufficiently nume-

I N S T I N C T.

rous to form a very complicated language; and he asserts, that he has observed them employ some of these sounds under circumstances so similar, as to leave scarcely any doubt of their attaching to them a fixed signification. His observations on this head are very interesting.

He likewise endeavours to prove, that various species are capable of improving their operations under certain circumstances: though perhaps the naturalist will object to him, that he has sometimes taken different species for the same species improved. Thus the architect beaver of Canada is not precisely the same as the burrowing beaver of the Rhine; and the social spider of Paraguay is not the same with our solitary spiders.

It may be supposed, that the greatest difficulty Mr. Dupont has to encounter is in explaining how insects have learned those wonderful precautions, with which they provide a shelter and proper nourishment for the egg, which they are about to lay, and the maggot that is to be produced from it; though frequently these insects have never seen, and never will see again, the egg, or a similar maggot; and the wants of the maggot have not the least resemblance to those of the insect that labours for it.

Among thousands of instances that might be adduced, Mr. Dupont has chosen but one, that of the sphex, or ichneumon wasp. In this he cannot be accused of having taken an easy example. The following is its economy: during its existence as a perfect insect, it lives entirely on flowers. When it is ready to lay, it forms a cylindrical hole in clayey sand, and deposits an egg at the bottom of it. It then seeks on cabbages a small green caterpillar on which it never preyed before; pierces it with its sting, so as to weaken it to such a degree, that it may be unable to resist the maggot which is afterward to issue from the egg and feed upon it; yet not so as to kill it, that it may not putrify; rolls it up in a circle, and lays it in the hole upon the egg. It successively proceeds in quest of eleven more of these, which it treats in a similar manner: it then closes the hole and dies. The little maggot is hatched, devours the twelve caterpillars in succession, and changes to a chrysalis in the hole. As soon as its final metamorphosis is completed, it issues from its subterranean abode a winged insect, to enjoy itself among the flowers till it also is ready to lay; when it repeats the operations its mother had performed before it, and with caterpillars of exactly the same kind.

Mr. Dupont supposes in his explanation, that the perfect insect retains the remembrance of the sensations it experienced in the state of a maggot, though its form and organs are totally changed. He must likewise suppose, though he does not expressly say it, that the sphex can afterward distinguish by the sight, or some merely imaginary sense, the caterpillar and the sand, of which it acquired a knowledge only by feeling, and this by its anterior feeling of a maggot; for the maggot is blind, it lives under ground, and when it there becomes a winged

insect the caterpillars are devoured. Lastly, Mr. Dupont dares not admit, that the sphex foresees the egg it lays will produce a maggot, and will have need of all it provides for it: according to him it does this merely for amusement, in imitating what it perceived in its infancy.

Dr. Darwin does not essentially differ from M. Dupont. He also resolves every instinctive effort into an exercise of observation, experience, imitation or habit, into "repeated efforts of the muscles (in the case of animal instinct), under the conduct of our sensations or desires." Yet sensation or desire must be the sensation or desire of something known or experienced, something that has occurred to us before, or with which we have by some means or other become acquainted. We cannot long for that which we know nothing about. They tell us that infants long for the breast, because in the uterus they have already been accustomed to open their mouths, and have been pleased with sucking in some portion of the amnios that surrounded them. Were this the cause, we should expect to find them hunting after the breast, and evincing other tokens of such desire and such experience as soon as they are born: but it is commonly several days, not only before this inclination becomes apparent, but before they can by any means be induced to suck at all. In some cases it is three weeks or a month. But again, it is not in general a simple desire of sucking or swallowing that the infant evinces, but a desire of sucking a particular organ, and in a particular manner, of which no hint or information whatever could have been obtained by any antecedent action; and for which nevertheless the young of every order of mammalian animals are not only fully prepared soon after birth, but infinitely better qualified than adults with all their experience and reason to boot. What instructs the female land-crab to desert her natural crannies in woods and mountains, and to travel at spawning-time to the nearest shore, and to plunge into an element she at other periods fastidiously avoids? What induces the male pigeon, contrary to the propensity of almost all other male birds, to feed its young from the mucilage secreted in its own crop, in the same manner as the female pigeon does? It is the stimulus of a fly or other insect upon the radical leaves of the *dionea muscipula*, perhaps, that induces these leaves to shut abruptly together like a serrated rat-trap. Yet the same stimulus, if merely mechanical, would still continue after the fly is dead and interlocked in the fly-trap. What, then, induces the leaves to re-open as soon as they have accomplished their purpose, notwithstanding the continuance of such stimulus? But the proofs are infinite, and we have not space to pursue them farther.

INSTINCT *s. (Instinctus, Lat.)* Desire or aversion acting in the mind without the intervention of reason or deliberation. (*Prior*).

INSTINCTED *s. (Instinctus, Lat.)* Impressed as an animating power. (*Bentley*).

INSTINCTIVE *s. (from Instinct.)* Act-

ing without the application of choice or reason (*Broome*).

INSTINCTIVELY. *ad.* By instinct; by the call of nature (*Shakespeare*).

To INSTITUTE. *v. n.* (*institutio*, Latin.)

1. To fix; to establish; to appoint, to enact; to settle; to prescribe (*Hale*). 2. To educate; to instruct; to form by instruction (*Decay of Piety*).

INSTITUTE. *s.* (*institutum*, Latin.) 1. Established law; settled order (*Dryden*). 2. Precept; maxim; principle (*Dryden*).

INSTITUTE, is a name which has lately been substituted for school or academy. Formerly institution, in the propriety of the English language, was sometimes used as a word of the same import with instruction; and now institute is employed, especially by the admirers of French innovations, to denote what had hitherto been called an academy. When royalty was abolished in France, it would have been absurd to continue the titles Royal Academy of Sciences, Royal Academy of Inscriptions, &c; but instead of merely abolishing the word royal, and substituting national in its stead, it occurred to the fertile brain of Condorcet to abolish the seven academies themselves, or rather to melt them all down into one great academy; to which was given the appellation of the

National Institute, or New Academy of Arts and Sciences.—This academy, founded on a decree of the new constitution, was opened on the 7th of December 1795, when Benezec, the then minister for the home department, attended, and the decree of foundation was read; which was to the following purport:

“The Academy of Arts and Sciences belongs to the whole republic, and Paris is its place of residence. Its employment is to aim at bringing all arts and sciences to the utmost perfection of which they are capable. It is to notice every new attempt, and all new discoveries, and to keep up a correspondence with all foreign literary societies. And by the particular orders of the Executive Directory, its first studies are to be directed to those subjects which more immediately tend to the reputation and advantage of the French republic.”

The academy consists of 288 members, half of whom are to reside in Paris, the other half in the departments; and to them is to be added a certain number of foreigners, as honorary members, confined at present to twenty-four.

The academy is divided into three classes, each class into sections, each section to contain twelve members.

1st class. Mathematics and natural philosophy. This class is divided into ten sections. 1. Mathematics. 2. Mechanical arts. 3. Astronomy. 4. Experimental philosophy. 5. Chemistry. 6. Natural history. 7. Botany. 8. Anatomy and animal history. 9. Medicine and surgery. 10. Animal economy, and the veterinary sciences.

2d class. Morality and politics. This class consists of six sections. 1. Analysis of sensations and ideas. 2. Morals. 3. Legislature.

4. Political economy. 5. History. 6. Geography.

3d class. Literature and the fine arts. This class consists of eight sections. 1. Universal grammar. 2. Ancient languages. 3. Poetry. 4. Antiquities. 5. Painting. 6. Sculpture. 7. Architecture. 8. Music.

For each class a particular room in the Louvre is appropriated. No one can be a member of two classes at the same time; but a member of one class may be present at the meetings of any other. Each class prints, yearly, an account of its transactions.

Four times a-year there are public meetings. On these occasions, the three classes meet together. At the end of each year, they give a circumstantial account to the legislative body of the progress made in that year in the arts and sciences. The prizes given yearly by each class are publicly notified at certain times. The sums requisite for the support of the institution are decreed yearly by the legislative body, upon a requisition made by the Executive Directory.

The first forty-eight members were chosen by the Executive Directory, to whom the choice of the remaining members was confided. To the members, residentary in Paris, is reserved the choice both of the department and foreign members. On a vacancy in any class, three candidates are named by the class for the choice of the body at large.

Each class is to have, at its place of meeting, a collection of the products, both of nature and art, and a library, according to its particular wants. The regulations of the institution, with respect to the times of meeting, and its employments, are to be drawn up by the body at large, and laid before the legislative assembly. The hall in which the body at large holds its meeting forms part of the west wing of the Old Louvre, at present called the Museum. It formerly went by the appellation of the Hall of Antiques (*Salle des Antiques*); and as long as the kings of France inhabited this part of the palace, was occupied by their guards, from which circumstance it obtained the name of the *Hall des Cent Suisses*. It was likewise appropriated to banquets and entertainments, given by the court on gala days; and it was to this place that Henry IV. was conveyed, on his assassination by Ravallac. It was built at the same time with the rest of this part of the Louvre, about the year 1528, after the designs of Pierre Lescot, abbot of Clagny. It is 144 feet in length, and 40 in breadth, and holds from 1000 to 1200 persons. In order to adapt it to its new destination, the floor has been sunk, which gives a greater air of lightness to the roof. In the centre stands a double table, in the form of a horse-shoe, supported by sphinxes, at which the members of the Institute take their seats. This table is surrounded by two tiers of benches, which are raised for the accommodation of spectators, who have likewise seats provided for them in the vast embrasures of the windows, and at each extremity of the hall.

Whether science will be essentially advanced

by this innovation, time must determine; but candour compels us to acknowledge, that thus far the proceedings of the National Institute have been abundantly interesting. Amid the changes to which the existing nomenclature of European establishments has been subjected by Bonaparte, it appears from Peyrard's translation of the Works of Archimedes, that the title of National Institute has sufficient novelty and dignity to remain without any farther modification.

INSTITUTION. s. (*institutio*, Latin.) 1. Act of establishing. 2. Establishment; settlement (*Swift*). 3. Positive law (*Atterbury*). 4. Education (*Hammond*).

INSTITUTION (Royal), a new establishment in London, set on foot for the purpose of applying science to the common purposes of life. The thought originated in 1799 with a committee of the Society for bettering the condition of the Poor. Count Rumford was extremely active in the formation of the Institution.

The funds of the Institution arise, 1st, from 60 guineas paid by each hereditary subscriber, who is named a proprietor; 2d, from 15 guineas paid by each life-subscriber; 3d, from three guineas paid by each annual subscriber; 4th, from particular donations and legacies.

A proprietor has an hereditary transferable share in the house and all the property belonging to it, has a vote in the election of managers and visitors, and two transferable tickets of admission to the establishment and lectures. A life-subscriber has a ticket of admission for life, not transferable. An annual subscriber is entitled to a similar ticket during the continuance of his subscription. The three classes are alike open to ladies and gentlemen, and every class of subscribers has the privilege in common of having copies of models or drawings made (at their own expence) from those belonging to the Institution.

The lectures in 1802, were, 1st, a course of experimental philosophy, comprehending the principles of astronomy, electricity, magnetism, mechanics, hydrostatics, pneumatics and optics. In this course all abstract and mathematical reasoning are avoided, and the whole calculated at once to instruct and amuse. 2d, A course of chemistry, in which the principles of the science and the modern discoveries are illustrated by experiments, and its application to the arts and manufactures, &c. shewn. 3d, An evening course, calculated for persons mechanically and scientifically engaged, in which the foregoing subjects are minutely and technically treated. Other lectures have been since added. But the principal celebrity of the Institution has arisen from the lectures of Professor Davy, and the brilliant discoveries which have been detailed and elucidated in the course of those lectures.

There are other Institutions for similar purposes in the metropolis, as the London Institution, the Surrey Institution, the Russell Institution, &c. but we have not room to detail their several plans here.

The English also boast of many charitable Institutions, as the Foundling Hospital, the Lock, the Asylum, the Small Pox Hospital, the Cow Pox Institution, the Magdalen, the Institution for the Deaf and Dumb, the London Female Penitentiary, &c. the beneficial effects of most of which have been very widely diffused.

Institutions for the purposes of education have been likewise established, as the Military Institution at Charlton, the Baptist Academical Institution at Stepney, &c.

INSTITUTION to a benefice, is that whereby the ordinary commits the cure of souls to the parson presented, as by induction he obtains a temporal right to the profits of the living. Previous to the institution, the oath against simony, the oaths of allegiance and supremacy, are to be taken; and if it be a vicarage, the oath of residence. They are also to subscribe the thirty-nine articles, and the articles concerning the king's supremacy, and the book of common prayer.

INSTITUTIONARY. a. (from *institution*.) Elemental; containing the first doctrines, or principles of doctrine (*Brown*).

INSTITUTIST. s. (from *institute*.) Writer of institutes, or elemental instructions (*Harvey*).

INSTITUTOR. s. (*institutor*, Lat.) 1. An establisher; one who settles (*Holder*). 2. Instructor; educator (*Walker*).

To INSTOP. v. a. (*in and stop*.) To close up; to stop (*Dryden*).

To INSTRUCT. v. a. (*instruo*, Latin.) 1. To teach; to form by precept, to inform authoritatively; to educate (*Milton*). 2. To model; to form (*Ayliffe*).

INSTRUCTOR. s. (from *instruct*.) A teacher; an institutor (*Addison*).

INSTRUCTION. s. (from *instruct*.) 1. The act of teaching; information (*Locke*). 2. Precepts conveying knowledge (*Young*). 3. Authoritative information; mandate (*Shakspeare*).

INSTRUCTIVE. a. (from *instruct*.) Conveying knowledge (*Holder*).

INSTRUMENT. s. (*instrumentum*, Lat.) 1. A tool used for any work or purpose. 2. A frame constructed so as to yield harmonious sounds (*Dryden*). 3. A writing containing any contract or order (*Tobis*). 4. The agent (*Shakspeare. Locke*). 5. One who acts only to serve the purposes of another (*Dryden*).

INSTRUMENTS (Mathematical). A pocket case of mathematical instruments contains the following particulars, viz. 1. A pair of plain compasses. 2. A pair of drawing compasses, with its several parts. 3. A drawing-pen and pointer. 4. A protractor, in form of a semi-circle, or sometimes of a parallelogram. 5. A parallel ruler. 6. A plain scale. 7. A sector, besides the black lead pencil for drawing lines. See the respective words.

INSTRUMENTAL. s. (*instrumental*, Fr.) 1. Conducive as means to some end; organical (*Smalridge*). 2. Acting to some end; contributing to some purpose; helpful (*Swift*). 3.

I N S

Consisting not of voices but instruments; produced by instruments; not vocal (*Milton*).

INSTRUMENTALITY. *s.* (from *instrumental*.) Subordinate agency; agency of any thing as means to an end (*Hale*).

INSTRUMENTALLY. *ad.* (from *instrumental*.) In the nature of an instrument, as means to an end (*Digby*).

INSTRUMENTALNESS. *s.* (from *instrumental*.) Usefulness as means to an end.

INSUBRIUM (*Ager*), in ancient geography, a tract of the Transpadana; situated between the Ticinus to the west, the Addua to the east, the Padus to the south, and Orobii to the north. The people are called Insubres by Livy, Insubri by Ptolemy, and Isombres by Strabo. Now the Duchy of Milan.

INSUFFERABLE. *a.* (in and sufferable.) 1. Intolerable; insupportable; intense beyond endurance (*Locke*). 2. Detestable; contemptible (*Dryden*).

INSUFFERABLY. *ad.* (from *insufferable*.) To a degree beyond endurance (*South*).

INSUFFICIENCY. **INSUFFICIENCY.** *s.* (*insufficiency*, Fr.) Inadequateness to any end or purpose, want of requisite value or power (*Atterbury*).

INSUFFICIENT. *a.* (*insufficient*, Fr.) Inadequate to any need, use, or purpose; wanting abilities; incapable; unfit (*Rogers*).

INSUFFICIENTLY. *ad.* With want of proper ability; not skilfully.

INSUFFLATION. *s.* (in and sufflo, Lat.) The act of breathing upon (*Hammond*).

INSULAR. **INSULARY.** *a.* (*insulaire*, French.) Belonging to an island (*Howel*).

INSULATED. *a.* (*insula*, Latin.) Not contiguous on any side.

In electrical experiments, when an electric body is interposed between the earth and another body the latter is said to be insulated.

INSULSE. *a.* (*insulsus*, Lat.) Dull; insipid.

INSULT. *s.* (*insultus*, Lat.) 1. The act of leaping upon any thing (*Dryden*). 2. Act of insolence or contempt (*Broome*).

To INSULT. *v. a.* (*insulto*, Latin.) 1. To treat with insolence or contempt (*Pope*). 2. To trample upon; to triumph over (*Shakspeare*).

INSULTER. *s.* (from *insult*.) One who treats another with insolent triumph (*Rowe*).

INSULTINGLY. *ad.* (from *insulting*.) With contemptuous triumph (*Dryden*).

INSUPERABILITY. *s.* (from *insuperabile*.) The quality of being invincible.

INSUPERABLE. *a.* (*insuperabilis*, Lat.) Invincible; insurmountable; not to be conquered; not to be overcome (*Pope*).

INSUPERABLENESS. *s.* (from *insuperabile*.) Invincibility; impossibility to be surmounted.

INSUPERABLY. *ad.* (from *insuperabile*.) Invincibly; insurmountably (*Grew*).

INSUPPORTABLE. *a.* (*insupportable*, Fr.) Intolerable; insufferable; not to be endured (*Bentley*).

INSUPPORTABLENESS. *s.* (from in-

I N T

supportable.) Insufferableness; the state of being beyond endurance (*Sidney*).

INSUPPORTABLY. *ad.* (from *insupportable*.) Beyond endurance (*Dryden*).

INSURANCE, in law and commerce, a contract whereby one party engages to pay the losses which the other may sustain, for a stipulated premium or consideration. The most common sorts are, insurance against the dangers of the seas, insurance against fire, insurance of debts, and insurance of lives. See **ASSURANCE**, and **LIFE ASSURANCE**: and on the latter subject, consult the ingenious work of Mr. Bailey on Life Assurances and Annuities.

INSURMOUNTABLE. *a.* (*insurmoumtable*, French.) Insuperable; unconquerable (*Locke*).

INSURMOUNTABLY. *ad.* (from *insurmoumtable*.) Invincibly; unconquerably.

INSURRECTION. *s.* (*insurgo*, Latin.) A sedition rising; a rebellious commotion (*Arbutnot*).

INSUSURATION. *s.* (*insusurro*, Lat.) The act of whispering into something.

INTACTE, the same as **ASYMPTOTES**.

INTACTIBLE. *a.* (in and tactum, Latin.) Not perceptible to the touch.

INTAGLIO. *s.* (Italian.) Any thing that has figures engraved on it so as to rise above the ground (*Addison*).

INTASTABLE. *a.* (in and taste.) Not raising any sensations in the organs of taste (*Grew*).

INTERGER. *s.* The whole of any thing. In arithmetic, a whole number, in contradistinction to a fraction. See **FRACTION**.

INTEGRAL. *a.* (*integral*, Fr.) 1. Whole: applied to a thing considered as comprising all its constituent parts (*Bacon*). 2. Uninjured; complete; not defective. 3. Not fractional; not broken into fractions.

INTEGRAL. *s.* The whole made up of parts (*Hale Watts*).

INTEGRAL, in the modern analysis, a variable quantity. See **INCREMENT**.

INTEGRAL CALCULUS, in the new analysis, the reverse of the differential calculus: it is similar to the inverse method of fluxions, or the finding of a fluent to a given fluxion. See **CALCULUS**.

INTEGRANT PARTICLES, the ultimate parts or molecula into which any substance may be supposed to be mechanically divided; they are the smallest particles into which a body can be reduced without decomposition. The difference between the integrant and the constituent parts of bodies, is pointed out and exemplified in the article **AGGREGATION**.

INTEGRITY. *s.* (*integritas*, Latin.) 1. Honesty; uncorrupt mind; purity of manners; uncorruptedness (*Rogers*). 2. Purity; genuine unadulterated state (*Hale*). 3. Intireness; unbroken; whole (*Broome*).

INTEGUMENT. *s.* (*integumentum*, Lat.) Any thing that covers or envelops another (*Addison*).

INTELLECT. *v.* (*intellectus*, Lat.) The

INT

Intelligent mind; the power of understanding (*South*).

INTELLECTION. *s.* (*intellectio*, Latin.) The act of understanding (*Bentley*).

INTELLECTIVE. *a.* (*intellectif*, Fr.) Having power to understand (*Glanville*).

INTELLECTUAL. *a.* (*intellectuel*, Fr.)

1. Relating to the understanding; transacted by the understanding (*Taylor*). 2. Mental; comprising the faculty of understanding, belonging to the mind (*Watts*). 3. Ideal; perceived by the intellect, not the senses (*Cowl*). 4. Having the power of understanding (*Mil*).

INTELLECTUAL. *s.* Intellect; understanding; mental powers or faculties (*Glanville*).

INTELLIGENCE. **INTELLIGENCY.** *s.* (*intelligentia*, Lat.) 1. Commerce of information; notice; mutual communication; account of things distant or secret (*Hayward*).

2. Commerce of acquaintance; terms on which men live one with another (*Bacon*). 3. Spirit; un bodied mind (*Collier*). 4. Understanding; skill (*Spenser*).

INTELLIGENCER. *s.* (from *intelligence*.) One who sends or conveys news; one who gives notice of private or distant transactions; one who carries messages (*Howel*).

INTELLIGENT. *a.* (*intelligens*, Latin.)

1. Knowing; instructed; skilful (*Milton*). 2. Giving information (*Shakspeare*).

INTELLIGENTIAL. *a.* (from *intelligent*.)

1. Consisting of un bodied mind (*Milton*). 2. Intellectual; exercising understanding.

INTELLIGIBILITY. *s.* (from *intelligible*.) 1. Possibility to be understood. 2. The power of understanding; intellection: not proper (*Glanville*).

INTELLIGIBLE. *a.* (*intelligibilis*, Latin.) To be conceived by the understanding; possible to be understood (*Watts*).

INTELLIGIBLENESS. *s.* (from *intelligible*.) Possibility to be understood; 'perspicuity' (*Locke*).

INTELLIGIBLY. *ad.* (from *intelligible*.) So as to be understood; clearly; plainly (*Rosc*).

INTEMERATE. *a.* (*intemeratus*, Latin.) Un defiled; unpolluted.

INTEMPERAMENT. *s.* (in and *temperament*.) Bad constitution (*Harvey*).

INTEMPERANCE. **INTEMPERANCY.** *s.* (*intemperantia*, Latin.) Want of temperance, or moderation, excess in meat or drink, or any other gratification (*Hakewill*).

INTEMPERATE. *a.* (*intemperatus*, Lat.)

1. Immoderate in appetite; excessive in meat or drink; drunken, gluttonous (*South*). 2. Passionate; ungovernable (*Shakspeare*). 3. Excessive; exceeding the just or convenient mean: as, an intemperate climate.

INTEMPERATELY. *ad.* 1. With breach of the law of temperance (*Fullerton*). 2. Immoderately; excessively (*Sprat*).

INTEMPERATENESS. *s.* (from *intemperate*.) 1. Want of moderation. 2. Unseasonableness of weather.

INTEMPERATURE. *s.* (from *intemperate*.) Excess of some quality.

To **INTEND.** *v. a.* (*intendo*, Latin.) 1. To stretch out: obsolete (*Spenser*). 2. To en-

INT

force; to make intense (*Newton*). 3. To regard; to attend; to take care of (*Bacon*). 4. To pay regard or attention to (*Bacon*). 5. To mean; to design (*Dryden*).

INTENDANT. *s.* (French.) An officer of the highest class, who oversees any particular allotment of the public business (*Arbutnot*).

INTENDIMENT. *s.* Attention; patient hearing; not in use (*Spenser*).

INTENDMENT. *s.* (*entendement*, Fr.) Intention; design (*L'Estrange*).

To **INTENERATE.** *v. a.* (in and *tener*, Lat.) To make tender; to soften (*Philips*).

INTENERATION. *s.* (from *intenerate*.) The act of softening or making tender (*Bacon*).

INTENIBLE. *a.* (in and *tenu*.) That cannot hold: not in use (*Shakspeare*).

INTENSE. *a.* (*intensus*, Lat.) 1. Raised to a high degree, strained; forced; not slight; not lax (*Boyle*). 2. Vehement; ardent (*Ad*). 3. Kept on the stretch; anxiously attentive (*Milton*).

INTENSELY. *ad.* To a great degree, not slightly; not remissly (*Addison*).

INTENSENESS. *s.* (from *intense*.) The state of being enforced in a high degree; force; contrariety to laxity of remission (*Woodward*).

INTENSION. *s.* (*intensio*, Lat.) The act of forcing or straining any thing (*Taylor*).

INTENSIVE. *a.* (from *intense*.) 1. Stretched or increased with respect to itself (*Hale*). 2. Intent; unremitted (*Wotton*).

INTENSIVELY. *ad.* By increase of degree.

INTENT. *a.* (*intentus*, Latin.) Anxiously diligent; fixed with close application (*Watts*).

INTENT. *s.* (from *intend*.) A design; a purpose; a drift; a view formed; meaning (*Hooker*).

INTENTION. *s.* (*intentio*, Lat.) 1. Eagerness of desire; closeness of attention; deep thought; vehemence or ardour of mind (*South*). 2. Design; purpose (*Arbutnot*). 3. The state of being intense or strained (*Locke*).

INTENTIONAL. *a.* (*intentionel*, Fr.) Designed; done by design (*Rogers*).

INTENTIONALLY. *ad.* 1. By design; with fixed choice (*Hale*). 2. In will, if not in action (*Atterbury*).

INTENTIVE. *a.* (from *intend*.) Diligently applied; busily attentive (*Brown*).

INTENTIVELY. *ad.* (from *intensive*) With application; closely.

INTENTLY. *ad.* (from *intend*.) With close attention; with close application; with eager desire (*Hammond*).

INTENTNESS. *a.* (from *intend*.) The state of being intent; anxious application (*Swift*).

To **INTER.** *v. a.* (*inter*, French.) To cover under; to bury (*Shakspeare*).

INTER. *v. a.* in ancient geography, so called from its situation between rivers, a town in the Chersonesus, situated between the Tanaïs and the Volga, now in ruins. The same name was given to a town and colony of the Volga, now in ruins.

INTERCALATE. *v. a.* (*intercalaris*, Latin.) To insert, in order to preserve the equation of time, as the

I N T

twenty-ninth of February in a leap year is an *intercalary* day.

To INTERCALATE. *v. a.* (*intercalo*, Lat.) To insert an extraordinary day.

INTERCALATION. *s.* (*intercalatio*, Lat.) Insertion of days out of the ordinary reckoning (*Brown*).

INTERCATIA, in ancient geography, a town of the Vaccæi in the Hither Spain. Here Scipio Æmilianus slew a champion of the barbarians in single combat; and was the first who mounted the wall in taking the town. It was situated to the south-east of Asturica; now said to be in ruins.

To INTERCEDE. *v. n.* (*intercedo*, Lat.)

1. To pass between (*Newton*). 2. To mediate; to act between two parties (*Calamy*).

INTERCEDER. *s.* (from *intercede*.) One that intercedes; a mediator.

To INTERCEPT. *v. a.* (*interceptus*, Lat.)

1. To stop and seize in the way (*Shaksp.*). 2. To obstruct; to cut off; to stop from being communicated (*Newton*).

INTERCEPTION. *s.* (*interceptio*, Lat.) Stoppage in course; hinderance; obstruction (*Watson*).

INTERCESSION. *s.* (*intercessio*, Latin.)

Mediation; interposition; agency between two parties; agency in the cause of another (*Romans*).

INTERCESSION was used in ancient Rome, for the act of a tribune of the people, or other magistrate, by which he inhibited the acts of other magistrates; or even, in case of the tribunes, the decrees of the senate. *Veto* was the solemn word used by the tribunes when they inhibited any decree of the senate, or law proposed to the people.

INTERCESSOR. *s.* (*intercessor*, Latin.)

Mediator; agent between two parties to procure reconciliation (*South*).

To INTERCHAIN. *v. a.* (*inter and chain*.)

To chain; to link together (*Shaksp.*).

To INTERCHANGE. *v. a.* (*inter and change*.)

1. To put each in the place of the other; to give and take mutually (*Shaksp.*). 2. To succeed alternately (*Sidney*).

INTERCHANGE. *s.* (from the verb.) 1.

Commerce; permutation of commodities (*Howel*). 2. Alternate succession (*Holder*). 3. Mutual donation and reception (*South*).

INTERCHANGEABLE. *a.* 1. Given and taken mutually (*Bacon*). 2. Following each other in alternate succession (*Tillotson*).

INTERCHANGEABLY. *ad.* Alternately; in a manner whereby each gives and receives (*Shaksp.*).

INTERCHANGEMENT. *s.* Exchange; mutual transference (*Swift*).

INTERCIPIENT. *s.* (*intercipiens*, Lat.)

An intercepting power; something that causes a stoppage (*Bacon*).

INTERCISION. *s.* (*inter and cido*, Lat.)

Interruption (*Brown*).

To INTERCLUDE. *v. a.* (*intercludo*, Lat.)

To shut from a place or course by something intervening; to interpose (*Holder*).

INTERCLUSION. *s.* (*interclusus*, Lat.)

Obstruction; intercepting.

I N T

INTERCOLUMNIATION, in architecture, denotes the space between two columns, which is always to be proportioned to the height and bulk of the columns.

From a medium, some authors have laid down the following proportions: in the Tuscan order, the intercolumniation is to be four diameters of the body of the column below; in the Doric, three; in the Ionic, two; in the Corinthian, two one quarter; and in the Composite one and a half.

To INTERCOMMON. *v. n.* (*inter and common*.) To feed at the same table (*Bacon*).

INTERCOMMUNITY. *s.* (*inter and community*.) A mutual communication of community.

INTERCOSTAL ARTERIES. Arteries intercostales. The superior intercostal artery is a branch of the subclavian. The other intercostal arteries are given off from the aorta.

INTERCOSTAL MUSCLES. Intercostales externi et interni. Between the ribs, on each side, are eleven double rows of muscles. These are the intercostales externi and interni. Galen has very properly observed, that they decussate each other like the strokes of the letter X. The intercostales externi arise from the lower edge of each superior rib, and, running obliquely downwards and forwards, are inserted into the upper edge of each inferior rib, so as to occupy the intervals of the ribs, from as far back as the spine to their cartilages; but from their cartilages to the sternum there is only a thin aponeurosis covering the internal intercostales. The intercostales interni arise and are inserted in the same manner as the external. They begin at the sternum, and extend as far as the angles of the ribs, their fibres running obliquely backwards. These fibres are spread over a considerable part of the inner surface of the ribs, so as to be longer than those of the external intercostals. Some of the posterior portions of the internal intercostals pass over one rib and are inserted into the rib below. Verheyen first described these portions as separate muscles, under the name of infra costales. Winslow has adopted the same name. Cowper, and after him Douglas, calls them costarum depressores proprii. These distinctions, however, are altogether superfluous, as they are evidently nothing more than appendages of the intercostals. The number of these portions varies in different subjects. Most commonly there is only four, the first of which runs from the second rib to the fourth, the second, from the third rib to the fifth, the third, from the fourth rib to the sixth, and the fourth, from the sixth rib to the seventh. The internal intercostals of the two inferior false ribs are frequently so thin, as to be with difficulty separated from the external; and, in some subjects, one or both of them seem to be altogether wanting. It was the opinion of the ancients, that the external intercostals serve to elevate, and the internal to depress the ribs. They were probably led to this opinion, by observing the different direction of their fibres; but it is now well known, that both have the same use, which is that of raising the ribs

INT

equally during inspiration. Fallopius was one of the first who ventured to call in question the opinion of Galen on this subject, by contending that both layers of the intercostals serve to elevate the ribs. In this opinion he was followed by Hieronymus Fabricius, our countryman Mayow, and Borelli. But, towards the close of the last century, Bayle, a writer of some eminence, and professor at Toulouse, revived the opinion of the ancients by the following arguments. He observed, that the oblique direction of the fibres of the internal intercostals is such, that, in each inferior rib, these fibres are nearer to the vertebræ than they are at their superior extremities, or in the rib immediately above; and that of course they must serve to draw the rib downwards, as towards the most fixed point. This plausible doctrine was adopted by several eminent writers, and amongst others, by Nicholls, Hoadley, and Schreiber; but, above all, by Hamberger, who went so far as to assert, that not only the ribs, but even the sternum, are pulled downwards by these muscles, and constructed a particular instrument to illustrate this doctrine. He pretended, likewise, that the intervals of the ribs are increased by their elevation, and diminished by their depression; but allowed, that while those parts of the internal intercostals that are placed between the bony part of the ribs pull them downwards, the anterior portions of the muscle, which are situated between the cartilages, concur with the external intercostals in raising them upwards. These opinions gave rise to a warm and interesting controversy, in which Hamberger and Haller were the principal disputants. The former argued chiefly from theory, and the latter from experiments on living animals, which demonstrate the fallacy of Hamberger's arguments, and prove beyond a doubt, that the internal intercostals perform the same functions as the external.

INTERCOSTAL NERVE. Nervus intercostalis. Great intercostal nerve. Sympathetic nerve. The great intercostal nerve arises in the cavity of the cranium from a branch of the sixth and one of the fifth pair, uniting into one trunk, which passes out of the cranium through the carotid canal, and descends by the sides of the bodies of the vertebræ of the neck, thorax, loins, and os sacrum: in its course it receives the small accessory branches from all the thirty pair of spinal nerves. In the neck it gives off three cervical ganglions, the upper, middle, and lower; from which the cardiac and pulmonary nerves arise. In the thorax it gives off the splanchnic or anterior intercostal, which perforates the diaphragm, and forms the semilunar ganglions, from which nerves pass to all the abdominal viscera. They also form in the abdomen ten peculiar plexuses, distinguished by the name of the viscus to which they belong, as the coeliac, splenic, hepatic, superior, aortic and lower mesenteric, two renal, and two spermatic plexuses. The posterior intercostal nerve gives accessory branches about the pelvis and ischiatic nerve, and at length terminates.

INT

INTERCOSTAL VEINS. Veins which empty their blood into the vena azygos.

INTERCOURSE. *s.* (entrecours, Fr.)

1. Commerce; exchange (Milton). 2. Communication (Bacon).

INTERCURRENCE. *s.* (from *intercurro*.) Latin) Passage between (Boyle).

INTERCURRENT. *a.* (intercurrens, Lat.) Running between (Boyle).

INTERDEAL. *s.* (inter and deal.) Traffick; intercourse: obsolete (Spenser).

To INTERDICT. *v. a.* (interdicto, Latin) 1. To forbid; to prohibit (Titchel). 2. To prohibit from the enjoyment of communion with the church (Ayliffe).

INTERDICT. *s.* (from the verb.) 1. Prohibition; prohibiting decree (Bacon). 2. A papal prohibition to the clergy to celebrate the holy offices (Wotton).

INTERDICTION. *s.* (interdictio, Lat.) 1. Prohibition; forbidding decree (Milton).

2. Curse; from the papal *interdict* (Shakspeare).

INTERDICTORY. *a.* (from *interdict*) Belonging to an interdiction (Ainsworth).

To INTERESS. **To INTEREST.** *v. a.* (interessere, French) To concern, to affect; to give share in (Dryden).

To INTEREST. *v. n.* To affect; to move; to touch with passion.

INTEREST. *s.* (interest, Lat *interet*, Fr)

1. Concern; advantage; good (Hammond).

2. Influence over others (Clarendon). 3.

Share; participation (Watts). 4. Regard to

private profit (Swift). 5. Money paid for

use; usury (Arbutnot). 6. Any surplus of

advantage (Shakspeare). In the fifth sense above, we must speak of interest more at large, as follows:

INTEREST is a sum reckoned for the loan or forbearance of another sum, or principal, lent for, or due at, a certain time, according to some certain rate or proportion; being estimated usually at so much per cent. or by the 100. This forms a particular rule in arithmetic. The highest legal interest now allowed in England is after the rate of 5 per cent. per annum, or the 20th part of the principal for the space of a year, and so in proportion for other times, either greater or less. Except in the case of pawn-brokers, to whom it has lately been made legal to take a higher interest, for one of the worst and most destructive purposes that can be suffered in any state.

Interest is either simple or compound.

INTEREST (Simple), is that which is counted and allowed upon the principal only, for the whole time of forbearance.

The sum of the principal and interest is called the amount.

As the interest of any sum, for any time, is directly proportional to the principal sum and time, therefore the interest of any sum, for one year being multiplied by any proposed principal sum, and by the time of its forbearance, in years and parts, will be the interest for that time. That is, if

r = the rate of interest per annum,

p = any principal sum,

t = the time in years and parts,

INTEREST.

a = the amount, or sum of principal and interest; then is prt = the interest of the sum p , for the time t , at the rate r ; and consequently $p +$

$prt = p \times 1 + rt = a$, the amount of the same for that time. And from this general theorem, other theorems can easily be deduced for finding any of the quantities above mentioned; which collected all together, will be as follow:

1st, $a = p + prt$ the amount,

2d, $p = \frac{a}{1 + rt}$ the principal,

3d, $r = \frac{a - p}{pt}$ the rate,

4th, $t = \frac{a - p}{pr}$ the time.

A very easy and general method of computing simple interest, is by means of the following small but comprehensive table.

A General Interest Table,												
By which the interest of any sum, at any rate, and for any time, may be readily found.												
Days.	3 per cent.				3½ per cent.				4 per cent.			
	l.	s.	d.	q.	l.	s.	d.	q.	l.	s.	d.	q.
1			1	3			2	1			2	2
2			3	3			4	2			5	1
3			5	3			6	3			7	3
4			7	3			9	0			10	2
5			9	3			11	2			11	3
6			11	3			1	3			1	3
7		1	1	3		1	4	0			1	6
8		1	3	3		1	6	1			1	9
9		1	5	3		1	8	2			1	11
10		1	7	2		1	11	0			2	2
20		3	3	1		3	10	0			4	4
30		4	11	0		5	9	0			6	6
40		6	6	3		7	8	0			8	9
50		8	2	2		9	7	0			10	11
60		9	10	1		11	6	0			13	1
70		11	6	0		13	5	0			15	4
80		13	1	3		15	4	0			17	6
90		14	9	2		17	3	0			19	8
100		16	5	1		19	2	0			2	2
200	1	12	10	2	1	18	4	1	2	3	10	0
300	2	9	3	3	2	17	6	1	3	5	9	0

N. B. This table contains the interest of 100l. for all the several days in the first column, and at the several rates of 3, 3½, 4, 4½, and 5 per cent. in the other five columns.

To find the interest of 100l. for any other time, as 1 year and 278 days, at 4½ per cent. Take the sums for the several days as here below.

The int. for 1 year 4 10 0 0

Against 200 ds. is 2 9 3 3

70 ds. -- 0 17 3 1

8 ds. -- 0 1 11 0

Interest required - 7 18 0 0

For any other sum than 100l. First find for 100l. as above, and take it so many times or parts as the sum is of 100l. Thus, to find for 355l. 11s. 6d. for one year and 278 days.

First, 3 times the above sum,

(for 300l.) is - 21 15 3 1

½ (for 50l.) is - 3 19 3 1

¼ of this (for 12½l.) 0 7 11 0

So for 355l. it is - 24 9 10 2

When the amount is required for any other rate than those in the table, it may be easily made out from them. So ½ of 4 is 2, ¼ of 4 is 1, ⅓ of 4 is 1⅓, &c. and ⅓ of 3 is 1. And so, by adding or subtracting, any rate may be found.

A very curious and singular mode of interest founded upon a singular theory of prime

numbers, has been invented by H. Goodwyn, Esq. It is given in Nicholson's Journal, vol. iv. p. 437, 4to.

INTEREST (Compound), called also Interest-upon-Interest, is that which is counted not only upon the principal sum lent, but also for its interest, as it becomes due, at the end of each stated time of payment.

Although it be not lawful to lend money at compound interest, yet in purchasing annuities, pensions, &c. and taking leases in reversion, it is usual to allow compound interest to the purchaser for his ready money; and therefore it is very necessary to understand this subject.

Besides the quantities concerned in simple interest, viz. the principal p , the rate or interest of 1l. for 1 year r , the amount a , and the time t , there is another quantity employed in compound interest, viz. the ratio of the rate of interest, which is the amount of 1l. for one time of payment, and which here let be denoted by R , viz. $R = 1 + r$. Then, the particular amounts for the several times may be thus computed, viz. As 1l. is to its amount for any time, so is any proposed principal sum to its amount for the same time; i. e.

INTEREST.

1l. : R :: p : pR the 1st year's amount,
 1l. : R :: pR : pR² the 2d year's amount,
 1l. : R :: pR² : pR³ the 3d year's amount,
 and so on.

Therefore in general, pR^t = a is the amount for the t year, or t time of payment. From whence the following general theorems are deduced :

1st, a = pR^t the amount,

2d, p = $\frac{a}{R^t}$ the principal,

3d, r = $\sqrt[t]{\frac{a}{p}}$ the ratio,

4th, t = $\frac{\log. \text{ of } a - \log. \text{ of } p}{\log. \text{ of } R}$ the time.

From which any one of the quantities may be found, when the rest are given.

For example, suppose it were required to find

in how many years any principal sum will double itself, at any rate of interest. In this case we must employ the 4th theorem, where a will be = 2p, and then it is

$$t = \frac{1. a - 1. p}{\log. R} = \frac{1. 2p - 1. p}{\log. R} = \frac{\log. 2}{\log. R}.$$

So, if the rate of interest be 5 per cent. per annum; then R = 1 + .05 = 1.05, and hence

$$t = \frac{\log. 2}{\log. 1.05} = \frac{.3010300}{.0211893} = 14.2067 \text{ nearly:}$$

that is, any sum doubles in 14½ years nearly, at the rate of 5 per cent. per annum compound interest.

But compound interest is best computed by means of such a table as the following; containing the amounts of 1l. from 1 year to 40, at various rates of interest.

Yrs.	at 3 per cent.	at 3½ per cent.	at 4 per cent.	at 4½ per cent.	at 5 per cent.	at 6 per cent.
1	1.03000	1.03500	1.04000	1.04500	1.05000	1.06000
2	1.06090	1.07123	1.08160	1.09203	1.10250	1.12360
3	1.09273	1.10872	1.12486	1.14117	1.15763	1.19102
4	1.12551	1.14752	1.16986	1.19252	1.21551	1.26248
5	1.15927	1.18769	1.21665	1.24618	1.27628	1.33823
6	1.19405	1.22926	1.26532	1.30226	1.34010	1.41852
7	1.22987	1.27228	1.31593	1.36086	1.40710	1.50363
8	1.26677	1.31681	1.36857	1.42210	1.47746	1.59385
9	1.30477	1.36290	1.42331	1.48610	1.55133	1.68948
10	1.34392	1.41060	1.48024	1.55297	1.62890	1.79085
11	1.38423	1.45997	1.53945	1.62285	1.71034	1.89830
12	1.42576	1.51107	1.60103	1.69588	1.79586	2.01220
13	1.46853	1.56396	1.66507	1.77220	1.88563	2.13293
14	1.51259	1.61869	1.73168	1.85194	1.97993	2.26090
15	1.55797	1.67535	1.80094	1.93528	2.07893	2.39656
16	1.60471	1.73399	1.87298	2.02237	2.18287	2.54035

INT

By this table we may calculate the interest, or the amount, of any principal sum for any time, not more than 40 years. For an example, take 529l. for 15 years, at 5 per cent per annum, compound interest. In the table on the line 15, and column 5 per cent. is the amount of 17, viz. 2-07893 This multiplied by the principal 529

gives the amount 1087-28039 or 1087l. 5s. 7d. Therefore the interest is 564l. 5s. 7d.

The reader may advantageously consult Keith's, Malcolm's, and Hutton's Arithmetic: Smart's and King's Interest Tables; and Bailly's Doctrine of Interest and Annuities. See also ANNUITIES, DISCOUNT, &c.

TO INTERFERE. *v. n.* (*inter* and *ferio*, Latin.) 1. To interpose; to intermeddle (Swift). 2. To clash; to oppose each other (Smulridge). 3. A horse is said to *interfere*, when the side of one of his shoes strikes against and hurts one of his fetlocks (Farrier's Dict.)

INTERFLUENT. *a.* (*interfluens*, Latin.) Flowing between (Boyle).

INTERFOLIA'CEOUS flowers or peduncles. In botany, *inter folia opposita*, *scilicet alternatim collocati*. Between opposite leaves, but placed alternately with them as in *Asclepias*. Contrasted with *oppositifolium*.

INTERFULGENT. *a.* (*inter* and *fulgens*, Latin.) Shining between.

INTERFUSED. *a.* (*interfusus*, Latin.) Poured or scattered between (Milton).

INTERJACENCY. *s.* (from *interjacens*, Latin.) 1. The act or state of lying between (Hale). 2. The thing lying between (Brown).

INTERJACENT. *a.* (*interjacens*, Latin.) Intervening; lying between (Raleigh).

INTERJECTION. *s.* (*interjectio*, Latin.) 1. A part of speech that discovers the mind to be seized or affected with some passion: such as are in English, *O! alas! &c.* 2. Intervention; interposition; act of something coming between (Bacon).

INTERIM. *s.* (*interim*, Lat.) Mean time; intervening time (Tatler).

TO INTERJOIN. *v. a.* (*inter* and *join*.) To join mutually; to intermarry (Shak.)

INTERIOUR. *a.* (*interior*, Latin.) Interior; inward; not outward; not superficial (Du.)

INTERIOR KNOWLEDGE. *s.* (*interior* and *know*.) Knowledge (Bacon).

TO INTERMIX. *v. a.* (*inter* and *mix*, Fr.) To mix; to put one thing within another (Bacon).

INTERMEDIATE. *a.* (*inter* and *medius*.) The flow of water over the middle (Har.)

TO INTERMEDIATE. *v. n.* (*inter* and *medius*, Fr.) 1. To mix; to put one thing within another (Bacon).

TO INTERMEDIATE. *v. n.* (*inter* and *medius*, Fr.) 2. To interpose; to put one thing between two others (Bacon).

TO INTERMEDIATE. *v. n.* (*inter* and *medius*, Fr.) 3. To diversify; to mix (Bacon).

TO INTERMEDIATE. *v. n.* (*inter* and *medius*, Fr.) To check a passion by the insertion of blank lines.

TO INTERMEDIATE. *v. n.* (*inter* and *medius*, Fr.) To write in alternate lines (Locke). 2. Vol. VI.

INT

To correct by something written between the lines (Dryden).

INTERLINEATION. *s.* (*inter* and *lineation*.) Correction made by writing between the lines (Swift).

TO INTERLINK. *v. a.* (*inter* and *link*.) To connect chains one to another; to join one in another (Dryden).

INTERLOCUTION. *s.* (*interlocutio*, Lat.) 1. Dialogue; interchange of speech (Hook).

2. Preparatory proceeding in law; an intermediate act before final decision (Addison).

INTERLOCUTOR. *s.* (*inter* and *loquor*, Latin.) Dialogist; one that talks with another.

INTERLOCUTORY. *a.* (*interlocutorius*, Fr.) 1. Consisting of dialogue (Fiddes). 2. Preparatory to decision.

TO INTERLOPE. *v. n.* (*inter* and *loopen*, Dutch.) To run between parties and intercept the advantage that one should gain from the other; to traffic without a proper licence (Tatler).

INTERLOPER. *s.* (from *interlope*.) One who runs into business to which he has no right (L'Estrange).

INTERLU'CENT. *a.* (*interlucens*, Latin.) Shining between.

INTERLU'DE, an entertainment exhibited on the theatre between the acts of a play, to amuse the spectators while the actors take breath and shift their dress, or to give time for changing the scenes and decorations. In the ancient tragedy, the chorus sung the interludes, to show the intervals between the acts. Interludes, among us, usually consist of songs, dances, feats of activity, concerts of music, &c.

INTERLU'ENCY. *s.* (*interlus*, Lat.) Water interposed; interposition of a flood (Hale).

INTERLU'NAR. } *a.* (*inter* and *luna*,
INTERLU'NARY. } Lat.) Belonging to the time when the moon, about to change, is invisible (Milton).

INTERMARRIAGE. *s.* (*inter* and *marriage*.) Marriage between two families where each takes one and gives another (Addison).

TO INTERMARRY. *v. n.* (*inter* and *marry*.) To marry one of each family with the other (Swift).

TO INTERMEDDLE. *v. n.* (*inter* and *meddle*.) To interpose officiously. (Clarend.)

TO INTERMEDDLE. *v. a.* (*inter* and *meddler*, Fr.) To mingle; to intermeddle (Spenser).

INTERMEDDLER. *s.* (from *intermeddler*.) One that interposes officiously; one that thrusts himself into business to which he has no right (L'Estrange).

INTERMEDIACY. *s.* (from *intermediate*.) Interposition; intervention (Derham).

INTERMEDIAL. *a.* Intervening; lying between; intercurrent (Evelyn).

INTERMEDIATE. *a.* (*intermediatus*, Fr.) Intervening; interposed (Newton).

INTERMEDIATELY. *ad.* (from *intermediatus*.) By way of intervention.

I N T

INTERMEDIUM, or **INTERMEDIATE SUBSTANCE**, in chemistry. Those are called intermediate substances, or intermediated, by means of which other substances, incapable of combining by themselves, are made to unite. For example, saline, acid, or alkaline substances, by means of which oils are brought to a saponaceous state, and are thereby rendered miscible with water, are the intermediates of this union of oil with water; because, without these substances, oil and water cannot be united, or even well mixed. An office nearly similar belongs to those fluxes which are used to effect or facilitate the reduction or melting of metals. See **FLUX**. Sometimes the term is applied to those substances that are used for the immediate purpose of disuniting others, which cannot otherwise be separated. In this sense, sulphuric acid is an intermediate, by which nitrous or muriatic acid may be separated from any alkaline salt, with which either of them may happen to be united.

To **INTERMELL**. *v. a.* (*entremeller*, Fr.) To mix; to mingle: not in use (*Spenser*).

INTERMENT, the act of interring, i. e. burying or laying a deceased person in the ground. Aristotle asserted, that it was more just to assist the dead than the living. Plato, in his Republic, does not forget, amongst other parts of justice, that which concerns the dead. Cicero establishes three kinds of justice: the first respects the gods, the second the manes or dead, and the third men. These principles seem to be drawn from nature; and they appear at least to be necessary for the support of society, since at all times civilized nations have taken care to bury their dead, and to pay their last respects to them.

We find in history several traces of the respect which the Indians, the Egyptians, and the Syrians entertained for the dead. The Syrians embalmed their bodies with myrrh, aloes, honey, salt, wax, bitumen, and resinous gums; they dried them also with the smoke of the fir and the pine tree. The Egyptians preserved theirs with the resin of the cedar, with aromatic spices, and with salt. These people often kept such mummies, or at least their effigies, in their houses; and at grand entertainments they were introduced, that by reciting the great actions of their ancestors they might be better excited to virtue.

The Turks have, at all times, been accustomed to wash the bodies of their dead before interment, and as their ablutions are complete, and no part of the body escapes the attention of those who assist at such melancholy ceremonies, they can easily perceive whether one be really dead or alive, by examining, among other methods of proof, whether the *contractant ani* has lost its power of contraction. If this muscle remains still contracted, they warm the body, and endeavour to recall it to life; otherwise, after having washed it with water and

I N T

soap, they wipe it with linen cloths, wash it again with rose water and aromatic substances, cover it with a rich dress, put upon its head a cap ornamented with flowers, and extend it upon a carpet placed in the vestibule or hall at the entrance of the house.

In the primitive church the dead were washed and then anointed; the body was wrapped up in linen, or clothed in a dress of more or less value according to circumstances, and it was not interred until after being exposed and kept some days in the house. The custom of clothing the dead was usual in France only for princes and ecclesiastics.

In other countries, more or less care is taken to prevent sudden interments. At Geneva, there are people appointed to inspect all dead bodies. Their duty consists in examining whether the person be really dead, and whether one died naturally or by violence. In the north, as well as at Genoa, it is usual not to bury the dead till three days have expired. In Holland, people carry their precautions much farther, and delay the funerals longer. And in England bodies generally remain unburied three or four days. Notwithstanding these precautions, however, it is to be feared, that in numerous instances too much precipitation attends this last office; and as the consequences of premature interment are extremely dreadful, we cannot forbear seizing another opportunity of recommending an earnest attention to what has been said relative to this subject under the articles **PREMATURE BURIAL**, **SYMPTOMS OF DEATH**, and **PUTREFACTION**.

Indeed, it must appear astonishing that the attention of mankind has been so little roused by an idea the most terrible that can be conceived on this side of eternity. According to present usage, as soon as the semblance of death appears, the chamber of the sick is deserted by friends, relatives, and physicians; and the apparently dead, though frequently living, body is committed to the management of an ignorant and unfeeling nurse, whose care extends no farther than laying the limbs straight, and securing her accustomed perquisites. The bed-clothes are immediately removed, and the body is exposed to the air. This, when cold, must extinguish any spark of life that may remain, and which, by a different treatment, might have been kindled into flame; or it may only continue to repress it, and the unhappy person afterwards revive amidst the horrors of the tomb.

In apoplectic and fainting fits, and in those arising from any violent agitation of mind, also when gums or spirits have been too freely used, there is reason to fear that the appearance of death has been frequently mistaken for the reality, and even in old age, when life seems to be gradually drawing to a close, the symptoms of death are often fallacious. The following instance is recorded in the *London Chronicle*, vol. iv. p. 456. A lady in Cornwall, more than 80

INT

years of age, who had been a considerable time declining, took to her bed, and in a few days seemingly expired in the morning. As she had often desired not to be buried till she had been two days dead, her request was to have been regularly complied with by her relations. All that saw her looked upon her as dead, and the report was current through the whole place; nay, a gentleman of the town actually wrote to his friend in the island of Scilly that she was deceased. But one of those who were paying the last kind office of humanity to her remains, perceived some warmth about the middle of the back; and acquainting her friends with it, they applied a mirror to her mouth, but, after repeated trials, could not observe it in the least stained; her under jaw was likewise fallen, as the common phrase is; and, in short, she had every appearance of a dead person. All this time she had not been stripped or dressed; but the windows were opened, as is usual in the chambers of the deceased. In the evening the heat seemed to increase, and at length she was perceived to breathe.

Almost every one knows that Vesalius, the father of modern anatomy, having been sent for to open a woman subject to hysterics, who was supposed to be dead, he perceived, on making the first incision, by her motion and cries, that she was still alive; that this circumstance rendered him so odious, that he was obliged to fly; and that he was so much affected by it, that he died soon after. On this occasion, we cannot forbear to add an event more recent, but no less melancholy. The Abbé Prevost, so well known by his writings and the singularities of his life, was seized with a fit of the apoplexy, in the forest of Chantilly, on the 23d of October 1763. His body was carried to the nearest village, and the officers of justice were proceeding to open it, when a cry which he sent forth affrightened all the assistants, and convinced the surgeon that the Abbé was not dead; but it was too late to save him, as he had already received the mortal wound!

INTERMIGRATION. *s.* (*Intermigration*, Fr.) Act of removing from one place to another; to as that of two parties removing, and taking the place of the other (*Hale*).

INTERMINABLE. *a.* (*in* and *termino*, Latin.) Immense; admitting no boundary (*Milton*).

INTERMINATE. *a.* (*interminus*, Latin.) Unbounded; unlimited (*Chambers*).

INTERMINUTION. *s.* (*interminus*, Latin.) Menace; threat (*Dryden*).

To INTERMINGLE. *v. a.* (*inter* and *minge*.) To mix; to put some things among others (*Hayward*).

To INTERMIX. *v. n.* To be mixed or incorporated.

INTERMITTENCE. (*intermittens*, Latin.) 1. Cessation for a time; pause; intermediate stop (*Wallis*). 2. Intervient time (*Shaks*).

INT

3. State of being intermitted (*Ben Jonson*). 4. The space between the paroxysms of a fever; or any fits of pain; rest (*Milton*).

INTERMISSIVE. *a.* (*from intermit*.) Coming by fits; not continual (*Brown*).

To INTERMIT. *v. a.* (*intermittens*, Latin.) To forbear any thing for a time; to interrupt (*Rogers*).

To INTERMIT. *v. n.* To grow mild between fits or paroxysms.

INTERMITTENT. *a.* (*intermittens*.) Coming by fits (*Harvey*).

INTERMITTENT FEVER. See *Fever*, and *FEBRIS intermittens*.

To INTERMIX. *v. a.* (*inter* and *mix*.) To mingle; to join; to put some things among others (*Hayward*).

To INTERMIX. *v. n.* To be mixed together.

INTERMIXTURE. *s.* (*inter* and *mixture*, Latin.) 1. Mass formed by mingling bodies (*Boyle*). 2. Something additional mingled in a mass (*Bacon*).

INTERMUNDANE. *a.* (*inter* and *mundus*, Latin.) Subsisting between worlds, or between orb and orb (*Locke*).

INTERMURAL. *a.* (*inter* and *murus*, Latin.) Lying between walls (*Ainsworth*).

INTERMUTUAL. *a.* (*inter* and *mutual*.) Mutual; interchanged (*Daniel*).

INTERNAL. *a.* (*internus*, Latin.) Inward; intestine; not foreign (*Howell*).

INTERNAL. *a.* (*internus*, Latin.) 1. Inward; not external (*Locke*). 2. Intrinsic; not depending on external accidents; real (*Rogers*).

INTERNALLY. *ad.* 1. Inwardly. 2. Mentally; intellectually (*Taylor*).

INTERNECINE. *a.* (*internecinus*, Latin.) Endeavouring mutual destruction. (*Hudib*).

INTERNECION. *s.* (*internecio*, Latin.) Mutual destruction; massacre; slaughter (*Hale*).

INTERNODE. In botany, *internodium*. The space between knot and knot, or joint and joint. In pure English, we have no term appropriate to this idea, for which reason we are compelled to anglicize the Latin term. The joint is properly the articulation itself, from *junctura*; although in common language we use it also for the space between two joints.

INTERNUNCIO. *s.* (*internuncius*, Latin.) Messenger between two parties.

INTEROSSEI MUSCULI. (*interosseus musculus*, from *inter*, between, and *os*, the bone.) These are small muscles situated between the metacarpal bones, and extending from the bones of the carpus to the fingers. They are divided into internal and external; the former are to be seen only on the palm of the hand, but the latter are conspicuous both on the palm and back of the hand. The *interossei interni* are three in number. The first, which Albinus names *posterior indicis*, arises tendinous and fleshy from the basis and inner part of the metacarpal bone of the fore-finger, and likewise from the up-

I N T

per part of that which supports the middle finger. Its tendon passes over the articulation of this part of these bones with the fore-finger, and uniting with the tendinous expansion that is sent off from the extensor digitorum communis, is inserted into the posterior convex surface of the first phalanx of that finger. The second and third, to which Albinus gives the names of prior annularis, and interosseus auricularis, arise, in the same manner, from the bases of the outsides of the metacarpal bones that sustain the ring finger and the little finger; and are inserted into the outside of the tendinous expansion of the extensor digitorum communis that covers each of those fingers. These three muscles draw the fingers, into which they are inserted, towards the thumb. The *interossei externi* are four in number, for ~~namely~~ these is included the small muscle that is situated on the outside of the metacarpal bone that supports the fore-finger. Douglas calls it *extensor tertii internodii indicis*, and Winslow, *semi interosseus indicis*. Albinus, who describes it among the *interossei*, gives it the name of prior indicis. This first *interosseus externus* arises by two tendinous and fleshy portions. One of these springs from the upper half of the inner side of the first bone of the thumb, and the other from the ligaments that unite the *os trapezoides* to the metacarpal bone of the fore-finger, and likewise from all the outside of this latter bone. These two portions unite as they descend, and terminate in a tendon, which is inserted into the outside of that part of the tendinous expansion from the extensor digitorum communis that is spread over the posterior convex surface of the fore-finger. The second, to which Albinus gives the name of prior medii, is not quite so thick as the last described muscle. It arises by two heads, one of which springs from the inner side of the metacarpal bone of the fore-finger, chiefly towards its convex surface, and the other arises from the adjacent ligaments, and from the whole outer side of the metacarpal bone that sustains the middle finger. These two portions unite as they descend, and terminate in a tendon, which is inserted, in the same manner as the preceding muscle, into the outside of the tendinous expansion that covers the posterior part of the middle finger. The third belongs likewise to the middle finger, and is thence named posterior medii by Albinus. It arises, like the last described muscle, by two origins, which spring from the roots of the metacarpal bones of the ring and middle fingers, and from the adjacent ligaments, and is inserted into the inside of the same tendinous expansion as the preceding muscle. The fourth, to which Albinus gives the name of posterior annularis, differs from the two last only in its situation, which is between the metacarpal bones of the ring and little fingers. It is inserted

I N T

into the inside of the tendinous expansion of the extensor digitorum communis that covers the posterior part of the ring finger. All these four muscles serve to extend the fingers into which they are inserted, and likewise to draw them inwards towards the thumb, except the third, or posterior medii, which, from its situation and insertion, is calculated to pull the middle finger outwards.

INTEROSSEI PEDIS. These small muscles in their situation between the metatarsal bones resemble the *interossei* of the hand, and, like them, are divided into internal and external. The *interossei pedis interni* are three in number. They arise tendinous and fleshy from the basis and inside of the metatarsal bones of the middle, the third, and the little toes, in the same manner as those of the hand, and they each terminate in a tendon that runs to the inside of the first joint of these toes, and from thence to their upper surface, where it loses itself in the tendinous expansion that is sent off from the extensors. Each of these three muscles serves to draw the toe, into which it is inserted, towards the great toe. The *interossei externi* are four in number. The first arises tendinous and fleshy from the outside of the root of the metatarsal bone of the great toe, from the *os cuneiforme internum*, and from the root of the inside of the metatarsal bone of the fore toe. Its tendon is inserted into the inside of the tendinous expansion that covers the back part of the toes. The second is placed in a similar manner between the metatarsal bones of the fore and middle toes, and is inserted into the outside of the tendinous expansion on the back part of the fore toe. The third and fourth are placed between the two next metatarsal bones, and are inserted into the outside of the middle and third toes. The first of these muscles draws the fore toe inwards towards the great toe. The three others pull the toes, into which they are inserted, outwards. They all assist in extending the toes.

INTERPELLATION. *a.* (*interpellatio*, Latin.) A summons; a call upon (*Ayliffe*).

TO INTERPOLATE. *v. a.* (*interpolo*, Latin.) 1. To foist any thing into a place to which it does not belong (*Pope*). 2. To renew; to begin again; not tired (*Hale*).

INTERPOLATION. *a.* (*Interpolation*, Fr.) Something added or put into the original matter (*Cromwell*).

INTERPOLATION, in the modern Algebra, is used for finding an intermediate term of a series, its place in such series being given.

The following are among the most useful rules and theorems in the method of interpolation. . . . When the first, second, or other successive differences of the terms of a series become at last equal, the interpolation of any term of such a series may be found by Newton's Differential Method.

INTERPOLATION.

When the algebraical equation of a series is given, the term required, whether it be a primary or intermediate one, may be found by the resolution of affected equations; but when that equation is not given, as it often happens, the value of the term sought must be exhibited by a converging series, or by the quadrature of curves.

Let A denote any term of an equidistant series of terms, and $a, b, c, \&c.$ the first of the first, second, third, $\&c.$ orders of differences; then the term z , whose distance from A is expressed by x , will be this, viz. Theorem 1.

$$x = A + xa + x \cdot \frac{x-1}{2} b + x \cdot \frac{x-1}{2} \cdot \frac{x-2}{3} c \&c.$$

Hence, if any of the orders of differences become equal to one another, or $=0$, this series for the interpolated term will break off, and terminate, otherwise it will run out in an infinite series.

Ex. To find the 20th term of the series of cubes 1, 8, 27, 64, 125, &c. or $1^3, 2^3, 3^3, 4^3, 5^3, \&c.$

Set down the series in a column, and take their continual differences as here annexed, where the 4th differences, and all after it become = 0, also $A = 1$, $a = 7$, $b = 12$, $c = 6$, and $s = 19$; therefore the 20th term sought is barely

$$z = 1 + (19 \times 7) + 19 \cdot \frac{18}{2} + 19 \cdot \frac{18}{2} \cdot \frac{17}{3} \cdot 6$$

$$= 1 + 133 + 2052 + 5814 = 8000.$$

Theor. 2. In any series of equidistant terms, a, b, c, d , &c. whose first differences are small; to find any term wanting in that series, having any number of terms given. Take the equation which stands against the number of given terms, in the following table; and by reducing the equation, that term will be found.

$$\begin{aligned} B_1 &= \frac{B - B_0}{p}, & C_1 &= \frac{B_2 - B_1}{q+r}, \\ B_2 &= \frac{B_1 - B_0}{p}, & C_2 &= \frac{B_3 - B_2}{r+s}, \\ B_3 &= \frac{B_2 - B_1}{p}, & & \end{aligned}$$

&c. &c.

No. Equations.

1 $a - b = 0$

2 $a - 2b + c = 0$

3 $a - 3b + 3c - d = 0$

4 $a - 4b + 6c - 4d + e = 0$

5 $a - 5b + 10c - 10d + 5e - f = 0$

6 $a - 6b + 15c - 20d + 15e - 6f + g = 0$

&c. &c.

$$n \quad a - nb + n \frac{n-1}{2} c - n \frac{n-1}{2} \sqrt{\frac{n-2}{2}} d$$

&c. = 0.

where it is evident that the coefficients in any equation, are the uncise of a binomial $k + 1$ raised to the power denoted by the number of the equation.

Ex. Given the logarithms of 101, 102, 104, and 105; to find the log. of 103.

Here are 4 quantities given, therefore we must take the 4th equation $4x + 6e = 103$, in which it is the middle quantity or term c that is to be found, because 103 is in the middle among the numbers 101, 109, 104, 105; then that equation gives the value of e as follows, viz.

$$c = \frac{4 \cdot \overline{b+d} - \overline{a+c}}{6}.$$

Now the logs. of the given numbers will be thus:

9'0043214 = a
 9'0086009 = b
 2'0170539 = c
 9'0211899 = d

 4'0256235 = e + d
 4

$$\begin{array}{r} 16 \cdot 1025940 = 4 \cdot \overline{b + d} \\ \text{subtr. } 4 \cdot 9255107 = \quad \overline{a + c} \end{array}$$

6) 12.0770233
2.0128379 the log. of 103.

Theor. 3. When the terms a, b, c, d , &c. are at unequal distances from each other, to find any intermediate one of these terms, the rest being given.

Let p, q, r, s , &c. be the several distances of those terms from each other; then let

$$D = \frac{C1 - C}{p + q + r}, \quad D1 = \frac{D1 - D}{p + q + r},$$

$$D1 = \frac{C2 - C1}{q + r + s}$$

I N T

Then the term z , whose distance from the beginning is x , will be

$$= a + Bx + Cx \cdot x - p + Dx \cdot x - p \cdot x - p - q + Ex \cdot x - p \cdot x - p - q \cdot x - p - q - r + \&c.$$

to be continued to as many terms as there are terms in the given series.

By this method may be found the place of a comet, or any other object at a given time, knowing the places of the same for several other given times.

Other methods of Interpolation may be found in the *Philos. Trans.* number 362; or *Stirling's Summation and Interpolation of Series*. See also *Briggs's Arithmetica Logarithmica*, and *Trigonometria Britannica*, where the Method of Interpolation by Differences was first applied to the calculation of logarithms.

INTERPOLATOR. *s.* (Latin.) One that forms the counterfeit passages (*Swift*).

INTERPOSAL. *s.* (from *interpose*.) 1. Interposition; agency between two persons (*South*). 2. Intervention (*Glanville*).

To INTERPOSE. *v. a.* (*interpono*, Lat.) 1. To place between; to make intervenient (*Bacon*). 2. To thrust in as an obstruction, interruption, or inconvenience (*Swift*). 3. To offer as a succour or relief (*Woodw.*)

To INTERPOSE. *v. a.* 1. To mediate; to act between two parties. 2. To put in by way of interpretation (*Boyle*).

INTERPOSER. *s.* (from *interposco*.) 1. One that comes between others (*Shak.*) 2. An intervenient agent; a mediator.

INTERPOSITION. *s.* (*interpositio*, Lat.) 1. Intervenant agency (*Atterbury*). 2. Mediation; agency between parties (*Add.*) 3. Intervention; state of being placed between two (*Raleigh*). 4. Any thing interposed (*Milton*).

To INTERPRET. *v. a.* (*interpretor*, Lat.) To explain; to translate; to decipher; to give a solution to (*Daniel*).

INTERPRETABLE. *a.* (from *interpret*.) Capable of being expounded (*Collier*).

INTERPRETATION. *s.* (*interpretatio*, Lat.) 1. The act of interpreting; explanation (*Shak.*) 2. The sense given by an interpreter; exposition (*Hooker*). 3. The power of explaining (*Bacon*).

INTERPRETATIVE. *a.* (from *interpret*.) Collected by interpretation (*Hammond*).

INTERPRETATIVELY. *ad.* As may be collected by interpretation (*Rhy*).

INTERPRETER. *s.* (*interpres*, Latin.) 1. An expositor; an expounder (*Burnet*). 2. A translator (*Sturburne*).

INTERPUNCTION. *s.* (*interpunctio*, Lat.) Pointing between words or sentences.

INTERREGNUM. *s.* (Latin.) The time in which a throne is vacant between the death of a prince, and accession of another (*Cowley*).

INTERREGN. *s.* (*interregne*, French,

interregnum, Latin.) Vacancy of the throne (*Bacon*).

To INTERROGATE. *v. a.* (*interrogo*, Lat.) To examine; to question.

To INTERROGATE. *v. n.* To ask; to put questions (*Hammond*).

INTERROGATION. *s.* (*interrogatio*, Lat.) 1. The act of questioning. 2. A question put; an inquiry (*Pope*). 3. A note that marks a question; thus?

INTERROGATIVE. *a.* (*interrogativus*, Lat.) Denoting a question; expressed in a questionary form of words.

INTERROGATIVE. *s.* A pronoun used in asking questions: *as, who? what?*

INTERROGATIVELY. *ad.* In form of a question.

INTERROGATOR. *s.* (from *interrogare*.) An asker of questions.

INTERROGATORY. *s.* (*interrogatoire*, Fr.) A question; an inquiry (*Shakespeare*).

INTERROGATORY. *a.* Containing a question; expressing a question.

To INTERRUPT. *v. a.* (*interruptus*, Lat.) 1. To hinder the process of any thing by breaking in upon it (*Hale*). 2. To hinder one from proceeding by interposition (*Ecclesiasticus*). 3. To divide; to separate.

INTERRUPT. *a.* Containing a chasm (*Milton*).

INTERRUPTED CADENCE, in music, one in which the bass instead of falling or rising from the fifth to the key note, passes to some other, and interrupts the full close.

INTERRUPTED PROPORTION, the same as **DISCRETE PROPORTION**: as in the case 6:8::3:4.

INTERRUPTED SPIKE, in botany. *Interrupta spica*. A broken spike. Divided by intervals of smaller flowers. As in *Mentha spicata*.

INTERRUPTEDLY. *ad.* (from *interrupted*.) Not in continuity; not without stoppages (*Boyle*).

INTERRUPTER. *s.* (from *interrupt*.) He who interrupts.

INTERRUPTION. *s.* (*interruptio*, Lat.) 1. Interposition; breach of continuity (*Hale*). 2. Intervention; interposition (*Dryden*). 3. Hindrance; stop; let; obstruction (*Shak.*) 4. Intermision (*Addison*).

INTERSCAPULAR. *a.* (*inter and scapula*, Lat.) Placed between the shoulders.

INTERSCENDENT QUANTITIES, in Algebra, such whose exponents are radical quantities: as

$$\sqrt{2} \cdot \sqrt{2}$$

$$x \cdot x$$

To INTERSCIND. *v. a.* (*inter* and *scindo*, Lat.) To cut off by interruption.

To INTERSCRIBE. *v. a.* (*inter* and *scribo*, Lat.) To write between.

INTERSECANT. *a.* (*intersecans*, Lat.) Dividing any thing into parts.

To INTERSECT. *v. a.* (*interseco*, Latin.) To cut; to divide each other mutually (*Brown*).

To INTERSECT. *v. n.* To meet and cross each other (*Wiseman*).

INTERSECTION. *s.* (*intersectio*, Latin.) Point wherelines cross each other (*Bentley*).

To INTERSERT. *v. a.* (*intersero*, Latin.) To put in between other things (*Brerewood*).

INTERERTION. *s.* (from *insert*.) An insertion, or thing inserted between any thing (*Hammond*).

To INTERSPERSE. *v. a.* (*interspersus*, Lat.) To scatter here and there among other things (*Swift*).

INTERSPERSION. *s.* (from *intersperse*.) The act of scattering here and there (*Watts*).

INTERSPINALES COLLI, (*Interspinales musculi*, from *inter*, between, and *spina*, the spine.) The fleshy portions between the spinous processes of the neck, that draw these processes nearer to each other.

INTERSPINALES DORSI ET LUMBORUM. These are rather small tendons than muscles that connect the spinal and transverse processes.

INTERSTELLAR. *a.* (*inter* and *stella*, Lat.) Intervening between the stars (*Bacon*).

INTERSTICE. *s.* (*interstitium*, Latin.) 1. Space between one thing and another (*Ash*). 2. Time between one act and another (*Ayliffe*).

INTERSTITIAL. *a.* (from *interstice*.) Containing interstices (*Brown*).

INTERTEXTURE. *s.* (*intertexto*, Lat.) Diversification of things mingled or woven one among another.

INTERTIES, in architecture, small pieces of timber which lie horizontally between the summers.

INTERTRANSVERSARES LUMBORUM. Four distinct small bundles of flesh, which fill up the spaces between the transverse processes of the vertebrae of the loins, and serve to draw them towards each other.

INTERTRIGO, (*intertrigo*, *trigo*, f. from *inter*, between, and *trigo*, to rub.) An excoriation about the axilla, axilla, or other parts of the body attended with inflammation and moisture. It is most commonly produced by the irritation of the urine, when rising, or some acrimony in children, and by the Greeks was denominated *Ecdora*.

To INTERTWIN. *v. a.* (*inter* and *twine*, or *twist*.) To unite by twining one in another (*Millon*).

INTERVAL. *s.* (*intervallus*, Latin.) 1. Space between distinct interstices; vacuity; space unoccupied; void place; vacancy; vacant place (*Newton*). 2. Time passing

between two assignable points (*Swift*). Remission of a tremor, or distemper (*Atterbury*).

INTERVAL, in music, the difference of two sounds with respect to acuteness and gravity; or, that imaginary space terminated by two sounds which differ in acuteness or gravity. The distance between any given sound and another, as *do* and *re*, is measured neither by ascending or descending by immediate sensation, or by computing the difference between the numbers of vibrations produced by two or more sonorous bodies, in the act of sounding, during the same given time. As the vibrations are slower and fewer during the same instant, for example, the sound is proportionally lower or graver; on the contrary, as during the same period the vibrations increase in number and velocity, the sounds are proportionably higher or more acute. An interval in music, therefore, is properly the difference between the number of vibrations produced by one sonorous body of a certain magnitude and texture, and of those produced by another of a different magnitude and texture in the same time. Taking the word in its more general sense, we must allow that the possible intervals of sound are infinite, but we only speak of those intervals which exist between the different tones of any established system. The ancients divided the intervals into simple, or uncomposite, which they call diastems, and composite intervals, which they call systems. The least of all the practical intervals in the Greek music was, according to Bacchius, the enharmonic diesis or fourth of a tone; but our scale does not notice so small a division, since all our tones concur in consonances, to which order only one of the three ancient genera, viz. the diatonic, was accommodated.

The ancients were extremely divided as to the measuring of intervals: Pythagoras and his followers measured them by the ratios of numbers; they supposed the difference of gravity and acuteness to depend on the different velocities of the motions that cause sound; and thought therefore that they could only be accurately measured by the ratios of those velocities; which ratios were first investigated by Pythagoras, on occasion of his passing by a smith's shop, and observing a concord between the sound of the hammers striking on the anvil. Aristoxenus opposed this; he thought reason and mathematics had nothing to do in the case, and that sense was the only judge in the dispute; the other being too subtil to be of any use. He therefore determined the octave, fifth, and fourth, which he thought the most simple concords, by the ear; and by the difference of the fourth and fifth, he found out the tone, which he settled as an interval the ear could judge of; he also measured every

I N T

interval by various additions and abstractions made with those mentioned one with another. Ptolemy kept a middle way between the two: he found fault with the one for despising reason, and with the other for excluding sense; and shewed how these two might mutually assist each other in this matter.

INTERVALS are divided into *consonant*, and *dissonant*; the former are such whose extreme sounds when heard simultaneously are agreeable to the soul; the latter, on the contrary, produce disagreeable sensations. Intervals are also divided into *enharmonic*, *chromatic*, and *diatonic*; an enharmonic interval, is the difference of a major and minor semitone; expressed by the ratio 81:80. A chromatic interval consists properly of a minor semitone, but may also admit the major, their ratios are 25:24 and 16:15. A diatonic interval consists of a semitone-major at least, but may consist of any number of tones within the octave. Intervals, again, are either *simple* or *compound*: modern musicians consider the semitone as a simple interval; and an interval which contains two or more semitones, a compound one.

The octave is commonly divided into its component intervals, by means of certain proportions resulting from combinations of the numbers 2, 3, and 5; which are given under the article *MONOCHORD*. But in this method of division, the simpler intervals have unequal ratios in different positions of the octave; the tones, for instance, being sometimes expressed by $\frac{1}{2}$ at others by $\frac{2}{3}$. It has, therefore, been thought proper to divide the octave into its component intervals by an *isotonic* scale of equal parts, and by a comparison of the numbers thus found, with the common division to determine the greatest errors. For the isotonic divisions of the octave, the rule is, to find as many geometrical means between 1 and $\frac{1}{2}$ as there are semitones between the two extremes, viz. 11; these means will be the ratios sought. They are as follow: fundamental, 1.00000; minor second, .94387; major second, .89090; minor third, .84090; major third, .79370; fourth, .74915; major fourth, .70711; fifth, .66742; minor sixth, .62926; major sixth, .59460; minor seventh, .56123; major seventh, .52973; octave, .50000. By comparing these with the common divisions, it appears that the differences or errors are, in general, quite minute; but that the greatest are at the minor third, and major sixth, where they are equivalent to $\frac{1}{11}$ of a tone. These errors, though small, produce very disagreeable effects, and give a widely different character to the same composition when performed in different keys; those concords being found imperfect in one key which were perfect in another. Hence, it has been found necessary to temper the concords and other intervals, either by an *isotonic* divi-

I N T

sion, or by some other expedient. See *TEMPERAMENT*.

To INTERVENE, *v. n.* (*intervenio*, Lat.)

1. To come between things or persons. 2. To make intervals (*Milton*). 3. To cross unexpectedly (*Taylor*).

INTERVENE, *s.* (from the verb.) Opposition, or perhaps interview; out of use (*Wotton*).

INTERVENIENT, *a.* (*intervenienti*, La.) Intercedent; interposed; passing between (*Bacon*).

INTERVENTION, *s.* (*interventio*, Latin.)

1. Agency between persons (*Atterbury*). 2. Agency between antecedents and consecutives (*L'Estrange*). 3. Interposition; the state of being interposed (*Holder*).

To INTERVERT, *v. a.* (*internerto*, Lat.)

1. To turn to another course (*Wotton*). 2. To turn to another use.

INTERVIEW, *s.* (*entrevue*, French.)

Mutual sight; sight of each other (*Hooker*).

To INTERVOLVE, *v. a.* (*intervolve*, Lat.)

To involve one within another (*Milton*).

To INTERWEAVE, *v. a.* *pret.* *interwove*, *part. pass.* *interwoven*, *interwove*, or *interweaved*. (*inter* and *weave*.) To mix one with another in a regular texture; to intermingle (*Milton*).

To INTERWISH, *v. a.* (*inter* and *wish*.)

To wish mutually to each other (*Donne*).

INTESTABLE, *a.* (*intestabilis*, Lat.) Disqualified to make a will (*Ayliffe*).

INTESTATE, *a.* (*intestatus*, Latin.)

Wanting a will; dying without a will (*Dryden*).

INTESTINA. In zoology, the first order of the class *vermes* or worms, possessing a formation the most simple, and some of them living within other animals, some in waters, and a few in the earth: all of them perhaps active in prosecuting physical effects eventually beneficial; and many of them producing results that are obviously so. Thus the *Gordius* perforates clay to give a passage to springs and waters; the *Lumbricus* pierces the earth, that it may be exposed to the action of the air and moisture, the *Terebra* penetrates wood, and the *Phloea* and *Mytilus* rocks, to effect their dissolution.

INTESTINAL, *a.* (*intestinal*, French, from *intestine*.) Belonging to the guts (*Arbuth.*).

INTESTINE, *s.* (*intestin*, French; *intestinus*, Latin.)

1. Internal; inward; not external (*Drapp*). 2. Contained in the body (*Milton*). 3. Domestic; not foreign (*Gray*).

INTESTINES, (*intestina*, from *intus*, from *intus*, within.)

The convoluted membranous tube that extends from the stomach to the anus; receives the ingested food, retains it a certain time; mixes with it the bile and pancreatic juices; propels the chyle into the lacteals (perhaps absorbed into the chyle) and covers the rest with mucus. They are situated in the middle of the abdomen, and are divided into small and large, which have, besides their own, other cir-

INT

circumstances of distinction. The small intestines are supplied internally with folds, called *valvulae conniventes*, and have no bands on their external surface. The large intestines have no folds internally, and are supplied externally with three strong muscular bands, which run parallel upon the surface, and give the intestines a saccated appearance; and they have also small fatty appendages, called *appendiculæ epiploicae*. The first portion of the intestinal tube, for about the extent of twelve fingers breadth, is called the *duodenum*; it lies in the epigastric region; makes three turnings, and between the first and second flexure receives, by a common opening, the pancreatic duct, and the ductus communis choledochus. It is in this portion of the intestines that chylification is chiefly performed. The remaining portion of the small intestines is distinguished by an imaginary division into the jejunum and ileum. The *jejunum*, which commences where the duodenum ends, is situated in the umbilical region, and is mostly found empty; hence its name: it is every where covered with red vessels, and about an hour and an half after a meal, with lacteals. The *ileum* occupies the hypogastric region and the pelvis; is of a more pallid colour than the former, and terminates by a transverse opening into the large intestines, which is called the *valve of the ileum*, *valve of the cæcum*, or the *valve of Tulpius*. The beginning of the large intestines is firmly tied down in the right iliac region, and for the extent of about four fingers breadth is called the *cæcum*, having a worm-like process adhering to it, called the *processus caeci vermiformis*, or *appendicula caeci vermiformis*. The great intestine then assumes the name of *colon*, ascends towards the liver, passes across the abdomen under the stomach to the left side, where it is contorted like the letter S, and descends to the pelvis; hence it is divided in this course into the *ascending portion*, the *transverse arch*, and the *sigmoid flexure*. When it has reached the pelvis it is called the *rectum*, under which denomination it proceeds in a straight line to the anus.

The intestinal canal is composed of three membranes or coats: the innermost from the peritoneum, the middle from a villous coat, the villous coat forming the fine terminations of the villi, and the origins of the lacteal and arterial vessels. The intestines are connected to the liver, by the mesentery; the descending has the peculiar connecting cellular membrane, which likewise the colon and rectum possess. Again the former is firmly adhered to the back, the colon to the kidneys, and the latter to the os coccygis, and in women to the vagina. The remaining portion of the tube is loose in the cavity of the abdomen. The arteries of this canal are branches of the superior and inferior mesenteric, and the duodenal. The veins evacuate their blood into the vena

INT

portæ. The nerves are branches of the eighth pair and intercostals. The lacteal vessels, which originate principally from the jejunum, proceed to the glands in the mesentery.

To INTHRA'LL. v. a. (to and thrall.) To enslave; to shackle; to reduce to servitude (*Prior*).

INTHRA'LEMENT. s. (from inthra'll.) Servitude; slavery (*Milton*).

To INTHRO'NE. v. a. (in and throne.) To raise to royalty; to seat on a throne (*Thomson*).

INTIMACY. s. (from intimacy.) Close familiarity (*Rogers*).

INTIMATE. a. (intimus, Latin.) 1. Inmost; inward; intestine (*Tillotson*). 2. Near; not kept at distance (*South*). 3. Familiar; closely acquainted (*Roscommon*).

INTIMATE. s. (intime, French; intimus, Latin.) A familiar friend; one who is trusted with our thoughts (*Gov. of the Tongue*).

To INTIMATE. v. a. (intimer, French.) To hint; to point out indirectly, or not very plainly (*Locke*).

INTIMATELY. ad. (from intimate.) 1. Closely; with intermixture of parts (*Arbuth.*) 2. Nearly; inseparably (*Addison*). 3. Familiarly; with close friendship.

INTIMATION. s. (from intimate.) Hint; obscure or indirect declaration or direction (*Addison*).

INTIME. a. Inward; being within the mass; internal: not used (Digby).

To INTIMIDATE. v. a. (intimider, Fr.) To make fearful; to daunt; to make cowardly (*Young*).

INTIRE. a. (entier, French; see ENTIRE.) Whole; undiminished; unbroken (*Hooker*).

INTIRE or *Entire*, in botany, opposed to jagged. Exemplified in Genipa.—*Intire stem*. *Simplicissimus, ramis vix ullis (Philos. Bot.)*—*Simplicissimus, ramis angustatis.*—(*Delin. Pl.*) where *Simplicissimus* is explained by *ramis vix ullis*.—In *Philosophical Botany*, *intire* is a species of the *Simple*; and means, that the stem is continued in one unbroken series from top to bottom—that is, has no branches. Very *entire* or *intire* leaf, *integerrimum folium*. A leaf quite or absolutely *entire*. *Cujus margo extimus integer absque omni crena est (Philos. Bot.)*.—*Ipsa margine lineari, nec minimum secta (Delin. Pl.)* Having the margin or edge entire, without any notches—or, without being in the least cut. *Intire* therefore refers only to such situations as extend far into the disk of the leaf; and a leaf may be *intire*, although the edge be indented.

INTIRENESS. s. (from intire.) Wholeness; integrity (*Donne*).

INTO. prep. (to and to.) 1. Noting entrance with regard to place; he went *into* the house (*Newton*). 2. Noting penetration beyond the outside; moisture sinks *into* the body (*Pope*). 3. Noting a new state to which any thing is brought by the agency of a cause; he was brought *into* danger by rashness (*Boyle*).

INT

INTOLERABLE. *a.* (*intolerabilis*, Latin.)
1. Insufferable; not to be endured; not to be born (*Taylor*). 2. Bad beyond sufferance.

INTOLERABLENESS. *s.* Quality of a thing not to be endured.

INTOLERABLY. *ad.* (from *intolerable*.) To a degree beyond endurance.

INTOLERANT. *a.* (*intolerant*, French.) Not enduring; not able to endure (*Arbuth.*)

To **INTOMB**. *v. a.* (*in and tomb*.) To enclose in a funeral monument; to bury (*Dryden*).

To **INTONATE**. *v. a.* (*intono*, Latin.) To thunder.

INTONATION. *s.* (*intonation*, French from *intonate*.) The act of thundering.

INTONATION, in music, relates both to the consonance and to the strength or weakness of sounds. Intonation not only includes the act of tuning, but the giving to the tones of the voice or instrument that occasional impulse, swell, and decrease, on which in a great measure, all impression depends. A good intonation is one of the first qualifications in the higher walks of execution.

To **INTONE**. *v. n.* (from *tonc*.) To make a slow protracted noise (*Pope*).

INTORSION. In botany (*intorsio*.) Flexio partium versus alterum latus (*Philos. Bot.*)—In Delin. Pl. it is called Torsio, and is thus explained. Directio plantæ in unam alteramve plagam a verticali diversam.—The writhing, bending, turning, twining or twisting of any part in a vegetable towards one side or other—or, in any direction from the vertical. Thus the stem in some plants twines from right to left; as in *Tamus*, *Dioscorca*, *Rajania*, *Menispermum*, *Cissampelos*, *Hippocratea*, *Lonicera*, *Humulus*, *Helxine*.—In others from left to right; as in *Phaseolus*, *Dolichos*, *Clitoria*, *Glycine*, *Securidaca*, *Convolvulus*, *Ipomœa*, *Cynancho*, *Periploca*, *Ceropegia*, *Euphorbia*, *Tragia*, *Basella*, *Eupatorium*, *Tournefortia*. It is also applied to the Clasper or Tendril; as in Leguminous plants, Vine, Bryony. In this last it is observed by Grew, that the tendril having made two or three turns one way, is then directed the contrary way, in order to be more sure of its hold. To the corol which twists to the left in *Asclepias*, *Nerium*, *Vinca*, *Rapunculus*, *Periploca*, *Stapelia*—to the right in *Pedicularis*, *Trientalis*, *Gentiana*.—It is applied also to the Pistil and Germ—to the Spike—to the Awn, as in the Wild Oat—to the beak of the seed, as in *Geranium*—to the peduncle, as in *Maum hygrometricum*.—When we speak of right and left, we suppose the spectator to have his face turned towards the south. See **TWINE**.

To **INTORT**. *v. a.* (*intortuo*, Latin.) To twist; to wreath; to wring (*Pope*).

To **INTOXICATE**. *v. a.* (*in and toxicum*, Latin.) To inebriate; to make drunk (*Bac.*)

INTOXICATION. *s.* (from *intoxicare*.) In-

INT

ebriation; ebriety; the act of making drunk; the state of being drunk (*South*).

INTRACIABLE. *a.* (*intractabilis*, Latin.) 1. Ungovernable, obstinate; stubborn; obstinate (*Rogers*). 2. Unmanageable; furious (*Woodward*).

INTRACIABLENESS. *s.* Obstinacy; perverseness.

INTRACIABLY. *ad.* (from *intractable*.) Unmanageably; stubbornly.

INTRADOS, in architecture, the interior curve of an arch; or that curve which is formed by the lower faces of the arch-stones.

INTRAFOLIACEOUS stipules. **INTRAFO-LIACEÆ** stipule. Growing above or within the leaves of a plant.

INTRANQUILLITY. *s.* (*in and tranquillity*.) Unquietness; want of rest (*Temp*.)

INTRANSMUTABLE. *a.* (*in and transmuta-*) Unchangeable to any other substance (*Ray*).

To **INTREASURE**. *v. a.* (*in and treasure*.) To lay up as in a treasury (*Shakespeare*).

To **INTRENCH**. *v. n.* (*in and trencher*, French.) To invade; to encroach; to cut off part of what belongs to another (*Dryden*).

To **INTRENCH**. *v. a.* 1. To break with hollows (*Milton*). 2. To fortify with a trench; as, the allies were intrenched in their camp.

INTRENCHANT. *a.* Not to be divided; not to be wounded; indivisible (*Shakespeare*).

INTRENCHMENT. *s.* (from *intrench*.) Fortification with a trench.

INTREPID. *a.* (*intrepide*, French; *intrepidus*, Latin.) Fearless; daring; bold; brave (*Thom.*)

INTREPIDITY. *s.* (from *intrepidus*, Fr.) Fearlessness; courage; boldness (*Swift*).

INTREPIDLY. *ad.* (from *intrepid*.) Fearlessly; daringly (*Pope*).

INTRICACY. *s.* (from *intricate*.) State of being entangled; perplexity; involution; complication of facts or notions (*Addison*).

INTRICATE. *a.* (*intricatus*, Latin.) Entangled; perplexed; involved; complicated; obscure (*Addison*).

To **INTRICATE**. *v. a.* (from the adjective.) To perplex; to darken; not proper, nor in use (*Camden*).

INTRICATELY. *ad.* (from *intricate*.) With involution of one in another; with perplexity (*Swift*).

INTRICATENESS. *s.* (from *intricate*.) Perplexity; involution; obscurity (*Steele*).

INTRIGUE. *s.* (*intrigue*, French.) 1. A plot; a private transaction in which many parties are engaged (*Addison*). 2. Intricacy; complication (*Hale*). 3. The complication or perplexity of a fable or poem; artful involution of feigned transactions (*Pope*).

To **INTRIGUE**. *v. a.* (*intriguer*, French.) To form plots; to carry on private designs.

INTRIGUER. *s.* (*intriguer*, French.) One who buies himself in private transactions;

INT

one who forms plots; one who pursues women (*Addison*).

INTRIGUINGLY. *adv.* (from *intrigue*.) With intrigue; with secret plotting.

INTRINSECAL. *a.* (*intrinsecus*, Latin.) 1. Internal; solid; natural; not accidental; not merely apparent (*Bentley*). 2. Intimate; closely; familiar; not used (*Wotton*).

INTRINSECALLY. *ad.* 1. Internally; naturally; really (*South*). 2. Within; at the inside (*Wotton*).

INTRINSECATE. *a.* Perplexed; entangled; not in use (*Shakespeare*).

INTRINSIC. *a.* (*intrinsecus*, Latin.) 1. Inward; internal; real; true (*Hammond*). 2. Not depending on accident; fixed in the nature of the thing (*Rogers*).

TO INTRODUCE. *v. a.* (*introducō*, Latin.) 1. To conduct or usher into a place, or to a person (*Locke*). 2. To bring something into notice or practice (*Brown*). 3. To produce; to give occasion to (*Locke*). 4. To bring into writing or discourse by proper preparatives.

INTRODUCER. *s.* (from *introduce*.) 1. One who conducts another to a place or person. 2. Any one who brings any thing into practice or notice (*Wotton*).

INTRODUCTION. *s.* (*introductio*, Latin.) 1. The act of conducting or ushering to any place or person; the state of being ushered or conducted. 2. The act of bringing any new thing into notice or practice (*Clarendon*). 3. The preface or part of a book containing previous matter.

INTRODUCTIVE. *a.* (*introductif*, Fr.) Serving as means to something else (*South*).

INTRODUCTOR, in antiquity, the officer who introduced the *Athletæ* to the Stadium.

INTRODUCTORY. *a.* (from *introductus*, Latin.) Previous; serving as conveyance to something further (*Boyle*).

INTROGRESSION. *s.* (*introgressio*, Lat.) Entrance; the act of entering.

INTRO'IT. *s.* (*introit*, French.) The beginning of the mass; the beginning of public devotions.

INTROMISSION. *s.* (*intromissio*, Latin.) The act of sending in (*Poacham*).

TO INTROMIT. *v. a.* (*intromitto*, Latin.) 1. To send in; to bring in; to admit. 2. To allow to enter; to be the medium by which any thing enters (*Newton*).

TO INTROSPECT. *v. a.* (*introspectus*, Lat.) To take a view of the inside.

INTROSPECTION. *s.* (from *introspect*.) A view of the inside (*Dryden*).

INTROVENIENT. *a.* (*inter* and *venio*, Lat.) Entering; coming in (*Brown*).

TO INTRODE. *v. a.* (*introduo*, Latin.) 1. To come in by force; by a kind of violence; to enter without invitation or permission (*Watts*). 2. To approach; to force in un-called or unperturbed (*Colossians*).

TO INTRADE. *v. a.* To force without right or welcome (*Pope*).

INV

INTRUDER. *s.* (from *intrude*.) One who forces himself into company or affairs without right or welcome (*Addison*).

INTRUSION. *s.* (*intrusio*, Latin.) 1. The act of thrusting or forcing any thing or person into any place or state (*Locke*). 2. Encroachment upon any person or place; unwelcome entrance (*Wake*). 3. Voluntary and uncalled undertaking of any thing (*Wotton*).

TO INTRUST. *v. a.* (*in* and *trust*.) To treat with confidence; to charge with any secret commission, or thing of value (*Abb*).

INTUITION. *s.* (*intuitus*, Latin.) 1. Sight of any thing; immediate knowledge (*Governments of the Tongue*). 2. Knowledge not obtained by deduction of reason, but instantaneously accompanying the ideas which are its object (*Glanville*).

INTUITIVE. *a.* (*intuitivus*, Lat.) 1. Seen by the mind immediately (*Locke*). 2. Seeing, not barely believing (*Hooker*). 3. Having the power of discovering truth immediately without ratiocination (*Hooker*).

INTUITIVELY. *ad.* (*intuitivement*, Fr.) Without deduction of reason; by immediate perception (*Hooker*).

INTUMESCENCE } *s.* (*intumescence*, Fr.)
INTUMESCENCY } *intumesco*, Latin.) Swell; tumour (*Brown*).

INTURGESCENCE. *s.* (*in* and *turgesco*, Lat.) Swelling; the act or state of swelling (*Brown*).

INTUSE. *s.* (*intusus*, Lat.) Bruise (*Spens*).

INTUS-SUSCEPTION, (*intus-susceptio*, f. from *intus*, within, and *suscipio*, to receive). A disease of the intestinal tube, and most frequently of the small intestines; it consists in a portion of gut passing for some length within another portion.

INTYBUS, (*Intybus*, i. m. from *in*, and *tuba*, a hollow instrument so named from the hollowness of its stalk). See *ENDIVIA*.

TO INTWINE. *v. a.* (*in* and *twine*.) 1. To twist, or wreath together (*Hooker*). 2. To be inscribed by being wreathed or twisted (*Dryden*).

TO INVADE. *v. a.* (*invado*, Latin.) 1. To attack a country; to make a hostile entrance (*Knolles*). 2. To attack; to assail; to assault (*Shakespeare*). 3. To violate by the first act of hostility; to attack (*Dryden*).

INVADER. *s.* (from *invado*, Latin.) 1. One who enters with hostility into the possessions of another (*Bacon*). An assailant. 3. Encroacher; intruder (*Hammond*).

INVALESCENCE. *s.* (*invalesco*, Latin.) Strength; health; force.

INVALID. *a.* (*invalidus*, Latin.) Weak; of no weight or cogency (*Milton*).

INVALID, a person wounded, maimed, or disabled for action by age. At Chelsea and Greenwich are magnificent hospitals or colleges built for the reception and accommodation of invalids, or soldiers and seamen worn out in the service. We have also twenty independent companies of invalids,

INV

dispersed in the several forts and garrisons; and there is a battalion of invalids belonging to the royal artillery.

TO INVALIDATE. *v. a.* (from *invalid*.) To weaken; to deprive of force or efficacy.

INVALIDE. *s.* (French.) One disabled by sickness or hurts (*Prior*).

INVALIDITY. *s.* (*invalidité*, French.) 1. Weakness; want of cogency. 2. Want of bodily strength (*Temple*).

INVALUABLE. *a.* (*in* and *valuable*.) Precious above estimation; inestimable (*Atterb.*)

INVARIABLE. *a.* (*invariable*, French.) Unchangeable; constant (*Brown*).

INVARIABleness. *s.* (from *invariable*.) Immutability; constancy.

INVARIABLY. *ad.* (from *invariable*.) Unchangeably; constantly (*Atterbury*).

INVASION. *s.* (*invasio*, Latin.) 1. Hostile entrance upon the rights or possessions of another; hostile encroachment (*Dryden*). 2. Attack of a disease (*Arbuthnot*).

INVASIVE. *a.* (from *invade*.) Entering hostilely upon other men's possessions (*Dry.*)

INVECTED, in heraldry, denotes a thing futed or furrowed.

INVECTIVE. *s.* (*invektive*, French.) A censure in speech or writing; a reproachful accusation (*Hooker*).

INVECTIVE. *a.* (from the noun.) Satirical; abusive (*Dryden*).

INVECTIVELY. *ad.* Satirically; abusively.

TO INVEIGH. *v. a.* (*invecho*, Latin.) To utter censure or reproach (*Arbuthnot*).

INVEIGHER. *s.* (from *inveigh*.) Vehement railer (*Wiceman*).

TO INVEIGLE. *v. a.* (*invogliare*, Italian.) To persuade to something bad or hurtful; to woo; to allure; to seduce (*Hudibras*).

INVEIGLER. *s.* (from *inveigle*.) Seducer; deceiver; allurer to ill (*Sandys*).

TO INVENT. *v. a.* (*inventer*, French.) 1. To discover; to find out; to excogitate; to produce something not made before (*Arbuth.*) 2. To forge; to contrive falsely; to fabricate (*Sittingfleet*). 3. To feign; to make by the imagination (*Shaks.*) 4. To light on; to meet with; not used (*Spenser*).

INVENTER. *s.* (from *inventeur*, French.) 1. One who produces something new; a deviser of something not known before (*Garth*). 2. A forger.

INVENTION. *s.* (*invention*, French.) 1. Excogitation; the act or power of producing something new (*Dryden*). 2. Discovery (*Rap*). 3. Forgery; fiction (*Shakspeare*). 4. The thing invented (*Milton*).

INVENTION, denotes the act of finding any thing new, or even the thing thus found. Thus we say, the invention of gunpowder, of printing, &c. The alchymy is a modern invention owing to the Arabs. The Dorian, Ionic, and Corinthian orders are of Greek invention; the Persian and Composite of Eastern invention. Pausanias of Amicleoven has written an Oration of inventions, which are above in an alphabetical order, the names of the inventors, and the time,

INV

place, &c. where they are made. Pancirollus has a treatise of old inventions that are lost, and new ones that have been made; Polydore Virgil has also published eight books of the inventors of things. De Inventoribus Rerum: and Professor Beckman a history of inventions. See **DISCOVERY**.

INVENTION is also used for the finding of a thing hidden. The Romish church celebrates a feast on the 4th of May, under the title of Invention of the Holy Cross.

INVENTION is also used for subtilty of mind, or somewhat peculiar to a man's genius, which leads him to a discovery of things new.

INVENTION, in painting, is the choice which the painter makes of the objects that are to enter the composition of his piece. See **PAINTING**.

INVENTION, in poetry, is applied to whatever the poet adds to the history of the subject he has chosen; as well as to the new turn he gives it. See **POETRY**.

INVENTIVE. *a.* (*inventif*, French.) 1. Quick at contrivance; ready at expedients (*Ascham*). 2. Having the power of excogitation or fiction (*Raleigh*).

INVENTOR. *s.* (*inventor*, Latin.) 1. A finder out of something new (*Milton*). 2. A contriver; a framer (*Shakspeare*).

INVENTORIALLY. *ad.* (from *inventory*, whence perhaps *inventorial*.) In manner of an inventory (*Shakspeare*).

INVENTORY, in law, a catalogue, or schedule orderly made, of all a deceased person's goods and chattels, at the time of his death, with their value appraised by indifferent persons, which every executor or administrator is obliged to exhibit to the ordinary at such time as he shall appoint.

INVENTORY, in trade, is a list or particular valuation of goods, &c.

TO INVENTORY. *v. a.* (*inventerier*, Fr.) To register; to place in a catalogue (*Shaks.*)

INVENTRESS. *s.* (*inventrice*, Fr. from *inventor*.) A female that invents (*Burnet*).

INVERARY, a royal borough in Argyleshire, seated on the N. W. side of Loch Fyne. Lat. 56. 16 N. Lon. 5. 0. W.

INVERKEITHING, a borough in Fife-shire, situate on a bay of the Frith of Firth. It has a considerable trade in coal and other articles. Lat. 57. 0. N. Lon. 3. 25. W.

INVERLOCHY, an ancient castle in the neighbourhood of Fort William in Inverness-shire. It is adorned with large round towers; and, by the means of building, seems to have been the work of the English in the time of Edward I, who had large fines on the Scotch barons for the purpose of erecting new castles. The largest of these towers is called Cumins. Not long prior to these ruins, Inverloch, according to Boece, had been a place of great note, a most opulent city, remarkable for the vast stores of French and Spanish, probably on account of trade. It was also a seat of the kings of Scotland.

INVERNESS, a seaport town of Scotland,

INV

is the county of the same name, at the mouth of the river Ness. It is a royal borough, holding its first charter from Malcolm Canmore. The harbour is safe and commodious. Seven vessels belong to it, of 400 to 500 tons; and nine boats, manned by six men each. The vessels trade principally to London, carrying fish, skins, and the manufacture of the country, bringing back grocery, &c. The manufactures of the town are leather, coarse hempen cloth, bagging, sacking, &c. linen, and thread. The memorable battle of Culloden was fought near this town. There are three national or Presbyterian churches, besides one of Episcopalians, a place of worship for methodists, &c. The number of inhabitants in the year 1791, was 5107, besides 1823 in the parish, making in the whole 6930. In 1801, the number was 8734. Lat. 57. 34. N. Lon. 4. 10. W.

INVERNESS-SHIRE, a county of Scotland, bounded on the north by the county of Ross, on the east by the counties of Murray and Nairn, on the south by Perth and Argyle, and on the west by the sea. It is divided into three districts, Inverness-shire Proper, Lochaber, and Badenock; and includes several of the Hebrides, or Western Islands, viz. Skye, Barra, North and South Vist, Benbecula, St. Kilda, Rona, Raasa, Rum, and some others, with the peninsula of Harris. Independent of the islands, it measures seventy-five miles from east to west, and forty-five from north to south. It abounds with oak and fir timber, and mines of iron ore; the pastures feed numbers of cattle, and the lochs are well furnished with fish; but the corn produced is trifling: on the whole, it is reckoned one of the least fertile counties of Scotland. The principal rivers are the Ness and the Spey. In 1801 this county contained 74,292 inhabitants. Inverness is the capital.

INVERSE proportion. See *RULE of three inverse*.

INVERSE ratio, is that in which more requires less, or less requires more. As for instance, in the case of light, or heat from a luminous object, the light received is less at a greater distance, and greater at a less distance; so that here more, as to distance, gives less, as so light. This is usually expressed by the term *inversely*, or *reciprocally*, as in the case above, where the light is *inversely*, or *reciprocally*, as the square of the distance, or in the inverse or reciprocal duplicate ratio of the distance.

INVERSE, *a. (inversus, French; inversus, Latin.)* Inverted; reciprocal; opposed to direct.

INVERSION, *s. (inversion, French; invertio, Latin.)* 1. Change of order or time, so as that the last is first, and first last (*Dryden*). 2. Change of place, so that each takes the room of the other.

INVASION of proportion. See *PROPORTION*.

INVERSION, in music, is a changed position either of a subject or of a chord. This inversion of a subject is produced by giving

INV

it a higher or lower situation among the several parts of a score, sometimes making it the bass, at other times the tenor, counter-tenor, or the treble. The inversion of a chord, is that changed position of its component parts with respect to its fundamental bass, by which, though the harmony remain the same, the intervals are varied, and the compound assumes another name. This inversion is sometimes effected by simply changing the bass: as in the chord of the seventh, if the fundamental bass be shifted to its third, the harmony is no longer called the chord of the seventh, but that of the fifth and sixth (*Busby*).

To INVERT, *v. a. (invertio, Latin.)* 1. To turn upside down; to place in contrary method or order to that which was before (*Watts*). 2. To place the last first (*Prior*). 3. To divert; to turn into another channel, to imbezzle; to convert (*Knolles*).

INVERTEDLY, *ad. (from inverted.)* In contrary or reversed order (*Derham*).

INVERURY, a borough in Aberdeenshire, situate on the fertile banks of the Don, 15 miles N.W. of Aberdeen.

To INVEST, *v. a. (investio, Latin.)* 1. To dress; to clothe; to array (*Milton*). 2. To place in possession of a rank or office (*Hook. Clarendon*). 3. To adorn; to grace (*Shaks.*) 4. To confer; to give (*Bacon*). 5. To enclose; to surround so as to intercept succours or provisions.

INVESTIENT, *a. (investiens, Latin.)* Covering; clothing (*Woodward*).

INVESTIGABLE, *a. (from investigate.)* To be searched out; discoverable by rational disquisition (*Hooker*).

To INVESTIGATE, *v. a. (investigo, Lat.)* To search out; to find out by rational disquisition (*Cheyne*).

INVESTIGATION, *s. (investigatio, Latin.)* 1. The act of the mind by which unknown truths are discovered (*Watts*). 2. Examination (*Pope*).

INVESTITURE, *s. (French.)* 1. The right of giving possession of any manor, office, or benefice (*Raleigh*). 2. The act of giving possession.

INVESTMENT, *s. (in and vestment.)* Dress, clothes; garment; habit (*Shaks.*)

INVEETERACY, *s. (inveteratio, Latin.)* 1. Long continuance of any thing bad; obstinacy confirmed by time (*Addison*). 2. (In physic.) Long continuance of a disease.

INVEETERATE, *a. (inveteratus, Latin.)* 1. Old; long established (*Bacon*). 2. Obstinate by long continuance (*Swift*).

To INVEETERATE, *v. a. (invetero, Latin.)* To fix and settle by long continuance (*Bacon*).

INVEETERATENESS, *s. (from inveterate.)* Long continuance of any thing bad; obstinacy confirmed by time (*Brown*).

INVEETERATION, *s. (inveteratio, Latin.)* The act of hardening or confirming by long continuance.

INVIDIOUS, *a. (invidiosus, Latin.)* 1. Envious; malignant (*Evelyn*). 2. Likely to incur or to bring hatred (*Swift*).

I N V

INVIDIOUSLY. *ad.* 1. Malignantly; enviously. 2. In a manner likely to provoke hatred.

INVIDIOUSNESS. *s.* (from *invidious*.) Quality of provoking envy or hatred.

TO INVIGORATE. *v. a.* (in and *vigour*.) To endue with vigour; to strengthen; to animate; to enforce (*Addison*).

INVIGORATION. *s.* (from *invigorate*.) 1. The act of invigorating. 2. The state of being invigorated (*Norris*).

INVINCIBLE. *a.* (*invincible*, French.) Insuperable; unconquerable; not to be subdued (*Shakespeare*).

INVINCIBLENESS. *s.* Unconquerableness; insuperableness.

INVINCIBLY. *ad.* (from *invincible*.) Insuperably; unconquerably (*Milton*).

INVIOABLE. *a.* (*invioable*, French.) 1. Not to be profaned; not to be injured (*Milton*). 2. Not to be broken (*Hooker*). 3. Inausceptible of hurt or wound (*Milton*).

INVIOABLY. *ad.* (from *invioable*.) Without breach; without failure (*Sprat*).

INVIOLATE. *a.* (*inviolatus*, Latin.) Unhurt; uninjured; unprofaned; unpolluted; unbroken (*Dryden*).

INVIOUS. *a.* (*intrius*, Latin.) Impassable; untrodden (*Hudibras*).

TO INVISCATE. *v. a.* (in and *viscus*, Lat.) To lime; to entangle in glutinous matter. (*Brown*).

INVISIBILITY. *s.* (*invisibiliti*, Fr.) The state of being invisible; imperceptibleness to sight (*Ray*).

INVISIBLE. *a.* (*invisible*, Fr.) Not perceptible by the sight; not to be seen (*Sidney*).

INVISIBLE Girl. See *GIRL*.

INVISIBLY. *ad.* (from *invisible*.) Imperceptibly to the sight (*Denham*).

INVITATION. *s.* (*in:itatio*, Latin.) The act of inviting, bidding, or calling to any thing with ceremony and civility (*Dryden*).

TO INVITE. *v. a.* (*invito*, Latin.) 1. To bid; to ask to any place with intreaty and complaisance (*Swift*). 2. To allure; to persuade; to induce by hope or pleasure (*Bacon*).

TO INVITE. *v. n.* To ask or call to any thing pleasing (*Milton*).

INVITER. *s.* (from *invite*.) He who invites (*Smalridge*).

INVITINGLY. *ad.* (from *inviting*.) In such manner as invites or allures (*Decay of Piety*).

INULA. Flea-bane. In botany a genus of the class *syngenesia*, order *polygamia superflua*. Receptacle naked; down simple: calyx imbricate; florets of the margin very numerous and linear; and others with two bristles at the base. Thirty-five species, chiefly European plants, many of Asia, some of America, and a very few of the Cape; four indigenous to the meadows, sea-coasts, or ditches of our own country. The chief are: 1. *E. Helentium*. Helicampne leaves, clasping, ovate, wrinkled downy under; calyx-lobes ovate. Found in the meadows of our own country. The *anula campana* of the

I N V

dispensaries in which it is known as a demulcent. The roots are a preserve still in fashion among our confectioners.

2. *E. Dysenterica*. Leaves clasping, arrow-shaped at the base, oblong, downy underneath, repand-toothed; stem downy, panicled; lateral branches longer than the top; calyx-scales setaceous, hairy. Found in the ditches of our own country: and formerly employed medicinally in diarrhœas and dysenteries.

3. *E. Crithmoides*. Golden sapphire leaves linear, fleshy, trienspidate at the top. Found on our own sea-coasts.

They are all perennials. The first species enumerated is often cultivated in gardens, propagated by seeds or offsets. The seeds should be sown in August soon after they are ripe: the offsets should have a but or eye, and be taken from the old roots in autumn as soon as the leaves begin to decay.

TO INUMBRATE. *v. a.* (*inumbro*, Latin.) To shade; to cover with shades.

INUNCTION. *s.* (*inunctus*, Latin.) The act of smearing or anointing (*Ray*).

INUNDATÆ. In botany, the name of the forty-fifth order in Linnæus's *Fragments of a Natural Method*; and the fifteenth of the Natural Orders in *Gen. Pl.*—Containing such plants as grow naturally in the water.

INUNDATION. *s.* (*inundatio*, Latin.) 1. The overflow of waters; flood (*Dryden*). 2. A confluence of any kind (*penner*).

TO INVOCATE. *v. a.* (*invoco*, Latin.) To invoke; to implore; to call upon; to pray to (*Milton*).

INVOCATION. *s.* (*invocatio*, Latin.) 1. The act of calling upon in prayer (*Hooker*).

2. The form of calling for the assistance or presence of any being (*Addison*).

INVOICE. *s.* (perhaps corrupted from the French *envoyer*, send.) A catalogue of the freight of a ship, or of the articles and price of goods sent by a factor.

TO INVOLVE. *v. a.* (*invoco*, Latin.) To call upon; to implore; to pray to (*Sidney*).

INVOLUCRE. In botany, (*involucrum*, from *involvere*, to wrap up.) Calyx (umbellæ) a flore remotus. A calyx remote from the flower; particularly in the umbel, but applied also to the whorl and other kinds of inflorescence.

INVOLUCRE UNIVERSAL. In botany, placed at the origin of the universal umbel. —Partial, at the origin of the partial umbel. —Proper, placed beneath a single flower.

Involucres are one-leaved, &c. or many-leaved, according to the number of leaves of which they are composed. Monophyllous, involucre, and polyphyllous, &c.

A dimidiato or halved involucre, is an involucre deficient on one side.

INVOLUCRED. In botany, having an involucre. As umbels, whorls, &c.

INVOLUCRET. } A little or partial involucre. Partial fence. **INVOLUCEL.** } Withering. As in umbellate plants and Euphorbia.

I N V

To INVOLVE. *v. a.* (*involvere*, Latin.) 1. To inwrap; to cover with any thing circumfluent (*Dryden*). 2. To imply; to comprise (*Villatou*). 3. To intwist; to join (*Milton*). 4. To take in; to catch (*Spral*). 5. To entangle (*Locke*). 6. To complicate; to make intricate (*Locke*). 7. To blend; to mingle together confusedly (*Milton*).

INVOLUNTARILY. *ad.* (from *involuntary*.) Not by choice; not spontaneously.

INVOLUNTARY. *a.* (*involuntaire*, Fr.) 1. Not having the power of choice (*Pope*). 2. Not chosen; not done willingly (*Locke*).

INVOLUTE. Figure or curve, is that which is traced out by the outer extremity of a string as it is folded or wrapped upon another figure, or as it is unwound from off it. The involute of a cycloid, is also a cycloid equal to the former, which was first discovered by Huygens, and by means of which he contrived to make a pendulum vibrate in the curve of a cycloid, and so, theoretically at least, vibrate always in equal times, whether the arch of vibration were great or small, which is a property of that curve.

INVOLUTE FOLIATION, or *vernatin*. In botany, quum margines laterales (toliorum in gemma) utrinque introrsum spiraler involuntur. (*Philos. Bot.*) Foliorum lateribus utrinque spiraler contortis versus superiorem paginam. (*Delin. Pl.*) When leaves within their bud have their edges rolled spirally inwards on both sides towards the upper surface. As in *Lonicera*, *Euonymus*, *Pyrus*, *Populus*, *Viola*, &c.

INVOLUTION. *s.* (*involutio*, Latin.) 1. The act of involving or inwrapping. 2. The state of being entangled; complication (*Glanville*). 3. That which is wrapped round any thing (*Brown*).

INVOLUTION, in arithmetic and algebra, the raising any quantity from its root, or original state, to any height or power assigned. The number 4, for instance, is thus raised:

4 or 4¹ or 4 . is the first power, or root.
4 × 4 or 4² or 16 . . . is the second power, or square.

4 × 4 × 4 or 4³ or 64 . . . is the third power, or cube, &c.

Hence, in arithmetic, to find any power of a given root, or quantity, let the root be multiplied by itself a number of times which is one less than the number of the index; i. e. once multiplied for the second root, twice for the third root, thrice for the fourth root, &c.

In algebra we may notice two cases:
CASE I.—When the quantity is simple.

Rule.—Multiply the exponent of the letters by the index of the power required, and raise the coefficient to the same power.

Thus, the second power of *a* is *a*¹ × 2 = *a*², of *a*² is *a*⁴.

The third power of 2*a*² is 8*a*² × 3 = 8*a*⁶; of *a*²*b*³ is *a*⁶*b*⁹.

I N W

For the multiplication would be performed by the continual addition of the exponents; and this multiplication of them is equivalent.

If the sign of the given quantity is +, all its powers must be positive. If the sign is —, then the powers whose exponents are even numbers are positive; and those whose exponents are odd numbers are negative.

This is obvious from the rule for the signs in multiplication.

CASE II.—When the quantity is compound.
Rule.—The powers must be found by a continual multiplication of the quantity by itself.

Thus, the square of $x + \frac{a}{2}$, found by multiplying it into itself, is $x^2 + ax + \frac{a^2}{4}$. The

cube is got by multiplying the square already found by the root, &c.

The involution of compound quantities is rendered much easier by the *binomial theorem*. See BINOMIAL.

To INURE. *v. a.* (*in and ure*.) To habituate; to make ready or willing by practice; to accustom (*Addison*).

INUREMENT. *s.* (from *inure*.) Practice; habit; use; custom; frequency. (*Wot.*)

To INCUR. *v. a.* (*in and urn*.) To intomb; to bury (*Shakespeare*).

INUITION. *s.* (*inustio*, Latin.) The act of burning.

INUTILE. *a.* (*inutile*, French, *inutillis*, Latin.) Useless; unprofitable (*Bacon*).

INUTILITY. *s.* *inutilitas*, Latin.) Uselessness; unprofitableness.

INVULNERABLE. *a.* (*invulnerable*, Fr.) Not to be wounded; secure from wound (*Shakespeare*).

To INWALL. *v. a.* To enclose or fortify with a wall (*Spenser*).

INWARD. } *ad.* (*inward*, Saxon.) 1. To-
INWARDS. } ward the internal parts;
within (*Bacon*). 2. With inflection or incurvity; concavely (*Dryden*). 3. Into the mind or thought (*Hooker*).

INWARD. *a.* 1. Internal; placed not on the outside but within (*Milton*). 2. Reflecting; deeply thinking (*Prior*). 3. Intimate; domestic; familiar (*Job*). 4. Seated in the mind (*Shakespeare*).

INWARD. *s.* 1. Any thing within, generally the bowels. Seldom has this sense a singular (*Milton*). 2. Intimate; near acquaintance (*Shakespeare*).

INWARDLY. *ad.* (from *inward*.) 1. In the heart; privately (*Shakespeare*). 2. In the parts within; internally (*Arbutnot*). 3. With inflection or concavity.

INWARDNESS. *s.* (from *inward*.) Intimacy; familiarity (*Shakespeare*).

To INWEAVE. *preter. inwove*, or *inweaved*, *part. pass. inwoven* or *inwoven* (to and *weave*). 1. To mix any thing in weaving, so that it forms part of the texture

(*Jope*). 2. To intertwine; to complicate (*Milton*).

To INWO'OD. *v. a.* (*in* and *wood*.) To hide in woods: not used (*Sidney*).

To INVRA'P. *v. a.* (*in* and *wrap*.) 1. To cover by involution; to involve (*Spenser*). 2. To perplex; to puzzle with difficulty or obscurity (*Bacon*). 3. To ravish; to transport (*Milton*).

INWROUGHT. *a.* (*in* and *wrought*.) Adorned with work (*Milton*).

To INWREATH. *v. a.* (*in* and *wreath*.) To surround with a wreath (*Milton*).

JO, in fabulous history, a daughter of Ixion, or, according to others, of Jasus, or Phene, was priestess of Juno at Argos. Ixion became enamoured of her; but Juno refused him in the company of Io. Jupiter changed Io into a beautiful heifer, and the goddess obtained from her husband the animal, whose beauty she had condescended to commend. Juno commanded the hundred-eyed Argus to watch the heifer; but Jupiter, anxious for the situation of Io, sent Mercury to destroy Argus, and to restore her to liberty (*Vide Argus*). Io was now persecuted by Juno, who sent a malicious insect to torment her. She wandered over the earth, and crossed the sea, till at last she stopped on the banks of the Nile, still exposed to Juno's insect. Here Jupiter changed her into a woman, and she brought forth Epaphus. Afterwards she married Telegonus, king of Egypt or Osiris. After death, she received divine honours, and was worshipped under the name of Isis. According to Herodotus, Io was carried away by Phœnician merchants, who wished to make reprisals for Europa, who had been stolen from them by the Greeks.

JO'AB, the general of David, king of Israel, distinguished himself by his valour, and also by his cruelties. He treacherously slew Abner, and stabbed Absalom, the son of David. That monarch, in consideration of his services, did not punish him; but Solomon put him to death for taking part with Adonijah, B. C. 1014.

JOA'CHIMSHAL, a town of Upper Saxony, in the Ucker Marche of Brandenburg. Lat. 53. 2. N. Lon. 13. 42. E.

JO'AN or Arc, or the maid of Orleans, was a servant at an inn when John Duke of Bedford was regent of France for Henry VI. and laid siege to the city of Orleans. From a wish to deliver her country, and to restore her sovereign to his crown, she became enthusiastically courageous, and assumed the dress of a warrior. By her exertions and declarations she spirited the besieged to an active resistance, and in a few weeks forced the English to retire. She next conducted the French through the midst of his enemies to Orleans, where he was crowned. After several gallant actions she was taken prisoner at the siege of Compiègne, and sent for captivity at Rouen, where she was burnt alive in 1411, aged

twenty-four, to the great disgrace of her enemies.

It may be proper to add, however, that in the opinion of many, Joan did not in fact undergo the horrid punishment to which she was condemned. An ingenious writer in the *Monthly Magazine* has shewn (perhaps satisfactorily) that when public commiseration had succeeded to a vindictive bigotry, a woman appeared at Metz who called herself Joan of Arc; that she was acknowledged as such by both her brothers; that she was married to a gentleman of the house of Amboise in 1436, and that her sentence was annulled in 1450. Indeed contemporary historians shew, that she was by some unusual contrivance, kept out of the reach and observation of even her executioners; and the circumstance, from which they concluded her sufferings must be much increased, might possibly be the contrivance which ensured her rescue.

JO'ANNA, Sr. See HIZUAN.

JO'B, or THE BOOK OF JOB, a canonical book of the Old Testament, containing the narrative of a series of misfortunes, which happened to a man whose name was Job, as a trial of his virtue and patience; together with the conferences he had with his cruel friends on the subject of his misfortunes: and the manner in which he was restored to ease and happiness. This book is filled with those noble, bold, and figurative expressions, which constitute the very soul of poetry.

Many of the Jewish rabbins pretend, that this relation is altogether a fiction; others think it a simple narrative of a matter of fact, just as it happened; while a third sort of critics own the ground-work of the story to be true, but that it is written in a poetical strain, and decorated with peculiar circumstances, to render the narration more profitable and entertaining.

See an express dissertation on the book of Job, in Bishop Warburton's *Divine Legation of Moses*, vol. ii. The bishop is of opinion that this book is a dramatic poem, written by Ezra, some time between the return of the Jews from the captivity of Babylon, and their thorough settlement in their own country, and adapted to the circumstances of those times, by being made allegorical as well as dramatic; thus, Job, who is supposed to have been a real person, that lived a generation or two before Moses, is designed to personate the Jewish people; his three friends, the three great enemies of the Jews, Sanballat, Tobiah, and Geshem, who, upon their return from the captivity, vexed and obstructed them in rebuilding their city and temple; Job's wife was intended by the poet to represent the idolatrous wives which many of the Jews had taken, contrary to the law, and for which they are reproved by the prophet Nehemiah. It there also supposes that the book of Job was written after the Jews were carried into

Babylon, and urges, in proof of this, the frequent Chaldaisms that occur in it.

Grotius apprehends that this book contains a true history, treated in a poetical manner; that the events recorded in it happened in Arabia, whilst the Hebrews wandered in the desert; and that the writer, who was a Hebrew, lived before the time of Ezekiel, but after David and Solomon; and that it was written for the use of the Edomites, transported to Babylon, to confirm them in the worship of the true God, and to teach them patience in adversity. Schultens ascribes the poetical, or dialogue part of this book, the style of which, he says, has all the marks of the most venerable and remote antiquity, to Job himself; the rest he supposes to be the work of some Hebrew collector. Most of the Jewish doctors believe, that Moses was the writer of this book; and M. Huet supposes that it was written by Moses in his exile in the land of Midian: nor is it improbable that it was designed to prepare the Israelites for their exodus from Egypt, and the hardships of their future peregrination.

For our own parts, we incline most to the opinion that the book was written by Moses: it was obviously written by a Hebrew, by one who had been in Arabia, and by one who wrote before the promulgation of the Mosaic law; these criterie all attach to Moses, and to no one else. Besides this we may add, that in the original the language is often peculiar, the expressions being such as are met with in the writings of Moses, and no where else.

There is a very elaborate and voluminous commentary on the book of Job, by Caryl; an ingenious version by Scott; and a valuable translation by Bishop Stock. Still, however, there is room for a new translation of this curious book with critical and theological annotations, and this we hope will soon be undertaken by a gentleman every way qualified for the task.

JOB. s. (A low word, of which the etymology is not known.) 1. Petty, piddling work; a piece of chance-work. 2. A low mean lucrative busy affair (*Pope*). 3. A sudden stab with a sharp instrument.

To JOB. v. s. 1. To strike suddenly with a sharp instrument (*L'Estrange*). 2. To stab with a sharp instrument (*Mosen*).

To JOB. s. s. To play the stockjobber; to buy and sell as a broker (*Pope*).

JOBBE. s. A botany. See *Coix*.

JOBBER. s. (from *job*.) 1. A man who sells stocks in the public funds (*Swift*). 2. One who does chance-work.

JOBBERNOWL. s. (*jobbe*, Flemish; dull, and nowl, hnd; Saxon; a head.) Logger-head; blockhead (*Hudibras*).

JOCAS TER, in fabulous history, a daughter of Menecceus, who married Laius king of Thebes, by whom she had Oedipus. She afterwards married her son Oedipus, without knowing who he was, and had by him

Eteocles, Polynices, &c. When she discovered that she had married her own son, and been guilty of incest, she hanged herself in despair. She is called Epicaest by some mythologists.

JOCKEY. s. (from *Jack*.) 1. A fellow that rides horses in the race (*Addison*). 2. A man that deals in horses. 3. A cheat; a trickish fellow.

To JOCKEY. v. s. (from the noun.) 1. To juggle by riding against one. 2. To cheat; to trick.

JOCKEY CLUB, a sporting establishment instituted and still held at Newmarket, composed of noblemen, gentlemen, and other celebrated characters attached to horse-racing; elected by ballot. This is regarded by sportsmen in general as the supreme court to which any appeal can be made; and its award is abided by as final, whenever some of the transactions within the official department of the stewards, the keeper of the match-book, the judge, and every subordinate officer is regulated by a system of laws, of which the following are the chief:

Riders.—Every person who shall ride at Newmarket for plate, sweepstakes, or match, shall be obliged to weigh when he comes in, allowing two pounds above the weight, and no more. Every rider who shall neglect to obey this resolution, is guilty of contempt of the orders of this club, and shall be disqualified from riding hereafter at Newmarket; unless any gentleman, or his rider, shall declare, before starting, that the rider is above the weight allowed of by the aforesaid resolution.

Forfeits.—The forfeits of all bets shall be paid according to the proportion in which the principals compromise their matches.

Members of the Coffee-house.—Any person desirous of being admitted into the coffee-room, Newmarket, must be proposed by a member of the Jockey Club, and his name put over the chimney and door the day before he is to be ballotted for; there must be at least twelve members present at the ballot, and three black balls exclude.

Horses entered for two or more Prizes.—The owner of every horse, &c. entered to run for two or more prizes on the same day, shall be obliged to declare to the keeper of the match-book, before eight o'clock in the evening, preceding the day of running, which of the said prizes he intends to start his horse for; and the said keeper of the match-book shall immediately declare it in the coffee-room.

Annual Dinner.—On the day preceding the king's birth-day, three members of the club shall be appointed stewards, and commence their office on the 4th of June annually. One new steward to be appointed every year, on the 3d day of June, by the steward who quits on that day, subject to the approbation of the members of the Jockey Club then present. The senior steward to quit his office on the 3d of June annually.

The three stewards, or any two of them, shall be vested with full power to make such regulations as they think proper, in regard to the exercise ground and the course. The three stewards, conjointly, shall have it in their power to appoint such person or persons, as they may choose, to keep the coffee-house, manage the bets, receive the stakes, collect the entrance-money,

JOCKEY.

and all other funds belonging to the Jockey Club. The stewards are to be responsible to the club for all the money collected, as belonging to it. They shall have it in their power to fix the hours of starting for each match, &c. but they shall be obliged to fix such hours of starting by eight o'clock in the evening preceding the day of running. The accounts to be produced by the stewards annually, on the 3d of June.

Watching Trials.—Any gentleman who keeps running-horses, having cause to complain of any feeder, rider, groom, boy, or other person employed by him in, or intrusted with, the knowledge of trials, or having discovered them, directly or indirectly, by betting, or wilfully in any other way (unless so allowed to do by his master), or any person, as aforesaid, living with any gentleman, being discovered in watching trials himself, or procuring other persons so to do, or by any unfair means whatsoever, endeavouring to discover trials; on such complaint being carried to any one of the stewards, such steward is to summon a general club meeting as soon as convenient; which meeting is to appoint a committee of three members, to examine into the accusation; and in case they shall be of opinion that the person or persons is or are guilty, then the person or persons so found guilty shall be dismissed from the service of the master, and shall not be employed by any member of the club in any capacity whatsoever; nor shall any horse, &c. fed or rode by him, or them, or in the management of which he or they are concerned, be suffered to start for plate, match, or subscription. And the names of the persons found guilty of these offences shall be exposed in the Racing Calendar, and inserted in a paper to be fixed up in the coffee-room at Newmarket.

Staking, shewing, and entering.—A copy of all the stakes to be made for matches, subscriptions, and sweepstakes, and the day and hour of shewing, or entering, shall be fairly written out, and fixed up, by order of the stewards, on the side of the chimney-piece, at each end of the coffee-room, on the Sunday evening before each meeting; to continue there each day of the meeting, as notice for staking, shewing, or entering, and no other shall be insisted upon.

Entry of Stakes.—A day-book shall be kept by the person appointed by the stewards, and continue in the coffee-room, in which shall be entered an account of all matches, subscriptions, and sweepstakes, to be run for each day within that meeting; and as the different stakes are made, the payments shall be marked to the names of the persons so paying.

Stakes, how to be made.—All stakes shall be made in cash, bank bills, bank post bills properly indorsed, bankers' notes payable to bearer, or bankers' notes payable to order, also properly indorsed, and not otherwise, without the consent of the party or parties present, concerned in the match, subscription, or sweepstakes, on whose account such stakes are made.

Time when.—All stakes for matches, subscriptions, and sweepstakes, shall be made before starting for the same; and in default thereof by any person, such person shall forfeit in like manner as if he had not produced his colt, filly, horse, or mare, to start; and shall have no claim to the stake or stakes of the match, subscription, or sweepstakes, should his colt, filly, horse, or mare, have started, and come first; and this to remain in full force, as an established agreement

of the club; unless such person have previously obtained the consent of the party or parties present, with whom he is engaged, to dispense with his making his stake as aforesaid.

Forfeits, when to be paid.—All forfeits unpaid before starting, for any match, subscription, or sweepstakes, shall be paid to the person appointed by the stewards to receive the same, at the coffee-room, before twelve o'clock at night, of the day such forfeits are determined; and each person making default therein, shall forfeit and pay to the person so appointed by the said stewards, after the rate of five pounds for every hundred pounds so forfeited; which shall be disposed of by the said stewards towards such uses as they shall think fit.

Bets made from signal.—And in order to prevent such frauds, notice shall be given, that if any person make any bet or bets, from signal or indication, after the race has been determined at the post, such person is not entitled to receive, or liable to pay the same; as such bet or bets are fraudulent, illegal, and totally void; and if any servant belonging to a member of the society shall be found to have made, or to have been engaged in the making, any such bet or bets, he shall be dismissed his service, and no farther employed by any member of the society.

Forfeits and Compromises to be entered.—All forfeits, or money paid on compromising any match or sweepstakes, shall *non fide* be declared and entered in the day-book, in order that all bettors may be put upon an equality with the persons who had the match or sweepstakes, and may thus ascertain in what proportion they are to pay or receive.

Age of young Horses.—The stewards shall appoint some proper person to examine every colt or filly, being of the age of two, three, or four years, at the ending-post, immediately after running, the first time any colt or filly shall start for any plate, match, sweepstakes, or subscription at Newmarket; and the said appointed person is to sign a certificate of such examination, and his opinion thereupon; which certificate is to be hung up before eight o'clock in the evening of the said day of running in the coffee-room at Newmarket. But for all plates, matches, subscriptions, or sweepstakes, where the colt or filly is required to be shewn before running, the examination shall be made at the time of shewing them; and the certificate of the person appointed shall immediately, in like manner, be fixed up in the coffee-room at Newmarket.

Time of Starting and Forfeit.—The hours of starting shall be fixed up in the coffee-house by eight o'clock in the evening preceding the day of running, and it is expected that every groom shall start at the time appointed; and any groom failing so to do, shall forfeit five guineas each time to the club. It is also expected that every groom will attend to the regulations and orders to which the stewards of the club may give relative the preservation of the course and exercise ground.

Trials.—No person shall borrow or hire any horse, &c. not belonging to his avowed confederates, to run in a private trial, without entering the name of such horse, before the trial shall be run, in the book appointed to be kept for that purpose in the coffee-room at Newmarket; and no persons shall be deemed confederates who do not subscribe this article as such.

Disputes.—All disputes relative to racing at Newmarket shall be determined by the three stew-

ards, and two referees to be chosen by the parties concerned. If there should be only two stewards present, they are to sit upon a third person in lieu of the absent steward.

Winner undecided.—If for any sweepstakes, or subscription, the first two horses shall come in so near together that the judge shall not be able to decide which won, such two horses shall run for such prize over again, after the last match on the same day. The other horses which started for such sweepstakes or subscription shall be deemed losers, and entitled to their respective places, as if the race had been finally determined the first time.

Single and double Bets.—All bets determined by one event shall be subject (as before agreed) to any compromise made by the principals, and paid in proportion to such compromise, but all double bets (on account of the frequent disputes which have arisen) shall be considered as play or pay bets.

Weight, when not specified.—When any match or sweepstakes shall be made, and no particular weight specified, the horses, &c. shall carry eight stone seven pounds each. And if any weight be given, the highest weight is, by this resolution, fixed at eight stone seven pounds.

Horses engaged, when to enter.—No horse that is matched to run on the day of entrance for any plate, &c. shall be obliged to shew and enter at the hour appointed, but shall shew and enter within an hour after his engagements are over, provided such horse, &c. be named at the usual time of entrance, which is to be between the hours of eleven and one, for all plates, subscriptions, and sweepstakes, where any entrance is required, and no other particular time specified.

Bets between two Horses void.—All bets depending between any two horses, either in match or sweepstakes, are null and void if those horses become the property of one and the same person, or his avowed confederate, subsequent to the bets being made.

Challenge for the Cup.—The cup shall be challenged for on the Monday in the first spring meeting; and the horses named for it declared at six o'clock on the Saturday evening of the same meeting.

The Whip.—The whip shall be challenged for on the Monday or Tuesday in the second spring or second October meeting; and the acceptance signified, or the whip resigned, before the end of the same meeting. If challenged for, and accepted in the spring, to be run for on the Thursday in the second October meeting following; and if in the October, on the Thursday in the second spring meeting. Beacon course: weight ten stone, and to stake two hundred guineas each.

Five per Cent. saved in Forfeits.—The proprietor of any horse, &c. engaged in match or sweepstakes, who shall declare his intention of not starting before eight o'clock on the evening preceding the engagement, to the keeper of the match-book, or either of the stewards, shall be entitled to five per cent. and no more, of the forfeit.

Not staking, a Disqualification.—No person shall be allowed to start any horse, mare, or gelding, for match, sweepstakes, or subscription, unless he shall have paid all former stakes and forfeits to the keeper of the match-book by eight o'clock in the evening before starting.

Trial Ground.—The ground shall not be en-

gaged for trials, by the proprietors of any stable of running horses, more than two days in the same week.

Crossing and Jostling.—When any match is made, in which crossing and jostling are not mentioned, they shall be understood to be barred.

Courses.—When any match or sweepstakes is made, in which no course is mentioned, it shall be understood to be the course usually run by horses of the same age as those engaged, viz. if yearlings, the Yearling Course; if two years old, the Two-years-old Course; if three years old, Rowley's Mile; if four years old, Ditchin; if five years old, or upwards, Beacon Course. And in case the horses matched should be of different ages, the course to be settled by the age of the youngest.

Forfeits.—All forfeits declared or incurred for any match, sweepstakes or subscription, shall be paid to the keeper of the match-book before twelve o'clock on the evening the race is run, under the former penalty of five per cent. to the club; and persons making default herein, shall not be allowed the deduction for the timely declaration of such profits.

Entering and shewing.—Horses, &c. entered for plates or subscriptions, shall not be required to be shewn, if such horse, &c. have before started at Newmarket; and the owner of each horse entered for a plate or subscription, shall declare to the stewards, or the keeper of the match-book, the evening before, by eight o'clock, or when the list is read, at half past nine o'clock, whether his horse be intended to run or not, which declaration shall be deemed obligatory, if in the affirmative, unless the horse be taken ill or matched; and if in the negative, his name shall be erased from the list.

Ten per Cent. saved in Forfeits.—The owners of horses, &c. engaged in matches or sweepstakes, in which the forfeits shall amount to one hundred guineas, or upwards, shall be entitled to a deduction of ten per cent. if they declare their forfeits by half an hour past nine o'clock the evening before running.

Trials.—No gentleman shall try the horse of any other person, except his declared confederate, without giving notice of such trial, by inscribing the name of such horse, or horses, or their pedigrees, with the names of their owners, before or immediately after such trials, in the book at the coffee-house.

JOCKGRIN, a town of France, in the department of Lower Rhine. Lat. 49. 13. N. Lon. 8. 16. E.

JOCO'SE. *a. (jocosus, Latin.)* Merry; waggish; given to jest (*Watts*).

JOCO'SELY. *ad.* Waggishly; in jest; in game (*Brown*).

JOCO'SENESS. } *s. (from jocose.)* Wag-

JOCO'SITY. } *gery; merriment (Br.).*

JOCULAR. *a. (jocularis, Latin.)* Used in jest; merry; jocose; waggish (*Dryden*).

JOCULARITY. *s. (from jocular.)* Merriment; disposition to jest (*Brown*).

JOCUND. *a. (jocundus, Latin.)* Merry; gay; airy; lively (*Milton*).

JOCUNDLY. *ad.* Merrily; gayly (*Saunders*).

JOEL, the second of the minor prophets, flourished about 789 years B. C. His prophecy, written in a vehement style, regards

J O G

chiefly the desolation of Judea by the Chaldeans. St. Peter in the Acts applies a passage from this prophet to the establishment of christianity, and the pouring out the spirit on the day of pentecost.

To JOG. *v. a.* (*schocken*, Dutch.) To push; to shake by a sudden impulse; to give notice by a sudden push (*Worris*).

To JOG. *v. n.* 1. To move by succussion; to move with small shocks like those of a low trot (*Shakespeare*). 2. To travel idly and heavily (*Dryden*).

JOG. *s.* (from the verb.) 1. A push; a slight shake; a sudden interruption by a push or shake; a hint given by a push (*Arbutnot*). 2. A rub; a small stop; an irregularity of motion (*Glanville*).

JÖGGER. *s.* (from *jog*.) One who moves heavily and dully (*Dryden*).

To JOGGLE. *v. n.* To shake (*Derham*).

JOGLING, in architecture, a method of joining stones, or timbers, so as to prevent them from sliding over each other laterally. As in fig. 1. pl. 14. where squared pieces of stone, called *joggles*, are let in half the way into each course of stones between E and F, and prevent either course from slipping horizontally. The *joggles* also put between the arch stones, as between H and L, prevent those stones from being forced either upwards or downwards.

JOGHIS, a sect of heathen religious in the East Indies, who never marry, nor hold any thing in private property; but live on alms, and practise strange severities on themselves. They are subject to a general, who sends them from one country to another to preach. They are, properly, a kind of penitent pilgrims; and are supposed to be a branch of the ancient Gymnosophists.

JOQUES, or YOGGS, certain ages, eras, or periods of extraordinary length, in the chronology of the Hindus. They are four in number:

1. The Sutte Jogue (or age of purity) is said to have lasted three million two hundred thousand years; and they hold that the life of man was extended in that age to one hundred thousand years; and that his stature was twenty-one cubits.

2. The Tirtah Jogue (in which one-third of mankind was corrupted) they suppose to have consisted of two million four hundred thousand years, and that men lived to the age of ten thousand years.

3. The Dwapaar Jogue (in which half of the human race became depraved) endured one million six hundred thousand years, and the life of man was then reduced to a thousand years.

4. The Collee Jogue (in which all mankind are corrupted, or rather lessened, for that is the true meaning of Collee) is the present era, which they suppose ordained to subsist four hundred thousand years, of which year five thousand are already past; and the life of man in that period is limited to one hundred years.

J O H

The above is the account of Mr. Halhed; from which it appears that the Chronology of the Hindoos, like that of many other Eastern nations is exceedingly wild and fabulous: it is, however, extremely probable, that the beginnings of these Jogues, are the results of retrospective calculation, as is the case with our Julian period.

JOHANNESBURG, a town of Eastern Prussia, with a citadel. Lat. 53. 16. N. Lon. 22. 39. E.

JOHANNIA. In botany a genus of the class syngenesia, order polygamia equalis. Receptacle villous; down feathery; corol floscular; calyx imbricate, radiate. One species only; a branched shrub of Peru; with small, prickly, ovate, entire, sessile, imbricate leaves; large, terminal flowers.

JOHN the Baptist (St.), the forerunner of the Messiah, was the son of Zacharias a priest, and Elizabeth. His birth was foretold by an angel. He passed his early years in retirement, and then came forth as a preacher of repentance, baptizing all who confessed their sins. Jesus himself was baptized by him in Jordan, and John bore public testimony to his being the Lamb of God that was to take away the sins of the world. This holy man was beheaded by Herod at the instigation of Herodias, his brother Philip's wife, with whom he lived in a state of adultery.

JOHN the Evangelist, was born at Bethsaida in Galilee, and was the son of Zebedee and Salome, and brother of James. Their occupation was fishing, in which they were engaged when Jesus called them to be "fishers of men." John was the beloved disciple of his master, and leaned on his breast at the last supper. After our lord was risen, Peter asked him what was to become of John, to which Jesus answered, "If I will that he tarry till I come, what is that to thee?" whence some have inferred that he was not to die, but to remain on the earth till the Messiah's second attempt; for which opinion there is no ground. After the ascension of his master he governed several churches in Asia, to which he addressed an epistle, and for whose use he drew up his gospel to counteract the opinion then getting abroad derogatory of the divinity of Christ. In the reign of Domitian he was banished to the solitary isle of Patmos, where he composed his Apocalypse, or rather recorded the visions with which he was favoured for the information of the church. It is said that before this the Roman emperor caused him to be cast into a cauldron of boiling oil, but that the apostle came out unhurt, and was then sent into exile. In the reign of Nerva, he was released and went to Ephesus, where he died under the reign of Trajan, A.D. 100, aged 84. In the sacred canon there are two other epistles by him, one to Gaius and the other to several ladies.

JOHN (surnamed MARY), disciple and

JOH

cousin to Barnabas; son of a woman whose name was Mary, at whose house the apostles and disciples generally met. This John Mark, whom some very improperly confound with the evangelist Mark; adhered to Paul and Barnabas; but at Perga left them and returned to Jerusalem. They afterwards disagreed about taking this John with them to Asia, upon which they separated, and Barnabas took John with him to the isle of Cyprus. After this we learn nothing of John till we find him at Rome, doing signal services for Paul.

JOHN, king of England, surnamed Lackland, was the fourth son of Henry II. and was born in 1199. He deprived his nephew Arthur of the throne to which he was heir, and confined him in prison at Rouen, where he was murdered. The States of Brittany demanded justice of Philip Augustus of France against the murderer, who was condemned to lose all his lands in that country. The pope excommunicated him, and absolved his subjects from their allegiance. He for some time resisted the papal authority, but in 1213 he found it necessary to make his submission. The English barons invited over Lewis the son of Philip, and crowned him at London in 1216, but he did not continue long in England. John died at Newark the same year, and was succeeded by his son Henry III. This prince signed the Magna Charta in 1215, being compelled so to do by the barons. He was buried at Worcester.

JOHN, or the Gospel of St. John; a canonical book of the New Testament, containing a recital of the life, doctrine, and death of our Saviour, Jesus Christ, written by St. John, the apostle and evangelist. See GOSPEL.

St. John, according to Mill, Fabricius, and Le Clerc, wrote his gospel at Ephesus, after his return from the isle of Patmos, A. D. 97, at the desire of the Christians of Asia. Wetstein thought that this gospel might be writ about the year 32, after our Lord's ascension: Basnage and Lampe suppose that it was writ before the destruction of Jerusalem: Dr. Lardner adopts this opinion, and assigns the date of it to the year of Christ 88. This period brings it nearer to that of the three other gospels, which was about the year 64 or 65, and the gospel itself the leading design of which was to show how inexcusable the Jews were in not receiving Jesus as the Christ, and to vindicate the providence of God in the calamities already befallen, or now coming upon them, was suitable to the circumstances of the Jews at this period. The ancients assign two reasons for this undertaking: the first is, because in the other three gospels, there was wanting, the history of the beginning of Jesus Christ's preaching, until the imprisonment of John the Baptist, which therefore he applied himself particularly to relate: the second reason was, in order to

JOH

remove the errors of the Corinthians, Ebionites, and others.

JOHN, St. Revelations of. See APOCALYPSE.

JOHN, St. one of the Philippine islands, E of Mindanao. Lat. 9. 20. N. Lon. 126. 32. E.

JOHN, St. a city of New Brunswick, situate at the mouth of a river of the same name, in the bay of Fundy. Lat. 45. 12. N. Lon. 65. 15. W.

JOHN, St. a town on the E. side of the island of Newfoundland. It has a good harbour, entirely landlocked, and defended by several forts. Lat. 47. 32. N. Lon. 52. 21. W.

JOHN, St. the capital of Antigua. It is one of the most regular towns in the West Indies, and has a very commodious harbour. Lat. 17. 4. N. Lon. 62. 4. W.

JOHN DOPER. In Ichthyology. See ZEUS.

JOHN'S ISLAND, an island of the Atlantic, near the coast of South Carolina. It is about 30 miles in circuit. Lat. 32. 42. N. Lon. 80. 10. W.

JOHNSON (Samuel), one of the greatest writers of whom this country has to boast, was born at Litchfield in 1706. His father was a bookseller in that city, and had no other child except Nathanael, who died in 1737. Samuel was educated partly at the free school of Litchfield, and partly under a Mr. Wentworth at Stourbridge. In 1728 he was entered of Pembroke college, Oxford, where he remained till 1731, and was then obliged to quit the university through the poverty of his circumstances. He soon after lost his father, at whose death he found himself possessed of no more than 20*l*. The place of usher of the school at Bosworth was offered him, and he found it prudent to accept it, but being displeased with the behaviour of the principal he soon after relinquished the situation, and then removed to the house of a printer at Birmingham, where he translated Lobo's account of Abyssinia, for Mr. Warren, a bookseller there. In 1734 he returned to Litchfield, and published proposals for a translation of the works of Politian, with the life of that author, but the design dropped for want of encouragement. In 1735 he married a widow lady of Birmingham, named Porter, and the same year opened a school at Edial near Litchfield; but this scheme also failed, as he obtained only three scholars, one of whom was David Garrick. About this time he began his tragedy of Irene, in which he was encouraged by his great friend Mr. Wainsley of Litchfield. In 1737 he set out for the metropolis, accompanied by Garrick. On fixing his residence in London he formed a connexion with Cave, the publisher of the Gentleman's Magazine, for which miscellany he continued to write several years, his principal department being an account of the parliamentary de-

J O H N S O N.

bates. At this period he contracted an intimacy with *Savage*, and, being alike destitute, a close friendship subsisted between them. Johnson has immortalized the name of that unfortunate wanderer by one of the most eloquent and instructive pieces of biography ever composed. In 1738 appeared anonymously his imitation of Juvenal's third Satire, under the title of *London*, a poem, which was commended by Pope, and well received by the public, though it rendered the author but little service in the way of profit. He made an attempt to get elected master of a free school in Leicester-shire, but was disappointed, owing to his not being a master of arts. He was now forced to adopt the profession of an author for his subsistence. In 1747 he issued proposals for an edition of *Shakspeare*, and published the plan of his *English Dictionary*. The price agreed upon between him and the booksellers for the last-mentioned work was 1575*l*. The year following Johnson instituted a literary club in Ivy-lane, Paternoster-Row. In 1749 Garrick brought his friend's tragedy on the stage at Drury-lane, but with all his exertions the play was unsuccessful, being too stiff and laboured a composition for the stage, though admirable in the closet. This year he was imposed upon by *Lauder*, who pretended to have discovered proofs of *Milton's* being a plagiarist, but when he found that *Lauder* was an impostor he discarded him. In 1750 he commenced his *Rambler*, a periodical paper of the first class, which was continued till 1752. In this excellent work he had so little assistance that only five papers were the productions of other writers. Soon after the close of this paper he lost his wife, a circumstance which affected him sensibly, as may be seen in his *Meditations*, and in the sermon which he wrote on her death, with a design that *Dr. Taylor* should have preached it at her funeral. In 1755 appeared his dictionary, and to give it some degree of distinction the university of Oxford previously conferred on him the degree of *M. A.* Lord *Chesterfield* also endeavoured to assist it by writing two papers in its favour in the world, but, as he had neglected the work till the eve of its publication, Johnson treated his lordship with indignant contempt. The publication of this great work did not relieve him from his embarrassments, for the price of his labour had been consumed in the progress of its execution, and the year following we find him under arrest for five guineas, from which he was released by *Samuel Richardson* the printer. In 1758 he began his *Idler*, a periodical paper, which was published in a weekly newspaper. On the death of his mother in 1758 he wrote the romance of *Rasselas* to defray the expenses of her funeral, and to pay off her debts. In 1758 his majesty settled on him a pension of 300*l*. per annum, without any stipulation with

respect to his future literary exertions. Johnson had the honour of a conversation with the king in the library of Buckingham-house, in February, 1765, when his majesty asked if he intended to publish any more works? To this he answered, that he thought he had written enough; on which the king said, "and so should I too, if you had not written so well." About this time he instituted the *Literary Club*, which consisted of some of the most celebrated geniuses of the age, and still continues. In 1771 his friend *Mr. Strachan* endeavoured to bring him into parliament, thinking that he would have shone as a speaker, but the attempt was unsuccessful. In 1773 he took a tour with *Mr. Boswell* to the western islands of Scotland, of which journey he shortly after published an account. This work occasioned a difference between him and *Mr. Macpherson* relative to the poems of *Ossian*, when the latter was weak enough to threaten him with personal chastisement, which drew from Johnson a letter full of dignified spirit. In 1775 the university of Oxford sent him the degree of *L.L.D.* by diploma, which had before been conferred on him by the university of Dublin. In 1779 he began his *lives of the English Poets*, which work was not completed till 1781. Though he was now 72 years of age we perceive no decay of intellect, nor abatement of his wonted vigour. On the contrary the work is a treasure of sound criticism, and a model of literary biography. This, however, was his last performance. Nature soon began to give symptoms of failure, and to warn him of his dissolution. This was an event which he had always looked to with dread bordering upon horror. But the last days of this excellent man were sun-shine. His gloomy apprehensions vanished; he saw the ground of his confidence, and he departed in strong faith and lively hope, December 13, 1784. His remains were interred in Westminster-abbey, close by his friend Garrick; and a statue, with an appropriate inscription, has been erected to his memory in the cathedral of St. Paul. His works have been published in 12 volumes, 8vo. and his life has been written by several authors, particularly *Sir John Hawkins*, *Mr. Murphy*, *Mrs. Piozzi*, and *Mr. Boswell*. Of these we would beg to recommend the life by the latter mentioned author, as a well drawn piece of biography, at once, entertaining, interesting, and instructive; the anecdotes he relates are in general authentic and accurate; and he has corrected many mistakes of *Mrs. Piozzi*, and *Sir John Hawkins*, as a writer few have done such essential service to this country, by fixing its language and regulating its morality, as *Dr. Johnson*. In his person he was large, robust, and un-wieldy. In his dress he was singular and slovenly. In conversation he was often violent, positive, and impatient of contra-

fiction. Yet with all his singularities he had an excellent heart, full of tenderness and compassion. All his actions were the result of principle. He was a stout advocate for truth, and a zealous champion for the christian religion as professed in the church of England. In politics he was a tory, and at one period of his life a great friend to the discarded house of Stuart. He had a noble independence of mind, and could never bear to stoop to any man however exalted, or to disguise his sentiments to flatter another. His judgment was uncommonly acute and steady, his imagination quick and ready, his memory tenacious to a wonderful degree, and his conversation brilliant and instructive. His piety was solemn, fervent, and impressive, founded on the purest principles, and regulated by sound wisdom. (*Watkins*).

JOHNSON (Mrs.) the Stella of dean Swift, under which name he always mentioned her, was the daughter of Sir William Temple's steward, and the concealed, though undoubted wife of Swift. Sir William Temple bequeathed her in his will a thousand pounds, as an acknowledgment of her father's faithful services. She had an elevated understanding, with all the delicacy and softness of her sex. Her voice, though sweet in itself, was rendered still more harmonious by what she said. Her wit was poignant without severity; her manners were humane, polite, easy, and unreserved: wherever she came she attracted attention and esteem. She was strictly virtuous, sincerely religious, and constant, though not ostentatious in her devotions. She had great skill in music, and was perfectly well versed in all the arts proper to employ a lady's leisure. Her wit was a fund of perpetual cheerfulness, and her prudence kept that cheerfulness within proper bounds. In short, she exactly resembled the description Homer has given of Penelope:

A woman loveliest of the lovely kind,

In body perfect, and complete in mind.

This is the character given of Stella by those who knew her best. How long she remained in England after Sir William Temple's death, is not known; but it appears that she was married to Dr. Swift in the year 1714, by Dr. Ashe, then bishop of Clogher, though she never could prevail upon him to acknowledge her openly as his wife. The flaw which in Swift's eye reduced the value of such a jewel, was the servile state of her father; he was a man of probity, but he was only the steward of Sir William Temple. Hence Dr. Swift and Mrs. Johnson preserved the same manner of life, after marriage as before it. They lived in separate houses; he remaining at the deanery, she in lodgings at a distance from him, and on the other side of the Liffey. Nothing appeared in their behaviour inconsistent with decorum, or beyond the limits

of Platonic love. They conversed like friends, but industriously took care to assume common witnesses of their conversation; a rule to which they adhered so strictly, that it would be difficult to prove that they had ever been together without a third person. A conduct so unnatural gave room for various comments and reflections; but however unaccountable the renunciation of the marriage rites may appear to the world, it certainly did not arise from any consciousness of too near a consanguinity between them, though the general voice of fame was willing to make them both the natural children of Sir William Temple; but this could not be true, Sir William being employed as a minister abroad from the year 1665 to 1670, so that Swift's mother, who never crossed the sea, except from England to Ireland, was out of all possibility of a personal correspondence with him, for two years before his birth. It may be imagined that a woman of Stella's delicacy must repine at such a situation. The outward honours she received are frequently bestowed on a mistress: though a wife, she was not acknowledged in that character, and though strictly virtuous, was obliged to submit to all the appearances of vice, except in the presence of those few witnesses of the cautious manner in which she lived with her husband. Hence inward anxiety disturbed by degrees the calmness of her mind, and the strength of her body. She began to decline in her health in the year 1724, and from the first symptoms of decay, rather hastened than shrunk back in the descent; tacitly pleased to find her footsteps tending to that place where they neither marry, nor are given in marriage. She died about the end of January 1727, or 1728, absolutely destroyed by the peculiarity of her fate; a fate which perhaps she could not have endured by an alliance with any other man upon earth.

JOHNSONIA, in botany. See CALLIGARPA.

JOIGNY, a town of France, in the department of Yonne. Its red wines, though not of the first quality, have a great demand. Lat. 48. 0. N. Lon. 3. 36. E.

To JOIN, *v. a.* (*joindre*, French.) 1. To add one to another in contiguity (*Isaiah*). 2. To couple; to combine (*Locke*). 3. To unite in league or marriage (*Dryden*). 4. To dash together; to collide; to encounter (*Kneller*). 5. To associate (*Acts*). 6. To unite in one act (*Dryden*). 7. To unite in concord (*Corinthians*). 8. To act in concert with (*Dryden*).

To JOIN, *v. n.* 1. To grow to; to adhere; to be continuous (*Acts*). 2. To close; to clash (*Shakespeare*). 3. To unite with in marriage, or any other league (*Ezra*). 4. To become confederate (*Maccabees*).

JOINDER, *s.* (from *join*.) Conjunction joining; not as d (*Shakespeare*).

JOINER. s. (from *join*.) One whose trade is to make utensils of wood compacted (*Mason*).

JOINERY, the art of working in wood, or of fitting various pieces of timber together. It is called by the French *menuiserie*, "small work," to distinguish it from carpentry, which is employed about large and less curious works.

JOINT. s. (*jointure*, French.) 1. Articulation of limbs; juncture of moveable bones in animal bodies (*Temple*). 2. Hinge; junctures which admit motion of the parts (*Shaks*). 3. (In joinery.) Straight lines, in joiners' language, are called a *joint*, that is, two pieces of wood are shot or planed (*Mason*). 4. A knot or commissure in a plant. 5. One of the limbs of an animal cut up by the butcher (*Swift*). 6. *Out of JOINT*. Luxated; slipped from the socket, or correspondent part where it naturally moves (*Herbert*). 7. *Out of JOINT*. Thrown into confusion and disorder; confused (*Shaks*).

JOINT. Articulus. In botany, according to Linnæ, that part of a culm which lies between two knots. See **INTERNODIUM**.

JOINTS, in masonry, the separations between the stones, filled with mortar, or cement. **JOINTS**, in carpentry. See **CARPENTRY**, **DOVERTAIL**, **MORTISE**, &c.

JOINT. a. 1. Shared among many (*Shaks*). 2. United in the same possession (*Donne*). 3. Combined; acting together in consort (*Addison*).

To JOINT. v. a. (from the noun.) 1. To form in articulations (*Ray*). 2. To form many parts into one (*Dryden*). 3. To join together in confederacy (*Shaks*). 4. To divide a joint; to cut or quarter into joints (*Dryden*).

JOINTED. a. (from *joint*.) Full of joints, knots, or commissures (*Philips*).

JOINTED. In botany articulus. Applied to the root, in *Lathræa*, *Oxalis*, *Martynia*, *Dentaria*—to the stem or culm, in corn and grasses—to the leaves, when one leaflet grows from the top of another, to the spike, peduncle, petiole, capsule, silique and legume.

JOINTER. s. (from *joint*.) A sort of plane (*Mason*).

JOINTLY. ad. (from *joint*.) 1. Together; not separately (*Hooker*). 2. In a state of union or co-operation (*Dryden*).

JOINTRESS. s. (from *jointure*.) One who holds any thing in jointure (*Shakspeare*).

JOINTSTOOL. s. (*joint* and *stool*.) A stool made not merely by insertion of the feet, but by inserting one part in another (*Arbutnot*).

JOINTURE. s. (*jointure*, French.) Estate settled on a wife at marriage to be enjoyed after her husband's decease (*Pope*).

JOINVILLE, an ancient town in France, in the department of Upper Marne. Lat. 48. 30. N. Lon. E. 30. E.

JOISTS, in carpentry, pieces of timber framed into the girders and summers, on

which the boards of the floor are laid. They are of various kinds; as 1. *Common joists*, those which are framed level or flush with the upper surface of the girders, but are seldom of equal depth. 2. *Trimming joists*, those which are framed into two other joists, that other joists may be framed into them, where the opening is made for a staircase, or a chimney. 3. *Binding joists*, those which are laid across from girder to girder, and about three or four inches lower than their upper surface, in order that other joists, called 4. *Bridging joists*, may be laid over them parallel to the girders. 5. *Ceiling joists*, are tenoned into the binding of joists, and are generally made slender, having but little weight to support. The best relative dimensions of common joists of fir timber, are contained in the following table.

Length.	Breadth.	Height.
6 f.	2 i	8 i
8	2.5	8.2
9	3.	8.
10	3.	8.4
11	3.5	8.1
12	4.	8

To JOIST. v. a. (from the noun.) To fit in the smaller beams of a flooring.

JOKE. s. (*jocus*, Latin.) A jest; something not serious (*Watts*).

To JOKE. v. n. (*jocor*, Latin.) To jest; to be merry in words and actions (*Gay*).

JO'KER. s. (from *joke*.) A jester; a merry fellow (*Dennis*).

IOLAIA, a festival at Thebes, the same as that called *Heraclæia*. It was instituted in honour of Hercules and his friend Iolas, who assisted him in conquering the Hydra. It continued during several days, on the first of which were offered solemn sacrifices. The next day horse-races and athletic exercises were exhibited. The following day was set apart for wrestling; the victors were crowned with garlands of myrtle generally used at funeral solemnities. They were sometimes rewarded with tripods, or brass.

IOLAS or **IOLAVA**, in fabulous history, a son of Iphiclus king of Thessaly, who assisted Hercules in conquering the Hydra, and burnt with a hot iron the place where the heads had been cut off, to prevent the growth of others. He was restored to his youth and vigour by Hebe, at the request of his friend Hercules. Some time afterwards Iolas assisted the **HERACLEIDA** against Eurytheus, and killed the tyrant with his own hand. According to Plutarch, Iolas had a monument in Boeotia and Phocis, where lovers used to go and bind themselves by the most solemn oaths of fidelity, considering the place as sacred to love and friendship. According

J O N

to Diodorus and Pausanias, Iolas died and was buried in Sardinia.

JOLE. *s.* (*gueule*, French; *crol*, Saxon.)
1. The face or cheek (*Collier*). 2. The head of a fish (*Pope*).

To JOLL. *v. a.* (from *joll*, the head.) To beat the head against any thing; to clash with violence (*Shakspeare*, *L'Estrange*).

JO'LLILY. *ad.* (from *jolly*.) In a disposition to noisy mirth (*Dryden*).

JO'LLIMENT. *s.* (from *jolly*.) Mirth; merriment; gayety; obsolete (*Penser*).

JO'LLINESS. } *s.* (from *jolly*.) 1. Gayety;
JO'LLITY. } elevation of spirit (*Sidney*).
2. Merriment; festivity (*Addison*).

JO'LLY. *a.* (*joli*, Fr.) 1. Gay; merry; airy; cheerful (*Prior*). 2. Plump; like one in high health (*South*).

To JOLT. *v. n.* To shake as a carriage on rough ground (*Swift*).

To JOLT. *v. a.* To shake one as a carriage does.

JOLT. *s.* Shock; violent agitation (*Swift*).

JO'LTHAD. *s.* A great head; a dolt; a blockhead (*Grew*).

ION, in fabulous history, a son of Xuthus and Creusa, daughter of Erectheus, who married Helice, the daughter of Selinus king of Egiale. He succeeded to the throne of his father-in-law; and built a city, which he called Helice, on account of his wife. His subjects from him received the name of Ionians, and the country that of Ionia. See **IONIA**.

ION, a tragic poet of Chios, who flourished about the 83d Olympiad. His tragedies were represented at Athens, where they met with universal applause. He is mentioned and greatly recommended by Aristophanes and Athenæus, &c.

IONA. See **ICOLMILL**.

JONAH, or *Prophesy of JONAH*, a canonical book of the Old Testament; in which it is related, that Jonah (about 771 B. C.) was ordered to go and prophesy the destruction of the Ninevites, on account of their wickedness. But the prophet, instead of obeying the divine command, embarked for Tarshish; when, a tempest arising the mariners threw him into the sea: he was swallowed by a great fish; and, after being three days and nights in his belly, was cast upon the land. ~~Mercy being sensible of his past danger and surprising deliverance, he betook himself to the journey and embassy to which he was appointed; and arriving at Nineveh, the metropolis of Assyria, he, according to his commission, boldly laid open their sins and miscarriages, and proclaimed their sudden overthrow: upon which the whole city, by prayer and fasting, and a speedy repentance, happily averted the divine vengeance, and escaped the threatened ruin. Jonah upon this, fearing to pass for a false prophet, retired to a hill at some distance from the city; where God, by a miracle, condescended to show him the unreasonableness of his discontent.~~

J O N

JONAS (*Armagrimus*), a learned Icelandic, acquired great reputation by his skill in the sciences, and particularly in astronomy. He was the coadjutor to Gundobran de Thorlac, bishop of Holar, in Iceland. He refused that bishopric, after the death of Gundobran; and died 1649. He wrote several works; the principal of which are, *Idea vera Majestatis*, and his history and description of Iceland.

JONEQUETIA. In botany a genus of the class decandria, order pentagynia. Calyx five-leaved; petals five; capsule five-grained, one-celled, five-valved, five-seeded; seeds coated. One species only: a Guiana tree with unevenly pinate leaves; oblong, pointed, entire veined, glabrous leaflets; terminal, panicked flowers.

JONES (Inigo), a famous architect, was born in London about 1572. He was bred a joiner, but his skill in drawing recommended him to the notice of the earl of Pembroke: he sent him to Italy, where he acquired a complete knowledge of architecture. James I. made him surveyor-general of his works, which office he discharged with great fidelity. He continued in the same post under Charles I. and had the same superintendence of the building of St. Paul's Cathedral; and the management of the masques and interludes for the entertainment of the court. This brought him into a squabble with Ben Jonson his coadjutor, who ridiculed him in his comedy of Bartholomew-fair under the name of Lantern Leatherhead. He suffered considerably during the time of Cromwell. Grief, misfortunes, and age, brought him to his grave in July 1651. In 1655 appeared his Discourse on Stonehenge, in which he attempts to prove it a Roman temple. As an architect Inigo generally, but not always, shines to great advantage. He designed the palace of Whitehall and the Banqueting-house, the church and piazza of Covent-garden, Coleshill in Berkshire, Cobham-hall in Kent, and various other buildings public and private. The principle of his designs were published in folio, in 1727, and some in 1744.

JONES (William), an eminent mathematician, was born in the isle of Anglesea, in 1676. He settled in London as a schoolmaster, and had the honour of instructing lord Macclesfield's son in the mathematics, which procured him the place of secretary to that nobleman, and the post of deputy-teller of the exchequer. He lived on terms of the greatest intimacy with sir Isaac Newton, and other great mathematicians; and was chosen a fellow of the Royal Society. He died in affluent circumstances in 1749. He published, 1. A compendium of the Art of Navigation, 8vo. 1702; 2. Synopsis Palmariorum Mathematicarum, or a new introduction to the Mathematics, 8vo. 1706; 3. Several papers in the Phil. Trans. 4. An elegant analysis of several of Newton's papers, entitled *Analysis per quantitatem Series, Flux-*

JONES.

Jones, ac Differentias; cum Enumeratione Linearum Tertiæ Ordinis.

In all these works of Mr. Jones, a remarkable neatness, brevity, and accuracy, every where prevails. He seemed to delight in a very short and comprehensive mode of expression and arrangement; insomuch that sometimes what he has contrived to express in two or three pages, would occupy a little volume in the ordinary style of writing.

JONES (Sir William), a celebrated English writer, and judge in India, was the son of the preceding, and born in September 1746. He received his education at Harrow school, from whence he removed to University college, Oxford, and about 1769 made the tour of France. The year following he translated the history of Nadir Shah, from a Persian MS. into French at the request of the king of Denmark, but received no other return than the honour of being chosen a member of the royal society of Copenhagen. The year following he published his grammar of the Persian language, and also Dissertation sur la Littérature Orientale, 8vo. which was followed by Lettre a Mons. A—— du P——, dans laquelle est compris l'Examen de sa Traduction des Livres attribués à Zoroastre, in which he vindicated the university of Oxford from the attack of an arrogant Frenchman. In 1773, having taken his degree of M.A. he resolved on making the law his profession, and accordingly applied to that study with great assiduity. Soon after his being called to the bar, he was appointed commissioner of bankrupts, but did not obtain much practice in the courts. In 1779 he published The speeches of Isaac, in causes concerning the law of succession to property at Athens, with a prefatory discourse, &c. 4to. The shameful riots in London in 1780 occasioned him to write a piece, entitled, An Inquiry into the Legal Mode of suppressing Riots; with a Constitutional Plan of future Defence. Next year he printed an essay on the Law of Bailments, 8vo. a treatise which did great honour to his legal abilities. About this time we find him engaged in politics, and a zealous member of the constitutional society. In 1788 he was appointed judge of the supreme court of Bengal, on which occasion he received the honour of knighthood. During his voyage to the East Indies he planned the scheme of a society which was afterwards established at Calcutta, and of which sir William became the active president. Several volumes of their transactions have been published, and the Asiatic Society promise immense benefits to the world of science and literature. Sir William's conduct as a judge was most exemplary, and his literary exertions continued indefatigable. He died in India in 1794. His works were collected and published in 6 vols. 4to. 1799, by his widow, the daughter of the late Dr. Shipley, bishop of St. Asaph. "It

is to the shame of scepticism (as one of his biographers well observes), to the encouragement of hope, and to the honour of genius, that this great man was a sincere believer in the doctrines of Christianity, and that he was found dead in his closet in the attitude of addressing his prayer to God." We shall give his character as it was drawn by Sir John Shore, baronet (now lord Teignmouth) in a discourse delivered at a meeting of the Asiatic Society, held on the 22d of May 1794.

"His capacity for the acquisition of languages has never been excelled. In Greek and Roman literature, his early proficiency was the subject of admiration and applause; and knowledge of whatever nature, once obtained by him, was ever afterwards progressive. The more elegant dialects of modern Europe, the French, the Spanish, and Italian, he spoke and wrote with the greatest fluency and precision; and the German and Portuguese were familiar to him. At an early period of life his application to Oriental literature commenced; he studied the Hebrew with ease and success; and many of the most learned Asiatics have the candour to avow, that his knowledge of Arabic and Persian was as accurate and extensive as their own; he was also conversant in the Turkish idiom, and the Chinese had even attracted his notice so far as to induce him to learn the radical characters of that language, with a view perhaps to further improvements. It was to be expected, after his arrival in India, that he would eagerly embrace the opportunity of making himself master of the Sanscrit; and the most enlightened professors of the doctrines of Brahma confess with pride, delight, and surprise, that his knowledge of their sacred dialect was most critically correct and profound. The Pandits who were in the habit of attending him, could not after his death, suppress their tears for his loss, nor find terms to express their admiration at the wonderful progress he had made in their sciences.

"Before the expiration of his twenty-second year, he had completed his Commentaries on the Poetry of the Asiatics, although a considerable time afterwards elapsed before their publication; and this work, if no other monument of his labours existed, would at once furnish proofs of his consummate skill in the Oriental dialects, of his proficiency in those of Rome and Greece, of taste and erudition far beyond his years, and of talents and application without example.

"But the judgment of Sir William Jones was too discerning to consider language in any other light than as the key of science, and he would have despised the reputation of a mere linguist. Knowledge and truth were the objects of all his studies, and his ambition was to be useful to mankind; with these views he extended his researches to all languages, nations, and times.

"Such were the motives that induced him

JONES.

to propose to the government of India, what he justly denominated a work of national utility and importance, the compilation of a copious Digest of Hindu and Mahomedan Law, from Sanscrit and Arabic originals, with an offer of his services to superintend the compilation, and with a promise to translate it. He had foreseen, previous to his departure from Europe, that without the aid of such a work, the wise and benevolent intentions of the legislature of Great Britain, in leaving to a certain extent the natives of these provinces in possession of their own laws, could not be completely fulfilled; and his experience, after a short residence in India, confirmed what his sagacity had anticipated, that without principles to refer to, in a language familiar to the judges of the courts, adjudications amongst the natives must too often be subject to an uncertain and erroneous exposition, or wilful misinterpretation of their laws.

"To the superintendence of this work, which was immediately undertaken at his suggestion, he assiduously devoted those hours which he could spare from his professional duties. After tracing the plan of the Digest, he prescribed its arrangement and mode of execution, and selected from the most learned Hindus and Mahomedans fit persons for the task of compiling it: flattered by his attention, and encouraged by his applause, the Pandits prosecuted their labours with cheerful zeal to a satisfactory conclusion. The Molavees have also nearly finished their portion of the work; but we must ever regret, that the promised translation, as well as the meditated preliminary dissertation, have been frustrated by that decree, which so often intercepts the performance of human purposes.

"During the course of this compilation, and as auxiliary to it, he was led to study the works of Menu, reputed by the Hindus to be the oldest and holiest of legislators; and finding them to comprise a system of religious and civil duties, and of law in all its branches, so comprehensive and minutely exact, that it might be considered as the Institutes of Hindu Law, he presented a translation of them to the government of Bengal. During the same period, deeming no labour excessive or superfluous that tended in any respect to promote the welfare or happiness of mankind, he gave the public an English version of the Arabic Text of the Sirajiah or Mahomedan Law of Inheritance, with a Commentary. He had already (as has been observed) published in England a translation of a tract on the same subject by another Mahomedan lawyer, containing, as his own words express, 'a lively and elegant Epitome of the Law of Inheritance of Zaid.'

"Besides these learned and important works, he had laid a plan (as appeared from a paper found after his death, entitled *Considerata*) for investigating the history and other interesting subjects relating to India,

Arabia, Persia, China, Tartary, and the eastern world in general. We have already enumerated attainments and works which from their diversity and extent, seem far beyond the capacity of the most enlarged minds; but the catalogue may yet be augmented. To a proficiency in the languages of Greece, Rome, and Asia, he added the knowledge of the philosophy of those countries, and of every thing curious and valuable that had been taught in them. The doctrines of the Academy, the Lyceum; or the Portico, were not more familiar to him than the tenets of the Vedas, the mysticism of the Susis, or the religion of the ancient Persians; and whilst, with a kindred genius, he pursued with rapture the heroic, lyric, or moral compositions of the most renowned poets of Greece, Rome, and Asia, he could turn with equal delight and knowledge to the sublime speculations or mathematical calculations of Barrow and Newton. With them also he professed his conviction of the truth of the Christian religion; and he justly deemed it no inconsiderable advantage, that his researches had corroborated the multiplied evidence of Revelation, by confirming the Mosaic account of the primitive world."

There were, in truth, few sciences in which he had not acquired considerable proficiency; in most, his knowledge was profound. The theory of music was familiar to him; nor had he neglected to make himself acquainted with the interesting discoveries lately made in chemistry; "and I have heard him (says Lord Teignmouth) assert, that his admiration of the structure of the human frame had induced him to attend for a season to a course of anatomical lectures, delivered by his friend, the celebrated Hunter."

His last and favourite pursuit was the study of botany, which he originally began under the confinement of a severe and lingering disorder, which with most minds would have proved a disqualification from any application. It constituted the principal amusement of his leisure hours.

Lord Teignmouth, addressing himself to the Asiatic Society, says, "Of the private and social virtues of our lamented president, our hearts are the best records. To you who knew him, it cannot be necessary for me to expatiate on the independence of his integrity, his humanity, probity, or benevolence, which every living creature participated; on the affability of his conversation and manners, or his modest, unassuming deportment; nor need I remark, that he was totally free from pedantry, as well as from arrogance and self-sufficiency, which sometimes accompany and disgrace the greatest abilities. His presence was the delight of every society, which his conversation exhilarated and improved; and the public have not only to lament the loss of his talents and abilities, but that of his example."

The singular abilities, worth, and excel-

JON

lence of this great man, will, we trust, be an ample apology for our dwelling thus long and minutely upon his character and attainments.

IONISIA. In botany a genus of the class heptandria, order monogynia. Calyx two-leaved; corol funnel-form, with a fleshy, closed tube, and four-cleft border; nectary a ring inserted in the throat of the tube of the corol, and bearing the stamens; germ pedicelled; legume similar-shaped; from four to eight-seeded. One species only: an East Indian tree with alternate, unequally pinnate leaves; leaflets four or six pair, oblong-lanceolate; orange flowers in axillary and terminal cymes.

IONIA, a country of Asia Minor, bounded on the N. by *Æolia*, on the W. by the *Ægean* and *Icarian* seas, on the south by *Caria*, and on the east by *Lydia* and part of *Caria*. It was founded by colonics from Greece, and particularly *Attica*, by the *Ionians* or subjects of *Ion*. *Ion* was divided into 1 small states, which formed a celebrated confederacy, often mentioned by the ancients. These 12 states were *Priene*, *Miletus*, *Colophon*, *Clazomenæ*, *Ephesus*, *Lebedos*, *Teos*, *Phocæa*, *Erythræ*, *Smyrna*, and the capitals of *Samos* and *Chios*. The inhabitants of *Ion* built a temple which they called *Pan Ionium*, from the concourse of people that flocked there from every part of *Ion*. After they had enjoyed for some time their freedom and independence, they were made a tributary to the power of *Lydia* by *Cresus*.

IONIAN MODE, in music. See *MODE*.

IONIC ORDER. See *ARCHITECTURE*.

IONIC Dialect, in grammar, a manner of speaking peculiar to the people of *Ion*.

IONIC Sect was the first of the ancient sects of philosophers; the others were the *Italic* and *Eleatic*. The founder of this sect was *Thales*, who, being a native of *Miletus* in *Ion*, occasioned his followers to assume the appellation of *Ionics*: *Thales* was succeeded by *Anaximander*, and he by *Anaximenes*, both of *Miletus*; *Anaxagoras*, *Clazomenius* succeeded them, and removed his school from *Asia* to *Athens*, where *Socrates* was his scholar. It was the distinguishing tenet of this sect, that water was the principle of all natural things.

IONIUM MARE, a part of the Mediterranean sea, at the bottom of the *Adriatic*. It lies between *Sicily* and *Greece*. It is said to have received its name from *Io*, who swam across it, after she had been metamorphosed into a heifer.

JONKIÖPING, a town of Sweden, in the province of *Småland*, situated near the *Wetter Lake*, containing two *fauxbourgs*, three churches, an arsenal, and a manufacture of arms, and about 3000 inhabitants. It is the seat of justice for *Gothland*: 156 miles SW. *Stockholm*, Lat. 57. 12. N. Lon. 14. 46. E.

JONQUIL, in botany. See *NARCISSUS*.

JONSON (*Bentham*), an English poet, was born in *Westminster* in 1574. His father

JOP

was a clergyman, and died about a month before the birth of our poet, who received his education at *Westminster school*, but his mother marrying a bricklayer, compelled him to work at the same business. This proving very disagreeable to him, he entered for a soldier, and went to the *Netherlands*, where he distinguished himself by his valour. On his return home he went to *St. John's college*, *Cambridge*, but did not remain there long, owing to his extreme poverty. He then turned his attention to the stage, and became both player and dramatic writer, but his success in both capacities was alike indifferent till *Shakspeare* gave him his assistance. His first printed play was the comedy, entitled, *Every Man in his Humour*, after which he produced a new piece annually for several years. He engaged with *Chapman* and *Marston* in writing a comedy called, *Eastward Hoe*, which being construed into a satire on the *Scotch nation*, had like to have brought the authors into the star chamber and the pillory. At the accession of *James I.* *Jonson* had the honour of preparing the device for the entertainment of the king, on his passage from the *Tower* to *Westminster-abbey*. He continued to have the management of all the masques and public shews during that reign, and also in that of *Charles I.* In 1619 he was honoured with the degree of *M.A.* by the university of *Oxford*, and in 1621 he was appointed poet-laureat on the death of *Samuel Daniel*. The salary was then but 100 marks per annum, but in 1630 *Jonson*, by a petition, got it raised to 100*l.* Notwithstanding this allowance, and the profits of his performances he continued poor, and sometimes was in very distressed circumstances, from which he was often relieved by the bounty of the king. He died in 1637, and was buried in *Westminster-abbey*: on his grave-stone is the following inscription:

O! Rare Ben Jonson!

His works, consisting of plays, poems, and some pieces in prose, were published in 1756, in 7 vols. 8vo. under the care of Mr. *Whalley*.

JONTHUS, (from *ion* the violet and *arbo*; a flower.) In medicine a hard pimple in the face, of a violet colour, frequent about the age of puberty.

JOPÆAN, among the ancients, an exclamation used on account of a victory, or some prosperous event.

JOPPA, a sea-port town in *Palestine*, lying south of *Cæsarea*; and anciently the only port to *Jerusalem*, whence all the materials sent from *Tyre* towards the building of *Solomon's temple* were brought hither and landed (2 Chr. ii. 16.) It is said to have been built by *Japhet*, and from him to have taken its name *Japho*, afterwards moulded into *Joppa*; and the very heathen geographers speak of it as built before the flood. It is

now called *Jafa*, somewhat nearer to its first appellation.

JORDAN, a river of Palestine, which rises in Mount Libanus, and runs from N. to S. forming two lakes, the one formerly called the Sea of Galilee, or lake of Tiberias, and the other, the Dead Sea.

JORDANO (Luca), a famous Italian painter, was born at Naples in 1632, and learnt the rudiments of his art from his father, after which he went to Rome, where he studied the manner of Pietro da Cortona, but applied himself chiefly to the works of Paul Veronese. In 1692 the king of Spain employed him to paint the Escorial. He here executed several great works, and then returned to Naples. He painted with great facility, and acquired considerable wealth. He died in 1705.

JORDEN. *s.* (*gop, stercus, and den, receptaculum.*) A pot (*Pope*).

JORTIN (John), a very learned and ingenious English clergyman, was born in Huntingdonshire about the year 1701. Having some private fortune of his own, and being of a peculiar disposition that could not solicit promotion, he remained long without preferment. In 1738, lord Winchester gave him the living of Eastwell in Kent; but the place not agreeing with his health, he soon resigned it. Archbishop Herring, who had a great value for him, about the year 1751 presented him to the living of St. Dunstan's in the East; and bishop Osbaldiston in 1762 gave him that of Kensington, with a prebend in St. Paul's cathedral, and made him archdeacon of London. His temper, as well as his aspect, was rather morose and saturnine; but in company that he liked, he was at all times facetious, yet still with a mixture of *sal censure superiorum*. His sermons were sensible and argumentative; and would have made more impression on his hearers, had he been more attentive to the advantages flowing from a good delivery; but he appeared to greater advantage as a writer. His remarks on ecclesiastical history, his six dissertations, his life of Erasmus, and his sermons, were extremely well received by the public, and have undergone several editions. He died in the year 1770.

JOSEPH, the son of Jacob and Rachel, was the favourite of his father, on which account his brethren hated him, and sold him to some Midianites, who carried him into Egypt, where he was disposed of to Potiphar, a lord of the court. His master placed an implicit confidence in him, and his mistress having conceived a passion for him, tempted him to commit adultery, which he resisted. Enraged at this treatment, she charged him with having endeavoured to violate her chastity, in consequence of which he was thrown into prison, but was delivered from thence owing to his skill in explaining a mysterious dream of Pharaoh. The king

then made him prime-minister, and by his wisdom he not only supplied Egypt with corn in a time of famine, but sold that commodity to the people of other countries. Among those who came thither to purchase corn were his brethren, to whom, after some interesting scenes, Joseph discovered himself, and then sent for his father, and all his relations to come to Egypt, where he assigned them the province of Goshen for their residence. Joseph married a daughter of the priest of On, by whom he had two sons, Ephraim and Manasseh, who became the heads of two tribes. He died B. C. 1635, after governing Egypt 80 years.

JOSEPHUS, the celebrated historian of the Jews, was of noble birth; by his father Mattathias, descended from the high-priests, and by his mother of the blood-royal of the Maccabees: he was born A. D. 37, under Caligula, and lived under Domitian. At 16 years of age, he betook himself to the sect of the Essenes, and then to the Pharisees; and having been successful in a journey to Rome, upon his return to Judaea he was made captain-general of the Galileans. Being taken prisoner by Vespasian, he foretold his coming to the empire, and his own deliverance by his means. He accompanied Titus at the siege of Jerusalem, and wrote his "Wars of the Jews," which Titus ordered to be put in the public library. He afterwards lived at Rome, where he enjoyed the privileges of a Roman citizen, and where the emperors loaded him with favours, and granted him large pensions. Besides the above work, he wrote, 1. Twenty books of Jewish antiquities, which he finished under Domitian. 2. Two books against Apion. 3. An elegant discourse on the martyrdom of the Maccabees. 4. His own life. These works are excellently written in Greek.

JOSHUA, a canonical book of the Old Testament, containing a history of the wars and transactions of the person whose name it bears. This book may be divided into three parts; the first of which is a history of the conquest of the land of Canaan; the second, which begins at the twelfth chapter, is a description of that country, and the division of it among the tribes; and the third, comprised in the two last chapters, contains the renewal of the covenant he caused the Israelites to make, and the death of their victorious leader and governor. The whole comprehends a term of 17, or, according to others, of 27 years.

To JOUSTLE. *v. s.* (*jouster, French.*) To juggle; to rush against.

JOT. *s.* (*Grec.*) A point, a little; the least quantity assignable. (*Shak.*)

JOVIAL. *s.* (*joval, Fr.*) 1. Under the influence of Jupiter (*Brown*). 2. Gay; airy; merry (*Race*).

JOYIALLY. *ad.* Merrily; gaily.

JOYFULNESS. *s.* (*from jovial.*) Gayety; merriment.

JOVIANUS (Flavius Claudius), a Roman emperor, was born in Pannonia, of a noble family, in 331. He was elected emperor by the Roman soldiers after the death of Julian, but refused the dignity because they were pagans, on which they assured him that they were christians, and he accepted the crown. He made a disadvantageous peace with Persia, and shut up the heathen temples, and recalled the banished clergy. He died after reigning seven months, owing to the suffocating vapour of burning charcoal which had been placed in his room, A. D. 364.

JOVIUS (Paul), an eminent historian, was born at Como in Italy, in 1483, and having received an excellent education, went to Rome, where he wrote his first piece, *De Piscibus Romanis*, which he dedicated to cardinal Lewis of Bourbon. He received a pension from Francis I. king of France, who gave him many other marks of his esteem. Jovius was a most importunate beggar, and in his solicitations never indulged much modesty. Clement VII. gave him the bishopric of Nocera, which dignity he by no means adorned in his course of life, being much given to women. He died in 1552, and was interred at Florence. His greatest work is a history of his own time, in folio, 3 vols. Strasburgh, 1556. It is written in an admirable style, but must be read with caution. There was another bishop of the same name in that age, who was a man of letters and a poet.

JOUISANCE. *s.* (*rajoissance*, Fr.) Jollity; merriment; festivity; obsolete. (*Spens.*)
JOURNAL. *a.* (*journal*, Fr.) Daily; quotidian, out of use. (*Shak.*)

JoURNAL. *s.* (*journal*, French.) 1. A diary; an account kept of daily transactions (*Arbutnot*). 2. Any paper published daily.

JoURNAL, a day-book, register, or account of what passes daily. See **DIARY**. In merchants' accounts, it denotes a book into which every particular article is posted out of the waste-book, and made debtor.

JoURNAL, in maritime affairs, is a register kept by the pilot, and others, noticing every thing that happens to the ship, from day to day, and from hour to hour, with regard to the winds, the rhumbs or courses, the knots or rate of running, the rake, soundings, astronomical observations, for the latitudes and longitudes, &c.; to enable them to adjust the reckoning, and determine the place where the ship is.

JoURNAL is also used for the title of several books which come out at stated times; and give accounts and abstracts of the new books that are published, with the new improvements daily made in arts and sciences.

The first journal of this kind was, the *Journal des Sçavans*, printed at Paris: the design was set on foot for the ease of such as are too busy, or too lazy, to read the entire books themselves. It seems an excellent way of satisfying a man's curiosity; and

becoming learned upon easy terms: and so useful has it been found, that it has been executed in most other countries, though under a great variety of titles.

Of this kind are the *Acta Eruditorum* of Leipsic; the *Nouvelles de la Republique des lettres* of Mr. Bayle, &c.; the *Bibliothèque Universelle*, Choisie, et Ancienne et Moderne, of M. le Clerc; the *Memoirs de Trevoux*, &c. In 1692, Juncker printed in Latin, *An Historical Treatise of the Journals of the Learned*, published in the several parts of Europe; and Wolfius, Struvius, Morhoff, Fabricius, &c. have done something of the same kind.

The *Philosophical Transactions* of London; the *Memoirs of the Royal Academy of Sciences*; those of the *Academy of Belles Lettres*; the *Miscellanea Naturæ Curiosorum*; the *Experiments of the Academy del Cimento*, the *Acta Philo-exoticorum Naturæ et Artis*, which appeared from March 1686 to April 1687, and which are a history of the *Academy of Bresce*; the *Miscellanea Berolinensia*, or *Memoirs of the Academy of Berlin*; the *Commentaries of the Academy of Petersburg*; the *Memoirs of the Institute at Bologna*; the *Acta Literaria Sveciæ*: the *Memoirs of the Royal Academy of Stockholm*, begun in 1740; the *Commentarii Societatis Regiæ Gottingensis*, begun in 1750, &c. &c. are not so properly Journals, though they are frequently ranked in the number.

Juncker and Wolfius give the honour of the first invention of Journals to Photius. His *Bibliotheca*, however, is not altogether of the same nature with the modern Journals, nor was his design the same. It consists of abridgments, and extracts of books which he had read during his embassy in Persia: M. Salo first began the *Journal des Sçavans* at Paris, in 1665, under the name of the *Sieur de Hedonville*; but his death soon after interrupted the work. The abbé Gallois then took it up, and he, in the year 1674, gave way to the abbé de la Roque, who continued it nine years, and was succeeded by M. Cousin, who carried it on till the year 1702, when the abbé Bignon instituted a new society, and committed the care of continuing the Journal to them, who improved and published it under a new form. This society is still continued, and M. de Loyer has had the inspection of the Journal, which is no longer the work of any single author, but of a great number.

The other French Journals are the *Memoirs and Conferences of Arts and Sciences*, by M. Dennis, during the years 1672, 1673, and 1674; *New Discoveries* in all the parts of Physic, by M. de Blegny; the *Journal of Physic*, begun in 1684, and some others, discontinued almost as soon as begun.

Bozier's *Journal de Physique*, begun in July 1771; and continued, till in the year 1780, there were 19 vols. quarto.

The *Nouvelles de la Republique des*

JOURNAL.

Lettres, News from the Republic of Letters, were begun by M. Bayle in 1684, and carried on by him till the year 1687, when M. Bayle being disabled by sickness, his friends, M. Bernard and M. de la Roque, took them up, and continued them till 1699. After an interruption of nine years, M. Bernard resumed the work, and continued it till the year 1710. The History of the Works of the Learned, by M. Basnage, was begun in the year 1686, and ended in 1710. The Universal Historical Library, by M. le Clerc, was continued to the year 1693, and contained 25 volumes. The Bibliothèque Choisie of the same author, began in 1703. The Mercury of France is one of the most ancient Journals of that country, and is continued by different hands: the Memoirs of a History of Sciences and Arts, usually called Memoires des Trevoux, from the place where they are printed, began in 1701. The Essays of Literature reached but to a twelfth volume in 1702, 1703, and 1704; these only take notice of ancient authors. The Journal Littéraire, by Father Hugo, began and ended in 1705. At Hamburg they have made two attempts for a French Journal, but the design failed: an Ephemerides Scavantes has also been undertaken, but that soon disappeared. A Journal des Scavans, by M. Daries, appeared in 1694, and was dropt the year following. That of M. Chauvin, begun at Berlin in 1696, held out three years; and an essay of the same kind was made at Geneva. To these may be added, the Journal Littéraire, begun at the Hague 1715, and that of Verdun, and the Memoires Littéraires de la Grande Bretagne by M. de la Roche; the Bibliothèque Angloise, and Journal Britannique, which are confined to English books alone. The Italian Journals are, that of abbot Nazari, which lasted from 1668 to 1681, and was printed at Rome. That of Venice began in 1671, and ended at the same time with the other: the authors were Peter Moretti, and Francis Miletii. The Journal of Parma, by Roberti and Father Bacchini, was dropped in 1690, and resumed again in 1692. The Journal of Ferrara, by the abbé de la Torre, began and ended in 1691. La Galerio di Minerva, begun in 1696, is the work of a society of men of letters. Scignor Apostolo Zeno, secretary to that society, began another Journal in 1710, under the protection of the grand duke: it is printed at Venice, and several persons of distinction have a hand in it.

The Fasti Euriditi della Bibliotheca Volante, were published at Parma. There has appeared since, in Italy, the Giornale dei Letterati.

The principal among the Latin Journals, is that of Leipsic, under the title of Acta Eruditorum, begun in 1682: P. P. Manzani began another at Parma. The Nova Literaria Maris Baltici, lasted from 1698 to 1708. The Nova Literaria Germaniae, collected at Hamburg, began in 1703.

The Acta Literaria ex Manuscriptis, and the Bibliotheca curiosa, begun in 1708, and ended in 1707, are the works of Struvius. Messrs. Kuster and Sike, in 1697, began a Bibliotheca Novorum Librorum, and continued it for two years. Since that time, there have been many Latin Journals; such, besides others, is the Commentarii de Rebus in Scientia Naturali et Medicina gestis, by M. Ludwig. The Swiss Journal, called Nova Literaria Helvetica, was begun in 1702, by M. Scheuchzer; and the Acta Medica Hafnensia, published by T. Bartholin, make five volumes from the year 1671 to 1679. There are two Low Dutch Journals; the one under the title of Bookzal van Europe, it was begun at Rotterdam in 1692, by Peter Rabbus; and continued from 1702 to 1708, by Sewel and Gavern: the other was done by a physician, called Ruiter, who began it in 1710. The German Journals of best note are, the Monatlichen Unterredungen, which continued from 1689 to 1698. The Bibliotheca Curiosa, begun in 1704, and ended in 1707, both by M. Tenzel. The Magazin d'Hambourg, begun in 1748: the Physikalische Belustigungen, or Philosophical Amusements, begun at Berlin in 1751. The Journal of Hanover begun in 1700, and continued for two years by M. Eccard, under the direction of M. Leibnitz, and afterwards carried on by others. The Theological Journal, published by M. Loescher, under the title of Altes und Neues, that is, Old and New. A third at Leipsic and Francfort, the authors Messrs. Walterck, Krause, and Groschuffius; and a fourth at Hall, by M. Turk.

The English Journals are, the History of the Works of the Learned, begun at London in 1699. Censura Temporum, in 1708. About the same time there appeared two new ones, the one under the title of Memoirs of Literature, containing little more than an English translation of some articles in the foreign Journals, by M. de la Roche; the other a collection of loose tracts, entitled, Bibliotheca curiosa, or a Miscellany. These, however, with some others, are now no more, but are succeeded by the Annual Register, which began in 1758; the New Annual Register, begun in 1780; the Monthly Review, which began in the year 1749. See CRITICISM PERIODICAL. A Journal of Natural Philosophy, Chemistry, and the Arts, was begun in 1797 by Mr. Nicholson, and has been conducted in such a manner, that it is one of the most valuable works of the kind to be found in any language; the Philosophical Magazine, begun in 1798 by Mr. Tilloch, and carried on upon much the same plan, and with much the same spirit, as Nicholson's Journal.

Besides these, we have several monthly pamphlets, called Magazines, which, together with a chronological series of occurrences, contain letters from correspondents, communicating extraordinary discoveries in

JOY

nature and art, with controversial pieces on all subjects.

JOURNALIST. *s.* (from *journal*.) A writer of journals.

JOJOURNEY. (*journée*, French.) 1. The travel of a day (*Milton*). 2. Travel by land; distinguished from a voyage or travel by sea (*Rogers*). 3. Passage from place to place (*Burnet*).

To JOJOURNEY. *v. n.* (from the noun.) To travel; to pass from place to place (*Milton*).

JOJOURNEYMAN. *s.* (*journée*, a day's work, French, and *man*.) A hired workman; a workman hired by the day (*Addison*).

JOJOURNEYWORK. *s.* (*journée*, Fr. and *work*.) Work performed for hire; work done by the day (*Arbuthnot*).

JOUST. *s.* (*joust*, French.) Tilt; tournament; mock fight. It is now written less properly *joust* (*Milton*).

To JOUST. *v. n.* (*jouster*, French.) To run in the tilt (*Milton*).

JOJWLER. *s.* The name of a hunting dog or beagle (*Dryden*).

JOJWTER. *s.* A fish driver (*Carew*).

JOY. *s.* (*joye*, French.) 1. The passion produced by any happy accident; gladness; exultation (*South*). 2. Gayety; merriment; festivity (*Dryden*). 3. Happiness; felicity (*Shak.*) 4. A term of fondness. (*Shak.*)

Joy, in the philosophy of the passions, is the vivid pleasure inspired on the immediate reception of something peculiarly grateful, or of something obviously productive of an essential advantage, or which promises to contribute to our present or future well-being. This delight may be communicated by our liberation from fearful apprehensions, or from a state of actual distress, by obtaining some new acquisition, some addition to our stock of enjoyment, or by the full assurance of this without any mixture of doubt. A sudden and instantaneous translation from extreme anxiety or the depth of distress, to an exalted pinnacle of happiness, constitutes the highest possible degree of joy.

On the first impulse of joy, we are perfectly passive. No effort of the will can check the sensation itself; and where the joy is excessive, it is not in the power of resolution to suppress every external sign. The state of passive impression is succeeded by the exertions of a vigorous imagination, which runs over, with rapid confusion, the many supposed advantages to be derived from the welcome treasure. These it is disposed to multiply and aggrandize far beyond the bounds of reason or probability. This pleasing, or we might almost say intoxicated state of mind, produces correspondent effects upon the system. A brisk and delectable flow of the animal spirits diffuses a pleasurable sensation over the whole frame. Every species of torpor is subdued, an exhilaration succeeds; indicating itself by emotions, which not only manifest the influence of the passion to spectators, but

IPE

solicit their participation. The subject feels himself too much animated to remain in a tranquil state. Unusual vivacity in the eyes, and smiles upon the countenance, are accompanied by joyful acclamations, clapping of hands, and various other lively gestures. Where the mind is strongly agitated, and under no restraint from a sense of decorum, or solicitude for character; loud laughter, jumping, dancing, and the most wild and extravagant gestures, indicate the frolicsomeness of the heart. (*Cogan*, p. 54.)

To JOY. *v. n.* (from the noun.) To rejoice; to be glad; to exult (*Wotton*).

To JOY. *v. u.* 1. To congratulate; to entertain kindly (*Prior*). 2. To gladden; to exhilarate (*Sidney*). 3. (*jouir de*, French.) To enjoy; to have happy possession of (*Milton*).

JOJYANCE. *s.* (*joiant*, old French.) Gayety; festivity: obsolete (*Spenser*).

JOJYFUL. *a.* (*joy and full*.) Full of joy; glad; exulting (*Kings*).

JOJYFULLY. *ad.* With joy; gladly (*Wake*).

JOJYFULNESS. *s.* (from *joyful*.) Gladness; joy (*Deuteronomy*).

JOJYLESS. *a.* (from *joy*.) 1. Void of joy; feeling no pleasure (*Dryden*). 2. Giving no pleasure (*Shakespeare*).

JOJYOUS. *a.* (*joyeux*, Fr.) Glad; gay; merry (*Prior*). 2. Giving joy (*Spenser*).

IPECA'CUANHA. (*Ipecacuanha*, *a.* *f.* Indian.) Ipecacuan. The plant from which this valuable root is obtained, was long unknown; it was said by some writers to be the psychotria emetica; class pentandria, order monogynia: by others, the viola ipecacuanha, a syngenesious plant of the order monogynia. But it has since been affirmed, chiefly upon the authority of Schreber, to be the root of a small plant which he denominates *callicocca*, a native of Brazil, and belonging to Jussieu's order rubiaceæ; under which designation it is referred to in the materia medica of the new pharmacopoeia of the London College. See *CALLICOCCA*. There are three sorts of ipecacuan to be met with in our shops, viz. the ash-coloured or grey, the brown, and the white. The ash-coloured is brought from Peru, and is a small wrinkled root, bent and contorted into a great variety of figures, brought over in short pieces, full of wrinkled and deep circular fissures, down to a small white woody fibre that runs in the middle of each piece: the cortical part is compact, brittle, looks smooth and resinous upon breaking: it has very little smell; the taste is bitterish and sabacid, covering the tongue as it were with a kind of mucilage. The brown is small, somewhat more wrinkled than the foregoing; of a brown or blackish colour without, and white within; this is brought from Brazil. The white sort is woody, has no wrinkles, nor any perceptible bitterness in taste. The first, the ash-coloured or grey ipecacuan, is that usually preferred for me-

dical use. The brown has been sometimes observed, even in a small dose, to produce violent effects. The white, though taken in a large one, has scarcely any effect whatever. It is still highly probable that this last is the root of the *viola ipecacuanha*, which is a native of Brazil. Experience has proved that this medicine is the safest emetic with which we are acquainted, having this peculiar advantage, that if it do not operate by vomit, it readily passes off by the other emunctories. Ipecacuan was first introduced as an infallible remedy against dysenteries and other inveterate fluxes, as diarrhœa, menorrhagia, leucorrhœa, &c. and also in disorders proceeding from obstructions of long standing; nor has it lost much of its reputation by time. Its utility in these cases is thought to depend upon its restoring perspiration. It has also been successfully employed in spasmodic asthma, catarrhal and consumptive cases. Nevertheless, its chief use is as a vomit, and in small doses, joined with opium, as a diaphoretic. The official preparations are the *pulvis ipecacuanhæ compositus*, and the *vinum ipecacuanhæ*.

IPECACUAN FALSE, or BASTARD, in botany. See *ASCLEPIAS* and *TRIOSTEUM*.

IPHICRATES. The most celebrated of this name is a general of Athens, who, though son of a shoemaker, rose to the highest offices in the state. He made war against the Thracians, obtained some victories over the Spartans, and assisted the Persian king against Egypt. He died 380 B. C. When once reproached with the meanness of his origin, he observed, that he would be the first of his family, but that his detractor would be the last of his own. (*C. Nep.*)

IPHIGENIA, a daughter of Agamemnon and Clytemnestra. When the Greeks, going to the Trojan war, were detained by contrary winds at Aulis, they were informed by Calchas, the soothsayer, that, to appease the gods, they must sacrifice Iphigenia to Diana, because her father had killed the favourite stag of the goddess. He heard this with the greatest horror and indignation, and rather than to shed the blood of his daughter, he commanded one of his heralds, as chief of the Grecian forces, to order all the assembly to sacrifice Agamemnon, however, after much solicitation of other chiefs, consented to immolate his daughter for the common cause of Greece, but as soon as Calchas took the knife, and was going to strike the fatal blow, Iphigenia suddenly disappeared, and a goat of uncommon size was found in her place. This supernatural change animated the Greeks, the wind suddenly became favourable, and the combined fleet set sail from Aulis. Iphigenia's innocence had raised the compassion of the goddess on whose altar she was going to be sacrificed, and the goddess then carried Iphigenia to Taurica, where she entrusted her with the care of

her temple, whence she afterwards fled with her brother Orestes and her friend Pylades.

IPHIS, son of Alektor, succeeded his father on the throne of Argos (*2. Ovid.*) 2. A beautiful youth of Argos, of ignoble birth. He became enamoured of Anaxarete, and the coldness and contempt he met with rendered him so desperate that he hung himself. Anaxarete saw him carried to his grave without emotion, and was instantly changed into a stone (*Ovid*). 3. A daughter of Ligdus and Telethusa, of Crete, was, in consequence of her sex, ordered by her father to be put to death, but Isis commanded her mother in a dream to spare the life of her child, and to educate her as if she were a boy. Ligdus continued ignorant of the deceit, and when Iphis was arrived to puberty, her father resolved to give her in marriage to Iauthe, daughter of Telestres. This involved Telethusa and her daughter in some perplexity, when Isis, on their entreaties, changed the sex of Iphis, and, on the morrow, the nuptials were consummated with the greatest rejoicings (*Ovid*).

IPOMŒA. *Quamoclit*, or *Scarlet Convolvulus*. In botany, a genus of the class pentandria, order monogynia. Corol funnel-form; stigma a globular head; capsule three-celled. Twenty-eight species, mostly with distinct, some few with aggregate flowers. Chiefly natives of the West Indies and South America, many of India, one or two of the Cape. Of the species chiefly cultivated in our own gardens is,

1. *Quamoclit*, by some gardeners called an Indian pink. Leaves pinnatifid, linear, opposite, filiform; flowers mostly solitary, axillary red, with a very long tube. It is a native of India, and an annual plant, but will not bear the open air of this country. It is best propagated by seeds sown on a hot-bed in the spring, and as the plants will soon appear, they should be each transplanted into a small pot filled with light earth, to prevent their twining about each other, in which case it will be difficult to disengage them without breaking their tops. When they are potted, they should be plunged into a new hot-bed, and sticks placed down by each plant for their stalks to twine round. After they have taken new root, they should have a good share of air in warm weather, to prevent their drawing up weak; and when they are advanced too high to remain under the frame, they should be removed into the tan-bed in the stove, and have support, as their branches will extend to a considerable distance. In this place they will begin to flower in June, and there will be a succession of flowers till the end of September, and the seeds will ripen very well. All the other annuals of this genus are propagated from seeds, much in the same manner; the seeds of a few, however, may be sown on a warm border of light earth. In the spring the plants will come up, and in a

I R E

favourable season will flower and produce good seed, but most gardeners raise the plants in a very gentle hot-bed, and transplant them afterwards into borders, by which method they are brought to perfect their seed earlier. One or two sorts are perennial plants, and may be propagated by seeds, which must be sown in a hot-bed in the spring, and afterwards managed like the quamoelit.

IPS. In entomology, a Fabrician tribe of the genus *SILFIA*, which see.

IPS, a town of Germany, in the Archduchy of Austria. Lat. 48. 13. N. Lon. 15. 11. E.

IPSALA, a town of Turkey in Europe, with a Greek archbishop's see. It is seated on the Larissa. Lat. 40. 57. N. Long. 20. 10. E.

IPSERA, a small island in the Archipelago, 15 miles N. W. of the island of Scio.

IPSWICH, a borough of Suffolk, with markets on Wednesday, Friday, and Saturday. It is of great antiquity. It contains 10 parish churches, a guildhall, two hospitals, a free school, a customhouse, and a good quay. It is populous, but irregularly built. The number of houses is 2220, and of inhabitants 11,277. Its present commerce chiefly depends upon the malting and exportation of corn. It has a considerable coasting trade, a small share of foreign commerce, and sends ships to Greenland. It is noted for being the birth-place of cardinal Wolsey,* and is seated on the Orwell. Lat. 52. 8. N. Lon. 1. 16. E.

IQUETALA. The inhabitants of the Brazils give this name to the *scrophularia aquatica*, which is there celebrated as a corrector of the ill flavour of senna. See *SCROPHULARIA*.

IRAC ARABIA, a province of Turkey in Asia, bounded by the desert of Arabia, by Kurdistan, Diarbeck, Irac Agemi, Kusistan, and the gulph of Persia. Bagdad is the capital.

IRAC-AGEMI, a province of Persia, bounded by Irac-Arabia, Kusistan, Aderbeitzan, Ghilan, Couhestan, and Farsistan. Ispahan is the capital.

IRASCIBLE. *a.* (*irascibilis*, low Latin; *irascible*, French.) Partaking of the nature of anger (*Digby*).

IRE. *s.* (French; *ira*, Lat.) Anger; rage; passionate hatred (*Dryden*).

IREFUL. *a.* (*ire* and *full*.) Angry; raging; furious (*Dryden*).

IREFULLY. *ad.* (from *ire*.) With ire; in an angry manner.

IREBY, a town in Cumberland, with a market on Thursday. Lat. 54. 30. N. Lon. 3. 18. W.

IREKEN, a rich and populous town of Tartary, the capital of Bocharia, with a castle. Lat. 41. 40. N. Lon. 73. 25. E.

IRELAND, a large island of Europe, separated from Great Britain by a narrow sea, indifferently called the Irish Sea and St.

I R E

George's Channel, at various distances, according to the projections of each country; in some parts 40 leagues, between Scotland and the county of Down, about six, and from the county of Antrim to a part of Scotland, called the Mull of Kintyre, hardly four: the extent from north to south in a meridian line, 185 miles, the breadth from east to west, from 98 to 143; and the superficial contents are supposed to amount to about 19,000 square miles. The number of houses is about 700,000. Ireland is divided into four great provinces, viz. Ulster, Leinster, Connaught, and Munster, which are again divided into 39 counties, containing 3436 parishes. Ulster, which occupies the northern part of the kingdom, contains nine counties, viz. Antrim, Armagh, Cavan, Donnegal, Down, Fermanagh, Londonderry, Monaghan, and Tyrone: Leinster, situated to the east, contains twelve counties, viz. Carlow, Dublin, Kildare, Kilkenny, King's County, Longford, Louth, Meath, Queen's County, Westmeath, Wexford, and Wicklow: Connaught, towards the west, contains five counties, viz. Galway, Leitrim, Mayo, Roscommon, and Sligo: Munster, which occupies the southern part of the kingdom, contains six counties, viz. Clare, Cork, Kerry, Limerick, Tipperary, and Waterford. The climate of Ireland is said to be more variable, and both heat and cold more moderate, than England. The air is certainly damper; but that quality, in the opinion of an ingenious and sensible writer, Dr. Beaufort, is not to be attributed entirely to the bogs which are scattered over the kingdom, but chiefly to its insular situation, and to the quantities of moist particles that are wafted from the ocean by the westerly winds, which most frequently prevail. The moisture, however, is not prejudicial to health, neither is the neighbourhood of bogs unwholesome. The bog waters, far from emitting putrid exhalations, like stagnant pools and marshes, are of an antiseptic and strongly astringent quality, as appears from their preserving for ages, and even adding to the durability of the timber which we find universally buried beneath their surfaces; and from their converting to a sort of leather the skins of men and animals, who have had the misfortune of being lost, and of remaining in them for any length of time. Thus does the vicinity of a bog widely differ from those apparently similar situations in other countries, which are rendered confessedly unhealthy by fens or marshes, but of which there are none in Ireland. Whether it be owing to the soil or the climate, certain it is, that in Ireland there are neither moles nor toads, nor any kind of serpents; and it is not more than 70 or 80 years since frogs, of which there are now abundance, were first imported from England. But though the same experiment has been made with snakes and vipers, it has happily

I R E

been unsuccessful. Wolves were extirpated by Oliver Cromwell. But if this island be free from some noxious, and all venomous creatures, it is, on the other hand, denied one of the sweetest of the feathered tribe. The nightingale is not to be found here, and when brought over in a cage, but lingers out a miserable existence for a short time. There are also some other birds, and several kinds of fish, which abound in England, but are unknown in Ireland. The soil of Ireland varies from the stiffest clay to the lightest sand; but of the latter there is not much to be met with, neither is chalk to be found in any part of it. It is in general much more stony than the soil of England; and in some districts the surface appears more than half covered with rocks. Great part of the kingdom lies upon a stratum of rock, at various depths, so that stone quarries abound every where: and much of this rock being lime-stone, it greatly contributes to enrich and improve the land. Marble of great beauty is found in several counties. Mines of coal, iron, lead, and copper, are not unfrequent; and many of them are worked to great advantage. The bogs, which supply most of the inland part of the country with fuel, produce on their surface heath, rushes, and coarse grass, with some other aquatic plants, and are generally pasturable in summer, especially on the sides of hills or mountains, and those which are in lower situations become excellent meadows when thoroughly drained. However the soil may vary, it is by nature remarkably fertile; and the pasturage is generally thought to be more luxuriant than in England; but in cultivation and good husbandry the Irish are still much behind their neighbours. Among the principal rivers of Ireland are the Shannon, Foyle, Bann, Liffey, Boyne, Slaney, Suir, Barrow, Erne, and Moy. Along the western coast are ranges of mountains, and in some other parts are some other mountains of considerable height, but not to so great a degree as to be called a mountainous country. Lakes are very numerous, and some of them of considerable extent: wood is wanting, but a spirit of planting will, it is hoped, remedy this inconvenience, for the benefit of posterity. Ireland is supposed by some to have been originally peopled from Spain, by others from Great Britain; but the ancient history is enveloped in darkness and uncertainty: however, it is generally thought Christianity was planted here at least as early as the 5th century, and that St. Patrick was engaged in propagating the Christian faith. In the 6th century, this island, as well as England, experienced the inroads of the Danes, who formed a settlement, and even when Henry II. first sent over with a design to conquer the country, were in possession of several towns on the coast. In the 12th century, Ireland was governed by five different kings, viz. of Ulster, Leinster, Meath, Connaught, and Munster,

I R E

with many other petty princes, who were, perhaps, in some degree tributary to the others. Dermot, king of Leinster, having invaded the dominions and carried away the wife of Ororic, or O'Roirk, prince of Bressin; the injured prince entered into an alliance with the king of Connaught, and expelled the tyrant from his dominions. Dermot fled to England to solicit the friendship of Henry II. offering to hold his crown in vassalage. Henry wanted little persuasion, as he had before entertained hopes of annexing Ireland to his dominions: Henry is called the conqueror of the island. His son, John, was created lord of Ireland, and, when he became king, gave them a body of laws: Henry VIII. was the first who assumed the title of king. Ireland is governed by a viceroy, appointed by the king, and before 1801 by a parliament, similar to the parliament of Great Britain, but totally independent of it, consisting of lords and commons, by whom all acts were passed before they became laws. The number of members returned to the Irish parliament by the counties, cities, and towns, was 300. But, during the year 1800, it was enacted both by the English and Irish legislatures, that, after January 1, 1801, the two separate governments of England and Ireland should be incorporated into one, the whole now forming the *United kingdom of Great Britain and Ireland*: the Irish members of parliament are now reduced to 100, who sit in the British House of Commons with the English and Scotch members. The established religion of Ireland is that of the English Church; but a majority of the people are Roman Catholics. Ireland contains four archbishoprics, viz. Armagh, Dublin, Cashel, and Tuam; and twenty bishoprics, namely, Dromore, Down and Connor, Derry, Raphoe, Clogher, Kilmore, Ardagh, Emly, Meath, Kildare, Ferns and Leighlin, Ossory, Waterford and Lismore, Cloyne, Cork and Ross, Limerick and Ardfort, Killaloe and Kilfenora, Clonfert and Kilmaedugh, Elphin, and Killala and Achonry. Ardagh is united to Tuam, and Emly to Cashel. Trinity College, in Dublin, is the only university in Ireland. Dublin is the capital. Lon. 5. 19. to 10. 15. W. Greenwich. Lat. 51. 22. to 55. 20. N. *Hibernia, Ierne, Ivernia, and Juverna*, were the ancient names of this island.

The number of inhabitants in Ireland, in 1731, was 700,453 protestants, and 1,309,769 papists; in all, 2,010,221. In 1754 the estimate gave 3 millions. In 1788, the number was about 3,900,000. And the estimates of 1809 gave 5,400,000 inhabitants, of whom more than three-fourths are papists.

IRENÆUS (St.), bishop of Lyons, and the disciple of Polycarp. He held a dispute at Rome with Valentinus, and held a council at Lyons, in which the heresies of the gnostics were formally condemned. He took great pains to terminate amicably

I R I

the dispute which was then begun about the time of celebrating Easter, and wrote many letters on the subject. He was beheaded at Lyons in the persecution under Severus, about A.D. 202. His books on heresies were edited by Grabe at Oxford, in 1702, folio.

IRISINE. In botany, a genus of the class dioecia, order pentandria. Calyx two-leaved; petals five, male, nectary five-scaled, between the stamens. Fem; stigmas two sessile, capsule with down seeds. One species only; a West Indian herb with weak stem and knotty joints; leaves ovate, entire glabrous: flowers in loose, terminal panicles.

IRIDIUM, a metallic substance, thus named by Mr. Tennant, on account of the striking variety of colours which it gives while dissolving in muriatic acid. It is obtained from the black powder which remains after dissolving platina: and was discovered much about the same time, about six years ago, by Mr. Tennant, in England, and by Messrs. Vauquelin and Descotils, in France. From the experiments of Mr. T. it appears to be soluble in all the acids, but least in muriatic acid, with which it forms octaedral crystals. If these crystals be exposed to heat, the oxygen and acid are expelled, and the metal is obtained in a state of purity: it is then of a white colour. Mr. T. was unable to melt it by heat. It is precipitated from its acid solutions by all the metals, except gold and platina; and partially so by the three alkalies. Galls and precipitate of potash take away the colour of the solution, but without any precipitate, and afford an easy test of its presence. When combined with gold or silver, it cannot be separated by the usual process of refining these metals. Two other metallic bodies have been obtained out of the powder which remains undissolved from the ore of platina; one by Mr. Tennant, which he calls **OSMIUM**; and the other by Dr. Wollaston, to which he has given the name of **RHODIUM**. See those words.

IRIS, in physiology, the rainbow. The word is Greek, ἵρις, supposed by some to be derived from ἵρω "I speak, I tell;" as being a meteor that is supposed to foretell, or rather to declare, rain. See **RAINBOW**.

IRIS LUNAR, or Moon-rainbow. See **LUNAR RAINBOW**.

IRIS, in optics and anatomy. The anterior portion of the choroid membrane of the eye, which is perforated in the middle by the pupil. It is of various colours. The posterior surface of the iris is termed the uvea.

IRIS. In botany, a genus of the class triandria, order monogynia. Corol six-parted, the divisions alternately reflected: stigmas petal-form. Fifty five species scattered over the globe, which may be thus sub-divided.

I R K

A. Bearded—leaves ensiform.

B. Bearded—leaves linear.

C. Beardless—leaves ensiform.

D. Beardless—leaves linear.

E. Beardless—leaves quadrangular. The following are the chief species.

1. **I. Florentina.** Florentine iris or orris. Bearded; leaves ensiform, glabrous, shorter than the scape; scape mostly two-flowered. A native of Italy and the south of Europe; in its recent state it is extremely acrid, and when chewed excites a pungent heat in the mouth, that continues several hours: on being dried, this acrimony is almost wholly dissipated; the taste is slightly bitter, and the smell agreeable, and approaching to that of violets. The fresh root is cathartic, and for this purpose has been employed in dropsies. It is now chiefly used in its dried state, and ranked as a pectoral and expectorant, and hence has a place in the trochisci amysi of the London Pharmacopoeia.

2. **I. Germanica.** Common iris or orris. Fleur-de-luce. Bearded; leaves ensiform, glabrous, falcate, shorter than the scape, scape many-flowered; tube as long as the germ: inner petals not emarginate; colour of the corol various. The roots have a strong disagreeable smell, and an acrid, nauseous taste. They are powerfully cathartic and are given in dropical diseases where such remedies are indicated. The plant is a native of Germany.

3. **I. Pseudacoms.** Yellow water-flag. Beardless; leaves ensiform; inner petals less than the stigma; found in the wet woods, marshes, and on the river banks of our own country. As a medicine it formerly had a place in the London Pharmacopoeia under the name of *gladiolus luteus*. The root is without smell, but has an acrid styptic taste, and its juice, on being snuffed up the nostrils, produces a burning heat in the nose and mouth, accompanied by a copious discharge from these organs; hence it is recommended both as an errhine and sialogogue. Given internally, when perfectly dry, its adstringent qualities are such as to cure diarrhoeas. The expressed juice is likewise said to be an useful application to serpiginous eruptions and scrofulous tumours.

IRISH SLATE. See **LAPIS HIBERNICUS**.

To IRK. v. a. (*yrk*, work, Islandic.) This word is used only impersonally, *it irks me*; it gives me pain; or, I am weary of it (*Shakspeare*).

IRKSOME. a. (from *irk*.) Wearisome; tedious; troublesome; toilsome (*Swift*).

IRKSOMELY. ad. Wearisomely; tediously.

IRKSOMENESS. s. (from *irksome*.) Tedioussness; wearisomeness.

IRKUTSK, the largest and least populous government of Russia, comprising all the E. part of Siberia. Its chief town is of the same name: it is the see of a Greek

IRON.

bishop, and situate on the lake Baikal. Lat. 52. 4. N. Lon. 104. 58. E.

IRON, *Mars, Ferrum*, the most useful, and the most plentiful of the metals. Its colour is too well known to need specifying here; that it is susceptible of a fine polish, is also well known. When broken, it appears to be internally composed of small shining facets. It is the most elastic of metals; and, next to platina, is the most difficult of fusion. Its hardness in some states is superior to that of any other metal; and it has the additional advantage of suffering this hardness to be increased or diminished at pleasure by certain chemical processes. Its tenacity is greater than that of any other metal, except gold: an iron wire the tenth part of an inch in diameter, has been found capable of sustaining more than 500lb. without breaking. Its ductility is such as to allow it to be drawn into wire as fine as hair. But these, and other properties of this metal, vary with the method of preparing it; the ore from which it is obtained, and the degree of purity to which it is brought. To specify all the uses of this valuable metal would occupy too much of our room, and, happily, this is unnecessary; for we are constantly surrounded with innumerable proofs of its utility, and presented with reasons for acknowledging the important services it renders us.

It differs from others of the metals in one very material respect: its abundance is in proportion to its intrinsic worth. It is very generally diffused throughout the globe, being frequently found mixed with sand, clay, chalk, and being likewise the colouring matter of a great number of stones and earths. It is found also in the ashes of vegetables, and in the blood of animals, in such abundance, that some authors have attributed both the colours of vegetables and of the vital fluid itself, to the iron contained in them. In consequence of this abundance, the iron ores are extremely numerous: the principal of them are noticed in our article **FERRUM**.

The ores from which iron is generally obtained in Britain are those which by some are called secondary ores, but which are better known by the name of **IRON STONES**. Cumberland and Lancashire, however, afford a primary ore, more rich in metal, but not so well adapted for smelting with pit-coal. Of the iron-stones, there are several varieties, consisting of various proportions of lime, clay, and silex, in combination with the metal: those of the argillaceous kind, or those in which clay predominates, are found, upon the whole, to answer best in working; though the other kinds, by adopting proper variations in their treatment, may be made to yield very good iron.

In the separation of iron from these ores, after a specimen has shown them, by the assay, to be worth working, the first process is torrefaction, or roasting, or as it is less properly styled by the manufacturers, calcination; the object of which is to free the mineral from the sulphur, air, water, and other volatile bodies which it may contain. In some parts of Wales the torrefaction is performed in kilns or conical furnaces; but in England and Scotland, it is done by exposing iron-stone, stratified with coals, to combustion in the open air. See **IRON MANUFACTURE**.

The iron obtained by smelting is called *crude-iron*, *cast-iron*, or *pig-iron*; and is yet far from

a state of purity. Cast-iron is scarcely malleable at any temperature; it is generally so hard as to resist the file; it can neither be hardened nor softened by ignition and cooling. It is exceedingly brittle; often breaking by merely being let fall upon the ground. It melts at about 130 of Wedgwood's pyrometer. For the most part it is of a dark grey or blackish colour; but sometimes it is whitish, and then it contains a quantity of phosphure of iron, which considerably impairs its qualities. In the state of cast-iron, the metal, as is well known, is applied to an immense number of purposes, and used in the formation of a great variety of articles, both for ornament and for use.

To refine crude iron, and render it malleable, it is necessary to free it from its impurities, and to expel the carbon with which it is combined. For this purpose the pigs of iron are melted in an open charcoal fire, by means of which the scoria and grosser impurities are deposited, and are then conveyed to a reverberatory furnace, where the flame continually playing upon the melted metal, it is kept stirring by a workman, that every part of it may be exposed to the air: this is called the puddling process. In about an hour the hottest part of the mass begins to heave and swell, and to emit a blue lambent flame. This continues nearly an hour; and by that time the property of malleability is acquired. As the process advances, the iron gradually increases in consistency, and, if not speedily removed, would, notwithstanding the heat, congeal altogether in a mass. At this juncture, it is subjected to the action of a very large hammer, driven by machinery, or exposed to the more equal but less forcible pressure of large iron rollers. This not only makes the particles of iron approach nearer each other, but drives away several impurities which would otherwise continue attached to the iron. It is then either formed into bars, and distinguished by the name of *bar-iron*, or slit into rods, or beaten or rolled into sheet, for the innumerable purposes to which this inestimable metal, in its state of malleability, is capable of being applied.

Malleable iron ought to possess no foreign mixture whatever, to be in a state of purity; but as the modes of operation have hitherto consisted in manufacturing this state of the metal from crude iron, and as crude iron is always found to contain principles inimical to malleability, it is obvious that the quality of malleable iron will at all times depend upon the degree of expulsion of the alterative mixtures contained in the crude iron; the destruction of which, and the consequent malleabilization of the iron, constitute the universal acknowledged principles of *bar-iron* making. The varieties of forged iron, resulting from these principles, are the three following:—*Hot-short* iron, which, though extremely malleable and ductile when cold, is so brittle when heated, that it will not bear the weight of a small hammer without breaking to atoms: it is also extremely fusible in a high temperature. 2. *Cold-short* iron, which possesses the opposite qualities, is infusible in the most violent heat, and though capable, while hot, of being beaten into any shape, is when cold, very brittle, and but slightly tenacious. With the causes of these different qualities, though many opinions have been advanced by chemists, we are still but not perfectly acquainted. 3. *Iron partaking of none* of these evils, and which may be so far denomi-

I R O N.

nated pure malleable iron, though the metal itself, in a chemical view, may not be perfectly free from every foreign admixture. It is in this third state that we consider it as more particularly belonging to our present article; and as possessing the properties with which our account was introduced, as well as a great number of others which yet remain to be mentioned.

It is worthy of remark, by the way, that an art which we seem not even to indulge the hope of attaining, is said by Mr. Eaton, in his Survey of the Turkish Empire, to have been once known to an Arabian, but, unhappily, to have perished with him. Mr. Eaton states the following instance of it as having occurred to his own knowledge:—An Arabian of Constantinople had discovered the secret of casting iron, which, when it came out of the mould, was as malleable as hammered iron. Some of his fabrication was accidentally shewn to M. de Gaffron, the Prussian chargé d'affaires, and M. Franzaroli (men of mineralogical science), who were struck with the fact, and immediately instituted an inquiry for its author. This man, whose art in Christendom would have insured him a splendid fortune, had died poor and unknown, and his secret had perished with him. His utensils were found, and several pieces of his casting, all perfectly malleable! M. Franzaroli analyzed them, and found that there was no admixture of any other metal. M. de Gaffron has since been made superintendent of the iron manufactory at Spandau, where he has in vain attempted to discover the process of the Arabian. If the possibility of the thing be but fairly established, we have every thing to hope, as to the attainment of it, from the ingenuity and perseverance of our countrymen. Whatever variety may exist in the modes of operation at different works, and in different countries to render iron malleable, the principle of operation is the same in all, namely, that by dissipating the carbon and oxygen contained in the crude iron, pure or malleable iron is the result; and we see no absurdity in allowing it to be possible that this expulsion may be effected in the process of casting, or even during some of its preliminary operations. It is probable, however, that to secure malleability, it will be necessary to lay some restraint upon the crystallization of the iron in cooling; but as mere speculation on a practical subject is of little utility, and as we can do nothing but speculate here, we must leave to practical men and to experiment the determination of the matter.

The chief chemical properties of this metal, refined and rendered malleable, are the following:

1. When applied to the tongue, it has a styptic taste, and emits a peculiar smell when rubbed.

2. Its specific gravity varies from 7.6 to 7.8; a cubic foot of its weight about 580lb. avoirdupois.

3. It is attracted by the magnet, or loadstone, and is itself, in one of its forms, the substance which constitutes the loadstone. See *FERRUM*. 8. It is also capable of acquiring itself the attraction and polarity of the magnet, in various ways.

Although the property of being magnetic is not peculiar to iron, yet the other metals in which it has been found possess it in so slight a degree as will not bear a comparison with its strength in this substance. By this property it is admirably

fitted for the purpose of making needles for the mariner's compass. See *MAGNETISM*.

When iron, however, is perfectly pure, it will retain the magnetic virtue a very short time.

4. It is malleable in every temperature, and its malleability increases as the temperature rises. It cannot, however, be hammered out nearly so thin as gold or silver, or even copper. Its ductility is very great; and its tenacity is such, that an iron wire .078, or rather less than one-twelfth, of an inch in diameter, is capable of supporting 549½ lb. avoirdupois without breaking.

5. It melts at about 1580° of Wedgewood.

6. It combines very readily with oxygen, as experience is continually shewing us, in various ways. When exposed to the air, its surface is soon tarnished, and it is gradually changed into a brown or yellow powder, usually called *Rust*. This change takes place more rapidly if the atmosphere be moist, and is occasioned by the absorption of oxygen by the iron. As carbonic acid is absorbed at the same time, and unites with the metallic oxyd, the composition thus formed is now termed *carbonat of iron*. To preserve iron, especially when polished, from rusting, various methods have been devised, with more or less success. Among others, that partial oxidation, known by the term *blueing*, has been adopted. This consists in heating the metal till it assumes the proper colour, and then heating and polishing it. The following method, practised by Conté, is pointed out in the 11th Vol. N. S. of Nicholson's Journal. It consists in mixing with fat oil varnish, at least half, or at most four-fifths, of its quantity of highly rectified spirits of turpentine. This varnish must be lightly and evenly applied with a sponge, after which the article is left to dry in some situation not exposed to the dust. He affirms that articles thus varnished retain their metallic lustre, and do not contract any spots of rust. This varnish may also be applied to copper, of which it preserves the polish, and heightens the colour. It may be employed with particular advantage to preserve philosophical instruments from any change. The strong affinity of iron for oxygen is also shewn by its power of decomposing water; which may be done either by keeping iron filings in water at any temperature not under 70°, or more speedily, by pouring hot water upon them, or by causing the steam of water to pass through a red hot iron tube, which decomposes the water instantly, and converts the inner surface into an oxyd. It is possible also to oxydize an iron wire by burning it in oxygen gas. According to Proust, there are only two distinct oxyds of iron: the first, or protoxyd, may be formed by either of the three methods just mentioned, or by dissolving the metal in sulphuric acid, and precipitating the oxyd by pouring potash into the solution. This oxyd, when properly prepared and pulverized, constitutes the substance long known by the name of *Martial Ethiops*. It is capable of crystallizing, and is often found native in that state. The second, or peroxyd, may be obtained by keeping iron filings red hot in an open vessel, and agitating them constantly till they are converted into a dark red powder. This oxyd was formerly called *Saffron of Mars*; and, with the addition of carbonic acid, forms the common rust of iron. It may also be prepared by precipitation, by means of an alkali, from a diluted solution of iron in sulphuric acid, after long exposure to the

IRON.

atmosphere. The protoxyd is composed of 73 parts of iron and 27 of oxygen; and the peroxyd of 52 of iron and 48 of oxygen.

7. Iron is capable of forming a variety of salts by dissolution in the acids, all which may be readily made to act upon it, though with different degrees of facility and of effect. These salts will be found described, and the modes of preparing them pointed out, in connection with the names of the respective acids which enter into their composition. See the table of Acids, and the articles they refer to. It is in these combinations that iron is of such extensive use in dyeing and many other arts, and in forming the characteristic properties of copperas, vitriol, Prussian blue, ink, &c. &c.

8. Iron may be made to combine with all the simple combustible bodies. With sulphur, it forms a sulphuret of iron, which when found in the very common state of an ore, has been denominated *martial pyrites*; with phosphorus it forms phosphuret of iron, called *siderum* by Bergman, with carbon it forms carburet of iron, which, according to the proportion of carbon which enters into the compound, is distinguished by different names:—When found native, it is usually in the form of *PLUMBAGO*, or *black-lead*; and in this state it appears, from the experiments of the French chemists, to be composed of about nine parts of carbon and one of iron. Cast iron and steel are also carburets of iron, or, as Dr. Thomson, from the small portions of carbon which they contain, denominates them, subcarburets, the first, however, has much more carbon than the second for the process of making steel, and the properties of this valuable material, see the word. From the experiments of Mr. Mushet, of the Calder Iron-works, whose excellent papers in most of the volumes of the Philosophical Magazine are highly interesting, and from whose researches much may be expected, the following table of the comparative proportions of carbon in different compounds, was deduced by himself. Having employed charcoal in the conversion of iron to the different states here mentioned, he noticed the following results.

Charcoal absorbed.	Result.
125.....	Soft cast steel.
165.....	Common cast steel.
25.....	The same, but harder.
30.....	{ The same, too hard for drawing.
25.....	
25.....	White cast iron.
20.....	Mottled cast iron.
75.....	Black cast iron.

From this statement it appears that steel does not contain, upon an average of the experiments, nearly half so much carbon in proportion as crude iron; that crude iron and steel only differ from each other in the proportion of the carbon they contain; and that, though the maximum of hardness is produced by about one-fiftieth part of charcoal to the iron, yet the maximum of utility, with respect to steel, is attained by the proportion of about one-hundredth part, or half the quantity, in combination with the iron.

9. Iron is capable of forming alloys, by combining with most of the metals; but as these alloys have not been much examined, and have seldom, if ever, been applied to any useful pur-

pose, we think it needless to specify them.—*Phil. Mag.* several vols.; *Nuk. Journ.* *Musket*, *Thomson*, *Rees*, *Fourcroy*, *Eng. Ency.* *Macquett*, *Accum*, &c. &c.

Iron constitutes a part of the red globules of the blood of all quadrupeds, and is found in no part of the animal body but the red globules. It has hence been supposed to give vigour to the constitution, and to form the colouring matter of the blood itself. But there are great difficulties in the way of both these hypotheses, and the real utility of the iron that exists in the blood is not at present decisively ascertained. See upon this subject the article *Blood*.

The utility of iron in the practice of physic is very considerable. It is the basis of many important medicines, which are frequently employed with the happiest success. It may be said to be the only metal which is not noxious, and whose operation is not to be feared. The effects of this remedy upon the animal economy are various. It gives energy to the nerves and muscles, increases the secretions in general, especially the menstrual discharge, and excites the action of the heart and arterics. Nor is its action less effectual on the fluids: it is readily carried into the blood, combines with it, renders it of a darker colour, and imparts to it a more healthy consistence, it is therefore a tonic and alterative, and unites in its operation the properties of a great number of other medicines. Like adstringents, it increases the motion of the parts, and has the advantage of being more constant and durable in its effects than many other remedies which possess the same virtue, because it combines with the organs themselves, by means of the fluids, which serve for their nutrition. It appears, therefore, that in every case wherein the muscular and nervous fibres are feeble in their action, in debilities of the stomach and intestines, and diseases dependent thereon; in short, in every case wherein the blood has not a sufficient quantity of cuor, or has not its healthy degree of consistency, steel medicines may be administered with success. The official preparations in the pharmacopoeias are very numerous. If iron be exposed to the action of the air, it becomes oxidated, and is converted into the oxydum ferri laterum. See *Rubigo ferri*.—Submitted to the action of diluted sulphuric acid, by concentrating the solution by evaporation, it forms the sulphas ferri. See *Ferrum vitriolatum*.—With muriatic acid, it forms the murias ferri, the ferrum salitum of Bergman, from which the tinctura ferri muriati is made. Iron filings sublimed with the muriate of ammonia, or sal ammoniac, form the Murias ferri ammoniacalis. See *Flores martiales*.—With the powdered crystals of tartar, it forms the Tartris potassæ acidulus ferriatus. See *Ferrum tarturatum*.—Iron, possessing the magnetic property, is said to produce very singular effects upon the animal economy; and it is affirmed that, when applied to the skin, it mitigates pain, diminishes convulsions, excites redness, sweat, and often a small eruption. How far these assertions are to be depended upon is uncertain; but that the magnet has very sensible effects, is proved by Thouret, in the Transactions of the Royal Society of Medicine of Paris.

IRON MANUFACTURE.

Under this head we propose to treat of the various processes for reducing iron from its ores,

I R O N.

into the state of *crude and malleable iron*: for the subsequent process, of converting the latter into *STEEL*, we refer to that article.

Iron is never found in a metallic state, but always as an oxyd, from the great affinity between oxygen and iron, they are always found combined, when in the natural state; this compound is called ore, and has none of the metallic properties or appearance exist, except in its specific gravity the red rust of iron is of this nature, being iron combined with oxygen; the ores of iron which are found in the earth always contain extraneous matters, besides iron and oxygen; the most volatile of these, are first expelled by calcination of the ore, and afterwards, by the operation of the blast furnace, the iron is separated from the oxygen and converted into cast or crude iron. This is done by exposing the ore to a most intense heat, at the same time that it is in contact with carbon supplied from the fuel. at this temperature the affinity between the oxygen and the carbon is greater than the former for the iron; a new combination is therefore formed of carbon and oxygen, leaving the iron still mixed with its impurities, a second combination of the carbon with the iron now takes place, which produces carbonated or cast iron; but in the practical application of this principle, the operation is not so perfect as to totally remove the oxygen. Some kinds of cast iron have less of it remaining than others, but are proportionally charged with carbon: this process of removing iron from its ore is called *smelting iron*, or *iron making*, and in this state iron is now most extensively used, by casting into all varieties of articles, though formerly cast iron was little regarded, except as a material for the manufacture of bars or malleable iron. To reduce it to this state, the crude iron undergoes a particular management, in a furnace called a *puery*, by which its carbon and any remaining oxygen are volatilized, leaving malleable iron, which is consolidated and manufactured into bars by the action of immense hammers or rollers, moved by machinery. The conversion of iron into steel is a subsequent process of cementation in charcoal, by which malleable iron becomes steel.

From this slight sketch it will appear that the manufacture of iron is divided into two branches, first, the smelting of iron from the ore; second, the conversion of crude into malleable iron, by expelling the carbon and oxygen contained in the former.

HISTORY OF THE IRON MANUFACTURE.

The invention of this important branch of metallurgy is involved in great obscurity: as iron is never found in a metallic state, its existence, as well as the processes of reduction, must have been a human discovery. At what period the state of society was so greatly improved, we are uncertain, though we have every reason to suppose it very remote. In our present state, when we depend so greatly upon the use of iron and steel, it is difficult to conceive how man could exist in a state of society without their aid; yet we are informed by Captain Cooke, that the natives of the South Sea Islands are wholly ignorant of the existence of any metals. From the Scriptures we learn, that but a short time after the creation, Tubal Cain, a descendant of Cain the son of Adam, was "an instructor of every artificer in brass and iron," though no mention is made of the manner by which he acquired these curious arts. The ancient mythologists, attri-

buted the invention to Vulcan, the god of subterranean fire and metals, who Sir Isaac Newton supposes to have been the same with Cinyras, king of Lemnon, an inventor of the art, who found out copper in Cyprus, the smith's hammer, anvil, and tongs, and employed workmen in making armour and other things in brass and iron. He was the only king celebrated in history for working in metals.

Herodotus says, that a class of men called *Ciretes*, who were celebrated for their skill in the arts and sciences, were brought into Greece, from *Phoenicia*, by *Cadmus*, son of *Agenor*, king of that country, some settled in *Phrygia*, and were called *Corybantes*, others in *Crete*, where they were called *Idari Dactyli*, some in *Rhodes*, called *Telchines*, some in *Samothrace*, and were then called *Cobly*; others in *Euboea*, where, before the invention of iron, they worked in copper, in a city called *Chalcis*; some in *Lemnos*, where they assisted *Vulcan*, and some in *Inchris* and other places. By the assistance of these artificers, *Cadmus* discovered gold, in the mountain *Pangium*, in *Thrace*, and copper at *Thebes*: whence copper ore is still termed *Cadmia*. In the countries where they settled, they first wrought in copper till iron was discovered, and then in iron, they made arms and edged tools, for hewing and carving wood, which gave *Minos*, king of *Crete*, an opportunity of building a fleet, and gaining dominion of the sea, and of establishing the trades of smiths and carpenters in Greece. A short time after, *Dædalus* and his nephew *Talus* invented the saw and the axe, the whimblet, the perpendicular and compasses, the turning lathe, glew, and potter's wheel, and *Epalamus* invented the anchor: these were in the reign of *Solomon*. The invention of iron by the *Idari Dactyli*, is by Sir Isaac Newton, fixed at about 1035 years before Christ, which it is said they discovered from the fusion of minerals, at the accidental burning of the woods on the mountain *Ida* in *Crete*: others make it 400 years earlier. It seems, however, that the historians of antiquity have in most cases, either attributed the discovery of metals to their gods, or they have deified those to whom mankind are so highly indebted, for having by that means been the founders of the present state of society.

On the modern history of the iron manufacture in England, we must be concise, as our limits will scarcely allow us to do justice to what is infinitely more important, its various processes, and the principles upon which they are founded.

The smelting of iron was formerly performed with charcoal of wood, used as fuel, in the same manner as it now is on the continent: previous to the period when every spot of land became cultivated, fire-wood was the chief produce of England, a circumstance peculiarly favourable to the manufacture of iron. Accordingly, we find it was in a very flourishing condition in the reign of King James the First, from which time the decrease of wood caused it to decline so greatly as to be nearly lost; until about forty years ago, when the perfecting of the process of making iron with pit coal placed it upon such a permanent basis, that it is capable of being extended to any magnitude, without affecting the agricultural interests of the country; as the iron, though it produces so much, costs nothing that is otherwise useful, but the labour of its reduction.

IRON.

When the minister in the year 1806 proposed to levy a tax on the manufacture of iron, and submit its various processes to the constant inspection of excise officers, the owners of the 133 iron-works which then existed in Great Britain, met in the several districts, and deputed fourteen of their number to assemble in London and arrange the information submitted to the committee of the House of Commons, on the bill for im-

posing this tax; shewing its impolicy and ruinous tendency on a manufacture which is essential to the success of almost all the branches of British industry. Through the kindness of one of these deputies, we are enabled to present the following abstract of the several iron furnaces, which in the spring of 1806 were working with coals of pit coal in England, Wales, and Scotland, viz.

No. of Works.	Counties.	No. of Furnaces.			Tons of Pig Iron made annually	Average Tons per Furnace
		In Blast	Out	Total		
4	Cumberland	4	—	4	1,491	373
11	Derbyshire	12	6	18	10,329	861
2	Gloucestershire	2	1	3	1,629	815
3	Lancashire	2	2	4	2,500	1,250
1	Leicestershire	—	1	1	—	—
3	Monmouthshire	3	—	3	2,444	815
19	Salop	28	14	42	54,966	1,063
25	Staffordshire	31	11	42	49,460	1,595
14	Yorkshire	23	4	27	26,671	1,160
82	Total in England	105	39	144	149,490	1,424
25	South Wales	36	11	47	75,601	2,100
3	North Wales	3	1	4	2,075	692
12	Scotland	18	9	27	23,240	1,291
142	Total of Coke Furnaces in Great Britain	162	60	222	250,406	1,546
11	Old charcoal Furnaces still in use, in different Counties	11	—	11	7,800	709
133	Total in Great Britain	173	60	233	258,206	—

Whence it appears, that the 133 furnaces which were then standing in Britain, were producing 258,206 tons of crude iron annually, although the quantity had been estimated twelve years before not to exceed 100,000 tons per annum.

That 60 of these furnaces, or nearly one-fourth of their whole number, were out of blast, or standing still, is attributed in great part to the frequent and periodical repairs which the lining and hearth of a blast furnace require, while other furnaces had been blown out, or ceased to work, owing to a temporary failure of their supply of iron-stone or coals within the owner or lessee's lands: for it is to be remarked, that nearly the whole of the iron smelting is carried on under leases, and very rarely by the land owners themselves.

It appears above, that 1546 tons of pig iron is the average produce of each of the 162 coke furnaces in blast; and it may be interesting to some of our readers to be informed, that at some of these, as at Cyfarthfa in South Wales, the average per furnace is as high as 2615 tons per annum; while in 13 others the quantity falls below 500 tons, being at Dewey, in North Wales, stated at only 150 tons per annum: the average for each county, as well as for the charcoal furnaces, will be seen in the last column of the above table.

The average quantity made at each of the 121 coke iron works is 2070 tons per annum; seven-

teen of these works make 4000 tons each or upwards; the seven largest are Cyfarthfa, in South Wales, 10,460 tons; Old Park, in Salop, 8359; Blackmour, in South Wales, 7846; Pennydarren in ditto, 7803; Ketley, in Salop, 7510, and Carron, in Scotland, 7380 tons per annum. While at the same time eleven of these works fall short of 500 tons in the quantity which they make. The three least of these are stated to be Golden Hill, in Staffordshire, 184 tons; Dutton, in Cumberland, 175; and Dewey, in North Wales, 150 tons of pig iron per annum.

Ninety-five thousand tons of this pig iron, manufactured in Great Britain, are afterwards rendered malleable. The capital employed in the manufacture of the raw material only, is estimated at five millions; and it furnishes employment to 200,000 persons, independent of all the labour necessary to fabricate articles of iron.

ON IRON ORES.

The minerals containing iron are very plentiful, though the richest ores alone are manufactured, and these only in countries where coals or wood can be procured in unlimited quantities. The ore is frequently found bedded in stratum of laminated clay termed bind, and partaking of the same inclination as the strata above and below. It is found in nodules nearly the shape of a convex lens, and of all sizes; these are termed iron stones: when broken, the internal fracture presents the most elegant configurations, tending

IRON.

in general to a centre; others contain the impressions of vegetables, some bearing resemblance to ferns. In some cases the stones contain impressions of fossil shells. Iron ore is not unfrequently found in a regular stratum, occupying the whole space between the strata above and below it. When the strata (usually a laminated blue or ockery clay) which contains the iron stones are not more than 25 or 30 feet in depth, they are procured by sinking a pit at first, about eight feet diameter, which is enlarged as the depth increases, until the iron stones are reached, the pit is undermined until it becomes near 20 feet diameter, and of a conical figure; when all the stones contained in the pit are taken out, another is dug so near the former that it will meet it at the bottom. the earth taken from the second pit is thrown into the first, and in this manner the work proceeds, until the depth becomes greater. it is then the most economical method to work a mine under ground in the same manner as for coals. It frequently happens that an iron furnace is situated, where coals are mined at a considerable depth while the ore is procured nearer the surface, by this method the same expense of machinery for drawing off the water serves for both.

Iron stones are distinguished by Mr. Muir into Siliceous, Argillaceous, and Calcareous, in proportion a sand, clay, or lime are found predominant in them, though none are found free from mixture of all three. These circumstances effect the quality of the iron extracted from them, and require a somewhat different treatment to produce as much as possible similar results: for as the metal contained in all iron ore is the same, but differing in the foreign matters combined with them, it is possible to separate it from them, and in the manufacture this is chiefly done by varying the proportions of fuel and flux used in the furnace.

Iron masters consider that with the same proportion of fuel the best iron will be produced from the argillaceous ores, that is, respecting strength and a moderate degree of fusibility.

Calcareous ores afford iron which melts easily, though it is deficient in strength, when manufactured into bar iron it becomes *red short*; that is, brittle when hot.

The metal produced from iron stones, containing nearly equal mixtures of sand, clay, and lime, has an intermediate degree of fusibility and softness; but generally very strong. The worst crude iron is obtained from argillaceous ore: it is unfit for any purpose in this state, and when rendered malleable is *cold short*, or brittle when cold.

The first operation to which the iron ore is subjected, is roasting; this is exposing the stones to a moderate heat, which volatilizes many extraneous mixtures of the ore. The operation is performed by spreading upon the ground a layer of coals, about eight or nine inches thick, and extending from 10 to 12 feet in length, the breadth being about eight or nine feet: these coals are covered with a stratum of ore five or six feet in thickness, and interspersed with coke dust and small cinders; the whole is covered over with slack or small coals. The fuel is now set on fire, and suffered to burn as long as any matter capable of supporting combustion remains; which will be sometimes three weeks or a month. The ore, by this operation, loses very considerably in weight; its colour is changed from a dark brown

to that of the red oxide of iron, a change which is probably owing to the increase of oxygen furnished by the decomposition of the water contained in the ore whilst the hydrogen is dissipated. The reduction of weight is owing in a great measure to the decomposition of the water as well as the absence of any other matters which may be volatilized by that heat. It is found by experience, that if the roasting is imperfectly performed or omitted, the quality of the iron made from it is greatly injured, which is attributed by practical men to the loss of heat, which is sustained by introducing raw ore into the furnace. Iron stones vary in their products of iron from 15 to 35 per cent by weight, of the raw ore.

THE FUEL FOR MAKING IRON.

Charcoal of wood stands foremost under this head, from the excellent quality of iron it produces. But we have little to offer our readers upon this subject, as very few charcoal furnaces are now used in England, and their number every day diminishing; being almost entirely superseded by coke furnaces within a few years. We shall therefore confine ourselves to coke-iron, first glancing at the idea of some French chemists, who, in a recent memoir, attribute the superiority of charcoal iron to the new-discovered metalloid potassium contained in the charcoal entering into combination with the iron.

Pit coals may be divided into three sorts:

1st. Hard or stone coal, which burns to a white ash, but is not remarkably inflammable.

2d. Soft or bright coal, which burns to a white ash, contains much hydrogen gas, and is the most inflammable.

3d. Crozzing or caking coal is that which when burnt the fragments unite and melt into a mass, such coal usually burns to a red ash.

Of these varieties only the hard and crozzing are deemed proper for iron making; the soft coal not running together in the operation of coking, so as to produce large pieces of coke; and indeed many kinds of crozzing coals are too soft for the furnace, though they produce excellent large cokes for malting, and other purposes, but when in the furnace, are crushed to dust by the great weight of the other materials.

The coals for the blast furnace must be first burnt to cokes which is done in heaps of from 20 to 60 tons, the large pieces of coals are first stacked up upon the ground, and the interstices filled with smaller coals; this heap is set on fire, and as the different parts become sufficiently burned, the fire in such parts is extinguished by covering it up with dust and the ashes of a former process. Cokes should be so much burnt as to expel all the hydrogen gas, which is known by the smoke ceasing; at the same time as little as possible of the coal should be destroyed by being burnt to ashes. In some places the cokes are burnt in an oven, and the fire put out by closing its mouth instead of smothering it with dust. A great difference prevails in the different kinds of coals, as to the quantity of coke they will produce and also in the quantity of carbon such cokes contain: the soft kinds of coal termed dicey from breaking into small rhomb, afford coke which is very brittle and spongy; when in the furnace the iron masters say it will not bear a burden of ore, that is, it requires a larger proportion of such coke to revive a given quantity of iron than of the cokes made from hard or stone coal; which they ascribe not so much to a deficiency of carbon, as to its softness which

I R O N.

causes it to give way and let the ore fall down to the hearth before it is sufficiently cemented by contact with the carbonaceous matter.

THE BLAST FURNACE.

We now come to describe this principal agent in the iron manufacture. In plate 89, which contains a plan and elevation of a furnace, with its appurtenances, AA, represents what is called the stack of the furnace of a pyramidal figure, 30 feet square at the base, and 40 feet in height, B, b, is the casting house, D is the house for the steam engine which gives motion to the blowing engine, to supply the furnace with air, *a* is its chimney, *b* the boiler with the fire place beneath it: the plan shews two such boilers either of which will supply the engine when the other is out of repair. The two dark circles *ee* in the plate are holes which convey the coals down to the arch before the fire place of each boiler; *f* is the steam pipe leading to the cylinder; *h* is the great lever or beam of the engine, alternating upon its centre and communicating the motion of the piston to the blast cylinder E, which is a large lifting pump, is shewn in fig. 3. of plate 2. The engine is of the atmospheric principle, which, with its construction and operation are detailed under the article STEAM ENGINE, it is sufficient here to say that the alternate motion of the piston of the blowing cylinder, forces its contents of air at each stroke through the pipes, into the regulating receiver F, which is an immense chest formed of cast iron plates open at the lower side and inverted in a reservoir of water about 12 feet in depth. The air is conveyed from the regulator to the furnace by pipes *k k* proceeding from each end of the chest to the furnace. Those furnaces which possess the command of a water fall are blown by an engine similar to that described under our article BLOWING ENGINE, either with or without the addition of a regulator.

The blowing cylinder E, is only of single power, that is, it throws out air only on the ascent of its piston, and it is the office of the regulator F, to receive this air at intervals and deliver it regularly into the furnace; and at every stroke of the engine, a quantity of water is displaced from the reservoir, by the engine throwing more air into it, than the two nose pipes at the ends of the pipes *k k* will convey away in the same time; it therefore distends the capacity of the receiver by expelling a portion of the water and on the descent of the piston, when the engine supplies no air, the return of the water into the receiver continues the blast until the cylinder resumes its office. The superficial area of the receiver must be very great so that the introduction of a cylinder of air will not cause such a descent of the water, as to be sensible, in the difference of pressure by the surrounding water. The internal dimensions of the receiver before us are 30 feet long, eight feet broad, and 10 feet deep. It is formed of cast iron plates screwed together, and loaded with an immense weight of masonry to keep it down steadily in its place. The external cistern is built of masonry or brickwork lined in such a manner as to avoid all danger of the escape of the water.

Plate 90, will explain the internal construction of the furnace. The mass of stone work AA called the stack, is lined with two thicknesses BB of brick or stone, which will withstand the continued action of an intense heat; between the two is a layer of sand represented by the

dark lines in the figures. The cone BB is termed the funnel of the furnace, its base abuts upon an inverted frustum, DD more obtuse called the boshes. Beneath this the diameter of the funnel is much diminished, being brought to a square figure; and it is at this part G called the hearth, where the blast is introduced by the two pipes *F h*. The lower part of the stack is perforated on three sides with arches; the two which are opposite are called *tuire* arches (from *tuire*, pipe) EE in the section 2. Their use is to expose the masonry of the hearth that the *tuirs* (i. e. the apertures through which the blow pipes are entered) may be accessible. The other arch F section 1, is called the *tym* arch from its leading to the *tym* stone *a*, forming one side of the hearth, from the top, to within about 18 inches of the floor, it is made moveable that it may be easily renewed when burnt; and to preserve it, if it should split by the intense heat, an iron plate *b* and figure *b* is placed behind it having an angle below to sustain the stone. Both are fastened into their places by wedging against the side walls of the hearth. The opening below the *tym* is stopped by the dam stone *d* set up upon the floor of the hearth, at about 20 inches distance from the *tym*.

The ends of the pipes *k k*, coming from the regulator, are connected with the blow pipes *m*, by very strong leathern tubes *l*, which are joined to the pipes by hoops *n*, adjustable by screws, so as to hold the leather tight round them. By means of these leathern pipes the blow pipe *m* can be directed to blow into the furnace, in any direction within the limits of the *tuirs*, or aperture to receive the pipes which are made through the stone work and lined with fire clay: the two small circles in the hearth of section 1, shews the position of the two *tuirs* and that they do not blow opposite each other.

The constructions of blast furnaces are as various as their dimensions. Our plate 90 represents that kind which is in most universal use in Derbyshire. A great number of new furnaces have been erected which possess evident advantages, but yet require the sanction of all-powerful custom to render their introduction general. Considerable allowance is on this score to be made to manufacturers on account of the heavy loss which would be sustained by the unsuccessful experiment of a new constructed furnace, and the comparative small advantage to be obtained from its perfect success.

The internal figure of a blast furnace has great influence upon its operation, requiring to be varied, according to the nature of the fuel and ore it is to be charged with. The furnace is not merely to be considered as a hearth for the fusion of the matters introduced into it, but as an extensive laboratory for separating the metal from its earthy mixtures. When first introduced the ore becomes gradually heated. As it descends in the furnace by the consumption of the fuel beneath, it is roasted and by contact of carbon supplied by the fuel parts with its oxygen. This operation requires to be continued from 24 to 36 hours, more or less, as the ore employed is disposed to part with its oxygen. It is evident that the time any quantity of ore takes in passing down through the furnace, will be regulated by the proportions of its height and internal diameter. In a low and proportionally large furnace the materials will speedily arrive at the

IRON.

hearth, being little retarded by friction against the sides of the funnel, and having less space to pass through. Such was the form of the old charcoal furnaces, which required less time from the greater quantity of carbon in the furnace. The deficiency of carbon in pit coal must be compensated by an additional period of cementation in the furnace. The descent of the materials is retarded by diminishing the diameter and increasing the height. In the same manner the furnaces burning soft cokes require narrower furnaces, than for hard cokes which have a similar quality as to their carbonic contents. This is necessary that the cokes may be more fitted to sustain the weight of water above them without being crushed: for hard cokes, but which are inferior in their carbon, a high furnace is adapted to produce a long continued cementation.

Similar reasons apply to the different qualities of ore as well as coal: some requiring to be longer in passing through the furnace than others in proportion as they are disposed to part with their oxygen: these various combinations render the proportions of the internal figure of an iron furnace so uncertain that no particular size can be mentioned as general. The furnace in the plate is 40 feet in height from the bottom of the hearth to the top, while others we have seen are as much as 60 feet. Many furnaces have the side of the funnel BB curved instead of straight, with a view to obviate any danger of the materials sticking in the furnace, which would have bad effects by rendering the operation of the furnace uncertain; owing to the sudden descents which must frequently occur by introducing improperly cemented ore into the furnace.

The intense heat raised in the furnace generally destroys the lining in about a year; though some will last three years, and others not six months; according to the quality of the lining. When this happens the furnace is burnt out, the stone work of the hearth and lining BB is removed and new put in without deranging the masonry of the stack; the dam stone in consequence of having the fluid metal constantly pended up against it, seldom lasts more than three months, and must be renewed without extinguishing the furnace, during the operation sand is rammed in under the tympan stone to keep in the heat, and the blast is stopped. The tympan is changed in the same manner when necessary. The casting house BB is provided with a crane to raise large work: its floor should be many feet deep, with casting sand; and it should contain a reverberating furnace, cupola and all the apparatus described in our article Foundry for casting the iron in its various articles.

An immense mound of earth is raised up, to form an inclined plane from the ground to the top of the furnace, on which the fuel and materials are conveyed to the top of the furnace. The site of a blast furnace is mostly upon the declivity of a hill, for the greater convenience of constructing the inclined plane. In many cases where the inclination of the hill is considerable it is practicable to make the top of the furnace level with the coke yard where the fuel and ore, are prepared for it. In this case the steam engine, house, and its boiler-house, are carried up as high as the furnace, and the bridge loft or road to the top of the furnace is constructed over the top of the building. This arrangement saves a very considerable expense in the formation of the mound. At

other works not possessing such advantages of ground, machinery is constructed to supersede manual labour altogether, in charging the furnace. In the elevation, PL. 89. the dotted line KK represents the inclined plane of the furnace, and the line LL is the original level of the ground, where the works are constructed: these lines are represented as at right angles to their true position, which is shown by KK in the plan, when they would be hidden behind the furnace in the elevation.

Operation of the Blast Furnace.

The furnace is lighted by introducing wood at the top, then a few cokes, the tures are stopped up, and the dam stone left out to cause a draft, which is of course very great in a tall furnace. The wood is then lighted and is suffered to burn a fortnight, a few cokes being introduced once every day until the furnace becomes heated and gradually filled. The charging of the furnace now commences with four baskets equal to eight bushels of cokes, 12 stone of 14lb. each of ore, and four of limestone for a flux; the dam stones are put in and eight or nine days afterwards, during which interval 60 or 70 charges are introduced, the tures are opened and the blast commenced, at first gently with a small nose pipe, and afterwards with a larger, until the furnace acquires the proper heat. These precautions are necessary to preserve the masonry of the furnace from cracking, which would otherwise happen by the unequal expansion of so large a mass, if the heat were urged too rapidly.

Twelve hours after the blast begins iron can be obtained from the furnace, and in the course of as many days if the business is well conducted, the furnace arrives at its proper heat and state for working constantly, as long as the lining lasts. The regular routine now takes place, charging every half hour with eight bushels of coke mixed with ore and limestone in different proportions according to the quality of the iron to be produced.

The ore and limestone when put into the furnace gradually descends as the matter below is consumed, becoming heated, and the carbon which abounds in the furnace enters into combination with the oxygen of the ore, and both pass off in the state of carbonic acid gas. A new combination now takes place between the carbon and the metal thus deprived of the oxygen; the carbonization proceeds more rapidly as the ore continues to descend and the heat increases. This process is continued until it arrives about the top of the cokes, where the heat becomes so intense, as to fuse both the iron and any of the impurities it contains: they now drop down in a fluid state, and accumulate in the bottom of the hearth, being kept in by the dam stone from flowing out into the casting-house. While the matter remains here, the iron by its superior weight sinks to the bottom; the other melted matters form a liquid lava floating upon it, and rising up as the quantity increases, until it becomes high enough to flow over the dam stone upon the sand of the casting-house. The metal also accumulates, and in twelve hours after the commencement, is ready for casting. The dam stone is not made long enough to fill entirely the space in which it is placed, but about three inches space is left between one end of it and the side walls of the hearth: this aperture is stopped with sand, which is removed when the metal is to be cast, and suffered to

IRON.

flow out into the moulds or pig beds formed in the casting-house BB.

The blast continues constantly night and day, except a cessation of about 20 minutes, every 12 hours while the metal is cast; otherwise as soon as the tap hole was opened a stream of flame would issue out many feet and greatly annoy the workmen: besides that, in furnaces burning the soft sorts of coal the blast is necessary when the tap hole is open to blow out the dust which accumulates and chokes up the tuyeres. After all the metal is let out the slag or lava follows, and if any remains it is drawn out by a hook. The furnace is now poked and stirred up with long bars called rangers, introduced over the dam stone, and under the tymph to loosen any slag which might have been held up among the cokes by the great pressure of the blast. The tap hole is next stopped up with sand, and also the space under the tymph and between the dam stone. The engine is now put in motion and the operation of the furnace resumed, the metal and slag soon dropping down into the hearth: in a short time the slag rises high enough to run over the dam stone, the sand before it being removed. The engraving shews that the bottom of the tymph is somewhat lower than the top of the dam stone, so that the slag touches the tymph iron, and prevents the blast or fire getting through at the same time that the slag runs off freely. The nose pipes are but very little above the level of the dam stone, and it is essential that the metal should be covered over with slag to defend it from the rapid oxygenation or burning which would take place by the stream of cold air striking upon the hot metal. From this circumstance it would appear that the blast is prejudicial; and so, in fact, it may be in some degree, by partially oxidizing the metal, while it remains in the hearth. Its use consists in augmenting the heat, for the affinity between the iron and the carbon is at first, insensible and increases in proportion to the temperature in which they are placed. The heat is, therefore, necessary on two accounts; first, to create a sufficient affinity between the iron and the carbon; and next, to melt down whatever is mixed with the ore.

The varieties of Slag.

The mixtures of the iron ore are by the operation of the furnace separated from the iron, and formed into a vitrified mass called slag, which is very brittle and hard. Its colour and appearance are very various, but affording a criterion of the state of the furnace by which the manager can form his judgment. The slag is composed principally of lime, siliceous, and clay melted together: it is most probable, that if it is coloured, it still contains a portion of iron, which ought to have been separated from it in the furnace. This is shewn by the slag produced before the furnace acquires the proper heat, being nearly black; and from its weight evidently containing a large portion of iron. Also, without a due proportion of lime, the slag breaks with a smooth fracture like bottle glass, and coloured black or dark blue: when melted, it runs freely, like water, holding the iron in solution. The iron produced at the same time is of the worst quality. On augmenting the quantity of lime, the slag becomes streaked with variegated colours, disposed in the most beautiful curved stripes, and mixed with much white. It still preserves its polish on breaking. This slag runs from the furnace in a more consis-

tent state than the former, similar indeed to cream. Each streak contains less metal as its colour becomes lighter; and the white contains the least, if any. An additional proportion of lime produces a white slag which, when broken, presents an uneven surface and without polish, very similar to the fracture of porcelain. Such slag retains but very little iron in solution, and is that which the manager endeavours to procure: it is more tenacious than any of the former. Any farther quantity of lime beyond the curdled white slag, renders the slag so clotted, that it is liable to cement the cakes together, and choke up the furnace: it also retains an immense number of small globules of good iron, which have not sufficient weight to make them escape from the slag, though it contains scarcely any metal in solution.

The different qualities of Crude Iron.

The different qualities of crude iron thus produced from the blast furnace, are denoted by manufacturers, No. 1, 2, 3, and 4, according to their value, which being regulated by the demand for any particular quality, is no certain criterion of the absolute quality or composition of the metal, the number being differently applied in remote places, according to the local demands of the country. The notation following is that used at some Derbyshire furnaces, which our draughtsman visited, and from which the drawings were taken.

No. 1 also called *grey melting pig*, is the best iron; it contains a large proportion of carbon, and but little, if any, oxygen. The carbon is in such excess, that when cast, its surface is found covered with carburet of iron (black lead), termed by manufacturers *kuoh*. It melts easily, is soft so as to yield to the file, and less brittle than any other crude iron: when broken, it is of a grey colour. To make such iron, some of the furnaces in Derbyshire are charged with eight bushels of coke, 18 stone of ore, and eight of limestone; a less quantity of ore to the same fuel will improve its quality, when it can be afforded; but will hardly produce so great a proportion of metal. It must be understood, that this is the average charge. The state of the air having great influence on the products of the iron, in summer only, 16 stones of ore, eight of limestone, and in winter, 20 stones of ore, with the eight bushels of coke, will produce the same quality of iron.

No. 1. is used for mixing with inferior qualities to make fine castings for machinery, and where the iron is, requires to be filed and drilled.

No. 2. or *Forge pig*, is used to make malleable iron. It contains less carbon than No. 1. and is not perfectly deprived of its oxygen. Its fracture is of a lighter colour than No. 1. it requires more heat to melt it, is harder, and more brittle. The average charge of the furnace for this kind is, 22 stones of ore, eight of limestone, to the eight bushels of coke.

No. 3. *Foundry metal*, is less carbonated, harder, more infusible and brittle than the last, and contains more oxygen. It is employed to cast grate bars, weights, and all common articles. It is also used to mix with No. 1 for the use of the foundry. This metal is often accidentally produced from nearly the same charge as the last, when bad cokes, or imperfectly roasted ore, are used; or on any sudden change of the air. The furnace always making the best metal in proportion to the fuel, in the coldest weather, under the

IRON.

same circumstances as the last, the charge would be 24, 25, or 26 stones of ore.

No. 4. *Ballast iron*, or *white hard iron*, being white like silver when broken, contains very little carbon, and much oxygen. It is harder than steel, and exceedingly brittle; so much so, indeed, as to be of little use but for ships ballast, and to mix with a large proportion of No. 1. for the foundry. It makes good axletree boxes for wheels; as, from its hardness, it is not liable to fuse by friction. It requires so great a heat to melt it, that at the ordinary state of the furnace, it will scarcely run into the moulds.

This information respecting the charges, however, can only be considered as local, and varying considerably at the next furnace, though only a few miles distant, owing to the different qualities of the coal and ore. The rules which the practical managers observe are, that the best iron will be produced when the largest proportion of coke is used with the ore, and about one-third of its weight of limestone: a larger quantity of the latter makes the slag lumpy, and chokes the furnace; and with a smaller, it still retains a portion of iron in solution, whence arises its black colour, though the proportion of lime necessary is very uncertain, as it depends upon the fusibility of the extraneous mixtures of the ore.

The object of a manager is, therefore, to make the best and most iron with the least coals; or, what is the same (as the furnace is always supplied with the same quantity of fuel), to make it bear the greatest burden of mine, that is, the greatest quantity of ore, without debasing the quality, or lessening the quantity of the iron below the required produce. The quantity and velocity of the blast or air thrown into a furnace, has great influence on the products of it; and, from the combination of so many circumstances, no accurate rule of proportion can be laid down; even at the same furnace, the charge is continually varied to meet the existing circumstances.

An excellent division of the varieties of crude iron, by Mr. Mushet, will be found in the 2d vol. of the Phil. Mag. where he distinguishes four kinds from their component parts, instead of the uncertain distinction of price; a new division, which it is much to be wished was more generally adopted by manufacturers:

1st. *Oxygenated crude iron*, shewing by its name that oxygen is predominant, and the carbon in small quantity; this is the No. 4. white iron above, but in Scotland it is used for the forge.

2d. *Carbo-oxygenated crude iron*, containing equal proportions of carbon and oxygen, which seems the same as the foundry metal above.

3d. *Carbonated crude iron*, where the carbon predominates; it seems the same as No. 2. forge metal above, but in Scotland is termed *good melting pig iron*.

4th. *Super carbonated crude iron*, contains an excess of carbon, and little oxygen; this is No. 1. Kishy iron; its surface covered with plum-bago.

A blast furnace of the dimensions given in the drawings, though by no means the largest sort, is charged 48 times with eight bushels of coke each time, in the course of a day and night; to produce this quantity of cokes, requires near 764 bushels of coals per day; it also consumes about nine tons of ore and limestone in the same time.

This furnace produces 25 tons of metal per week in summer, and 20 in winter, when making

No. 1. metal. with No. 2. it will make from 35 to 40 tons per week.

At many iron works, three furnaces and their foundries are constantly in use; the coal and iron mines, together with forges and rolling mills for making the iron into bars, belonging to the same concern, the great number of steam engines, mills, waggons, horses, workmen's tools, frequently a railway or canal, from one part of the works to another, a large farm to maintain the horses, and the capital necessary to carry on such works, will give some idea of the opulence and general knowledge necessary for an iron master, to conduct his business with advantage to the community, and profit to himself.

The Manufacture of Malleable Iron.

Malleable iron should be pure iron without any mixture. No method has yet been practised in England of making pure iron from the ore at one operation; it must first pass through the state of crude or carbonated iron, and the carbon is afterwards expelled, leaving pure iron: the manipulations of this process are much more simple than the principles of mutual affinity upon which they operate.

The works for making malleable iron are termed *forges*; they contain, 1st. *fineries*, or furnaces and their blowing machines, 2d. the *forge stamping hammer*, 3d. *balling furnace*, 4th. *chaferies*, or second furnaces; and 5th. the *forge drawing hammer* for forming the iron into bars. In the vicinity of a large forge, a rolling mill is usually erected; and, though not essential, it is a very useful addition for slitting and finishing the bars neatly. In small works, the same mill is used both as a stamping and drawing hammer, and all the machinery is contained in one building. A plan and elevation of such a work is given in plate 91, where A A A are the fineries or forges in which the iron is deprived of its carbon; B the water wheel for the blowing engine; D the wheel for working the hammer; X the balling furnace; E the chafery or second forge for heating the iron to be made into bars.

The Blowing Machine.

The engine acts by two single acting cylinders FF (See our article *BLOWING ENGINES*), moved by means of wheels *a a*, called *camms*, fixed on the axis of the water wheel B. They are in the figure of a heart, and hence are sometimes called heart wheels. The ends of the piston rods *b b* of the cylinders FF, have small wheels in the lower end of them, resting upon the circumference of the camms *a a*; and they are guided in a truly vertical motion, by wheels *t t* on each side of them.

The revolution of the water wheel by the eccentricity of the camms alternately lift up the pistons of the cylinders, blowing the air through the pipes *f f* to the furnaces. The pistons descend again by their own weight, but much quicker than they ascend, which is effected by the different curvatures of the camms; the cylinders act in the same manner as the blowing engine, under that article.

The Finery.

The air from either cylinder is conducted by cast iron pipes *f f f*, supported in the roof from the blowing engine to the chafery E, and the fineries A A; one of which is represented on a larger scale in fig. 2. plate 92. where *f* represents a part of the same air pipe, provided with a cock *g*, to intercept and regulate the stream of air; and the lower end of it is connected by a

IRON.

leathern tube *h*, with a nose pipe *s*, which turns horizontally into the tuire of the furnace, which is exceedingly simple, being only a dome *G*, and chimney *H* of brickwork, and beneath a square hole *k*, called the hearth, to contain the fuel. The hearth is lined with cast iron plates, and the lower one left hollow beneath to keep it cool, by throwing water under, and preserve it from melting. The plate against the back wall is raised much higher than the others, to receive the tire iron fig. 3 which is a wrought iron tube projecting a small distance into the fire, to contain the nozzels of the air-pipe. This tire iron being exposed to a great heat, would be rapidly burnt away, without some contrivance which will keep it cool. The conical tire iron is, in fact, formed of two tubes, one within another, leaving a small cavity between them to receive a thin sheet of cold water which is conveyed in a trough to a pipe *m*, communicating with the cavity: *n* is another similar pipe to take away the water, but bent down, so that its orifice is lower than the former, which is turned up to receive the stream of cold water, while the lower pipe conveys it away when warm into a cistern *o*, fig. 2. The stream of cold water is supplied by four small buckets upon the circumference of the water wheel *B*, which are filled when at the lowest part of their motion, and discharge their contents when at the highest, into a cistern which communicates the water by means of a trough and pipes to the tire irons.

The only difference between the finery and chafery, is in the latter being somewhat larger, and standing higher from the ground, and to be described shortly.

The Forge Hammer.

The water wheel *D* (plates 91, 92.) of the hammer mill, has on its axis *K* a large wheel *p*, furnished with four cogs, which in succession lift up the hammer *L*; it moves on an axis *g*, supported by two uprights *s s* of cast iron, which are in the same piece, and cast at the same time with a large iron plate, acting as a floor for a third, upright iron *T* extending from the ground to a large beam *D* called the drome, which is also supported at one end by a beam across the house, and at the end towards the water wheel, by a large vertical post *n*; *v* is a strong ash spring, supported by passing through the upright *WT*, and extending over the hammer *L*. By the motion of the water wheel, the cogs of the wheel *p* throw the hammer forcibly up against the spring *v*; by this it is reflected down upon the anvil with an additional power, from the weight of the hammer, which for stamping never weighs less than six cwt. and very often much more. The anvil *z* is made of cast iron, bedded in a large block of stone or wood, and care must be taken that no conduit or arch is made near the anvil block, or the bearings of the gudgeon of the cog wheel *p*, because all the power required to lift up the hammer is first exerted upon the gudgeon of the wheel. The ground, therefore, should be made as solid as possible, or the reiterated blows of so heavy a mass will shake all the foundation of the building. The large anvil block is perforated with a square hole to receive a small anvil face, which can be changed for another of different figure at pleasure, without disturbing the anvil block. The hammer handle is made of sound oak, and is well hooped with iron, to fortify it against the violent shocks it is constantly receiving from the cogs of the wheel *p*. The hammer is easily changed by taking its axis out of the bearings, to put in another of different weight or figure, and, as the head is only wedged on to the

handle, it can be taken off when the handle is shaken to pieces, which often happens in two or three months wear. A violent action is constantly exerted upon the spring *v*, which tends to throw up all the framing. To resist this, a weight of arc tons of cast iron is placed on the drome at *Y*, but is insufficient to prevent a considerable vibration, which soon destroys the wood framing.

The Process of Converting Iron.

The operation of the fineries is as follows, 3 cwt. of crude iron of the number 2 or forge metal is put into the hearth, which is previously filled up with burning charcoal. The metal is covered up with the fuel, and the blast commenced. It quickly melts down into the bottom of the hearth; and in about 20 minutes the workman opens a tap hole called the cinder hole, which is rather above the level the surface of the metal is supposed to occupy in the hearth. A small quantity of liquid lava called finery cinder flows out at this aperture; and if any of the metal comes out at the same time, the workman throws water upon it, and returns it to the furnace again. When the bottom plate *92* of the finery hearth is very hot, it often happens that as much as 2 cwt. of the metal will flow out in this manner, which must be returned to the furnace. But in general the principal part which runs out, is cinder only; as this becomes separated from the melted iron it gradually thickens and becomes more infusible. All this time the workman is employed continually, poking, and stirring the metal, that every portion may be equally submitted to the action of the fire; and to prevent the iron from adhering to the sides of the finery, or the tire iron, he searches all round such places with his tool and removes any metal he finds. In about half an hour's time or three-quarter's at farthest, the cinder hole is stopped up with dust, to keep in the remaining cinder, which is found conducive to the conversion of the iron. The sparks which have hitherto arisen from the fire are of a bright red colour, but about this time they change to a white colour: it is by this appearance, the workman is guided in stopping up the tap hole. To retain the cinder also by the adhesion of the metal to the iron bar used to stir the furnace, which is less now than at the commencement of the process, when a hammer *N* was necessary to knock off the adherent metal. These signs indicate that some of the metal is beginning to change into malleable iron. At this time the cock in the air pipe is further opened to increase the quantity of the blast, and the metal is suffered to remain enveloped in the cinder without much disturbance until about 75 minutes after the commencement, by which time the whole of the metal is become so far malleable that it will no longer melt in the heat of the finery; but lies in large lumps at the bottom. The workman now divides the lumps, and by his poker endeavours to expose new surfaces to the action of the fire, and turns the whole mass over. It now remains until two hours and a quarter after the first, when it is generally found completely converted into malleable iron, and is taken out of the fire by a hook *P*. It has now lost all metallic appearance, an indifferent observer scarcely distinguishing it from the surrounding charcoal. It is divided into the most minute particles, not larger than sand, but still adhering together: and this appearance commences as soon as the iron comes into nature as the workmen term it, that is, becomes malleable. The globules are at first of considerable size, but afterwards dividing into an almost infinite number

IRON.

of small grains, which seem to repel each other by reason of their being so greatly divided that light may be seen through every part of a small piece. During the above process the workman frequently covers up the charcoal, and throws on water with the bowl R wherever the flames break out; both with a view to economise fuel, and to moderate the great heat thrown out; which together with the labour of stirring up so heavy a mass of metal, and the tremendous roaring of the blast renders the post excessively fatiguing to the workmen.

Immediately on taking a portion of the iron from the fire, the blast is diminished so much as only to keep the remaining iron in a welding heat; more than this would oxydate and burn away the remaining metal, without producing any good effect. The piece of iron is shoved along the floor with a fork S, to the hammer which is then put in motion by raising the water-wheel shuttle with the handle O, pl. 92. The first time the hammer is lifted up, the workman places the iron upon the anvil, and the hammer immediately falls with a tremendous blow upon it. The next cog of the wheel P throws the hammer up again in an instant; and by striking the spring it is thrown down with increased force. After two or three blows in this manner the water wheel acquires its full velocity, striking from 15 to 30 times per minute, according to the quantity of water running upon the wheel, during this time the workman continually turns the iron about, that every part may be hammered. The operation of the hammer while the iron is in a welding heat, welds and consolidates the divided particles of metal into a solid mass, which however is not free from flaws, particularly the edges, being cracked very much. The cakes which are thus produced are termed stampings. The great percussion of the hammer forces out the remaining slag, or melted cinder, from the iron by mechanical pressure. When the iron is under the hammer, a stream of liquid fire is frequently projected out of the cavities, on the stroke of the hammer, with such force as to strike the roof of the building.

The operation of the finery is intended to expel the carbon from the crude iron, which it is supposed, by practical men, to effect by burning and consuming the carbon contained in the iron; but this does not sufficiently account for the absence of the oxygen which forge pigs always contain. It is more probably effected by the carbon and oxygen entering into combination and passing off in carbonic acid gas, an explanation which is confirmed by some experiments of Dr. Beddoes on an operation called Puddling, which is analogous to the finery.

IRON BAR Manufacture. The stampings obtained by the foregoing process are malleable iron; but in a state too divided to be fit for the smith, and must therefore be first manufactured into bars. If a rolling-mill is near the forge the stampings are carried thither, and, being heated, are passed two or three times through the rolls, to close up the flaws and render them compact. They are then whilst red hot clipped into pieces by the shears (See *ROLLING MILL*) and taken back to the forges. Where no rolling mill is near, the stampings are broken while cold into pieces, and the fragments are sorted into various qualities, as they are more or less completely deprived of their impurities, and are piled up on circular stones or tiles, being intermixed with pieces of old iron called scraps. As many of these piles

termed scraps-ball weighing half cwt. each are introduced into the baling furnace, as it will contain. This furnace is a reverberatory one, as described in the article FURNACE, having a level floor to place the balls upon. Here a welding heat is given by the flame to the balls, which in this state are termed shingles; and they are taken out by a hook. At this temperature the fragments composing the pile adhere together strongly, and are carried all together to the hammer to be welded into a solid mass, and form them into bloom or slabs. For this purpose two workmen are employed, and assisted by the turnace-tender. When the metal is at the proper heat the latter carries the shingle to the hammer, the first hammer-man brings an iron bar, the end of which has been heated in the chafery, and the second man draws the water-wheel shuttle. At the first rising of the hammer the turnace-man lifts the shingle upon the anvil with a pair of tongs; the hammer-man places the end of his bar upon it, and the falling of the hammer welds all together. The bar now becomes a handle to direct the shingle under the hammer, the workman turning it over between each blow that it may be struck on different sides; this is continued as long as the heat is sufficiently great, by which time the workman will have formed the shingle into a large and short bar, termed a bloom, or half bloom, according to its weight. The turnace-man now brings another shingle, and the second hammer-man an iron bar which they place upon the anvil together, and at the same instant the first man takes his bloom to the chafery, so that the hammer never strikes upon the anvil. The first man then rests himself until his partner has finished; when he must resume his labour while the other rests. In this manner the operation proceeds until all the shingles contained in the furnace are made into blooms, and placed in the chafery fire. By this time those first introduced are sufficiently heated, for a second forging, which employs the hammer while the baling furnace is charging again. By the second forging the blooms are drawn out in the middle to a bar the true shape and size of the bar intended to be manufactured; the ends are at the same time left unformed, it is now termed an ancory, and at two more heats its ends are drawn out and it becomes a bar. Iron which is intended to be made into plate at the rolling mill, is forged from the scraps ball at two heats into a slab which is a parallel pipedon or piece of very thick plate its size according to what are intended to be rolled; the largest are about 18 inches by 12, and three inches in thickness. In the above operation the iron loses considerably in weight: 25 cwt of crude iron being allowed to make one ton of bar iron: a great part of this waste is sustained in the finery, the cinder of which is black and evidently contains a large proportion of metal; and in the subsequent operation of the hammer the forge scales or black oxyde which comes from the surface of the metal is very considerable. The workmen are allowed 52 baskets of charcoal to convert a ton of pig iron, each of which we estimate to contain about half a bushel or less. They observe that more fuel is required after a heavy fall of snow or rain.

In all large works two hammers and often three are used: the first is in the same building with the fineries to make stampings: the other (sometimes in a separate building which contains the chaferies, and baling furnace) is used to draw the stamping out into bars, and is therefore termed the drawing

IRON.

hammer. The same mill also sometimes turns a pair of rollers. We thought it unnecessary to extend the number of our plates by giving the second forge; as it may be easily comprehended from those we have delineated.

The interior of an extensive forge presents a spectacle which perhaps approaches the nearest of any work of art, to the poetical description of Vulcan's Cave. Some of these buildings contain six of the fineries, which produce a most intense heat and light. The roaring of the blast is truly tremendous, added to the falling of the water on the wheels of two blowing machines, and two hammer mills, which strike alternately with such violence as to shake the earth for a considerable distance: the number of workmen busily employed in the midst of such confusion in carrying hot metal about, and the strong reflection of light and shade upon their faces produce a scene which would be an excellent subject for the painter.

Process of Puddling Iron.

A process termed *Puddling* has been lately invented, to make malleable iron from crude by an air reverberating furnace similar to that described in the article furnace; except that the floor is hollowed out into a basin in the middle opposite the door into the furnace, two and a half cwt. of crude iron is introduced into the basin and the flame of pit coal forcibly reverberated upon it. In half an hour after charging, it is melted; the attendant now shuts off the flame from the metal by opening another vent for the draught of the chimney, he stirs up and turns over the metal, and in 50 minutes it becomes collected into lumps about the size of gravel. As soon as the heat becomes so far diminished that the metal works with any difficulty, the flame is turned on again; which is usually about 30 minutes. In three minutes more it becomes soft and semi-fluid, and the flame is turned off. The hottest part of the mass now begins to heave and swell, emitting a lambent blue flame. An appearance called fermentation which becomes generally throughout the furnace in the course of an hour. It is a remarkable circumstance that in about 75 minutes the metal seems rather more heated than before the flame was turned off, though a quarter of an hour since it received any heat from the fire. In 78 minutes the blue flame and heaving partially ceases, and where this happens the mass is only of a dull red heat. All this time the metal adheres to the iron tool with which it is worked, or stirred up, and continually requires a sharp blow with a hammer upon the end of it to shake off the adherent metal. In about 80 minutes this property of the metal diminishes, and by the time it is lost the operation is judged complete. In 83 minutes the fermentation and blue flame nearly cease; the metal becoming cool and stiff; the flame is then turned on and quickly off again. In 86 minutes the metal is become as fine as sand, the blue flame which again appears is of a lighter blue. At 90 minutes the metal is heated again for a short time; it ferments strongly and hisses, a noise which was heard from the first appearance of blue flame, but exceedingly faint till now. At 100 minutes less blue flame. In the succeeding eight minutes the metal is heated twice, by which time it is clotted and stands wherever it is placed without tendency to flow, and no liquid metal remains in the basin of the furnace. A little finery cylinder boils up in the metal at 110 minutes, and it is to this the workman attributes the hissing noise

above mentioned. In 113 minutes the fermentation ceases, the metal is collected into lumps, the furnace shut up close, and a fierce flame applied to heat the metal sufficiently for the hammer or rollers.

This account of the puddling process is collected from an excellent paper by Dr. Beddoes in the Philosophical Transactions, and exactly corresponds with what we have observed. The Doctor afterwards details a set of interesting experiments to determine the nature of the gaseous which was evolved during the fermentations or blue flame; and which proved to contain carbonic acid gas, or carbon and oxygen volatilized by heat: whence he concludes that the carbon in the crude iron is not merely burnt away from it, but that it combines with the oxygen of the air, leaving malleable iron in the furnace. In the operation of the finery as well as the puddling furnace the manufacturers consider the oxygen furnished by a draft or blast of atmospheric air to be necessary to combine with the carbon of iron; and in many places we have visited, water is thrown into the puddling furnace at several periods to furnish oxygen by its decomposition, a method which is found to be advantageous. Dr. Beddoes with much probability, suggests, that this air is permeous from the great waste of metal it occasions, for every gram of carbon which is converted into gas by it, many of these irons are converted into black oxide; and hence he remarks that great advantage would be derived from making such crude iron as would contain the proper portion of oxygen to combine with the carbon, without farther addition from the blast. In such case the operation might be performed in a close vessel, and by that means greatly diminish the loss of metal occasioned by oxidation.

At all the puddling furnaces we have visited the iron undergoes a fusion in a finery with coke, previous to the puddling. The finery has two tubes directed downwards so as to blow upon the metal, which is soon fused and afterwards let out into a mould or cast iron trough; before it cools it is broken into pieces and carried to the puddling furnace.

At some works the puddled iron is worked into bars in the same manner as above described, but by a modern invention it is manufactured without a forge hammer. The puddling balls when taken from the furnace are passed between a large pair of rollers which have a number of grooves of different sizes formed round them; these compress the iron and answer the purpose of the hammer. As soon as the metal comes through the rollers, a workman behind lifts it over the upper roll to the first workman who puts it between them again, in this manner the metal is rolled 10 or 12 times; at each time being put through a smaller groove of the rollers so as to compress it in a greater degree every time. After these operations the pieces thus rolled are piled up four together, and put into a ball furnace, and when heated they are rolled into bars by rolls similar to the former, but provided with grooves the proper size of the intended bars, in which state they are sent to market, or slit into nail- rods, &c. See *SLITTING Mill*.

The advantage of the puddling process is in the dispatch with which the iron is converted and comparatively small expense of fuel; at present the puddled iron is not so good in quality as the finery; though this circumstance should not deter manufacturers from using it, as it is scarcely

IRON BRIDGE.

possible that a newly invented process should be at first brought to equal perfection with another which has exercised the ingenuity of manufacturers for ages past. But in the course of practice many improvements will arise, which might have remained undiscovered if the process in its present state were neglected.

The rollers are thought to enclose the impurities in the iron rather than expel them; but as rollers require much less power to give them motion than the hammer, it becomes worth the consideration of manufacturers, to improve their construction, and render them equal in effect to the hammer, even in the present state the puddled iron made with rollers is by no means to be despised when its price and quality are compared.

IRON BRIDGE. Iron being the most abundant, cheap, and generally useful of all the metals, has of late been applied in all works where great strength was required in proportion to the weight of the material: hence cylinders, beams, and pumps for steam engines, boats and barges for canals, and navigable rivers, beams and pillars for large buildings, and at length *bridges*, have been constructed of iron.

The first iron bridge in point of time, is that over the river Severn, near Colbrook Dale in Shropshire. It consists of an arch of above 100 feet span, and rises 45 feet. There are five ribs, each cast in two pieces, secured where they join at the crown of the arch by a cast iron key-plate, and connected together horizontally and vertically by cast iron braces, formed with dovetails and bolts. The ribs are covered with cast iron plates, and the railing to the sides is of iron. The total weight of iron is 378½ tons. This bridge was built by Mr. Abraham Darley, and the iron work was cast at Colbrook Dale in the year 1779. It was a very bold effort for in the first instance, in adopting a new material, the span of the centre arch at Blackfriars Bridge was exceeded, and that had always been considered as a great exertion with stone.

The second iron bridge was built over the same river, about two miles above the former one, at a place called Buildwas. It was erected at the expense of the county of Salop, agreeably to a plan, and under the direction of Mr. Thelford, surveyor of the public works of that county. It also was cast at Colbrook Dale in 1795 and 1796. The arch is 130 feet in the span, and rises from the springing to the soffit of the arch 27 feet. In this bridge, as it was necessary to keep the roadway as low as possible, the principle of the Schaffhausen and Wittingen bridges (see *Wooden Bridge*) is in some degree adopted: for the outside ribs are made to go up as high as the railing; they are connected with the ribs that bear the covering plates, by means of pieces of iron dovetailed in the form of king-posts. The plates which form the covering over the lower ribs are cast with deep flanches, are laid close to each other, and form an arch of themselves, so that altogether the bridge is compact and firm. The weight of iron is nearly 174 tons.

Some smaller bridges, and an aqueduct at Longden (the first made of iron for a navigable canal) have also been made, in Shropshire, under Mr. Thelford's direction.

The next bridge, on a large scale, which was made of iron, was that magnificent and elegant one over the river Wear, at Monk Wearmouth, near Sunderland. The projector and architect

was *Ronald Burdon, Esq. M. P.* The arch is a segment of a circle, whose diameter is about 444 feet. The span of the arch is 236 feet, and its versed sine, or spring, is 34 feet. It springs at the elevation of 60 feet from the surface of the river at low water, so that vessels of 200, or perhaps 300 tons burden, may pass under it in the middle of the stream, or even 50 feet on each side of it, without lowering their top-masts. This bridge is rendered very considerably lighter than it could have been if made of stone, by means of the great voids which cast iron will permit, and the simplicity with which that metal may be reduced to any form. The blocks are so cast as to serve as arch-stones; and in the arch they butt on each other, in the same manner as the voussoirs of a stone arch. The thickness of the arms of which a block was constituted, is no more than four inches. The longest dimension of a block is about three feet, and its weight about 1200 lbs. These are kept in their places, and made to bear accurately upon each other by bars of wrought iron, which run along grooves on each side of the blocks, and are bolted through at equal distances to bricks of cast iron, passing horizontally between the ribs, of six of which, placed at five feet distance from each other, the arch consists. One rib contains a series of about 125 blocks. This admirable structure is able to withstand an enormous pressure, so long as the abutments of the arch do not spring, and of this there is hardly any risk, because they are solid rock faced with about four or five yards of solid block masonry. It were desirable though that something were done to stiffen the arch at the sides, by the manner of filling up the spandrels, or space between the arch and the roadway. They are so filled up as to be extremely light and pleasing to the eye, namely, by large cast iron circles which touch the roadway and the extrados of the arch. The roadway rests upon them as on so many hoops, while they rest on the back of the arch, and also touch each other laterally. But this cannot contribute much to the strength of the arch, for these hoops will be easily compressed at the points of contact, and, changing their shape, will oppose very little resistance. This part of the arch might have been greatly strengthened, by connecting it with the roadway by trussed frames, in the same manner as a judicious carpenter would have framed a roof.

The arch contains only 260 tons of iron, of which about 55 are wrought iron. The superstructure is of wood planked over at top. This floor is covered with a coating of chalk and tar, on which are laid the materials for the carriage road, consisting of marble, limestone, and gravel; with footways of flag-stones at the sides. The weight of the whole does not exceed 1000 tons; whereas the lightest stone arch which could have been erected would have weighed 15,000. It was turned on a very light but stiff scaffolding, most judiciously constructed for the preservation of its form, and for allowing an uninterrupted passage for the numerous ships and small craft which frequent the busy harbour of Sunderland. The mode of framing the arch was so simple and easy that it was put up in ten days! without an accident; and when all was finished and the scaffolding removed, the arch did not sensibly change its form. This noble structure, undoubtedly superior to any thing of the kind existing in Europe, was finished in the autumn of 1796: it was

IRON BRIDGE.

executed at the expense of about 25,000*l.* of which sum 19,000*l.* was advanced by Mr. Burdon,

We were sorry to learn very recently, that this bridge has shewn some symptoms of instability, the arch, estimating it according to a vertical section, having swayed nearly 18 inches from a correct plane. This is a source of danger which it does not seem easy to remedy completely.

An elegant iron bridge has been lately erected over the Thames, at Staines. The arch of this structure is the lightest ever built or so large a scale, being the meat of a circle of 2.2 feet diameter; the chord, or span, 180, and the height, or rise, 16 feet. It springs from abutments of stone built on piles, and is 27 feet in breadth. It consists of six ribs placed five feet asunder, kept in their position by perforated cross bars placed horizontally at the top and bottom of each arch-piece quite across the bridge. Each of the ribs is composed of arch-pieces, four feet seven inches for equidistances long at top, and four feet six inches and three-eighths at bottom, four feet deep, and four inches one-quarter thick. They are cast hollow for the purpose of introducing dowels four inches and a half wide, and two inches thick. Flange these dowels, and likewise the arch-pieces, are cast holes, into which wedges are driven, which bring the parts into close contact. The spandrels are filled up with cranks which diminish from the abutments to the centre, after the manner of the Wearmouth arch: this part we do not approve. The whole is covered with plates one inch thick, and two feet broad, on the ends of which rest the pannels, on which is placed the balustrade. The whole weight of iron is 270 tons, and of this the covering plates weigh 100 tons. The bridge was cast by the Walkers of Rotherham on an improved plan invented by Mr. T. Wilson, the ingenious engineer of the Wearmouth Bridge, who has taken out a patent for this invention. The whole iron-work was thrown across in less than six months, and the bridge was opened for public use on Saturday, Sept. 3, 1803. The king and royal family passed over the bridge in the first four coaches that crossed it.

We have been the more particular in our account of iron bridges, and especially the one at Wearmouth, because of their connection with the proposed plan of erecting an iron bridge across the Thames in lieu of London Bridge. The select committee of the House of Commons, upon the improvement of the port of London, conceived it "essential to the improvement and accommodation of that port, that London Bridge should be rebuilt on such a construction as to permit a free passage, at all times of the tide, for ships of such a tonnage at least as the depth of the river would admit at present between London Bridge and Blackfriars Bridge" and, "That an iron bridge having its centre arch not less than 65 feet high in the clear above high-water mark, will answer the intended purposes, with the greatest convenience, and at the least expense." After the third report of this committee was framed, they received among other plans and designs, one from Messrs. Thelford and Douglass, recommending an iron bridge of a single arch, of the height pointed out in their resolutions, and no less than 600 feet in the span, being the width to which, by Mr. Jessop's report, the river ought to be contracted.

According to this plan the length of the arch

of the bridge will be about 618½ feet, being 48° 34' of a circle whose diameter is 1449 8.3 this feet the width of the bridge at the crown will be 41 or 50 feet, and increasing gradually in width to the abutments, which will be 90 or 100 feet wide. The bridge is to be composed wholly of cast iron, which is much less liable to decay or alteration than wrought iron; the ribs are to be cast in portions of as large a size as can be conveniently handled and cast correctly, and such as can be readily inserted in the connecting and parting rivets, they are to be connected together by rivets and diagonal struts and braces, placed in such manner, and any of the ribs, or struts, or braces, may be taken out separately and replaced without injury to the structure of the bridge. The ribs are to receive the weight and pressure in such a direction that the struts will operate upon the pieces of iron radially, therefore, before the bridge can give way, the iron must be crushed to pieces. All the joints, or rivets, are to be connected vertically and horizontally, from the soffit of the arch to the road-way; so that, in great measure, the whole bridge will act as one frame, and by that means lessen the lateral pressure against the abutments, and provide against any small error in the equilibrium of the arch. The ribs are to be so disposed as to spread from the middle of the bridge to the abutments, and thus they may, by carrying a greater space on the shore, accommodate the road-way in turning at the end of the bridge, and at the same time prevent any tendency of the bridge inight to side vibrations, the side vibrations will also be further opposed by the cross and diagonal ties and braces, and by a plate of grating which is to be laid across the ribs to receive the road-way. This road way is to be composed first of a light, dry, and durable substance laid next to the iron plates, so sandy, or compact substance, which will not admit of water passing through it, and thirdly, of the side paths and pavements for the driving way. The whole external form of the bridge is to be composed of galvanized iron, the ceiling is also to be of galvanized iron, with galvanized plates to receive the lamps, so that the light will, at a distance, have the appearance of a large of light galvanized iron, finished on the top with that will be of outline of which the Gothic style is so capable. The estimate which accompanies this plan, lays the whole expense of the bridge at about 262,289*l.*

The obvious advantages which would be obtained if the communication could be effected by means of a single arch, as well as the magnificence of the proposed structure, appeared to give this design a particular claim to the notice of the committee, yet the attempt was of so novel a nature, that they thought it absolutely necessary for their own information, as well as for the purpose of affording some grounds upon which the House of Commons might form their judgment as to the expediency of the measure, to request the opinions of some of the persons most eminent in Great Britain for their theoretic as well as practical knowledge of such subjects. For this purpose they drew up a series of twenty-one very judicious and apposite queries, and transmitted, together with the proposed design of Messrs. Thelford and Douglass, and the explanatory drawings, to such persons as were thought most capable of affording them information. To these queries they received answers from Dr.

Maskelyne, Mr. A. Robertson, Mr. Playfair, Mr. Robison, Dr. Milner, Dr. Hutton, Mr. Atwood, Colonel Twiss, Mr. Jessop, Mr. Rennie, Mr. Watt, Mr. Southern, Mr. Reynolds, Mr. Wilkinson, and Mr. Bage. Some of these gentlemen suggested particular improvements and modifications of the plan: but considering all the circumstances of the case, it was nearly their unanimous opinion, that a cast iron arch of 600 feet in the span was practicable and advisable, and capable of being rendered a beautiful, useful, and durable edifice.

The report of the committee, which contains the answers of the above-named gentlemen to the queries proposed, was ordered to be printed on the 3d of June, 1801: it is almost needless to add, that it comprises a great deal of scientific and valuable information, on the subject of bridges in general.

At the time the preceding account was drawn up (viz. 1801) there seemed much probability that the iron bridge would be erected: we have now (April, 1806) only to add, that the project seems to be altogether abandoned.

Much information on the subject of Iron Bridges will be given in the collection of Dr. Hutton's Works, now publishing.

IRON denotes—1. any instrument or utensil made of iron, as, a flat iron, or smoothing iron (Pope). 2. Chain, shackle; manacle (Psalms).

IRON, *v.* 1. Made of iron (Montmer). 2. resembling iron in colour (Woodward). 3. Harsh, severe; rigid, miserable (Crahan). 4. Insoluble, unbroken (Philips). 5. Hard; impenetrable (Shakspeare).

TO IRON, *v. a.* (from the noun) 1. To smooth with an iron. 2. To shackle with irons.

IRON Moulds, and spots of ink in linen may be taken out by moistning the stained part in a solution of oxalic acid in distilled water, and then washing it out with pure water.

IRON Ochre, in mineralogy. See FERREUM.

IRON Pyrites, in mineralogy. See FERREUM.

IRON Wood, in botany. See SIDERONYTUM and FAGARA.

IRON Wort, in botany. See SIDERITS.

IRO'NICAL. *a.* (from *irony*.) Expressing one thing and meaning another; speaking by contraries (Brown).

IRONICALLY. *ad.* (from *ironical*.) By the use of irony (Bacon).

IRONMONGER. *s.* (from *iron* and *monger*.) A dealer in iron.

IRONWOOD. *s.* A kind of wood extremely hard, and so ponderous as to sink in water.

IRONY. *a.* (from *iron*.) Made of iron; partaking of iron (Linnæus).

IRONY. *s.* (*ironie*, French.) A mode of speech in which the meaning is contrary to the words (Swift).

IROQUOIS, the name of five nations in North America, in alliance with the British Colonies. They are bounded by Canada on the north, by the British plantations of New York, and by Pennsylvania on the east and south, and by Lake Ontario on the west.

IRRA'DIANCE. } *s.* (*irradiance*, French.)

IRRA'DIANCY. } 1. Emission of rays or beams of light upon any object (Brown). 2. Beams of light emitted (Milton).

TO IRRA'DIATE. *v. a.* (*irradio*, Latin.)

1. To adorn with light emitted upon it; to brighten (South). 2. To enlighten intellectually; to illumine; to illuminate (Milton). 3. To animate by heat or light (Hale). 4. To decorate with shining ornaments (*ope*).

IRRADIA'TION. *s.* (*irradiation*, French.)

1. The act of emitting beams of light (Digby). 2. Illumination; intellectual light.

IRRATIONAL. *a.* (*irrationalis*, Latin.)

1. Void of reason; void of understanding; wanting the discursive faculty (Milton). 2. Absurd; contrary to reason (Harvey).

IRRATIONAL NUMBERS OF QUANTITIES, are such roots as cannot be accurately extracted, being incommensurable to unity. See RADIX.

IRRATIONALITY. *s.* (from *irrational*.)

Want of reason.

IRRATIONALLY. *ad.* (from *irrational*.)

Without reason, absurdly.

IRRECLAIMABLE. *a.* (in and reclaimable.) Not to be reclaimed; not to be changed to the better (Addison).

IRRECONCILEABLE. *a.* (*irreconcilable*, Fr.) 1. Not to be recalled to kindness; not to be appeased (Dryden). 2. Not to be made consistent (Rogers).

IRRECONCILEABLENESS. *s.* (from *irreconcilable*.) Impossibility to be reconciled.

IRRECONCILEABLY. *ad.* (from *irreconcilable*.) In a manner not admitting reconciliation.

IRRECONCILED. *a.* (in and reconciled.) Not atoned (Shakspeare).

IRRECOVERABLE. *a.* (in and recoverable.) 1. Not to be regained; not to be restored or repaired (Rogers). 2. Not to be remedied (Hooker).

IRRECOVERABLY. *ad.* (from *irrecoverable*.) Beyond recovery; past repair (Milton).

IRREDUCIBLE. *a.* (in and reducible.) Not to be brought or reduced (Boyle).

IRREDUCIBLE CASE, in algebra, that case of cubic equations where the root, according to Cardan's rule, appears under an impossible or imaginary form, and yet is real. The general form being $x^3 - ax = +b$, where $\frac{1}{4}a^3$ is greater than $\frac{1}{2}b^2$, or $4a^3$ greater than $27b^2$. Thus, in the equation $x^3 - 90x - 100 = 0$, the root, according to

Cardan's rule will be $x = \sqrt[3]{50 + \sqrt{-24500}} + \sqrt[3]{50 - \sqrt{-24500}}$, which is an impos-

sible expression, and yet one root is equal to 10; and the other two roots of the equation are also real. Algebraists, for two centuries, have in vain endeavoured to resolve this case, and bring it under a real form; and the question is not less famous among them, than the squaring of the circle is among geometers.

One of the most convenient methods of determining the roots of equations of this

IRREDUCIBLE.

kind, is by means of a Table of Natural Sines, &c. for which purpose the following formulæ will be found extremely commodious, the arc, in each case, being always less than a quadrant, and therefore attended with no ambiguity.

If the equation be $x^3 - ax = b$; let A be put = arc whose cos. is $\frac{3b}{2a} \sqrt{-1}$ to rad. 1, then the three roots, or values of x , will be as follows:

$$\begin{aligned} x &= 2\sqrt{\frac{a}{3}} \times \cosine \frac{A}{3} \\ x &= -2\sqrt{\frac{a}{3}} \times \sine \frac{90^\circ + A}{3} \\ x &= -2\sqrt{\frac{a}{3}} \times \sine \frac{90^\circ - A}{3} \end{aligned}$$

And, if the equation be $x^3 - ax = -b$; let A be put = arc whose sine is $\frac{3b}{2a} \sqrt{\frac{3}{2}}$ to rad. 1; then the three roots, or values of x , will be as follows:

$$\begin{aligned} x &= 2\sqrt{\frac{a}{3}} \times \sine \frac{A}{3} \\ x &= 2\sqrt{\frac{a}{3}} \times \cos. \frac{90^\circ + A}{3} \\ x &= -2\sqrt{\frac{a}{3}} \times \cos. \frac{90^\circ - A}{3} \end{aligned}$$

Ex. Let $x^3 - 3x = 1$, to find the 3 roots of the equation.

Here $\frac{3b}{2a} \sqrt{\frac{3}{2}} = \frac{3}{6} \sqrt{\frac{3}{2}} = \frac{1}{2} = .5 = \cos. 60^\circ = A$.

$$\begin{aligned} \text{Hence } \left\{ \begin{aligned} x &= 2 \cos. \frac{60^\circ}{3} = 2 \cos. 20^\circ = \\ &1.8793852 \\ x &= -2 \sine \frac{150^\circ}{3} = -2 \sine 50^\circ = \\ &-1.5320888 \\ x &= -2 \sine \frac{30^\circ}{3} = -2 \sine 10^\circ = \\ &-.3472964 \text{ all real.} \end{aligned} \right. \end{aligned}$$

This improved method is the invention of Mr. Bonnycastle, who first gave the investigation of it in the 2d vol. of Hutton's Dict. Consult likewise, the Appendix to Friend's Algebra, and Dr. Hutton's ingenious paper on Cubics and Infinite series, in the Philosophical Transactions.

Mr. Barlow, of the Royal Military Academy, has lately computed a table for the solution of cubic equations of the irreducible form, by means of which the greatest root of any such equation may be readily and accurately obtained to eight or nine places

of figures; the principle of which will be clearly understood from the following explanation. It has been before observed, that every cubic equation of the form $x^3 - px = q$, falls under the irreducible case when

$$\frac{q}{4} < \frac{p^3}{27}, \text{ or when } q^2 < \frac{4p^3}{27} \text{ Now every}$$

cubic equation $x^3 - px = q$, may be transformed to a similar equation $y^3 - y = r$, in which

transformed equation we have $r = \frac{q\sqrt{p}}{p^2}$, and

$$y = \sqrt[3]{p}, \text{ or } x = y \sqrt{p}. \text{ So that the value}$$

of y being found in the latter equation, we know immediately that of x in the original one, because $x = y\sqrt{p}$; and since $x^3 - px = q$, is of the irreducible form, the transformed or dependent equation $y^3 - y = r$, is so likewise,

$$\text{and consequently } r^2 < \frac{4}{27}, \text{ or } r < \frac{\sqrt{12}}{9},$$

or $r < .3849001$. therefore assuming this as the maximum value of r , we find that the greatest value of y cannot exceed 1.1549, nor the least value of the same root ever be less than 1. So that all possible values of the greatest roots in equations of the above form fall between the limits 1 and 1.1549. Now the table to which we have above alluded is made to exhibit all the values of r , corresponding to each of those of y , between the limits 1 and 1.1549; and consequently, the root of every cubic equation of the irreducible form, when reduced as above, may be found by inspection true to five places of figures, and these, by a simple proportion, may be extended to eight or nine figures true. Having, therefore, found the value of y in the transformed equation, true to the extent above mentioned, we are led to that of x in the original equation, because $x = y\sqrt{p}$. The only operations, therefore, that are requisite for the solution of the irreducible case by this method, consist in one extraction of the square root, (which being generally of a small number, may be supplied from tables where these numbers are given to a limited extent), one in division, and one in multiplication; which are very trifling when contrasted with any other method of solution that has been at present discovered for the solution of those equations. This table, which will occupy only six octavo pages, forms a part of a set of tables which have just been completed in manuscript by the gentlemen above mentioned; which, with an introduction, &c. will contain about 500 pages 8vo. and are principally designed for facilitating the solution of equations, particularly those of the 2d, 3d, and 4th degree, the extraction of square and cube roots of numbers to any extent, the computation of fluents, &c. where logarithms cannot be conveniently

T R R

employed, or not with a sufficient degree of accuracy.

IRREFRAGABILITY. *s.* (from *irrefragable*.) Strength of argument not to be refuted.

IRREFRAGABLE. *a.* (*irrefragabilis*, Latin.) Not to be confuted; superior to argumental opposition (*wise*).

IRREFRAGABLY. *ad.* (from *irrefragabile*.) With force above confutation (*Atterbury*).

IRREFUTABLE. *a.* (*irrefutabilis*, Latin.) Not to be overthrown by argument.

IRREGULAR. *a.* (*irregular*, Fr. *irregularis*, Latin.) 1. Deviating from rule, custom, or nature (*Prior*). 2. Unmethodical; not confined to any certain rule or order (*Milton*, *Cowley*). 3. Not being according to the laws of virtue.

IRREGULAR COROL. in botany. Quæ limbi partibus, figura, magnitudine, aut proportionibus diversa est. Philos. bot. In Delin. Pl. we read et proportionibus. Different in the figure, size, or proportion of the parts of the border. I prefer the disjunctive, because a diversity in any of the above recited circumstances is sufficient to produce an irregularity. The term is originally Rovicus's, whose arrangement is founded on the regularity or irregularity of the corol. Jungius expressed the idea by the term *difformis*; Ray, Tournefort, and others, by *anomalus* (*flos*). Dr. Beichenhout's explanation gives Jungius's idea. An irregular flower is that whose parts want uniformity.

IRREGULARITY. *s.* (*irregularitas*, Fr.) 1. Deviation from rule. 2. Neglect of method and order (*Brown*). 3. Inordinate practice; vice (*Rogers*).

IRREGULARLY. *ad.* (from *irregular*.) Without observation of rule or method (*Locke*).

To IRREGULATE. *v. a.* (in and *regula*, Latin.) To make irregular; to disorder (*Brown*).

IRRELATIVE. *a.* (in and *relativus*, Lat.) Having no reference to any thing; single; unconnected (*Brown*).

IRRELIGION. *s.* (*irreligion*, Fr.) Contempt of religion; impiety (*Rogers*).

IRRELIGIOUS. *a.* (*irreligieux*, French) 1. Contemning religion; impious (*South*). 2. Contrary to religion (*Swift*).

IRRELIGIOUSLY. *ad.* (from *irreligious*.) With impiety; with irreligion.

IRREMEABLE. *a.* (*irremediabilis*, Latin.) Admitting no return (*Dryden*).

IRREMEDIAL. *a.* (*irremediable*, Fr.) Admitting no cure; not to be remedied (*Bacon*).

IRREMEDIABLY. *ad.* (from *irremediable*.) Without cure (*Taylor*).

IRREMISSEBLE. *a.* (*irremissible*, Fr.) Not to be pardoned.

IRREMISSEBLENESS. *s.* The quality of being not to be pardoned (*Hammond*).

I R R

IRREMOVABLE. *a.* (in and *remove*.) Not to be moved; not to be changed (*halsp*).

IRREOWNED. *a.* (in and *renown*.) Void of honour; unknown (*Spenser*).

IRREPAIRABLE. *a.* (*irreparabilis*, Latin.) Not to be recovered; not to be repaired (*Shakspeare*).

IRREPARABLY. *ad.* (from *irreparable*.) Without recovery; without amends (*Boyle*).

IRREPLEVABLE. *a.* (in and *replevy*.) Not to be redeemed. A law term.

IRREPREHENSIBLE. *a.* (*irreprehensibilis*, Latin.) Exempt from blame.

IRREPREHENSIBLY. *ad.* (from *irreprehensibilis*.) Without blame.

IRREPRESENTABLE. *a.* (in and *represent*.) Not to be figured by any representation (*filling fleet*).

IRREPROACHABLE. *a.* (in and *reproachable*.) Free from blame; free from reproach (*Atterbury*).

IRREPROACHABLY. *a.* (in and *reproachable*.) Without blame; without reproach.

IRREPROVEABLE. *a.* (in and *reprovable*.) Not to be blamed; unprovable.

IRRESISTIBILITY. *s.* (from *irresistible*.) Power or force above opposition (*Hammond*).

IRRESISTIBLE. *a.* (*irresistible*, Fr.) Superior to opposition (*Hoodcr*).

IRRESISTIBLY. *ad.* (from *irresistible*.) In a manner not to be opposed (*Rogers*).

IRRESOLUBLE. *a.* (in and *resolubilis*, Latin.) Not to be broken; not to be dissolved (*Boyle*).

IRRESOLUBLENESS. *s.* (from *irresoluble*.) Resistance to separation of the parts (*Boyle*).

IRRESOLVEDLY. *ad.* (in and *resolved*.) Without settled determination (*Boyle*).

IRRESOLUTE. *a.* (in and *resolute*.) Not constant in purpose; not determined (*Temp*).

IRRESOLUTELY. *ad.* Without firmness of mind; without determined purpose.

IRRESOLUTION. *s.* (*irresolution*, Fr.) Want of firmness of mind (*Addison*).

IRRESPECTIVE. *a.* (in and *respective*.) Having no regard to any circumstances (*Rogers*).

IRRESPECTIVELY. *ad.* Without regard to circumstances (*Hammond*).

IRRETRIEVABLE. *a.* (in and *retrieve*.) Not to be repaired; irrecoverable; irreparable.

IRRETRIEVABLY. *ad.* Irreparably; irrecoverably (*Woodward*).

IRREVERENCE. *s.* (*irreverentia*, Latin; *irreverence*, French.)

1. Want of reverence; want of veneration; want of respect (*Pope*). 2. State of being disregarded (*Clarendon*).

IRREVERENT. *a.* (*irreverent*, Fr.) Not paying due homage or reverence; not expressing or conceiving due veneration or respect (*Raleigh*).

IRREVERENTLY. *ad.* Without due re-

spect or veneration (*Government of the Tongue*).

IRREVERSIBLE. *a.* (*in and reverse.*) Not to be recalled; not to be changed (*Roze*).

IRREVERSIBLY. *ad.* (from *irreversible*.) Without change (*Hammond*).

IRREVOCABLE. *a.* (*irrevocabilis*, Latin.) Not to be recalled; not to be brought back, not to be reversed (*Dryden*).

IRREVOCABLY. *ad.* (from *irrevocable*.) Without recall (*Boyle*).

TO IRRIGATE. *v. a.* (*irrigo*, Lat.) To wet; to moisten; to water (*Ray*).

IRRIGATION. *s.* (from *irrigate*.) The act of watering or moistening (*Bacon*).

IRRIGATION. in agriculture, is the artificial watering of land. See *HYDRICULTURE*.

IRRIGUOUS. *a.* (from *irrigare*.) 1. Watery; watered (*Milton*). 2. Dey; moist (*Philips*).

IRRSION. *s.* (*irrisio*, Latin.) The act of laughing at another (*Hoodward*).

IRRITABILITY. In physiology, the contractile power of a muscle upon the application of certain stimuli, without a consciousness of action. This is the usual definition of the term; but it does not appear to be quite correct; for plants as well as animals are, in many instances, possess of very high degrees of irritability and contractility, of which we have sufficient proofs in the *hedysarum gyrans*, the *dionaea muscipula*, and the *urtica urens*, or common stinging nettle, the sting of which consists of a minute drop of acrimomous fluid lodged in a small bleb or bladder at the root of every aculeus or prickle, and which, in consequence of the irritability both of itself and the prickles with which the plant is armed, and which are tubular, contracts upon being touched, and discharges its limpid and to the naked eye invisible contents upon the hand or other substance that touches it. Yet plants are not, properly speaking, possessed of muscularity: they have no fibres that can in any respect be compared to the muscular fibres of animals, the immediate organ of animal irritability. The fibres of plants afford no gluten or ammonia, and are insensible to the action of Voltaic electricity.

The property of irritability, therefore, as applied to animals and vegetables, appears to depend upon powers altogether unconnected and distinct. What is the cause of it in vegetables has hitherto altogether eluded the researches of the physiologist: and but little indeed has ever been offered upon the subject by any inquirer whatever. In regard to animals the case is widely different: for if the cause have not been accurately ascertained, it has at least been conjectured, and accounted for by a variety of hypotheses, and the system of laws attempted to be traced by which the production of irritability is regulated.

We shall first examine the mode by which animal irritability has been attempted to be

accounted for by those who have chiefly speculated upon this subject.

Glisson is said to be the first discoverer of the irritable principle in the solid fibre a discovery which was afterwards enlarged upon by Haller, who found, by a variety of experiments, that the irritability of muscle remains a long time after their connexion with the brain is destroyed. To this principle he gave the name of *vis insita*. Forthrigill, in his *Hints on Animation*, considers oxygen as the proximate cause of irritability. Girtanner looks upon himself to be the discoverer of the same principle in the fluids of the body; and it is to this celebrated physiologist, in conjunction with M Humboldt, that we are indebted for the most curious observations on this principle. According to Girtanner, irritability is the principle of life in organized nature, and oxygen is the principle of irritability. His opinion is, that the irritable fibre, improperly as he contends, called the muscular fibre, is universally expanded through all organized nature; and that it is on this the organic motion, sensation, and even life depend. He affirms that this irritable fibre is the same in all parts, and subject to the same laws: that the fluids of animals are endued with irritability as well as the solids; their irritability consisting in their coagulability, which is subject to the same law as that of the fibre: that the degree of irritability of the solids and fluids is continually changing, and is different according to the age or regimen of the same animal, according to the sex, animation, and size, or the individual: that the state of health, or the tone of the fibre, consists in a certain quantity of the irritable principle necessary to its preservation.

To maintain this state it is necessary that the action of the stimulus be sufficiently strong to deprive the fibre of the surplus of the irritable principle which the lungs and the circulation of the fluids continually furnish. When the irritability is totally destroyed, the fibre is in a state of gangrene. It changes its colour, becomes livid or black, and is then subject to the laws of unorganized matter. That the irritable fibre, from the first moment of its existence, to that of its dissolution, being constantly surrounded by bodies that act on it by stimulating it, and upon which it re-acts by its contraction, it follows that, during life, the irritable fibre is in a continual action; that life consists in action, and not in a passive state as some authors have advanced. According to the experiments of this physician, poisons act on the blood by depriving it, (as was before observed by Fontana,) of the principle of irritability or of its oxygen.

Humboldt, in like manner, regards irritability as the common foundation of all vital action: he asserts that it depends upon the property of the elementary parts of the

I R R I T A B I L I T Y.

muscular fibre to change their relative situation on the approach of a stronger or weaker stimulus, whilst, in the sensible fibre of the nerve, the fluid is accumulated, known by the name of Galvanic or Voltaic; and he asserts, that by means of this Voltaic fluid the state of the irritable capacity of a muscle or nerve may be ascertained, for which experiment a metallic stimulus, composed of zinc and silver, is necessary. He lays down three principles, as necessary to excite the irritability.

1. *Oxygen*, which forms combinations with different acidifiable bases.

2. The *acidifiable bases* of the fibre with which the oxygen may combine. The acidifiable bases are *carbon*, with which it forms carbonic acid; *hydrogen*, with which it forms water or oxyde of hydrogen; *azot*, with which it forms oxyde of azot; *phosphorus*, with which it forms oxyde of phosphorus.

3. The *Voltaic fluid*.

It is therefore only in a just equilibrium of these principles that the necessary irritability of the parts consists: and on this hypothesis the different animal functions are a series of continual combinations produced in the body.

According to Mr. Davy the chief principles of the animal fibre are nitrogen, hydrogen, carbon, oxygen and light; and the immediate cause of irritable action is the combination of the oxygen with the hydrogen and carbon forming water and carbonic acid, and liberating the azot and electric fluid; since it is certain that water and carbonic acid are liberated during muscular action; and probably azot and light, in its condensed state electric fluid; as it is well known that the torpedo and some other animals give out the electric fluid during animal action.

Such are the supposed *causes* of irritability. *Its laws* are attempted to be reduced to somewhat of a systematic form by Dr. Crichton in his treatise on Mental Derangement, and are stated to be as follows:

1st. After every action in an irritable part a state of rest, or cessation from motion must take place, before the irritable part can be again excited to action. If by an act of volition we throw any of our muscles into action, that action can only be continued for a certain space of time; the muscle becomes relaxed, notwithstanding all our endeavours to the contrary, and remains a certain time in that relaxed state, before it can be again thrown into action. 2. Each irritable part has a certain portion or quantity of the principle of irritability which is natural to it, part of which it loses during action, or from the application of stimuli. 3. By a process wholly unknown to us it regains this lost quantity during its repose or state of rest. In order to express the different quantities of irritability in any part, we say that it is either more or less

redundant, or more or less defective. It becomes redundant in a part when the stimuli which are calculated to act on that part are withdrawn, or withheld for a certain length of time, because then no action can take place. While, on the other hand, the application of stimuli causes it to be exhausted, or to be deficient, not only by exciting action, but by some secret influence, the nature of which has not yet been detected, for it is a circumstance extremely deserving of attention, that an irritable part or body may be suddenly deprived of its irritability by powerful stimuli, and yet no apparent cause of muscular or vascular action takes place at the time. Thus a certain quantity of spirits taken at once into the stomach kills almost as instantaneously as lightning does. The same thing may be observed of some poisons, as opium, laurel-water, the juice of some poisonous vegetables, &c. Each irritable part has stimuli which are peculiar to it; and which are intended to support its natural action: thus blood, which is the stimulus proper to the heart and arteries, if by any accident it gets into the stomach, produces sickness or vomiting. 5. Each irritable part differs from the rest in regard to the quantity of irritability which it possesses. This law explains to us the reason of the great diversity which we observe in the action of various irritable parts. Thus the muscles of voluntary action can remain a long time in a state of action, and if it be continued as long as possible, another considerable portion of time is required before they regain the irritability they lost; but the heart and arteries have a more short and sudden action, and their state of rest is equally so. The circular muscles of the intestines have also a quick action and short rest. 6. All stimuli produce action in proportion to their irritating powers. As a person approaches his hand to the fire, the action of all the vessels in the skin is increased, and it glows with heat; if the hand be approached still nearer, the action is increased to such an unusual degree as to occasion redness and pain; and if it be continued too long, real inflammation takes place; but if this heat be continued, the part at last loses its irritability, and a sphacelus or gangrene ensues. 7. The action of every stimulus is in an inverse ratio to the frequency of its application. A small quantity of spirits taken into the stomach increases the action of its muscular coat, and also of its various vessels, so that digestion is thereby facilitated. If the same quantity, however, be taken frequently, it loses its effect. In order to produce the same effect as at first, a larger quantity is necessary; and hence the origin of dram-drinking. 8. The more the irritability of a part is accumulated, the more that part is disposed to be acted upon. It is on this account that the activity of all animals, while in perfect health, is much

livelier in the morning than at any time of the day; for during the night the irritability of the whole frame, and especially, that of the muscles destined for labour, viz. the muscles of voluntary action, is re-accumulated. The same law explains why digestion goes on more rapidly the first hour after food is swallowed than at any other time; and it also accounts for the great danger that accrues to a famished person upon first taking in food. 9. If the stimuli which keep up the action of any irritable body be withdrawn for too great a length of time, that process on which the formation of the principle depends is gradually diminished, and at last entirely destroyed. When the irritability of the system is too quickly exhausted by heat, as is the case in certain warm climates, the application of cold invigorates the frame, because cold is a mere diminution of the overplus of that stimulus which was causing the rapid consumption of the principle. Under such, or similar circumstances, therefore, cold is a tonic remedy; but if in a climate naturally cold, a person were to go into a cold bath, and not soon return into a warmer atmosphere, it would destroy life just in the same manner as many poor people, who have no comfortable dwellings, are often destroyed from being too long exposed to the cold in winter. Upon the first application of cold the irritability is accumulated, and the vascular system therefore is disposed to great action; but after a certain time all action is so much diminished, that the process, whatever it be, on which the formation of the irritable principle depends, is entirely lost. See article LIFE.

TO IRRITATE, *v. a.* (*irrito*, Latin.) 1. To provoke; to tease (*Larrendon*). 2. To fret; to put into motion or disorder by any irregular or unaccustomed contact; to stimulate; to vellicate (*Bacon*). 3. To agitate; to enforce (*Bacon*).

IRRITATION, *s.* (*irritatio*, Latin.) 1. Provocation; exasperation. 2. Stimulation; vellication (*Arbuthnot*).

IRROMANGO, one of the New Hebrides, in the S. Pacific Ocean. Lat. 18. 48. N. Lon. 169. 20. E.

IRRUPTION, *s.* (*irruptio*, Latin.) 1. The act of any thing forcing an entrance (*Burnet*). 2. Inroad; burst of invaders into any place. (*Addison*).

IRTYSH, a large river in Siberia, which running from the S. to the N. E. falls into the Ob near Tobolsk.

IRVINE, a royal borough and sea-port in Ayrshire, seated at the mouth of a river of the same name, on the frith of Clyde. Lat. 55. 38. N. Lon. 2. 41. W.

IRWELL, a river in Lancashire, which rises above Bolton, flows thence to Manchester, and falls into the Mersey below Flixton.

IS, (*yr*, Saxon.) The third person singular of to be; I am, thou art, he is,

ISA'AC, the son of Abraham and of Sarah, was born: 1896 B.C. His father was commanded to offer him up as a sacrifice, and was about to obey the divine command, when an angel stopped him. Isaac had two sons, Esau and Jacob; but his life affords only a few incidents. He died 1716 B.C.

ISABELLA, a town in the N. coast of Hispaniola. Lat. 19. 55. N. Lon. 36. 2. W.

ISABELLA Fort, a fort of Austrianlanders, seated on the W. side of the Scheldt, opposite Antwerp.

ISÆUS, an orator of Chaicis, who came to Athens, and became the pupil of Lysias, and soon after the master of Demosthenes. Demosthenes imitated him in preference to Isocrates, because he studied force and energy of expression rather than floridness of style. Ten of his sixty-four orations are extant. Juv. &c.—Another Greek orator, who came to Rome A.D. 17, greatly recommended by Pliny the younger.

ISAIAH, the principal of the four great prophets, was the son of Amos, and of the royal family of David. He prophesied in the reigns of Ozias, Jotham, Ahaz, and Hezekiah, from 735 to 681 B.C. in which last year it is said Manasseh caused him to be cut in two with a wooden saw. He is justly called the evangelical prophet, from the clear and constant view which he has taken of the Messiah throughout his predictions, which are composed in a style truly divine. Bishop Lowth's translation and notes first published, in 1778, throw considerable lights upon the composition and meaning of Isaiah.

ISATIS, Woad. In botany a genus of the class tetradynamia, order siliiculosa. Silicle lanceolate, obtuse, deciduous, one-celled, one-seeded, with two-boat-shaped valves. Four species—all European plants, and one common to our own country: this is *I. tinctoria*, or common woad, found wild in our fields, but often cultivated as of great use in the art of dyeing. See DYEING. Its specific character is root-leaves crenate; stem-leaves arrow-shaped; silicles rather obtuse, downy. There is another variety with the root-leaves obtuse and entire.

ISATIS, in zoology, a synonym of the canis lagopus.

ISAU'RA, or **ISAU'RU**, in ancient geography, a strong city, at mount Taurus. The country in which it stood was called Isauria, it was rugged and mountainous, and touched Pamphylia and Cilicia on the North.

ISCA DUMNIORUM, the ancient name of EXETER.

ISCA Silurum, the ancient name of CAERLEON.

ISCHŒMA'TIS, (from *ισα* to restrain and *μα* blood.) Styptics. Medicines that restrain hæmorrhages.

ISCHŒMU'M. In botany a genus of the class polygamia, order monœcia. Hermaph. Calyx, glume two-valved, two-flowered, cartilaginous; corol glume two-valved; stamens three; styles two; seed one. Male;

stamens three. Eight species all natives of the East Indies.

ISCHA'LIS, the ancient name of **ICHAETER**.

ISCHIA, an island in the Mediterranean, near the coast of Naples, about ten miles in circumference. It appears to have been formed by a volcano: for although no eruptions are now visible, scoria and lava are found, and several hot springs. It is mountainous, but fertile in fruits, and abounds in game; the white wine is much esteemed. The air is healthy, on which account it is much resorted to by invalids, as it is but a small distance from the continent, and hardly more than four leagues from Naples. Ischia, the town is situated on the north coast of the island, on a rock surrounded by the sea, and communicating with the island by means of a bridge. It is the see of a bishop, suffragan of Naples. Lat. 10. 11. N. Lon. 14. 2. E.

ISCHIA'DIC *a.* (ισχια). In anatomy, an epithet to the crural vein; in pathology, the ischiadic passion is the gout in the hip, or the sciatica.

ISCHIAS, (*Ischias*, *a*ris, f. *ισχιας*; from *ισχια*, the hip). *Sciatica*. A rheumatic affection of the hip joint; one of the terminations of acute rheumatism.

ISCHIATOCELE, (*Ischiatocele*, *es*, f. *ισχιατοκελη*; *ισχια*, the hip, and *κελη*, a rupture). *Ischiatocele*. An intestinal rupture through the sciatic ligaments.

ISCHIOCAVERNO'SUS. See **ERECTOR PENIS**.

ISCHIOCELE, (*Ischioccele*, *es*, f. *ισχιοκελη*). See **ISCHIATOCELE**.

ISCHIS (from *ισχυς*; strength) The loin, or seat of strength.

ISCHIUM, (*Ischium*, *i*, n. *ισχιον*; from *ισχυς*, the loin, so named because it is near the loin). A bone of the pelvis of the fœtus. See **INNOMINATUM OS**.

ISCHURATICS (from *ισχυρισμος*). Medicines which relieve a suppression of urine.

ISCHURIA, (*Ischuria*, *a*, f. *ισχυρια*; from *ισχυς*, to restrain, and *ουρα*, the urine.) A suppression of urine. A genus of disease in the class locales and order epischeses of Cullen. There are four species of ischuria: 1. *Ischuria renalis*, coming after a disease of the kidneys, with a troublesome sense of weight in that part. 2. *Ischuria ureterica*, after a disease of the kidneys, a sense of pain or uneasiness in the course of the ureters. 3. *Ischuria vesicalis*, a frequent desire to make water, with a swelling of the hypogastrium, and pain at the neck of the bladder. 4. *Ischuria urethralis*, a frequent desire to make water, with a swelling of the hypogastrium, and pain of some part of the urethra.

ISELA'STICS, games or combats celebrated in Greece and Asia, in the time of the Roman emperors. The victor had very considerable privileges conferred on him.

ISENBURG, a large town of Germany,

capital of a county of the same name, with a handsome castle, seated on the river Isar. Lat. 50. 42. N. Lon. 7. 34. E.

ISER, a river of Germany, which rises in the Tyrolese, about five miles north from Inspruck, passes by Munich, Mosburg, Landshut, Dingeltingen, Landau, &c. and runs into the Danube, two miles below Pöckendorf.

ISERE, a department of France, which includes part of the late province of Dauphiny. It is named from a river which rises on the confines of Savoy, and falls into the Rhone, above Valence.

ISERIAN, in mineralogy. See **TITANUM**.

ISERNIA, a town of Naples, in Molise, with a bishop's see. It is seated at the foot of the Appennines. Lat. 41. 36. N. Lon. 14. 21. E.

ISERTIA. In botany a genus of the class hexandria, order monogynia. Calyx superior, six-toothed; corol funnel-form, six-cleft; stigma six-cleft, some six-celled, many-seeded. Two species, one a cayenne tree with opposite, lance-elliptic leaves: terminal panicles the other with oblong glabrous leaves, and ovate thyrse.

ISH, (*or* Saxon) 1. A termination added to an adjective to express diminution of any quality: as, bluish, tending to blue. 2. It is likewise sometimes the determination of a genitive or possessive adjective as, Swedish. 3. It likewise notes participation of the qualities of the substantive to which it is added: as, manish.

ISA, feasts and sacrifices anciently solemnized in honour of **ISIS**. They were full of the most abominable impurities.

ISIAC table, one of the most considerable monuments of antiquity, discovered at Rome in 1525, and supposed (on account of its various figures in bas-relief) to represent the feasts of **ISIS**, and other Egyptian deities. Respecting the antiquity of this monument there are various conjectures.

ISIACI, priests of the goddess **ISIS**: they bore a branch of sea-wormwood in their hands instead of olive; sung the praises of the goddess twice a day, viz. at the rising of the sun, when they opened her temple; after which they begged alms the rest of the day, and returning at night, repeated their orisons, and shut up their temple.

ISCLE *s.* (more properly *icicle*, from *ice*.) A pendent shoot of ice (*Dryden*).

ISIGNI, a sea-port of France, in the department of Calvados, noted for its salt-works, cider, and butter. Lat. 48. 30. N. Lon. 0. 59. W. There is a town of the same name, but of small note, in the department of the channel, and district of Mortain.

ISINGLASS, a well-known gelatinous substance, otherwise called *Ichthyocola*, or fish-glue. For particulars concerning it, the reader is referred to the latter part of the article **GELATIN** in this work: see also **ICHTHYOCOLLA**, and a valuable paper. "On the

manner of making Isinglass in Russia, with a particular description of its manufacture in England from the produce of British fisheries. By Humphrey Jackson Esq." in vol. 62 Phil. Trans. or New Abridgement, vol. 13. p. 361—367.

ISIS, a celebrated deity of the Egyptians, daughter of Saturn and Rhea, according to Diodorus, of Sicily. Some suppose her to be the same as Io, who was changed into a cow by her lover Jupiter, and restored to her human form in Egypt, where she taught agriculture, and received divine honours after death. Isis was the Venus of Cyprus, the Minerva of Athens, the Cybele of the Phrygians, the Ceres of Eleusis, the Proserpine of Sicily, the Diana of Cete, the Bellona of the Romans, &c. Osiris and Isis reigned conjointly in Egypt; but the rebellion of Typhon, the brother of Osiris, proved fatal to this sovereign (Vid. Osiris and Typhon). The ox and cow were the symbols of Osiris and Isis, because these deities, while on earth, had diligently applied themselves to cultivating the earth (Vid. Apis). Isis was also supposed to be the moon, and Osiris the sun. The Egyptians believed that the inundations of the Nile proceeded from the tear, which Isis shed for the loss of Osiris, whom Typhon had murdered. The worship of Isis was universal in Egypt; Cleopatra, the beautiful queen of Egypt, was wont to dress herself like this goddess, and effected to be called a second Isis.

The following is an encomium of Isis related by Diodorus, as it is engraven on a column.

"I am Isis the queen of Egypt, instructed by Mercury. Nobody can abolish what I have established by my ordinance. I am the wife of Osiris, I have first invented the use of corn. I am the mother of king Horus. I shine in the dog-star. By me the city of Bubasti was founded; wherefore rejoice thou, Egypt, rejoice thou, thou hast brought me up and fed me."

The Egyptians ascribed the overflowings of the Nile, to the tears that she shed for the death of her husband Osiris.

We have a statue of Isis habited like a Roman Matron, having a half moon on the top of her Head, her right hand turned towards Heaven, and her left towards the earth, to inform us, that she receives the influence of Heaven. We have also a medal of the emperor Commodus, where Isis is represented with a half moon, holding a sphere with her right hand, and a vessel full of fruits with her left. The sphere denotes astrology, wherein the Egyptians excelled; and the fruits the fecundity of Egypt.

ISIS, a name often given to the river Thames, before it joins the Thame at Dorchester.

ISIS. In zoology. Coral, a genus of the order zoophyta, class vermes. Animal growing in the form of a plant; stem stony, jointed, the joints longitudinally striate, united by spongy or horny junctures, and

covered by a soft porous cellular flesh or bark; mouth beset with oviparous polypes. Six species as follow:

1. *I. Hippuris*. With white striate joints and black junctures; of which there are two varieties. They inhabit the Indian seas; growing to rocks; and are from two inches to two feet long; stony joints longer, black junctures more contracted.

2. *I. Dichotoma*. Stem coralline, with smooth joints, and decorticated junctures. Inhabits the Indian and Ethiopic seas; about half a foot high; somewhat nexuous; joints clear flesh-colour, with a concave flesh beset with convex papillae.

3. *I. ochrasca*. Stem coralline, with decorticated joints and knotty junctures. Inhabits the East Indies among the Spice Islands; deep red sometimes white with the junctures brownish-yellow; stem irregularly channelled, as if eaten into; branches numerous, dichotomous, spread; joints connected by deep, yellow, spongy knobs; flesh pale yellow, full of stichate mouths; polypes with eight claws.

4. *I. Entrocha*. Stem testaceous, round, with orbicular, perforated joints, and verticillate, dichotomous branches. Inhabits the Ocean. Stem about the thickness of a finger with crowned, flat, orbicular joints perforated in the centre, the perforation pentagonal, with the disk subulate from the centre; outer-bark or flesh unequal and surrounded by a row of tubercles; branches thin, dichotomous, continued and not jointed.

It should seem, therefore, that those fossil bodies called *Entrochi* are petrified specimens of this species of Coral.

5. *I. Aspera*. Stem testaceous, jointed, pentagonal; branches verticillate, with a terminal dichotomous star. Inhabits the ocean, and is found to slide in our own country and in all other parts of Europe; and known by the name of the *Star-stone*.

6. *I. Cocinea*. Stem jointed, slender, very red, and subulate. Flesh on the outside, covered with small scarlet prominent cells each furnished with a mouth. Inhabits the Indian Ocean, two or three inches high. A very minute coral with irregularly spreading branches, and is sometimes, but very rarely, found quite white.

The calcareous matter of these animals is often used in medicine as an absorbent earth; but it does not seem to possess any medicinal virtue beyond that of common chalk. From the occasional difference of its colour it is called in the *dispensatorie corallum album—white coral*, or *corallum rubrum, red Coral*, yet the red coral is more frequently the *gurgonia nobilis*; which see, as also *MILIPORA*.

ISLAM, or ISLAWISM, the true faith, according to the Mahometans. See *MAHOMETANISM*.

ISLAND, or ISLE, a tract of dry land encompassed with water; either with the sea, a river or lake. In which sense island stands

contradistinguished from continent, or terra firma.

Floating-Islands. Histories are full of accounts of floating-islands; but the greater part of them are either false, or founded on exaggerations. What we generally see of this kind is no more than the concretion of the lighter and more viscous matter floating on the surface of water in cakes, and with the roots of plants, forming congeries of different sizes, which not being fixed to the shore in any part, are blown about by the winds, and float on the surface. These are generally found in lakes, where they are confined from being carried too far: and from being broken by the agitation of the water.

ISLANDER, an inhabitant, or a native of a country surrounded with water.

ISLANDICUS MUSCUS. See **LICHEN Islandicus**

ISLAND Y. See **ILAY**.

ISLE. *s.* (*Isle*, French. Pronounced *île*.)

1. An island; a country surrounded by water (*Walter*). 2. A long walk in a church, or public building (*Pope*).

ISLE-ADAM, a town of France, in the department of Seine and Oise, with a castle seated on the Oise. Lat. 49. 7. N. Lon. 2. 13. E.

ISLE de-dieu, a small island of France, 14 miles from the coast of Poitou. Lon. 2. 15. W. Lat. 46. 45. N.

ISLE-de-France. See **FRANCE**, *Isle of*.

ISLE-Jourdain, a town of France in the department of Gers, and late province of Armagnac, in an island of the little river Save, eight miles N. of Lombez. Lon. 1. 2. E. Lat. 43. 40. N.

ISLE and VILAINE, a department of France, containing part of the late province of Bretagne. Rennes is the capital.

ISLEWORTH, a village in Middlesex, seated on the Thames, 9 miles W. of London.

ISLINGTON, a village of Middlesex, on the north side of London, to which it is almost contiguous. It appears to be of Saxon origin; and in the conqueror's time was written Isledon, or Isendon. The church is one of the pretends of St. Paul's; to the dean and chapter of which a certain precinct here belongs, for the probate of wills, and granting administrations. The church was a Gothic structure, erected in 1503, and stood till 1751, when the inhabitants applied to parliament for leave to rebuild it, and soon after erected the present structure, which is a very substantial brick edifice, though it does not want an air of lightness. Its houses are above 4000, including the Upper and Lower Holloways, three sides of Newington-green, and part of Kingsland, on the road to Ware. The White Conduit-house in this place, so called from a white stone conduit that stands before the entrance, has handsome gardens with good walks, and two large rooms one above the other for the entertainment of company at tea, &c. In this

village is the celebrated place of entertainment called Sadler's Wells.

ISLIP, a village in Oxfordshire, 4 miles N. of Oxford. It is noted for the birth and baptism of Edward the Confessor. The chapel in which the ceremony was performed, stands a little N. of the church, and is still called the king's chapel; it has now a roof of thatch.

ISLIP, a village in Northamptonshire, separated from the town of Thrapston by the river Nen, over which here is a long stone bridge.

ISMAELITES, the descendants of Ismael; dwelling from Havilah to the wilderness, of Sur, toward Egypt, and thus overspreading Arabia Petraea, and therefore Josephus calls Ismael the founder of the Arabs.

ISMA'IL, a strong town of Turkey in Europe, in Bessarabia. It was taken by storm, by the Russians, on 22d of December 1790; and it is said, that the long siege, and the capture did not cost them less than 10 000 men. The most shocking part of the transaction is, that the garrison (whose bravery merited, and would have received from the generous foe, the highest honours) were massacred in cold blood by the merciless Russians, to the amount, by their own account of 30,000 men; and the place was abandoned to the fury of the brutal soldiery. Ismail is seated on the N. Side of the Danube. Lat. 45. 11. N. Lon. 29. 30. E.

ISNA'DIA. In botany a genus of the class tetrandria, order monogynia. Corollaless; calyx four-cleft; capsule four-celled, surrounded by the calyx. One species only—an aquatic annual plant common to Europe and America.

ISNIC, a town of Turkey in Asia, and in Natolia, with a Greek archbishop's see. It is the ancient Nice, famous for the first general council held here in 325. Lat. 40. 13. N. Lon. 30. 9. E.

ISOCHRONAL, or **ISOCRONOUS**, is applied to such vibrations of a pendulum, as are performed in equal times.

Of which kind are all the vibrations or swings of the same cycloidal pendulum, whether the arcs it describes be longer or shorter; for when it describes a shorter arc, it moves so much the slower; and when a long one, proportionably faster.

ISOCHRONAL Line, is that wherein a heavy body is supposed to descend without any acceleration.

Leibnitz, in the Act. Erud. Lips. for April, 1689, has a discourse on the linea isochrona, in which he shews, that a heavy body, with a degree of velocity acquired by its descent from any height, may descend from the same point by an infinite number of isochronal curves, which are all of the same species, differing from one another only in the magnitude of their parameters (such as are all the quadratocubical paraboloids), and consequently similar to one another. He shews also, how to find a line, in which

ISO

a heavy body descending, shall recede uniformly from a given point, or approach uniformly to it.

ISOCRATES, the most conspicuous of this name is an orator, son of a rich musical instrument-maker at Athens. He has always been much admired for the sweetness and graceful simplicity of his style, for the harmony of his expressions, and the dignity of his language. The remains of his orations extant inspire the world with the highest veneration for his abilities, as a moralist, an orator, and above all, as a man. About thirty-one of his orations are extant. The defeat of the Athenians at Checonæa, by Philip of Macedon, had such an effect on his spirits, that he died, after he had been four days without aliment, in the 99th year of his age, about 338 B. C.

ISOETES. In botany a genus of the class cryptogamia, order musci. Its popular name is Quillwort. Male and within the base of the inner leaves; anthers solitary on an inversely heart-shaped receptacle. Fem. within the base of the outer leaves; germ on an inversely heart-shaped receptacle; capsule membranaceous; seeds numerous, angular rough. Two species.

Of which one is, *I. Lacastrix* common to our own country.

ISOLA, a sea-port town of Italy, in the kingdom of Naples, and in the farther Calabria, with a bishop's see. Lat. 39. 1. N. Lon. 17. 26. E.

ISOMERIA, a term in algebra, sometimes used by Vieta, and denoting the freeing an equation from fractions.

ISO'PERIMETRICAL Figures, are such as have equal perimeters, or circumferences. It is demonstrated in geometry, that among isoperimetrical figures, that is always the greatest which contains the most sides or angles.—From whence it follows, that the circle is the most capacious of all figures which have the same circumference with it.

The analysis of the general problem concerning figures that, among all those of the same perimeter, produce maxima and minima, was given by Mr. James Bernoulli, from computations that involve 2d and 3d fluxions. And several inquiries of this nature have been since prosecuted in like manner, but not always with equal success. Mr. Maclaurin to vindicate the doctrine of fluxions from the imputation of uncertainty, or obscurity, has illustrated this subject, which is considered as one of the most abstruse parts of this doctrine, by giving the resolution and composition of these problems by first fluxions only; and in a manner that suggests a synthetic demonstration, serving to verify the solution. See Maclaurin's Fluxions, p. 486; and Simpson's Fluxions, p. 98.

M. Lhuillier has some elementary problems on isoperimeters, in his "Polygonometric." Thus he shows from the simplest geometrical

ISP

principles, 1st. That, of all triangles having the same base and the same perimeter, the iso-celes triangle has the greatest surface. 2dly. Of all isoperimetrical triangles, the equilateral has the greatest surface. 3dly. Of all isoperimetrical figures whose number of sides is given, that which is the greatest has all its sides equal. 4thly. If a circle and a figure circumscribable about a circle are isoperimeters, the surface of the circle is a geometrical mean proportional between that figure and a similar figure circumscribed about the same circle. 5thly. If a circle and a figure circumscribable about a circle are equal, the perimeter of that figure is a geometrical mean proportional between the perimeter of the circle and the perimeter of a similar figure circumscribed about the same circle. 6thly. The circle is greater than any rectilinear figure of the same perimeter; and it has a perimeter smaller than any rectilinear figure of the same surface. 7thly. The surface of regular isoperimetrical figures are so much the greater as the number of their sides is the greater: and the perimeters of equal regular figures are the smaller as the number of their sides is the greater. 8thly. Of all right cones that whose side is triple the radius of the base, has the total surface the smallest, and reciprocally. 9thly. The sphere is greater than any solid of the same surface, circumscribable about a sphere; and reciprocally.

ISO'PSEPHUS, *ισοψεφος*, in antiquity an appellation given to judges, who had equal jurisdiction and authority! it was likewise applied to a case where the votes were equal on both sides.

ISO'PYRUM. In botany a genus the class polyandria, order polygymia. Calyx less: petals five, nectaries three-cleft, tubular; capsules recurved, many-seeded. Three species:—two natives of the Alps; one of Siberia.

ISO'SCELES Triangle, (*ισος*, equal, and *σελος*, leg) is a triangle which has two equal sides. In an isosceles triangle, the angles and opposite to the equal sides, are equal; and a line drawn from the top or vertex, cutting the base into two equal parts, is perpendicular, to the base. The same line, also bisects the vertical angle of the triangle.

ISPAPHAN, a city of Persia, and capital of the whole country, situated on the river Zenderoud, in the province of Irac, surrounded by a wall and ditch, and defended by a castle. The walls are built of mud, and are about 20,000 paces in compass; but kept in no repair, and so hidden by the adjoining houses and gardens, that they cut no figure, and are hardly to be discovered. The beauty of the city consists chiefly in a great number of sumptuous palaces, handsome and airy houses, spacious caravanseras, very beautiful bazars, many canals, and streets planted on both sides with lofty plane-trees; though, generally speaking, the other streets are

narrow, crooked, and not paved: but the air being very dry here, and every house-keeper causing the street to be watered before the door twice a day, there is neither so much dirt nor dust as in many great cities in Europe. The Meidan Shah, or Royal Square, is one of the finest in the world. It is four hundred and forty paces long, and one hundred and sixty broad, and is surrounded by a canal, built with bricks, cemented with a black mortar, which, in time, becomes harder than fire-stone. The royal mosque is at the south end of this square, and its portico is wonderfully adorned with a thousand figures, and an incredible profusion of gold and azure, the whole being also enlaid with enamelled squares, and a frieze round it of the same materials. Few structures can equal the magnificence of this, many of its pieces and decorations being wrought in a manner unknown to our European architects. The same may be said of the royal palace, and the haram, or woman's apartment. The palace is certainly one of the most spacious in the world, being near a league and a half in compass. Its great portico stands in the royal square, and is all built with porphyry, and very high. The Persians revere it as sacred. The suburbs of Ispahan are very large, and chiefly inhabited by Armenians. There are besides 1460 villages round about Ispahan, and the inhabitants live chiefly upon the manufacturing of silk and wool. Lat. 32. 25. N. Lon. 52. 25. E.

ISRAEL, the name which the angel gave Jacob, after having wrestled with him all night at Mahanaim or Peniel (Gen. xxxii. 1, 2, and 28, 29, 30, and Hosea xii. 3.) It signifies the conqueror of God, or a prince of God, or, according to many of the ancients, a man who sees God. By the name of Israel is sometimes understood the person of Jacob; sometimes the whole people of Israel, or the whole race of Jacob; and sometimes the kingdom of Israel, or of the ten tribes, distinct from the kingdom of Judah.

ISRAELITES, the descendants of Israel; who were at first called Hebrews, by reason of Abraham, who came from the other side of the Euphrates; and afterwards Israelites, from Israel the father of the twelve patriarchs; and lastly Jews, particularly after their return from the captivity of Babylon.

ISSACHAR, one of the divisions of Palestine by tribes; lying to the south of Zabulon, so as by a narrow slip to reach the Jordan, between Zabulon and Manasseh, Josh. xix. But whether it reached to the sea is a question.

ISSEL, or **YSSSEL**, a river of the United Provinces, which rises in Westphalia, runs N. by Doesburg, afterward by Zutphen, Deventer, and Campen, and soon falls into the Zuider-Zee, by two mouths.

ISSEL, or **YSSSEL**, THE LITTLE, another river of the United Provinces, which waters

Ysselstein, Montfort, and Gouda; and falls into the Maese, a mile and a half above Rotterdam.

ISSOIRE, an ancient town of France, in the department of Puy de Dome. It is seated on the Couze. Lat. 45. 34. N. Lon. 3. 15. E.

ISSOUDUN, a town of France, in the department of Indre. It is seated on the Theols. Lat. 46. 57. N. Lon. 2. 6. E.

ISSUE, *s.* (*issue*, French.) 1. The act of passing out. 2. Exit; egress; passage out (*Proverbs*). 3. Event; consequence (*Fairfax*). 4. Termination; conclusion (*Broome*). 5. Sequel deduced from premises (*Shakspeare*). 6. A fontanel; a vent made in a muscle for the discharge of humours (*Wiseman*). 7. Evacuation (*Matthew*). 8. Progeny; offspring (*Dryden*). 9. (In law.) *Issue* hath divers applications: sometimes used for children begotten between a man and his wife; sometimes for profits growing from an amercement; sometimes for profits of lands or tenements; sometimes for that point of matter depending in suit, whereupon the parties join and put their cause to the trial of the jury (*Cowell*).

To ISSUE, *v. n.* (*isser*, French.) 1. To come out; to pass out of any place (*Pope*). 2. To make an eruption; to break out (*Dryden*). 3. To proceed as an offspring (*King*). 4. To be produced by any fund (*Lytffe*). 5. To run out in lines (*Bacon*).

To ISSUE, *v. a.* 1. To send out; to send forth (*Bacon*). 2. To send out judicially or authoritatively (*Clarendon*).

ISSUELESS, *a.* (from *issue*.) Having no offspring; wanting descendants (*Carew*).

ISSUS, a town of Cilicia, on the confines of Syria, famous for a battle fought there between Alexander the Great and the Persians under Darius their king, in October, B. C. 333. In this battle the Persians lost 100,000 foot, 10,000 horse, and the Macedonians only 300 foot, and 150 horse, according to Diodorus Siculus. The Persian army, according to Justin, consisted of 400,000 foot, and 100,000 horse, and 61,000 of the former, and 10,000 of the latter, were left dead on the spot, and 40,000 were taken prisoners. The loss of the Macedonians, as he farther adds, was no more than 130 foot and 150 horse. According to Curtius, the Persians slain amounted to 100,000 foot, and 10,000 horse; and those of Alexander to 32 foot, and 150 horse, killed, and 504 wounded. This spot is likewise famous for the defeat of Niger by Severus, A. D. 104.

ISTHMA, sacred games among the Greeks, instituted B. C. 1326. They received their name from the isthmus of Corinth, where they were observed. They were celebrated in commemoration of Melicerta, who was changed into a sea deity, when his mother Ino had thrown herself into the sea with him. They were for some time interrupted, but Theseus at last reconstituted them in honour of Neptune, whom he publicly called his father. These games were observed

every third, or rather fifth year. Combats of every kind were exhibited, and the victors were rewarded with garlands of pine leaves. Some time after the victor received a crown of withered parsley.

ISTHMUS, a narrow neck, or slip of ground, which joins two continents; or joins a peninsula to the terra firma, and separates two seas. See **PENINSULA**. The most celebrated isthmuses are, that of Panama or Darien, which joins North and South America; that of Suez, which connects Asia and Africa; that of Corinth, or Peloponnesus, in the Morea; that of Crim-Tartary, otherwise called Taurica Chersonesus; that of the peninsula Romania, and Eriaso, or the isthmus of the Thracian Chersonesus, twelve furlongs broad, being that which Xerxes undertook to cut through.

ISTHMUS VIEUSSENI. The ridge surrounding the oval fossa or remains of the foramen ovale, in the right auricle of the human heart.

ISTRIA, a peninsula of Europe, bounded on all sides by the sea, except towards the north, where it is joined to Carniola. It was anciently a part of Illyrium; but being conquered by the Romans, between the first and second Punic wars, was annexed to Italy. At present, part of it belongs to the Venetians, and part to the house of Austria.

IT. pronoun. (*It*, Saxon.) 1. The neutral demonstrative (*Cowley*). 2. *It* is used absolutely for the state of a person or affair (*Shakspeare*). 3. *It* is used for the thing; the matter; the affair (*Shakspeare*). 4. *It* is used ludicrously after neutral verbs, to give an emphasis (*Locke*). 5. Sometimes applied familiarly, ludicrously or rudely to persons (*Shakspeare*).

ITALIAN, the language spoken in Italy. This tongue is derived principally from the Latin, and of all the languages formed from the Latin, there is none which carries with it more visible marks of its original than the Italian.

It is accounted one of the most perfect among the modern languages. It is complained, indeed, that it has too many diminutives and superlatives, or rather augmentatives; but without any great reason: for if those words convey nothing farther to the mind than the just ideas of things, they are no more faulty than our pleonasm and hyperboles.

The language corresponds to the genius of the people; they are slow and thoughtful; and accordingly, their language runs heavily, though smoothly; and many of their words are lengthened out to a great degree.—They have a great taste for music; and, to gratify their passion this way, have altered abundance of their primitive words; leaving out consonants, taking in vowels, softening and lengthening out their terminations, for the sake of the cadence.

Hence the language is rendered extremely musical, and consequently better than any other

in operas, and some parts of poetry: but it fails in strength and nervousness: hence also a great part of its words, borrowed from the Latin become so far disguised, that they are not easily known again.

The multitude of sovereign states into which Italy is divided, has given rise to a great number of different dialects in that language; which, however, are all good in the place where they are used.—The Tuscan is usually preferred to the other dialects, and the Roman pronunciation to that of the other cities; whence the Italian proverb, *Lingua Toscana in bocca Romana*.

ITALIAN Courier, in ornithology. See **CORRIERA**.

ITALIC CHARACTER, in printing. See **LETTER**.

ITALICA, in ancient geography, a town of Baetica, in Spain, built by Scipio Africanus. It was the birth-place of Trajan, Adrian, and the poet Silius Italicus: in the same place now stands a small village called Sevilla Vieja, four miles from Seville.

ITALY, one of the finest countries of Europe. On the north, N. W. and N. E. it is bounded by France, Switzerland, the country of the Grisons, and Germany; on the E. by the gulph of Venice; and on the S. and W. by the Mediterranean; its figure bearing some resemblance to that of a boot. Its length, from Aousta, at the foot of the Alps, in Savoy, to the utmost verge of Calabria, in the kingdom of Naples, is about 600 miles; but its breadth is very unequal, in some places near 400 miles, in others not above 25 or 30. It is the most celebrated country in Europe, having been formerly the seat of the Roman empire, and, afterwards, of that astonishing universal usurpation, the spiritual dominion of the Pope.

Italy had several names, sometimes it was called *Hesperia*, either from Hesperus, brother to Atlas, king of Mauritania, or Hesperus the star of Venus, called Lucifer, at the rising of the sun; and Hesperus or Vesper in the evening when the sun sets. Wherefore the Greeks have called the western parts of Italy, *Hesperia magna*, to distinguish it from Spain, called *Minor Hesperia*.

Italy was also called *Oenotria*, of Oenotrus king of the Sabins, or Oenotrus the son of Lycæon king of Acadia, or rather from the Greek word *oinos*, wine, which Janus brought into this country, by planting there the vine. They gave her also the name of *Iusonia*, from Ausonius the son of Ulysses and Calypso.

That country is now called *Italia*, Italy, either of Italus king of Sicily, or from Oxen called *Italo* in the old Greek,

Italiam dixisse minores Virg.

Strabo, speaking of Italy, gives it this following encomium:—"There," says he, "men breathe a temperate air; there are abundance of fountains, the waters thereof cure several distempers, and preserve health.

ITA

There are all sorts of excellent fruits, and quarries of marble of several colours. The inhabitants thereof are witty, subtle, and cunning, fit for learning, and principally poetry and eloquence; but are great dissemblers and revengeful, even to the very altars. The chief city of Italy is Rome, famous for the birth of several great men, both in war and peace."

The Romans have represented Italy in their medals like a queen sitting upon a globe, holding with her right hand a horn of plenty, having the other arm and the breast uncovered. With this title *Italia*. Italy is, or at least till very lately, has been divided into a great number of states, which differ much in extent and importance. Between the confines of France and Switzerland, on the west and north, are the continental dominions of the king of Sardinia, namely, Piedmont, Savoy, Montserrat, part of the Milanese, and Oneglia. To the north east are the territories of Venice, which are enumerated under that article. South of these, are the Italian dominions of the emperor, namely, part of the Milanese, and Mantuan. South of these, are Modena, Mirandola and Reggio, belonging to the Duke of Modena. West of these, are the duchies of Parma, Placentia, and Guastalla, whose sovereign is of the house of Bourbon. South of Parma lies the republic of Genoa, and south east of this, that of Lucca. Hence extends, along the coast of the Mediterranean, the grand duchy of Tuscany, whose sovereign is brother to the present emperor of Austria. The ecclesiastical state, or territory of the pope, lies principally to the east and south east of Tuscany, between the gulph of Venice and the Mediterranean; and the remainder of Italy, which occupies the whole southern extremity, is the kingdom of Naples, with its dependent islands, of which Sicily is the principal. The air of Italy is very different, according to the different situations of the countries it contains. In those on the north sides of the Appennines, it is more temperate; but on the south it is very warm. The air of the Campagna of Rome, and of the Ferrarese, is said to be unwholesome, which is owing to the lands not being duly cultivated, nor the marshes drained. That of the other parts is generally pure, dry, and healthy. In summer the heat is very great in the kingdom of Naples, and would be almost intolerable, if it were not mitigated by the sea-breezes. The principal rivers are the Po, Tiber, Arno, Adige, and Var; and there are several fine lakes, as the Maggiore, Lugano, Como, Garda, Perugia, Bracciano, and Celano. As there are a number of rivers in Italy, besides those mentioned above, the soil, in general, is very fertile. It produces a great variety of wheat, and the best oil in Europe; excellent silk in abundance; corn of all sorts, but not in such plenty as in other countries; oranges, lemons, citrons,

ITC

pomegranates, almonds, raisins, sugar, &c. numerable mulberry trees, figs, peaches, nectarines, apricots, pears, apples, filberts, chestnuts, &c. Most of these fruits were first imported by the Romans from Asia Minor, Greece, Africa, and Syria, and were not the natural products of the soil. The tender plants are sheltered, in winter, on the north side of the Appennines; but on the south side they have no need of that precaution. This country also yields good pasture, and abounds with cattle, sheep, goats, buffaloes, wild boars, mules, and horses. The forests are well stored with game; and the mountains have not only mines of iron, lead, alum, sulphur, marble of all sorts, alabaster, jasper, porphyry, &c. but also gold and silver; with a great variety of aromatic herbs, trees, shrubs, and evergreens, as thyme, lavender, laurel, wild olive trees, samarinds, junipers, oaks, and pines. Wine, oil, perfumes, fruits, and silks, are the principal articles of exportation, and great sums of money are expended by travellers in the purchase of pictures, curiosities, relics, antiquities, &c. The Italians are generally well-reportioned; but of their complexion they cannot boast. With respect to dress, they follow the fashions of the countries on which they border, or to which they are subject; namely, those of France, Spain, and Germany. As to their genius and taste in architecture, painting, carving and music, they are thought to excel greatly the other nations of Europe: but their music, perhaps, is too soft and effeminate to merit all the praises bestowed upon it; and their houses, in respect to convenience, are far inferior to those of England. No country has produced better politicians, historians, poets, painters, and sculptors; that is, since the revival of the arts and sciences, exclusive of those of ancient times. The governments of several of the principalities, duchies, and republics of Italy have undergone various changes, since the French revolution; and some of them will probably undergo other changes still, before the affairs of the continent are brought to a settled state: we therefore think it would be improper to enter minutely into these particulars here. At present the whole of Italy is a kingdom on the throne of which the emperor of the French places whomsoever he pleases. Since his determination to marry young wives as frequently as he needs them, that is, until he has a son, he has determined that that son shall be called *King of Rome*. Rome, therefore, is to be reckoned the second city of the French empire. The pope is in consequence deprived of all secular dominion, is made a mere dependent upon the caprice of Napoleon; and is to reside half the year at Rome, the other half at Paris!

ITCH, a cutaneous disease, supposed to be caused by an insect, a species of the genus *Acarus*, viz. *A. scabiei*, which, when

viewed by a good microscope, is white with reddish legs; the four hind ones having a long bristle. It is found in the small pellucid vesicles with which the hands and joints of persons infected with the itch are covered. It appears to be not only the cause of the disorder, but the reason why it is so highly infectious. See ACARUS, and MEDICINE.

ITCH signifies also—1. The sensation of uneasiness in the skin, which is eased by rubbing. 2. A constant teasing desire (*Pope*).

To ITCH. *v. n.* (from the noun.) 1. To feel that uneasiness in the skin which is removed by rubbing (*Dryden*). 2. To long; to have continual desire (*Shakspeare*).

ITCHY. *a.* (from *itch*.) Infected with the itch.

ITCHEN, or ALRE, a river in Hants, which rises near Alresford, and falls into the bay of Southampton.

ITRITE, a termination in the new chemical nomenclature, adopted for the purpose of designating a certain class of compound salts, resulting from the union of acids in their weakest state with different bases, in the same manner as the termination AR or ATE is applied to those salts which contain the same acids in a state of saturation with oxygen. Thus *sulphit* or *sulphite*, of *potash* is a combination of that alkali with *sulphurous acid*; while *sulphat* of *potash* is produced by a union of the alkali with *sulphuric acid*. See CHEMISTRY and NOMENCLATURE.

ITEA. In botany a genus of the class pentandria, order monogymia. Petals long, inserted into the calyx: capsule one-celled; two-valved. Two species—a Virginia shrub, and Carolina herb, both with alternate leaves, and white terminal racemes.

ITEM. *ad.* (Latin.) Also. A word used when any article is added to the former.

ITEM. *s.* 1. A new article (*Shakspeare*). 2. A hint; an innuendo (*Glanville*).

To ITERATE. *v. a.* (*itero*, Latin.) 1 To repeat; to utter again; to inculcate by frequent mention (*Hooker*). 2. To do over again (*Milton*).

ITERANT. *a.* (*iterans*, Latin.) Repeating (*Bacon*).

ITERATION. *s.* (*iteratio*, Latin.) Repetition; recital over again (*Hammond*).

ITHACA, in ancient geography, an island in the Ionian Sea, on the coast of Epirus: this was the country of Ulysses. It is about eight miles in circuit (though Pliny states it at 25); is now uninhabited, and called *Jathaco*.

ITINERANT. *a.* (*itinerant*, French.) Wandering; not settled (*Addison*).

ITINERARY. *a.* (*itinerarius*, Latin.) Travelling; done on a journey (*Bacon*).

ITINERARY, ITINERARIUM, a book of travels, or a journal for account of the distance of places. The most remarkable is that which goes under the names of *Antoninus* and *Ethicus*, or as *Bartheus* found in VOL. VI.

his copy, *Antoninus Ethicus*. *Itinerarium* denotes a day's march.

ITINERARY Column. See COLUMN.

ITSELF. *pronoun.* (*it* and *self*.) The neutral reciprocal pronoun applied to things.

ITYS, in fabulous history, son of Tereus king of Thrace, by Procne, daughter of Pandion, king of Athens, was killed by his mother when about six years old, and served up before his father. He was changed into a pheasant, his mother into a swallow, and his father into an owl.

ITZEBOA, an ancient town of Lower Saxony, in the duchy of Holstein. Lat. 53. 58. N. Lon. 9. 38. E.

I'VA. In botany, a genus of the class syngenesia; order polygamia accessaria. Receptacle hairy; seeds naked, obtuse: Calyx three-leaved; florets of the ray five; styles two long. Four species.—all American plants—two shrubby, two herbaceous.

JUAN FERNANDEZ, an island in the South Pacific Ocean, lying in 83. W. lon. and 33. S. lat. 300 miles W. of Chili. It is uninhabited, but having some good harbours, is found extremely convenient to touch at and water. Alexander Selkirk, a Scotchman, having been left on shore in this solitary place, by his captain, lived here some years, till he was discovered by Captain Rogers, in 1709. When brought on board he had forgotten his native language, and could scarcely be understood. He was dressed in goat skins, would drink nothing but water, and was some time before he could relish the ship's victuals. From this singular circumstance Daniel de Foë derived the hints which gave rise to his celebrated production, *The Adventures of Robinson Crusoe*.

JUAN DE LA FRONTERA, (Sr.) a town of Chili, in South America. In its neighbourhood are gold mines. Lat. 33. 25. S. Lon. 68. 55. W.

JUAN DE PORTO RICO, one of the Caribbee Islands, in America. It is 100 miles long, and 50 broad, and belongs to the Spaniards. It produces sugar, rum, ginger, corn, and fruits. The island was taken by the Earl of Cumberland, in Queen Elizabeth's reign, but he was obliged to abandon it, on account of a dreadful sickness which raged among his men. Its capital town is of the same name. Lat. 18. 17. N. Long. 67. 4. W.

JUBA, a king of Numidia and Mauritania, who succeeded his father Hiempsal, and favoured the cause of Pompey against Julius Cæsar. He defeated Curio, whom Cæsar had sent to Africa, and after the battle of Pharsalia, he joined his forces to those of Scipio. He was conquered in a battle at Thapsus, and totally abandoned by his subjects. He killed himself with Petrejus, who had shared his good fortune in this adversity. His kingdom became a Roman province, of which Ballust was the first governor. *Plut. Cæs. &c.*—The second of that name was the son of Juba the First. He was led

JUB

among the captives to Rome to adorn the triumph of Cæsar, but was afterwards, in consequence of his courteousness and fidelity, restored by Augustus to his father's dominions, and received in marriage Cleopatra, the daughter of Antony. Juba wrote a history of Rome in Greek, and also on the history of Arabia, and the Antiquities of Syria, &c.

JUBE, the name of a kind of hymn sung by the Greeks, and after them by the Romans, at harvest time, in honour of Ceres and Bacchus.

JUBILANT. *a. (jubilans, Latin.)* Uttering songs of triumph (*Milton*).

JUBILATION. *s. (jubilation, French; jubilatio, Lat.)* The act of declaring triumph.

JUBILEE, among the Jews, denotes every fiftieth year; being that following the revolution of seven weeks of years; at which time all the slaves were made free, and all lands reverted to their ancient owners. The jubilees were not regarded after the Babylonish captivity. Some say, that *jobel* signifies a *ram*, and that the jubilee was thus called, because proclaimed with a ram's horn, in memory of the ram that appeared to Abraham in the thicket. Masius chooses to derive the word from *Jubal*, the first inventor of musical instruments, which, for that reason, were called by his name; whence the words *jobel* and *jubilee* came to signify the year of deliverance and remission, because proclaimed with the sound of one of those instruments, which at first was no more than the horn of a ram. Others derive *jobel* from *יבול* *jubal*, in *hiphil* *הביל* *hobil*, which signifies to recall or return; because this year restored all slaves to their liberty, &c. The institution of this festival is in Lev. xxv. 8. 17.

JUBILEE, in a more modern sense, denotes a grand church solemnity or ceremony, celebrated at Rome, wherein the pope grants a plenary indulgence to all sinners; at least to as many as visit the churches of St. Peter and St. Paul at Rome.

The jubilee was first established by Boniface VII. in 1300, in favour of those who should go *ad limina apostolorum*; and it was only to return every hundred years. But the first celebration brought in such store of wealth to Rome, that the Germans called this the golden year; which occasioned Clement VI. in 1343, to reduce the period of the jubilee to fifty years. Urban VI. in 1389, appointed it to be held every thirty-five years, that being the age of our Saviour; and Paul II. and Sixtus IV. in 1475, brought it down to every twenty-five, that every person might have the benefit of it once in his life.

One of our kings, viz. Edward III. caused his birth-day to be observed in manner of a jubilee, when he became fifty years of age, in 1352. This he did by releasing prisoners, pardoning all offences except treason, mak-

JUD

ing good laws, and granting many privileges to the people. The name of jubilee has also been applied to the fiftieth year of the reign of his present majesty George the Third.

JUCAT'AN, or YUCATAN, a province of New Spain, in North America. It is unhealthy, by reason of frequent inundations. The English cut log-wood here.

JUCUNDITY. *s. (jucunditas, Latin.)* Pleasantry; agreeableness (*Brown*).

JUDAISM, the religious doctrines and rites of the Jews. Judaism was but a temporary dispensation, and was to give way, at least the ceremonial part of it, at the coming of the Messias. For a complete system of Judaism, see the books of Moses. Judaism was anciently divided into several sects; the principal whereof were the Pharisees, Sadducees, and Essenians.

At present there are two sects among the Jews, viz. the Caraites, who admit of no rule of religion, but the law written by Moses; and the Rabbinites, who add to the law the traditions of the Talmud.

It has been observed, that Judaism, of all religions, is that which is the most rarely abjured.

To JUDAI'ZE. *v. n. (judaizo, low Latin.)* To conform to the manner of the Jews (*Sundys*).

JU'DAS TREE, in botany. See CERCIS.

JUDAS MACCABEUS, a celebrated general of the Jews, renowned for his many victories over his enemies, at last slain in battle 261 B. C. His exploits are recorded by Josephus in his History of the Jews.

JUDE (St.), an apostle of Christ, was called Lebbeus, Thaddeus, or the Zealous. He was the brother of St. James the Less, and preached the Gospel in Mesopotamia, Arabia, Syria, Idumea, and Libya. He is said to have suffered martyrdom at Berytus, A. D. 80. An epistle of his stands in the sacred canon as the last of the seven general epistles.

In the early ages of Christianity, several rejected this epistle, because the apocryphal books of Enoch, and the ascension of Moses, are quoted in it. Nevertheless it is to be found in all the ancient catalogues of the sacred writings; and Clement of Alexandria, Tertullian, and Origen, quote it as written by Jude, and reckon it among the books of sacred Scripture.

JUDEA, in ancient geography, taken largely, either denotes all Palestine, or the greater part of it. But in the New Testament, and in Josephus, it is often taken for the third part of Palestine on this side Jordan, and the southern part as distinct from Samaria and Galilee. It was bounded by Samaria, Jordan, and Lacus Asphaltites, Arabia Petrea, and the Mediterranean.

JUDENBURG, a considerable town of Germany, the capital of Upper Silesia, with a handsome castle. It is seated on the Muehr. Lat. 47. 10. N. Lon. 14. 30. E.

J U D

JUDGE. *s.* (*Juge*, French; *judex*, Latin.) 1. One who is invested with authority to determine any cause or question, real or personal (*Milton*). 2. One who presides in a court of judicature (*Shakespeare*). 3. One who has skill sufficient to decide upon the merit of any thing (*Pope*).

To Judge. v. a. (*juger*, French.) 1. To pass sentence (*Genesis*). 2. To form or give an opinion (*Milton*). 3. To discern; to distinguish; to consider accurately (*Ad.*)

To Judge. v. a. 1. To pass sentence upon; to examine authoritatively: to determine finally (*Dryden*). 2. To pass severe censure; to doom severely (*Maithe*).

JU'DGER. *s.* (from *judge*.) One who forms judgment, or passes sentence (*Digby*).

JU'DGES, in England, are in number twelve, viz. the lords chief justices of the courts of King's Bench and Common Pleas; the lord chief baron of the Exchequer; the three puisne or inferior judges of the two former courts, and the three puisne barons of the latter.

By stat. 1 Geo. III. c. 23. the judges are to continue in their offices during their good behaviour, notwithstanding any demise of the crown (which was formerly held immediately to vacate their seats), and their full salaries are absolutely secured to them during the continuance of their commissions, by which means the judges are rendered completely independent of the king, his ministers, or his successors.

A judge at his creation takes an oath that he will serve the king, and indifferently administer justice to all men, without respect of persons, take no bribe, give no counsel where he is a party, nor deny right to any, though the king or any other, by letters, or by expressed words, command the contrary, &c. and in default of duty, to be answerable to the king in body, land, and goods.

Where a judge has an interest, neither he nor his deputy can determine a cause, or sit in court: and if he does, a prohibition lies. *Hardw.* 503.

Judges are punishable for wilful offences against the duty of their situations; instances of which happily live only in remembrance. There are ancient precedents of judges who were fined when they transgressed the laws, though commanded by warrants from the king.

JUDGES, Book of, a canonical book of the Old Testament, so called from its relating the state of the Israelites under the administration of many illustrious persons who were called judges, from being both the civil and military governors of the people, and who were raised up by God upon special occasions, after the death of Joshua, till the time of their making a king. In the time of this peculiar polity, there were several remarkable occurrences, which are recorded in this book. It acquaints us with the gross impiety of a new generation which sprung up after the death of Joshua, and gives us

J U D

a short view of the dispensations of heaven towards this people, sometimes relieving and delivering them, and at others severely chastising them by the hands of their enemies.

JUDGMENT, or JUDGEMENT. *s.* (*judgment*, French.) 1. The power of discerning the relations between one term or one proposition and another (*Locke*). 2. Doom; the right or power of passing judgment (*Shakespeare*). 3. The act of exercising judicature (*Addison*). 4. Determination; decision (*Burnet*). 5. The quality of distinguishing propriety and impropriety; criticism (*Dennis*). 6. Opinion; notion (*Shaks.*) 7. Sentence against a criminal (*Milton*). 8. Condemnation (*Millotson*). 9. Punishment inflicted by Providence (*Addison*). 10. Distribution of justice (*Arbutnot*). 11. Judiciary law; statute (*Deuteronomy*). 12. The last doom (*Shakespeare*).

JUDGMENT, a faculty of the soul, by which it perceives the relation between two or more ideas.

Thus, when we judge that the sun is greater than the moon, the understanding first compares the two ideas of the sun and the moon; and, finding the idea of the sun greater than that of the moon, the will perfectly acquiesces in that perception, nor puts the mind upon any farther inquiry.

It is not the understanding then that judges, as is ordinarily thought; judgments and reasonings on the part of the understanding are but mere perceptions; it is the will alone that judges, by acquiescing in what is represented to it by the understanding.

The only difference then between perception, judgment, and reasoning, so far as the understanding is concerned in them, is this: that it perceives a thing simply, without any relation to any other thing, in a simple perception; that it perceives the relations between two or more things in judgments; and, lastly, that it perceives the relations that are between the relations of things in reasonings; so that all the operations of the understanding are in effect no more than pure perceptions.

Thus, when we perceive, for instance, twice 2, or 4, this is no more than a simple perception; when we judge that twice 2 are 4, or that twice 2 are not 5, the understanding does no more than barely perceive the relation of equality that is between twice 2 and 4, or of inequality between twice 2 and 5.

JUDGMENT. The opinion of the judges is so called, and is the very voice and final doom of the law; and, therefore, is always taken for unquestionable truth; or it is the sentence of the law pronounced by the court upon the matter contained in the record. Judgments are of four sorts, viz. 1. Where the facts are confessed by the parties, and the law determined by the court, which is termed judgment by demurrer. 2. Where the law is admitted by the parties, and the

facts only are disputed, as in judgment upon a demurrer. 3. Where both the fact and the law arising thereon are admitted by the defendant, as in case of judgment by confession or default. 4. Where the plaintiff is convinced that fact or law, or both, are insufficient to support his action, and therefore abandons or withdraws his prosecution, as in case of judgment upon a nonsuit or *relaxxit*. See WARRANT OF ATTORNEY.

Judgments are either interlocutory or final. Interlocutory judgments are such as are given in the middle of a cause, upon some plea, proceeding, or default, which is only intermediate, and doth not finally determine or complete the suit; as upon dilatory pleas, when the judgment in many cases is that the defendant shall answer over, that is, put in a more substantial plea. Final judgments are such as at once put an end to the action, by declaring that the plaintiff hath either entitled himself, or hath not, to recover the remedy he sues for.

JUDGMENT OF ZEAL, among the Jews, a custom in conformity with which every private Israelite thought he had a right to put another to death on the spot, if he found him in a capital breach of the divine law. on this principle the Jews acted when they "sought to kill" our Lord, "because he not only had broken the sabbath, but said also that God was his father, making himself equal with God," John v. 18. On this principle also they acted when they stoned Stephen, Acts vii. 58. And again, "when they went about to kill Paul," Acts xxi. 32.

JUDICATORY. *s.* (*judico*, Latin.) 1. Distribution of justice (*Clarendon*). 2. Court of justice (*Atterbury*).

JUDICATURE. *s.* (*judicature*, French.) 1. Power of distributing justice (*Bacon*). 2. Court of justice (*South*).

JUDICIAL. *a.* (*judicium*, Latin.) 1. Practised in the distribution of public justice (*Bentley*). 2. Inflicted on as a penalty (*South*).

JUDICIALLY. *ad.* In the forms of legal justice (*Grew*).

JUDICIARY. *a.* (*judicare*, French.) Passing judgment upon any thing (*Boyle*).

JUDICIOUS. *a.* (*judicieux*, French.) Prudent; wise; skilful (*Locke*).

JUDICIOUSLY. *ad.* Skilfully; wisely; with just determination (*Dryden*).

JUDICIUM DEI, Judgment of God, was a term anciently applied to all extraordinary trials of secret crimes; as those by arms, and single combat, and the ordeals; or those by fire, or red-hot plough-shares, by plunging the arm in boiling water, or the whole body in cold water; in hopes God would work a miracle, rather than suffer truth and innocence to perish.

Si super defendere non possit, iudicio Dei, scil. aqua vel ferro, flet de eo iustitia.

These customs were a long time kept up,

even among Christians; and they are still in use in some nations. See ORDEAL, WATER, COMBAT, DUEL, and CHAMPION.

Trials of this sort were usually held in churches, in presence of the bishops, priests, and secular judges; after three days fasting, confession, communion, and many adjurations and ceremonies, described at large by Du Cange.

JUDICIUM PARIUM denotes a trial by a man's equals, *i. e.* of peers by peers, and of commoners by commoners. In Magna Charta it is more than once insisted on as the principal bulwark of our liberties, but especially by chap. 29. that no freeman shall be hurt in either his person or property, *nisi per legale iudicium parium suorum vel per legem terræ*. And this was ever esteemed, in all countries, a privilege of the highest and most beneficial nature. See JURY.

IVES, or YVES, bishop of Chartres, was born in 1035, and raised to that see in 1073. He died in 1115. There are extant by him, 1. A Collection of Decrees; 2. Exceptions Ecclesiasticarum Regularum; 3. Sermons, &c.

IVES, or *Vives*, a disease which has a near affinity to the strangles. See STRANGLES. It is a slight inflammation and enlargement of the glands under the ears of a horse. These seldom come to suppuration, however, as in the strangles, but wear off gradually, and the pain and soreness often abate, as in persons affected with the mumps, or when the almonds of their ears are said to be down. The disease is cured often only by keeping the part warm, and protected from the external cold. Sometimes the swelling of these glands continues for a week or a fortnight, and at last spreads downwards under the throat, and terminates in the strangles, and then it requires to be treated as such.

The ives, like the strangles, is most incident to young horses, and usually proceeds from the same causes, viz. their catching cold, being over-heated, or in any degree over-worked about the time of shedding their teeth, &c. A horse that has the ives rather coughs more and oftener than one that has only the strangles, and has a no less difficulty in swallowing, occasioned by the pain and tenderness of the glands, which in some is so sensible, that they can scarcely bear to be touched about the neck and throat; and, in some, the eyes appear swollen, tender, and watery. A fever, for the most part, also attends the ives, and this is often of the malignant kind. Some horses in this disease appear to be extremely sick, and for a short time refuse all manner of food. When it happens at the time of shedding their teeth, the gums will appear red and tumified all round their sockets. The lamps generally rise at the same time to a great degree, and reach beyond the edges of the upper teeth; all which concomitant symptoms excite pain, and make a horse very

JUG

uneasy. When the ives take place in a horse that is old or full-aged, Gibson says, it is a sign of great malignity, and often of inward decay, which, for the most part, proves dangerous, and therefore ought to be treated as other malignant distempers.

The ives in young horses requires a more simple treatment. The usual method of cure is, in the first place, to anoint the glands with ointment of marsh-mallows, and to cover the horse's head and neck with warm clothing. At the same time it is proper to bleed in proportion to the horse's strength, and repeat the bleeding in a day or two in a smaller quantity, if the fever continue violent; but if the glands inflame and swell, suppuration is to be promoted by frequent embrocations, and keeping the parts warm with poultices. When the swelling retires downwards under the jaws, then the case presents no difficulty, but must be treated as the strangles.

Internally, the same method is to be followed as in colds, and the same opening diet used till the horse recovers his appetite. Drinking water-gruel plentifully is a great help in all such cases, with scalded bran as a mash; in his bran may be given sulphur and honey with good effect, and an ounce of nitre should be mixed with it once a day. As soon as he gets flesh, and has recovered his strength, it will be proper to give him one or two mild purges. Purging is also sometimes necessary after the strangles, especially in cases where the horse looks unfledged or hide-bound. This, however, seldom happens, except where there has been some previous ill habit, some bad management, or a more than ordinary malignity in the disorder; for, in most cases, the strangles are so kindly, that horses have been observed to thrive the better afterwards than before.

IVES, *St.* a sea-port town of Cornwall, in England, seated on a bay of the same name, which is chiefly frequented by fishermen, for the taking of pilchards. By this trade, and that of Cornish slates, it has thriven greatly, and twenty or thirty sail of ships now belong to it. It is a corporation, governed by a mayor, recorder, &c. and it sends two members to parliament. Here is a handsome spacious church, and a grammar-school, which was founded by Charles I. Lat. 50. 18. N. Lon. 5. 30. W.

IVES, *St.* is also the name of a town in Huntingdonshire, 64 miles from London, 5 from Huntingdon, and 12 from Cambridge. It has a fine strong bridge over the Ouse; a church with a lofty spire, and had in the ninth century a mint. Here is a very large market on Mondays for fatted cattle. Lat. 52. 20. N. Lon. 0. 20. W.

JU'G. *s.* (*jugge*, Danish) A large drinking vessel, with a gibbous or swelling belly (*Swift*).

JU'GALE OS. (*jugalis*, from *jugum*, a

JUG

yoke, from its resemblance, or because it is articulated to the bone of the upper jaw like a yoke.) *Oss. malar.* *Oss. zygomaticum.* The ossa malarum are the prominent square bones which form the upper part of the cheeks. They are situated close under the eyes, and make part of the orbits. Each of these bones has three surfaces to be considered. One of these is exterior and somewhat convex. The second is superior and concave, serving to form the lower and lateral parts of the orbit. The third, which is posterior, is very unequal, and concave, for the lodgment of the lower part of the temporal muscle. Each of these bones may be described as having four processes, formed by their four angles. Two of these may be called orbital processes. The superior one is connected with the orbital process of the os frontis; and the inferior one with the malar process of the maxillary bone. The third is connected with the temporal process of the sphenoid bone; and the fourth forms a bony arch, by its connexion with the zygomatic process of the temporal bone. In infants these bones are entire and completely ossified.

To JU'GGLE. *v. n.* (*jouglér*, French.) 1. To play tricks by slight of hand (*Digby*).

2. To practise artifice or imposture (*Shaks*) JU'GGLE. *s.* (from the verb.) 1. A trick by legerdemain. 2. An imposture; a deception (*Villotson*).

JU'GLERS are a kind of people whose profession has not been often deemed either respectable or useful. Professor Beckmann, however, has undertaken their defence; and in a long and learned chapter in the third volume of his History of Inventions, pleads the cause of the practisers of legerdemain; rope-dancers; persons who place their bodies in positions apparently dangerous; and of those who exhibit feats of uncommon strength. All these men he classes under the general denomination of Jugglers; and taking it for granted (surely upon no good grounds) that every useful employment is full, he contends, that there would not be room on the earth for all its present inhabitants, did not some of them practice the arts of juggling.

Our author, however, proves in a very learned manner, that all these tricks were of high antiquity: that the Hirpi, who lived near Rome, jumped through burning coals; that women were accustomed to walk over burning coals at Castabala in Cappadocia, near the temple dedicated to Diana; that the exhibition of balls and cups (see *LEGER-DEMAIN*) is often mentioned in the works of the ancients; that in the third century, one Firmus, or Firmius, who endeavoured to make himself emperor in Egypt, suffered a smith to forge iron on an anvil placed on his breast; that rope-dancers with balancing poles are mentioned by Petronius and others; and that the various feats of horsemanship

exhibited in our circuses passed, in the thirteenth century, from Egypt to the Byzantine court, and thence over all Europe.

JUGGLINGLY. *ad.* (from *juggle*.) In a deceptive manner.

JUGLANS. (*juglans*, *dis*, *f. quasi Jovis glans*, the royal fruit, from its magnitude.) The walnut. In botany a genus of the class and order monœcia polyandria. *Male*: calyx one-leaved, scale-loom; corol six-parted; filaments from twelve to twenty-four. *Female*: four-cleft, superior; corol four-parted; styles two; drupe with a grooved nut. Eight species—all American trees except one. The two following are chiefly known in England:

1. *L. Alba*. Hickory. Leaflets seven, lanceolate, serrate; odd one sessile. A native of North America.

2. *L. Regia*. Common walnut. Leaflets about nine, oval or oblong, glabrous, slightly serrate, nearly equal; the one petioled. A native of Persia. In its cultivated state among ourselves it exhibits several varieties, as the larger, the thin-shelled, the French walnut. They are all easily propagated from the nut; but the variety cannot be depended upon: and hence it is better to purchase them of the nurserymen when under fruit, that no disappointment may be experienced. The unripe fruit, which has an astringent bitterish taste, and has been long employed as a pickle, is directed for medicinal use by the London College, on account of its anthelminthic virtues. An extract of the green fruit is the most convenient preparation, as it may be kept for a sufficient length of time, and made agreeable to the stomach of the patient by mixing it with cinnamon water.

JUGO'RA, a province of Muscovy, depending to the government of Archangel.

JUGULAR. *a.* (*jugulum*, Lat.) Belonging to the throat (*Wiseman*).

JUGULAR FISHES. In zoology the second order of the Linnæan class Pisces: characterised by having the ventral fins before the pectoral, and the gills bony. See **PISCES** and **ZOOLOGY**.

JUGULAR VEINS. (*Venæ jugulares* from *jugulum*, the throat.) These veins run from the head down the sides of the neck, and are divided, from their situation, into external and internal. The external or superficial jugular vein receives the blood from the frontal, angular, temporal, auricular, sublingual or ranine, and the occipital veins. The internal or deep-seated jugular vein receives the blood from the lateral sinusses of the dura mater, the laryngeal and pharyngeal veins. Both jugulars unite, and form with the subclavian vein, the superior vena cava, which terminates in the superior part of the right auricle of the heart.

JUGUM. In botany, a yoke, couple, or pair of leaflets. Hence *folium conjugatum*,

a leaf paired or having one pair of leaflets, of which there are many instances in the class Diadelphia.

JUGUM, an humiliating mode of punishment inflicted by the victorious Romans upon their vanquished enemies. It was thus. They set up two spears, and laying a third across, in the form of a gallows, they ordered those who had surrendered themselves to pass under this ignominious erection, without arms or belts. None suffered the disgrace of passing *sub jugo* but such as had been obliged to surrender.

JUGURTHA, the illegitimate son of Manastabal, the brother of Micipsa. Micipsa and Manastabal were the sons of Masinissa, king of Numidia. Micipsa, who had inherited his father's kingdom, educated his nephew with his two sons, Adherbal and Hiempsal; but, as he was of an aspiring disposition, he sent him with a body of troops to the assistance of Scipio, who was besieging Numantia, hoping to lose a youth whose ambition seemed to threaten the tranquillity of his children. His hopes were frustrated, Jugurtha showed himself brave and active, and endeared himself to the Roman general. Micipsa appointed him successor to his kingdom with his two sons, but this kindness of the father proved fatal to the children. Jugurtha destroyed Hiempsal, stripped Adherbal of his possessions, and obliged him to fly to Rome. The Romans listened to the complaints of Adherbal, but Jugurtha's gold prevailed among the senators. Cæcilius Metellus was at last sent against Jugurtha, and his firmness soon obliged him to fly among his savage neighbours for support. Marius and Sylla succeeded Metellus, and fought with equal success. Jugurtha was at last betrayed by his father-in-law Bocchus, and was delivered into the hands of Sylla, after a war of five years. He was exposed to the view of the Roman people, and dragged in chains to adorn the triumph of Marius. He was afterwards put in a prison, where he died six days after hunger, B. C. 106.

JVICA, an island of the Mediterranean, 56 miles S. W. of Majorca. It is about 60 miles in circuit. It is mountainous, but fertile in corn, wines, and fruits; and is remarkable for great quantities of salt. The capital is of the same name, and has a good harbour. Lat. 38. 52. N. Lon. 1. 25. E.

JUICE. *s.* (*jus*, French.) 1. The liquor, sap, or water of plants and fruits (*Watts*). 2. The fluid in animal bodies. (*Ben Jonson*).

JUICELESS. *a.* (from *juice*.) Dry; without moisture (*More*).

JUICINESS. *s.* (from *juice*.) Plenty of juice; succulence.

JUICY. *a.* (from *juice*.) Moist; full of juice; succulent (*Milton*).

JUJUBE TREE. See **ZIZYPHUS**.

JUJUBES. See **JUSUBS** and **RHAMNES**.

JUJUBE. (*Arab.*) Jujubes. A half-dried

fruit of the plum kind, about the size and shape of an olive, the produce of the *Rhamnus zizyphus* of Linnæus. Jujubes, when in perfection, have an agreeable sweet taste, and in the southern parts of Europe, where they are common, make an article of food in their recent state, and of medicine when half dried.

IRINGHO, a town in Buckinghamshire, with a market on Fridays. Lat. 51. 51. W. Lon. 0. 35. W.

To JUCKE. *v. n.* (*jucher*, Fr.) To perch upon any thing as birds.

JUL, or JOL, a Gothic word, signifying a "sumptuous treat;" and particularly applied to a religious festival, first among the heathens, and afterwards among Christians. By the latter it was given to Christmas; which is still known under the name of Jul, or Yool, in Denmark, Norway, Iceland, and Sweden; nay, even in the north of Britain; and whence the month of Januarius by the Saxons was styled *Gjalt*, i.e. "the Festival." As this feast had originally been dedicated by our heathen ancestors to the Sun, their supreme deity; so the Christians, for the purpose of engaging the minds of their Ethnic (gentile) brethren, ordered it should be celebrated in memory of the birth of Christ: and thus it has been through ages a feast of joy and entertainment. We are indebted to Procopius for the first account of this feast.

JULAP, (*gulab Arab.*) A julep or sweet liquid medicine.

JULIAN, the Roman emperor, surnamed the Apostate, was the younger son of Constantius, brother of Constantine the Great, and was born in 331 at Constantinople. His education was liberal, and he made an open and rather zealous profession of christianity, till his accession to the imperial throne on the death of Constantius his cousin in 361. He was no sooner become his own master than he threw off the mask, and made a public avowal of paganism; and though he did not directly persecute the christians, yet he endeavoured all in his power to root out their religion. He stigmatized the followers of Jesus by the nick-name of Galileans, wrote several books against christianity, and connived at the cruelties which some of his governors committed on their persons. He also caressed the Jews, and promised to rebuild Jerusalem, and to make it the imperial residence, by way of confuting the prophecies of our Saviour. He accordingly set about building the temple, but the design was defeated by the destruction of the workmen, who were assaulted by balls of fire issuing from the foundations. When this happened Julian was at Antioch on an expedition against the Persians, in which he was at first successful, but after several partial engagements a general battle took place June 26, 363, wherein Julian was mortally wounded and died the ensuing night. Julian was a man of great talents, but strangely bigoted to the religion of paganism. His

works were published by Spanheim in 2 vols. folio, 1626.

The works of Julian furnish us with another instance in which the cause of divine truth may be served by the attempts of an adversary to injure it. Julian, who seemed desirous to say something that might render the divinity of our Lord suspected, argues that neither Matthew, Mark, Luke nor Paul himself, ever presumed to call him God; but that it was St. John who talked after this manner. He says that "John perceiving how the persuasion of Christ's being God, prevailed nightly among the christians dispersed through many cities of Greece and Italy, did then take upon him to assert the same doctrine in his gospel, with a view to humour them, and to get himself reputation;" (*Julian apud Cyril. L. 10. p. 327. Edit. Lips.*) Here then, we have a plain confession from a vehement adversary; a confession which (ridicule and banter apart) amounts to this; that the generality of christians, as early as the apostolic age, were exceedingly zealous for the doctrine of Christ's divinity, and that St. John himself commended them for it, encouraged them in it, and wrote his gospel to confirm it. Since he could not disown the *fact*, he endeavoured in his ludicrous way, to turn the whole into ridicule. Now, how wrong soever he was in his observations, yet his *concession* deserves particular notice. He not only acknowledges the divinity of our Lord as a prevalent doctrine in the apostolic times; but he lets us know that he took those writings which in his time bore the names of Matthew, Mark, Luke, John, Paul, to be the genuine productions of those authors. Hence, he was certainly very sensible that the evidences for the genuineness of these books, were at that period so very clear and convincing, that it would have been perfectly scandalous for any one to have called them in question: otherwise he would have attacked the christians after another manner, and instead of citing these books in so tame and innocent a way as he has done in the passage we above refer to, he would have exposed them as so many pieces of shameful imposture, and the christians as the worst of fools for thinking otherwise. See CELSUS.

JULIAN *Calendar*, is that depending on, and connected with the Julian year and account of time; so called from Julius Cæsar, by whom it was established. See CALENDAR.

JULIAN *Epoch*, is that of the institution of the Julian reformation of the calendar, which began the 46th year before Christ.

JULIAN *Period*, is a cycle of 7980 consecutive years, invented by Julius Scaliger, from whom it was named, though some say his name was Joseph Scaliger, and that it was called the Julian Period, because he made use of Julian years. This period is formed by multiplying continually together the three following cycles, viz.

JUL

that of the sun of 28 years, that of the moon of 19 years, and that of the indiction of 15 years; so that this epoch, although but artificial or feigned, is yet of good use; in that every year within the period is distinguishable by a certain peculiar character; for the year of the sun, moon, and indiction, will not be the same again till the whole 7980 years have revolved. Scaliger fixed the beginning of this period 764 years before the creation, or rather the period naturally reduces to that year, taking the numbers of the three given cycles as he then found them; and accounting 3950 years from the creation to the birth of Christ, this makes the 1st year of the Christian era answer to the 4714th year of the Julian period; therefore, to find the year of this period, answering to any proposed year of Christ, to the constant number 4713, add the given year of Christ, and the sum will be the year of the Julian period. thus, to 4713 adding 1791, the sum 6504 is the year of this period for the year of Christ 1791. Hence the first revolution of the Julian period will not be completed till the year of Christ 3267, after which a new revolution of this period will commence.

But the year of this period may be found for any time, from the numbers of the three cycles that compose it, without making use of the given year of Christ, thus multiply the

numbers $\begin{Bmatrix} 4815 \\ 4200 \\ 6916 \end{Bmatrix}$ respectively by $\begin{Bmatrix} \text{sun,} \\ \text{the year of the} \\ \text{moon,} \\ \text{indiction} \end{Bmatrix}$

then add the three products together, and divide the sum by 7980, so shall the remainder after division be the year of the Julian period corresponding to the given years of the other three cycles.

JULIAN Year, is the old account of the year, established by Julius Caesar, and consisted of 365½ days. This year continued in use in all Europe till it was superseded in most parts by the new or Gregorian account, in the year 1582. In England however it continued to be used till the year 1752. See **BISSEXTILE**.

JULIEN, St. a town of France, in the department of Upper Vienne, Lat. 45. 50. N. Lon. 1. 4. E.

JULIERS, a duchy of Westphalia, 68 miles long, and 30 broad; bounded on the N. by Guelderland, on the E. by the archbishopric of Cologne, on the S. by Luxemburg and Treves, and on the W. by Limburg. It is subject to the elector palatine.

JULIERS, a town of Germany, capital of a duchy of the same name, with a strong citadel. It is seated on the Roer, 15 miles E. of Aix-la-Chapelle. Lat. 50. 56. N. Lon. 6. 40. E.

JULIUS CÆSAR. See **CÆSAR**.

JULUS. In botany a Catkin or Ament. For this term of Tournefort's and others, Linnæus substituted Amentum. Hence Hermann and others had a class of trees entitled *julifera*.

JULUS. In Zoology a genus of the class in-

JUM

secta and order aptera. Lip crenate, emarginate; antennæ moniliform; feelers two, filiform; body long, semi-cylindrical, consisting of numerous, transverse segments; legs numerous, twice as many on each side as there are segments of the body. Fourteen species, scattered over the globe; of which four are common to our own country. Some inhabit nuts. Some are found under stones, others in the earth.

The whole tribe, however, so nearly resembles the oniscus as to be included under one genus in the fauna succica. The following are the chief.

1. *J. cabulosus*. An hundred and twenty legs on each side; body livid; glabrous, and of ash-colour; antennæ short, and consisting of five rings. When the animal is touched it wraps itself up into a round ball, the feet all turned inwards: length about an inch and a quarter; often found in the soft mould of hollow trees.

2. *J. Indus*. Great Indian *julus*. Six or seven inches long; colour and general structure like the preceding; found in the warmer parts of Asia and America, inhabiting woods and other retired spots; legs a hundred and fifteen on each side.

3. *J. Lagurus*. Hare-tailed *julus*. Very minute; not exceeding, when full grown the eighth of an inch in length; colour pale brown; shape broad and flattish; body consisting of eight segments, each fringed with whitish hairs; head large; tail furnished with two milk-white plumes or tufts. Found in the summer about the bark of trees, walls, &c. Linnæus considered it as a centiped or species of scolopendra; but its legs are too numerous for this arrangement.

4. *J. Maximus*. This is the largest of all the *juli*, being as long and as thick as a man's finger. The head is small, and obtuse, antennæ clavate, eyes black; body of a pale colour, and divided into forty-three segments, each having a pair of feet on either side, the whole amounting to an hundred and seventy-two. This last species is taken from a drawing of Pere Plummer, as given by Dr. Lister, who affirms it to be a native of South America. In Seba it occurs under the name of *Millepeda orientalis*, omnium maxima.

JULY, the 7th month of the year, consisting of 31 days; about the 21st of which the sun usually enters the sign ♌ leo. This month was so named by Mark Antony, from Julius Cæsar, who was born in this month.

JULY-Flower. *Clove*: *Queen*: *Stock*. See **DIANTHUS**, **HESPERIS**, and **CHEIRANTHUS**.

JU'MART, *s.* (French.) The mixture of a bull and a mare (*Locke*).

To JU'MBLE, *v. a.* To mix violently and confusedly together (*Locke*).

To JU'MBLE, *v. n.* To be agitated together (*Swift*).

JU'MBLE, *s.* (from the verb.) Confused mixture; violent and confused agitation. (*Swift*).

JUMENT, *s.* (*jument* Fr.) Beasts of burden (*Brown*).

JUMIEGE, a town of France, in the department of Lower Seine, with a late celebrated Benedictine Abbey. Lat. 49. 24. N. Lon. 0. 55. E.

JUMNA, a river of Hindoostan Proper, which rises to the N. W. of Delhi, and joins the Ganges 100 miles below Benares.

To JUMP, *v. a.* (*gumpen* Dutch.) 1. To leap; to skip; to move without step or sliding (*Swift*). 2. To leap suddenly (*Collier*). 3. To jolt (*Vahum*). 4. To agree; totally; to join (*Hakewill*).

To JUMP, *v. n.* To pass by a leap, to pass eagerly or carelessly over (*Shakspeare*).

JUMP, *ad.* Exactly; nicely: obsolete (*Shakspeare*).

JUMP, *s.* (from the verb.) 1. The act of jumping; a leap; a skip; a bound (*Locke*). 2. A lucky chance (*Shakspeare*). 3. (*jeu* French.) A waistcoat; a kind of lumber stays worn by sickly ladies (*Cleveland*).

JUNCATE, *s.* (*juncade*, French.) 1. Cheesecake; a kind of sweetmeat of curds and sugar. 2. Any delicacy (*Hilton*). 3. A futile or private entertainment: now improperly written *junket*.

JUNCIOUS, *a.* (*juncous*, Latin.) Full of bulrushes.

JUNCTION, *s.* (*junction*, French) Union; coalition (*Addison*).

JUNCTURE, *s.* (*juncture* Latin.) 1. The line at which two things are joined together (*Boyle*). 2. Joint; articulation (*Hale*). 3. Union; amity (*K. Charles*). 1. A critical point or article of time (*Addison*).

JUNCUS, Rush, in botany a genus of the class hexandria, order monogynia. Calyx six-leaved, permanent; corolless; capsule superior, three-valved, one or three-celled; seeds numerous; stigma, three. Forty-one species, mostly natives of Europe, nineteen common to the marshes, bogs, and wet pastures of our own country; several indigenous to America; a few to the Cape. Of the different species, nearly half have naked, the rest leafy, culms. The whole are generally regarded as weeds; yet in many countries, and especially in Holland, several species, are regularly mown, tied up in bundles, and employed as fuel. A few of them are of still higher and very considerable value: as giving, by their growth, tenacity to the banks of rivers, so as considerably to retard the encroachments of a rapid current; as affording a useful and pleasant matting for floors and chairs; and especially as furnishing, from their pith, a wick for the very valuable night-candle called rush-light. Of this useful tribe of juncus the three most common species are.

1. *J. Conglomeratus*. Conglomerate rush. Culm naked, stiff; panicle lateral, conglomerate; capsule, retuse; stamens three.

2. *J. effusus*. Spreading rush. Culm, naked, stiff; panicle lateral, effuse; more than decapound; capsules obtuse.

3. *J. acutus*. Sea-rush. Culm naked, round, panicle terminal; involucre, two-leaved, spinous, capsules roundish, mucronate.

Of these the first two are found wild in our wet pastures; the last on our sea-coasts.

JUNCUS odoratus. *Fenum camelorum*. *Juncus aromaticus*. Camel hay. Sweet rush. This dried plant, *Andropogon schananthus* of Linneus, is imported into this country from Turkey and Arabia. It has an agreeable smell, and a warm, bitterish, not unpleasant taste. It was formerly employed as a stomachic and deobstruent. See *ANDROPOGON*.

JUNE, the 6th month of the year; during which the sun enters the sign ♋ Cancer, at the time of the summer solstice. It contains 30 days. The word comes from the Latin *Junius*, which some derive a *Junone*.

JUNGERMANNIA. In botany, a genus of the class cryptogamia, order hepatica. Male: flowers sessile. Fem: capsule peduncled, naked, arising from a sheath, four valved; seeds attached to elastic filaments. Eighty-eight species, of which fifty are indigenous to the woods, shades and ditches of our own country.

They may be thus arranged.

A Caulescent: branches compound, pinnate.

B Caulescent: fronds pinnate, or nearly so.

C Caulescent: fronds imbricate.

This embraces by far the largest section.

D Stemless, of which there are not more than eleven species

JUNGIA. In botany, a genus of the class syngenesia, order polygama segregata. Receptacle chaffy, down feathery, calyx three or four flowered; florets all hermaphrodite, tubular, two-lipped; outer lip ligulate, inner-lip two parted. One species only, a native of South America, with terminal panicle.

JUNGLE, in Bengal, waste land, or land covered with wood, brambles, &c.

JUNIOR, *a.* (*junior*, Latin.) One younger than another (*Swift*).

JUNIPER. See *JUNIPERUS*.

JUNIPER GUM. See *SANDARACK*.

JUNIPERUS. **JUNIPER**. In botany, a genus of the class diccia, order monadelphia. Male: calyx the scales of anament; corolless; stigmas three. Fem: calyx scales of anament, fewer, becoming fleshy, uniting into a three seeded berry. Twelve species; chiefly natives of the south of Europe, a few of Asia, and America. The following are the chief.

1. *J. communis*. Common Juniper. Leaves in threes, spreading, spinous-mucronate, longer than the berries. A native of the mountains of our own country: the tops and berries of which are directed in our pharmacopoeias, but the latter are usually preferred, and are brought chiefly from Holland and Italy. Of their efficacy as a stomachic, carminative, diaphoretic, and diuretic, there are several relations by physicians of great

authority: and medical writers have also spoken of the utility of the juniper in nephritic cases, uterine obstructions, scorbutic affections, and some cutaneous diseases. Our pharmacopoeia direct the essential oil, and a spirituous distillation of the berries, to be kept in the shops.

The resinous tears wept by this tree are called Sandarac or Sandrac, and, when pounded, pounce, which is used as a preventative of blotting on writing paper.

2. *J. Sabina*. Savin. Leaves opposite, erect, decurrent; the oppositions closed. A native of the South of Europe. It affords several varieties.

3. *J. Virginiana*. Red Cedar. Virginian Cedar. Leaves ternate, fixed by the base; the younger ones imbricate; older ones spreading. A native tree of North America, growing thirty or forty feet high, and branching pyramidally from the sort to the summit.

4. *J. Thurifera*. Frankincense Juniper. Leaves imbricate in four rows, acute, with large berries of a black hue when ripe. From this and several other species is obtained the frankincense of the shops. The tree reaches about twenty feet in height, and is a native of the South of Europe.

5. *J. Lycia*. Leaves ternate, every where imbricate, ovate, obtuse. A native of the South of Europe, about twenty feet high. It is from this species chiefly that the gum called *Olibanum exudes*.

All the species may be easily propagated by seeds; but the Savins are more generally increased by cuttings and layers.

JUNIUS (Adrian), a learned Dutchman, was born at Hoorn in 1511. He studied physic, and took his doctor's degree at Bologna, after which he went to England, where he wrote several works, and among the rest a Greek and Latin lexicon, which he dedicated to king Edward VI. He afterwards returned to his own country, where he practised physic, but settled at last at Middleburgh, and died there in 1575. He was an able physician and good poet, and a man of extensive learning. His works are numerous.

JUNIUS (Francis), professor of divinity at Leyden, was born at Bourges in 1545. He studied theology at Geneva, and in 1565 became minister of the Walloon church at Antwerp, from whence he was obliged to remove, owing to the contests between the papists and protestants. He afterwards became chaplain to the prince of Orange, and having resided at different places and filled several stations, settled at Leyden, where he died of the plague in 1602. His works are numerous, but what he is chiefly known by, is a Latin version of the Bible with notes, performed in conjunction with Tremellius.

JUNIUS (Francis), son of the preceding, was born at Heldenburg in 1589. In 1620 he visited England, and was taken into the family of Thomas earl of Arundel. Here

he studied the northern languages, in which he acquired an uncommon skill. He died at Windsor in 1677, and left his MSS. to the public library at Oxford. His works are, 1. *Glossarium Gothicum*; 2. *De Pictura Veterum* 1637; this book he afterwards published in English; 3. *Observationes in Willeramii Francicam paraphrasin Cantici Canticorum*. His *Etymologicon Anglicanum* was published in 1743 in folio.

JUNK, in sea language, a name given to any remnants or pieces of old cable, which are usually cut into small portions, for the purpose of making points, matts, sen-net, &c.

JUNK, is also the name of a small Chinese ship.

JU'NKET. *s.* (properly *juncate*.) 1. A sweatmeat (*Shakspeare*). 2. A stolen entertainment.

To JU'NKET. *v. a.* (from the noun.) 1. To feast secretly; to make entertainments by stealth (*Swift*). 2. To feast (*South*).

JU'NKSCILAN, a fertile island in the Indian ocean, near the S. W. coast of Siam. The principal town is of the same name, and situate on the N. part of the island, with a good harbour. Lat. S. 40. N. Lon. 98. 30. E.

JUNO, in Pagan worship, the sister and wife of Jupiter, and the goddess of kingdoms and riches; she is also styled the queen of heaven; she presided over marriage and child-birth, and was represented as the daughter of Saturn and Rhea. She married Jupiter; but was not the most complaisant wife; for that god was sometimes obliged to make use of all his authority to keep her in due subjection; and Homer observes, that on her entering into a conspiracy against him, he punished her by suspending her in the air with two anvils fastened to her feet, and golden manacles in her hands, which all the other deities looked on without a possibility of helping her. However, her jealousy made her frequently find opportunities of interrupting her husband in the course of his amours, and prompted her to punish with unrelenting fury Europa, Semele, Io, Latona, and the rest of Jupiter's mistresses. Jupiter himself having conceived, without any commerce with a female, Juno, in revenge, conceived Vulcan by the wind; Mars by touching a flower, pointed out to her by the goddess Flora; and Hebe by eating greedily of lettuces. Juno, as the queen of heaven, preserved great state: her usual attendants were terror and boldness, Castor, Pollux, and 14 nymphs; but her most faithful attendant was the beautiful Iris, or the rainbow. Homer describes her in a chariot, adorned with precious stones; the wheels of which were of ebony, and which was drawn by horses with reins of gold. But she is more commonly painted drawn by peacocks. She was represented in her temple at Corinth, seated on a throne, with a crown on her head, a pomegranate in one hand, and in

the other a sceptre, with a cuckoo on its top. This statue was of gold and ivory.

Poets have given many epithets to Juno, calling her *Lucina*, *Opigena*, *Juga*, *Domeduca*, *Cinxia*, *Unxia*, *Fluonia*.

She was called *Lucina*, à *Luce*, because she helped women to bring forth children, and show them the light: and for the same reason she was also named *Opigena* and *Obstetrix*, because she helped women in labour.

JUNO was called *Juga*, because she presided at the yoke of matrimony, and consequently over the union of husband and wife, and because of that qualification, she had an altar erected to her in one of the streets of Rome, therefore called *Vicus Jugarius*, the street of yokes.

Domiduca, because she brought the bride to the house of her bridegroom.

Unxia, because of the bride's anointing the side posts of the door of her husband going in thereat.

Cinxia, because she helped the bridegroom to unite the girdle the bride was girded with; in fine she was called,

Fluonia, because she stopped the flux of blood in women's labours.

In one word, Juno was like a guardian angel to women, in the like manner that god *genii* was the keeper of men; for according to the opinion of the ancients, the *genii* of men were males, and those of women females: wherefore women swore by Juno, and men by Jupiter.

JUNO, in astronomy, the name given to the small planet discovered by M. Harding, at Lilienthal, on September 1, 1804. It is situated between *Pallas* and *Jupiter*. For the principal elements of the orbit of this planet, see our article **ASTRONOMY**. Its apparent diameter is $2\frac{1}{4}$ seconds according to Lalande, Herschel assigns it at much less. Its real diameter Lalande says is about 1550 miles.

JUNONIA, certain feasts celebrated in honour of Juno, at which time the maids of all ages ran races, and petitioned her to give them husbands; at Rome an altar was erected to her as the goddess of marriage, where the new-married couple offered either a white cow, geese; or ravens, from which they took the gall before they sacrificed, and threw behind the altar, to intimate that in that state no bitterness of spirit shall remain.

JUNTA, *Junro*, or *Junro* (*juncti*, Latin, whence *junta*, Spanish; a meeting or assembly.) in matters of government, denotes a select council for taking cognizance of affairs of great consequence, which require secrecy.

Hence the word is used to signify any cabal, or number of men combined to promote any secret design.

IVORY, a hard, solid, and firm substance, of a white colour, and capable of a very good polish. It is the tusk of the elephant, and is hollow from the base to a

certain height. It is brought to us from the East Indies, and from the coast of Guinea. Tusks are valuable in proportion to their size; and it is observed, that the Ceylon ivory, and that from the island of Achem, do not become yellow by wear, as all other ivory does: hence the teeth of these places bear a larger price than those of the coast of Guinea.

IVORY-BLACK, is prepared from ivory, or bones burnt in a close vessel. This, when finely ground, forms a more beautiful and deeper colour than lamp-black; but, in the common methods of manufacturing, it is apt to be adulterated with charcoal dust, so as to be almost, or altogether, unfit for use. See **LAMPBLACK**.

IVORY-COAST, a name given to a country of Africa, situated on the coast of the Atlantic, between Cape Apollonia and Cape Palmas, containing several towns, which are situated at the mouths of rivers called by the same name. The interior country is but little known, the natives refusing the Europeans leave to build settlements, or even to trade amongst them, except by means of the coast negroes, and even this with the most circumspect caution. The chief commodities are gold, ivory, and slaves, the former in the greatest plenty, but no regular tariff, or table, of the different proportions of each was ever settled. The inhabitants of this district have the reputation of being the most savage and barbarous on the whole coast; and some writers scruple not to call them anthropophagi. Barbot advises mariners to touch with caution on this shore; the natives, says he, bring on board some beautiful ivory, as a bait to draw the seamen on shore, and, perhaps, to devour them. This is the more probable, from their keeping their goods at so high a price, as will assuredly ever prevent Europeans from purchasing them, although they ask for every thing they see, and are greatly incensed if they meet with a refusal. Their suspicion and jealousy are predominant qualities; inasmuch, that, on the least noise, they will precipitate themselves headlong into the sea, and swim to the canoes: for many of them have been carried off by European traders. Whatever the Gold Coast produces, is also found here in greater abundance and perfection, and, indeed, the fruits and vegetables of the warmer climates seem all to be united on the Ivory Coast.

JUPITER, in Pagan worship, the father of gods and men, and the greatest of all their deities, was the son of Saturn and Rhea. That goddess perceiving her husband devoured her children as fast as she brought them forth, and being in pain for Jupiter, she substituted a stone in his room, which Saturn immediately swallowed. He was educated by the sound of the instruments of the Corybantes. Virgil tells us, that he was fed by the bees, out of gratitude for which he changed them from an iron

J U P I T E R.

to a golden colour. Some say, that his nurses were Amalthæa and Melissa, who gave him goat's milk and honey; and others, that Amalthæa was the name of the goat who nourished him, and which as a reward for her great services, was changed into a constellation. According to others, he was fed by wild pigeons, who brought him ambrosia from Oceanus; and by an eagle who carried nectar in his beak from a steep rock; for which he rewarded the former by making them the foretellers of winter and summer, and the last by giving him immortality, and appointing him his thunder-bearer. When grown up, he defeated the Titans, dethroned his father Saturn, and divided his kingdom with his two brothers; Jupiter had the earth, Neptune the sea, and Pluto hell. Jupiter had several wives, the first of which, named Metis, he is said to have devoured when big with child, by which he himself became pregnant, and Minerva issued out of his head, completely armed and fully grown. His second was Themis; the name of his third is not known; his fourth was the celebrated Juno, whom he deceived under the form of a cuckoo, who to shun the violence of a storm fled for shelter to her lap. He was the father of the Muses and Graces; and had a prodigious number of children by his mistresses. He metamorphosed himself into a satyr to enjoy Antiope; into a bull to carry off Europa; into a swan to abuse Leda; into a shower of gold to corrupt Danaë; and into several other forms to gratify his passions. He had Bacchus by Semele, Pallas by Thetis, Diana and Apollo by Latona, and was the father of Mercury, and the other gods.

The inhabitants of almost every nation had their Jupiter, called by several names; but the Greeks and Romans called the Sovereign God of each nation by the name of Jupiter. Pliny, speaking of the god of the Ethiopians in Africa, called Assabimus, says that he was esteemed to be Jupiter.

Osiris, the most famous king of Egypt, ranked in the number of gods, was also known by the name of Jupiter; as is recorded by Diodorus Siculus.

The Phœnicians had their Belus, or the sun, whom the Greeks called Jupiter, as Eusebius reports. Dagon, the god of the Phœnicians of the city of Tyrolus, was called by the husbandmen Jupiter, because he had taught them how to manure the ground, and cultivate wheat. "*Dagon quod frumentum & aratrum invenisset, nuncupatus est Jupiter Aratrus.*" Jupiter the son of Neptune was a god of the Sidonians, called Maritimus, because this people was wholly given to navigation.

Stephanus assures us, that the same who was called Marnas at Gaza, was named Jupiter at Crete, for Marnas or Maranasin in the Phœnician language, signify king of men.

There was a Jupiter Belus amongst the

Babylonians, and a Jupiter Indiges amongst the Latins, which shews, that what Varro affirms, as Tertullian relates in his Apologetic, is true, that there were three hundred Jupiters, i. e. three hundred kings, and kings' fathers, who called themselves Jupiter, to immortalize their name, and obtain divine honours.

Notwithstanding it must be granted that the Jupiter of Crete, the father of Minos, was one of the most famous, and most ancient Jupiters of the West. Callimachus the poet, and his Scholiasts have written, that Minos having been buried in that island, with this inscription, "that he was the son of Jupiter;" the name of Minos was put out, and that of Jupiter left. Wherefore the inhabitants of Crete said, that they had the sepulchre of Jupiter.

The Dactyl of Mount Ida, the Curetes and Corybants, were ascribed to this Jupiter, because they had taken care of his education.

Jupiter Ammon was also very famous, and was represented with a ram's head, because of his intricate oracles, if we believe Servius. Herodotus gives us a better reason for the same, when he says that the Ammonites had that worship from the Egyptians, who inhabited the city of Thebes, where Jupiter was represented with a ram's head.

Jupiter Ammon was a king of Egypt, ranked by the Egyptians in the number of gods, and adored in the most remote provinces. Diodorus Siculus reporting the tradition of the inhabitants of Libya, gives us a quite different account of him, which yet comes to the same; for he says that Jupiter Ammon was a great king, who, after his death, was reckoned a fabulous god, and a chimerical oracle. This historian mentions still another writer more ancient than himself, who wrote that Ammon reigned in Libya, and married Rhea the daughter of Cælus, sister to Saturn and other Titans, and that Rhea being divorced, she married Saturn, and induced him to make war against Ammon, whom he vanquished, and forced him to make his escape by sea, and retired to Crete, where he possessed himself of the kingdom.

Then the same author tells us, that Dionysius having conquered Egypt, established young Jupiter king of that country, and gave him Olympius to be his governor, from whence Jupiter was named Olympius.

Strabo writes, that the Arabians had also their Jupiter; however this Jupiter was but one of their kings, as it appears not only because he was associated with Bacchus, but also by the undertaking of Alexander. For this prince being acquainted that the Arabians honoured but two divinities, Jupiter and Bacchus, resolved to subdue them, that he might be their god amongst them.

JUPITER, in astronomy, 24, one of the primary planets: it is the brightest of all,

J U P

except sometimes the planet Venus; and is much larger than any other planet.

The longer diameter of Jupiter is about 89,170 miles; and his mean distance from the sun about 490 millions of miles. His tropical revolution about the sun is performed in 4330d. 14h. 39m. 2s.: he therefore moves at the rate of more than 25 thousand miles per hour; and he revolves about his own axis in the short space of 9 hours 56 minutes, by which his equatorial parts are carried round at the amazing rate of 26 thousand miles per hour, which is about 25 times faster than the like parts of our earth revolve.

Jupiter is surrounded by faint substances, called zones or belts, in which so many changes appear, that they are generally ascribed to clouds. See BELTS.

The axis of Jupiter is so nearly perpendicular to his orbit, that he has no sensible change of seasons; which is a great advantage, and wisely ordered by the author of nature. For, if the axis of this planet were inclined any considerable number of degrees, just so many degrees round each pole would, in their turn, be almost six years together in darkness. And, as each degree of a great circle on Jupiter contains about 706 miles, it is easy to judge what vast tracts of land would be rendered uninhabitable by any considerable inclination of his axis.

The difference between the equatorial and polar diameters of Jupiter, is upwards of 6000 miles; the former being to the latter as 13 to 12. This happens from his quick motion round his axis; for the fluids, together with the light particles, which they can carry or wash away with them, recede from the poles which are at rest, towards the equator where the motion is quickest, until there be a sufficient number accumulated to make up the deficiency of gravity lost by the centrifugal force, which always arises from a quick motion round an axis.

Jupiter's orbit is 1. 19. inclined to the ecliptic. The place of his aphelion 11. 8. of ♈, the place of his ascending node 7. 29. of ♌, and that of his south or descending node 7. 29. of ♍.

The gravity of bodies on the surface of Jupiter is nearly twice as great as on the surface of our earth: this, though, is in some measure compensated by the centrifugal force, which on the surface of Jupiter is about 60 times as great as on the surface of the earth. A body weighing 9 cwt. at Jupiter's equator, if the planet stood still, would gravitate with a force but as 8 cwt. upon the commencement of its diurnal rotation.

This planet has four satellites revolving about him. They are frequently eclipsed in the shadow of their primary, or hid behind his body; and the great subserviency of these eclipses and occultations to geo-

J U R

graphy and navigation has occasioned the motions of these satellites to be very carefully observed. See LONGITUDE and SATELLITES.

Mr. Pound observed long ago, that the irregularities of the three interior satellites were repeated in a period of 437 days; and this observation is found to be just to this day.

247	{ revolutions of the }	first occupy 437 d. 3 h. 44'
123		second 437 3 42
61		third 437 3 36
26		fourth 435 14 16

This naturally led mathematicians to examine their motions, and see in what manner their relative positions, or configurations, as they are called, corresponded to this period: and it is found, that the mean longitude of the first satellite, minus thrice the mean longitude of the second, plus twice the mean longitude of the third, always made 180 degrees. This requires that the mean motion of the first, added to twice that of the third, shall be equal to thrice the mean motion of the second. This correspondence of the mean motions is of itself a singular thing, and the odds against its probability seems infinitely great; and when we add to this the particular positions of the satellites in any one moment, which is necessary for the above constant relation of their longitudes, the improbability of the coincidence, as a thing quite fortuitous, becomes infinitely greater. Doubts were first entertained of the coincidence, because it was not indeed accurate to a second. The result of the investigation is curious. When we follow out the consequences of mutual gravitation, we find, that although neither the primitive motions of projection, nor the points of the orbit from which the satellites were projected, were precisely such as suited these observed relations of their revolutions and their contemporaneous longitudes; yet, if they differed from them only by very minute quantities, the mutual gravitations of the satellites would in time bring them into those positions, and those states of mean motion, that would induce the observed relations; and when they are once reduced, they will be continued for ever.

JUPITER is a name applied in the writings of the older chemists, to TIN.

JUPITER's *Beard*, in botany. See ANTHYLLIS.

JUPITER's *Beard*, *American*. See AMORFHE.

JUPITER's *Distaff*, in botany, a provincial name given to one or two of the species of SALVIA, which see.

JUPPON. *s.* (*juppon*, French) A short close coat (*Dryden*).

JURA, a mountain, or rather a long chain of mountains, which extend from the Rhine, near Bale, to the Rhône, about ten miles below Geneva; sometimes more, some-

J U R

times less elevated; and in different places takes different names.

JURA, a department of France, bounded on the north by the department of the Upper Saône, on the east by the department of the Doubs and the canton of Bern, in Switzerland, on the south by the department of the Aine, and on the west by the departments of the Saône and Loire and Côte-d'Or. Lons le Saunier is the capital.

JURA, an island in the North Sea, near the west coast of Scotland, about twenty-five miles in length, and from two to six in breadth: chiefly mountainous or barren heath; however, from the thinness of the population, there is generally bear and oats enough for the consumption of the inhabitants, if not made into whiskey; as shell-fish and potatoes form the principal food of the poorer people. What are called *The Paps of Jura*, are three lofty mountains, of a conic form, of stupendous height. Some black cattle are raised, and about three or four hundred sold annually out of the island, and about one hundred horses: the wool is remarkable for its fineness; but the sheep are small, and not numerous: goats are in greater plenty. Some wild deer are still remaining, but the number is continually growing less. The number of inhabitants is said scarcely to exceed 900, who all reside on the east side of the island: the western part being too rugged for cultivation. There are two good harbours on the east side of the island, but no vessels above five or six tons belonging to them. The village of Jura is situated about the centre from north to south, on the east coast.

JURATS, magistrates like aldermen in several corporations.

IVREA, a strong town of Piedmont; capital of Canarez, with a bishop's see, a fort, and an ancient castle. Lat. 45. 22. N. Lon. 7. 48. E.

JURATORY. *a. (juratoire, Fr.)* Comprising an oath (*Ayliffe*).

JURIDICAL. *a. (juridicus, Latin.)* 1. Acting in the distribution of justice. 2. Used in courts of justice (*Hale*).

JURIDICALLY. *ad.* With legal authority; according to forms of justice.

JURIEU (Peter), a French protestant divine, was born in 1637. He studied under his uncle Peter du Moulin, in England, and was episcopally ordained, but was afterwards re-ordained in the presbyterian manner. On his return to France he became professor of divinity and Hebrew at Sedan; but when the persecution commenced, he fled to Holland, and settled at Rotterdam, where he brought himself into great notice by his controversial writings, and by his *Commentary on the Revelations*, in which he predicted the speedy destruction of Antichrist. He died in 1713. He wrote a *History of Calvinism*, and many pieces against popery.

J U R

JURIN (Dr. James), a distinguished person, who cultivated medicine and mathematics with equal success. He was secretary of the Royal Society in London, as well as president of the College of Physicians there. He had great disputes with Michellotti upon the momentum of running waters, with Robins upon distinct vision, and with the partisans of Leibnitz upon moving bodies. A treatise of his "upon Vision" is printed in Smith's "Optics." He died in 1750. Some of his papers in the Phil. Trans. are very valuable.

JURISCONSULTUS, or **JURECONSULTUS**, *Ierus*, among the Romans, was a person learned in the law; a master of the Roman jurisprudence; who was consulted on the interpretation of the laws, and customs, and the difficult points in law-suits.

JURISDICTION. *s. (jurisdictio, Latin.)* 1. Legal authority; extent of power (*Hayw.*)

2. District to which any authority extends.

JURISPRUDENCE. *s. (jurisprudence, French; jurisprudentia, Latin.)* The science of law.

JURIST. *s. (juriste, Fr.)* A civil lawyer: a man who professes the science of the law; a civilian (*Bacon*).

JUROR. *s. (juro, Latin.)* One that serves on the jury (*Spenser. Dryden*).

JURY, a certain number of persons sworn to inquire of and try some matter of fact, and to declare the truth upon such evidence as shall be laid before them. The jury are sworn judges upon all evidence in any matter of fact. Juries may be divided into two kinds, common and special. A common jury is such as is returned by the sheriff, according to the directions of the statute 3 George II. chap. 25, which appoints that the sheriff's officer shall not return a separate pannel for every separate cause, but one and the same pannel for every cause to be tried at the same assizes, containing not less than forty-eight, nor more than seventy-two jurors; and their names being written on tickets shall be put into a box or glass, and when each cause is called, twelve of those persons whose names shall be first drawn out of the box shall be sworn upon a jury, unless absent, challenged, or excused. When a sufficient number of persons are impannelled, they are then separately sworn well and truly to try the issue between the parties, and a true verdict give according to the evidence.

Special juries were originally introduced in trials at bar, when the causes were of too great nicety for the discussion of ordinary freeholders. To obtain a special jury, a motion is made in court, and a rule is granted thereupon, for the sheriff to attend the master, prothonotary, or other proper officer, with his freeholder's book, and the officer is to take indifferently forty-eight of the principal freeholders, in the presence of the attorneys on both sides, who are each

JUR

of them to strike off twelve, and the remaining twenty-four are returned upon the pannel.

Jurors are punishable for sending for, or receiving, instructions from either of the parties concerning the matter in question.

In causes of *nisi prius*, every person whose name shall be drawn, and who shall not appear after being openly called three times, shall, on oath made of his having been lawfully summoned, forfeit a sum not exceeding 5l. nor less than 40s. unless some reasonable cause of absence be proved, by oath or affidavit, to the satisfaction of the judge. If any juror shall take of either party to give his verdict, he shall, on conviction, by bill or plaint, before the court where the verdict shall pass, forfeit ten times as much as he has taken; half to the king, and half to him who shall sue. A man who shall assault or threaten a juror for giving a verdict against him, is highly punishable by fine and imprisonment; and if he strike him in the court, in the presence of the judge of assize, he shall lose his hand and his goods, and the profits of his lands during life, and suffer perpetual imprisonment.

The mode of trial by jury is very ancient, and seems to have been coeval with the civil government of this nation. Traces of juries may be found in the laws of all those nations which adopted the feudal system, as in Germany, France, and Italy; and in England we find actual mention of them so early as the laws of king Ethelred, and even then not as a new invention. The establishment and use of this mode of trial in our island, though for a time greatly impaired and shaken by the introduction of the Norman trial by battle, were so highly esteemed and valued by the people, that no conquest, no change of government, could ever prevail to abolish it. See *JUDICIUM PARIVM*.

Trial by Jury has long been one of the objects of English idolatry. But the Edinburgh Reviewers, who inform us "they are not partial to idols," have lately striven to remove our prejudices upon this subject. They say "there is a kind of established cant upon this subject, which we suppose must always be used to the vulgar, like the slang about roast beef and liberty." "The fact," they continue, "is that we are misled into an admiration of juries, from what we see of them in criminal cases." The way in which these "lights of the world" think we are misled in respect to juries, we have not much inclination to explore here: the "cant" about juries, is a cant we like; those who are tired of the sound, and wish to fortify themselves with plausible arguments against a national blessing may turn to the 18th No. of the work just mentioned.

JURYMAN. *s.* (*Jury and men.*) One who is impanelled on a jury (*Suffr.*).

JUS

JU'RYMAST. *s.* So the seamen call whatever they set up in the room of a mast lost in a fight or by a storm (*Harris*).

JUS CORONÆ. See *HEREDITARY Right and SUCCESSION*.

Jus Civile, among the Romans, signified no more than the interpretation given by the learned, of the laws of the twelve tables, though the phrase now extends to the whole system of the Roman laws.

Jus Civitatis signifies freedom of the city of Rome, which entitled those persons who had obtained it to most of the privileges of Roman citizens—yet it differs from *Jus Quiritium*, which extended to all the advantages which a free native of Rome was entitled to—the difference is much the same as betwixt denization and naturalization with us.

Jus Trium Liberorum was a privilege granted to such persons in the city of Rome as had three children, by which they were exempted from all troublesome offices. The same exemption was granted to any persons who lived in other parts of Italy, having four children; and those that lived in the provinces, provided they had five (or as some say seven) children were entitled to the same immunities. This was good policy, and tended to the population of the empire. See *CHILDREN*.

JUSSIEVA. So denominated from the deservedly celebrated Jussiev. A botanic genus of the class decandria, order monogynia. Calyx four or five parted;—superior; petals four or five; capsule four or five celled, oblong, opening at the angles; seeds numerous, minute.

Twelve species natives of the East or West Indies or South America: mostly herbaceous, a few shrubby.

JUST. *a.* (*Juste*, French.) 1. Upright; incorrupt; equitable in the distribution of justice (*Dryden*). 2. Honest; without crime in dealing with others (*Tillotson*). 3. Exact; proper; accurate (*Glaucville*). 4. Virtuous; innocent; pure (*Matthew*). 5. True; not forged (*Hooker*). 6. Grounded on principles of Justice; rightful (*Millon*). 7. Equally retributed (*Romans*). 8. Complete without superfluity (*Bacon*). 9. Regular; orderly (*Addison*). 10. Exactly proportioned (*Shaks*). 11. Full; of full dimensions (*Knolles*).

Jus. ad. 1. Exactly; nicely; accurately (*Hooker*). 2. Merely; barely (*Dryden*). 3. Nearly; almost (*Temple*).

Jus, a sportive kind of combat on horseback, a man against man, armed with lances. Justs and tournaments differ in this that the latter is the genus, of which the former is only a species. Tournaments included all kinds of military sports and engagements made out of gallantry and diversion: justs were those particular combats where the parties were near each other, and engaged with lance and sword. Add, that the tournament was frequently performed by a num-

ber of cavaliers, who fought in a body: the just was a single combat of one man against another.

To *Jusr. v. n.* (*jouster*, French.) 1. To engage in a mock fight; to tilt. 2. To push; to drive; to juggle.

JU'STICE. *s.* (*justice*, French; *justitia*, Latin.) 1. The virtue by which we give to every man what is his due (*Locke*). 2. Equity; agreeableness to right. 3. Vindicative retribution; punishment (*Bacon*). 4. Right; assertion of right (*Shakspeare*). Justice may be divided, into distributive, commutative, and legal.

JU'STICE, *distributive*, is concerned in matters of government, and of beneficence; and is either remuneratory, or punitive: it observes an equality in dealing rewards and punishments, according to each man's condition and merit; for as actions are either good or evil, for the good, rewards must be assigned; and for the evil, punishments; and herein a geometrical proportion is observed.

JU'STICE, *commutative*, is conversant in matters of commerce, and in the equal commutation, or changing, of things; and proceeds according arithmetical equality, without any regard to persons and circumstances.

JU'STICE *legal*, is that which resides in the state, or monarch, by whose power and authority the effects of commutative and distributive justice are frequently superseded, or suspended; as in a dearth of corn, if a person that has a stock by him will not sell it, it shall be taken from him; and the like.

JU'STICE is also an appellation given to a person deputed by the king to administer justice to his subjects, whose authority arises from his deputation, and not by right of magistracy. Of these justices there are various kinds in England; viz.

Chief Justice of the King's Bench is the capital justice of Great Britain, and is a lord by his office. His business is chiefly to hear and determine all pleas of the crown; that is, such as concern offences against the crown, dignity, and peace of the king; as treasons, felonies, &c. The officer was formerly not only chief justice, but also chief baron, for the exchequer, and master of the court of wards. He usually sat in the king's palace, and there executed that office formerly performed per countem palatii; he determined in that place all the differences happening between the barons and other great men. He had the prerogative of being the vicegerent of the kingdom whenever the king went beyond sea, and was usually chosen to that office out of the prime nobility; but his power was reduced by king Richard I. and king Edward I. His office is now divided, and his title changed from capitalis Anglie justitiarius, to capitalis justitiarius, ad placita coram regetenda, or capitalis justitiarius banci regii.

Chief Justice of the Common Pleas, the who with his assistants hears and determines all causes at the common law; that is to say, all civil causes between common persons, as well personal as real; and he is also a lord by his office.

JU'STICE of the Forest, is a lord by his office, who has power and authority to determine offences committed in the king's forests, &c. which are not to be determined by any other court of justice. Of these there are two; whereof one has jurisdiction over all the forests on this side Trent, and the other beyond it.

JU'STICES OF ASSISE, are such as were wout, by special commission, to be sent into this or that country to take assises.

JU'STICES in Eyre (*justitiani itinerantes*, or *errantes*), were those who were anciently sent with commission into divers counties to hear such causes especially as were termed pleas of the crown; and that for the ease of the subject, who must else have been hurried to the courts of Westminster, if the cause were too high for the county-courts. According to some, these justices were sent once in seven years; but others will have them to have been sent oftener. Camden says, they were instituted in the reign of king Henry II. A. D. 1184; but they appear to be of an older date. They were somewhat like our justices of assise at this day.

Ten Justices of Gaol Delivery, are such as are sent to determine all causes pertaining to such as for any offence are cast into gaol.

JU'STICES of Nisi Prius, are now the same with justices of assise. It is a common adjournment of a cause in the common pleas to put it off to such a day, Nisi prius justitiam venerint ad eas partes ad capiendas assisas: from which clause of adjournment they are called justices of nisi prius, as well as justices of assise, on account of the writ and actions they have to deal in.

JU'STICES of oyer and terminer. As the justices of assise and nisi prius are appointed to try civil cases, so are the justices of oyer and terminer, and gaol delivery, to try indictments for all crimes all over the kingdom, at what are generally denominated the circuits or assizes; and the towns where they come to execute their commission are called the assize towns, and are generally the county towns.

JU'STICES of the peace, are persons appointed by the king's commission, to attend to the peace of the county where they dwell. They were called guardians of the peace till the thirty-sixth year of Edw. III. c. 12, where they are called justices. A justice of the peace must, before he acts, take the oath of office, which is usually done before some persons in the county, by virtue of a dedimus protestatorem out of chancery. Sheriffs, coroners, attorneys, and proctors, may not act as justices of the peace.

The power, office, and duty of this magistrate extends to an almost infinite number of instances, specified in some hundreds of acts of parliament, and every year accumulating. The commission of the peace does not determine by the demise of the king, nor until six months after, unless sooner determined by the successor: but before his demise, the king may determine it, or may put out any particular person, which is most commonly done by a new commission, leaving out such person's name.

Justices of the peace can only be appointed by the king's special commission, and such commission must be in his name; but it is not requisite that there should be a special suit or application to, or warrant from the king for the granting it, which is only requisite for such as are of a particular nature, as constituting the mayor of such a town and his successors perpetual justices of the peace within their liberties, &c. which commissions are neither revocable by the king, nor determinable by his demise, as the common commission of the peace is, which is made of course by the lord chancellor according to his discretion.

The form of the commission of the peace, as it is at this day, was, according to Hawkins, settled by the judges about 23 Elizabeth.

The power of justices is ministerial, when they are commanded to do any thing by a superior authority, as the court of Banco Regis, &c. In all other cases they act as judges; but they must proceed according to their commission, &c. Where a statute requires an act to be done by two justices, it is an established rule, that if the act be of a judicial nature, or the result of discretion, the two justices must be present to concur and join in it, otherwise it will be void; as in the orders of removal and filiation, the appointment of overseers, and the allowance of the indenture of a parish apprentice; but where the act is merely ministerial, they may act separately, as in the allowance of a poor-rate. This is the only act of two justices which has been construed to be ministerial; and the propriety of this construction has been justly questioned.

Where a justice shall exceed his authority in granting a warrant, the officer must execute it, and he is indemnified for so doing; but if it be in a case wherein he has no jurisdiction, or in a matter whereof he has no cognizance, the officer ought not to execute such warrant; for the officer is bound to take notice of the authority and jurisdiction of the justice. If a justice of the peace will not, on complaint to him made, execute his office, or if he shall misbehave in his office, the party grieved may move the Court of King's Bench for an information, and afterwards may apply to the Court of Chancery to put him out of the commission. But the most usual way of compelling justices to

execute their office, in any case, is by writ of mandamus out of the Court of King's Bench.

Where the plaintiff in an action against a justice shall obtain a verdict, and the judge shall in open court certify on the back of the record, that the injury for which such action was brought was wilfully and maliciously committed, the plaintiff shall have double costs. And if a justice of peace act improperly, knowingly, information shall be granted. No justice shall be liable to be punished both ways, that is, criminally and civilly; but before the court will grant an information, they will require the party to relinquish the civil action, if any such be commenced. And even in the case of an indictment, and though the indictment be actually found, the attorney-general, on application made to him, will grant a *noli prosequi* upon such indictment, if it appear to him that the prosecutor is determined to carry on a civil action at the same time.

If any action shall be brought against a justice for any thing done by virtue of his office, he may plead the general issue, and give the special matter in evidence; and if he recover, he shall have double costs. Such action shall not be laid but in the county where the fact was committed. And no suit shall be commenced against a justice of the peace till after one month's notice. And unless it is proved upon the trial that such notice was given, the justice shall have a verdict and costs. And no action shall be brought against any constable or other officer, or any person acting by his order and in his aid, for any thing done in obedience to the warrant of a justice, till demand hath been made, or left at the usual place of his abode, by the party or by his attorney, in writing, signed by the party demanding the same, of the perusal and copy of such warrant, and the same has been refused or neglected for six days after such demand. And no action shall be brought against any justice for any thing done in the execution of his office, unless commenced within six months after the act committed.

To Justice. v. a. (from the noun.) To administer justice to any: not in use (*Hayw.*)

JUSTICKMENT. s. (from *justice*.) Procedure in courts.

JUSTICER. s. (from *To justice*.) Administrator of justice (*Davies*).

JUSTICESHIP. s. (from *justice*.) Rank or office of justice (*Swift*).

JUSTICIA. In botany, a genus of the class diandria, order monogynia. Calyx single or double; corol one-petalled irregular; capsule opening with an elastic claw, the partition opposite to the valves. Ninety species; natives of Asia, Africa, and America, but not of Europe. They may be thus subdivided.

A. With a double calyx and single anther; and hence not properly belonging to this class.

B With a double calyx and two anthers.

C With a single calyx, corol two-lipped, the lips undivided.

D Calyx single; corol two-lipped, the lips divided; anther single.

E Calyx single; corol two-lipped, the lips divided; anthers double.

F Calyx single; corol ringent; anthers single.

G Calyx single; corol ringent; anthers double.

H Calyx single; corol nearly equal.

I Calyx and corol unknown.

JU'STICIABLE. a. (from *justice*.) Proper to be examined in courts of justice.

JU'STICIAR, in our old laws, an officer instituted by William the Conqueror, as the chief officer of state, and who principally determined all pleas civil and criminal. He was called in Latin, capitalis justiciarius, totius Angliæ.

JU'STICIARII, in church history, an appellation given to heretics who boast much of perfect righteousness, and despise others: such were the Pharisees among the Jews, and the Novations and Donatists among the Christians.

JU'STICIARIUS, *Magister*, a judge in the kingdom of Naples, who has supreme jurisdiction in all cases of treason, and pleas of the crown, and finally determines all appeals. He has four assessors.

JU'STICIARY Court, in Scotland. The court of judiciary has supreme jurisdiction in all criminal causes. It came in place of that of justice-cyre, or justice-general, which was last in the person of the earl of Argyle, who transacted for it with king Charles I. and was made justice-general of all the islands; which raising great debates between him and some hereditary sheriffs there, the jurisdiction was taken away in 1672, and this court of judiciary erected instead of it, consisting of a justice-general, alterable at the king's pleasure; a justice-clerk, and five other judges, who are likewise lords of the session.

This court commonly sits on Mondays, and has an ordinary clerk, who has his commission from the justice-clerk. They have four ordinary macers and a doomsday appointed by the lords of session.

JU'STIFIABLE. a. (from *justify*.) Defensible by law or reason (*Brown*).

JU'STIFIABLENESS. s. Rectitude; possibility of being fairly defended (*K. Charles*).

JU'STIFIABLY. ad. (from *justifiable*.) Rightly; so as to be supported by right (*Locke*).

JUSTIFICATION. s. (*justification*, Fr.)

1. Absolution (*Shakspeare*). 2. Defence; maintenance; vindication; support (*Swift*). 3. Deliverance by pardon from sins past (*Clarke*).

JUSTIFICATOR. s. (from *justify*.) One who supports, defends, vindicates, or justifies.

JU'STIFIER. s. (from *justify*.) One who

justifies; one who defends or absolves; one who frees from sin by pardon (*Romans*).

To JU'STIFY. v. a. (*justifier*, French.) 1. To clear from imputed guilt; to absolve from an accusation (*Dryden*). 2. To maintain; to defend; to vindicate (*Atterbury*). 3. To free from past sin by pardon (*Acts*).

JU'STIN, a Latin historian of the second century. He made an abridgment of the Universal History of Troguus Pompeius. This work remains, but the original is lost. It is written in an excellent style, clear, and interesting. The best editions are that of Oxford, 8vo. 1705, and that of Barbou, Paris, 1770, 12mo.

JU'STIN, surnamed the Martyr, a celebrated father of the church, was born in Samaria, of heathen parents. He attached himself to the doctrines of Plato, and became a distinguished philosopher. He was converted to Christianity about the year 132, but still continued to wear the pallium or cloak of the Greek philosophers. In the reign of Antoninus Pius he went to Rome, where he opposed the heresy of Marcion, and presented to the emperor an Apology for the Christians, which prevailed so far as to obtain a temporary stop to the persecution. He afterwards went to Ephesus, where he formed an acquaintance with Trypho, a noted Jew, his dialogue with whom is still extant. He returned again to Rome, where he suffered martyrdom, A. D. 165. The best editions of St. Justin are those of R. Stephens, in 1551 and 1571, in Greek and Latin; that of Morel, in Greek and Latin 1656; and that of Don Pondentius Marandus, a learned Benedictine, in 1742, in folio.

JU'STINIAN I. emperor of Rome, succeeded his uncle Justin I. in 527. He was a zealous protector of Christianity, and carried his arms with great success against his enemies, for which indeed he was chiefly indebted to his general Belisarius, who also preserved him from a formidable conspiracy that was formed against him. Peace being restored, Justinian set himself to form into a body all the Roman laws, which was executed under the title of *Digests* or *Pandects*. After this great work was accomplished, the laws of modern date were collected into one volume called, the *Novellæ*. He exerted himself against the ecclesiastical encroachments of Popes Sylvester and Vigilius, and died in 565, aged 83. He built many churches, particularly the famous Sancta Sophia at Constantinople, and abolished the consulate.

JU'STINIAN II. was the eldest son of Constantine Pogonatus, whom he succeeded in 685. He retook several provinces from the Saracens, and made an advantageous peace with them; but his actions, cruelties, and debaucheries, tarnished the glory of his arms. He formed the design of massacring all the inhabitants of Constantinople, which being discovered, this new Nero was deposed and sent into exile. But he afterwards re-

J U S

covered his throne, though he still continued his cruelties. He was slain in 711 by Philippicus Bardanes, his successor.

JU'STINIANI (Augustin) bishop of Nebbio in the isle of Corsica, was born at Genoa in the year 1470. He became a Dominican the 25th of April, 1487, and applied himself to his studies with so much earnestness, and under such able masters, that he became a very learned man. He understood philosophy, mathematics, divinity, Greek, Hebrew, Arabic, and Chaldee. He taught in the province of Lombardy eighteen years with great advantage to his hearers; he was made bishop of Nebbio the 15th of November, 1514, at the recommendation of Cardinal Bordinello Saoli his cousin, and received his bulls before he knew the good offices this cardinal had done him. He assisted at the council of Lateran, and opposed some articles of the Concordate agreed upon between France and the court of Rome. Nevertheless Francis I. invited him to Paris, and made him his almoner. He made use of this prelate's great skill to set up the study of the Oriental tongues in the university of Paris. Justinian finding himself so near England, took a voyage thither, and was very much caressed by Henry VIII. He collected a very fine library, and left it by his will to the republic of Genoa. He made many reparations in his bishopric, and increased the revenues of it; he so beautified his cathedral church, dedicated to the holy virgin, that Maracci placed him among her faithful servants. He also translated into the vulgar tongue some Latin works, the reading whereof might be useful to clergymen. He lost his life at sea, in passing from Genoa to the isle of Corsica, in the year 1536. He was not only a learned prelate, but very laborious, as appears from the works he composed, and from those which he caused to be printed. He went about a Polyglot bible, part whereof we may reckon the psalter, which he published. He was at great charges for the edition, and finding that he could not get his money by the sale, and that the princes did not promote his designs, he complained of the ingratitude of his age.

JU'STITIA, in Pagan worship, one of the virtues to whom the Romans erected altars. She was represented in the figure of a woman with a severe countenance, holding a pair of scales in one hand, and a sword in the other; or rods, and a bundle of axes, and sitting upon a square stone. She frequently appears blindfold, to shew that justice has no respect of persons.

JUSTERBOCH, a town of Upper Saxony, situate on the Angerbach. Lat. 52. 1. N. Lon. 12. 52. E.

To JU'STLE. v. n. (*jouster*, French.) To encounter; to clash; to rush against each other (*Lee*).

To Ju'STLE. v. a. To push; to drive; to force by rushing against it (*Brown*).

J U V

JU'STLY. ad. (from *just*.) 1. Uprightly; honestly, in a just manner (*South*). 2. Properly; exactly; accurately (*Dryden*).

JU'STNESS. s. (from *just*.) 1. Justice; reasonableness; equity (*Shaks*). 2. Accuracy; exactness; propriety (*Dryden*).

To JUT. v. n. (supposed to be corrupted from *jet*, perhaps from *shoot*.) To push or shoot into prominences; to come out beyond the main bulk (*Broome*).

JUTES, the ancient inhabitants of Jutland in Denmark.

JUTLAND, a large peninsula, which makes the principal part of the kingdom of Denmark. It is bounded on the south-east by the duchy of Holstein, and is surrounded on the other sides by the German Ocean and the Baltic sea. It is about 180 miles in length from north to south, and 50 in breadth from east to west. The air is very cold, but wholesome; and the soil is fertile in corn and pastures, which feed a great number of bees, that are sent to Germany, Holland, and elsewhere. This was anciently called the Cimbric Chersonesus, and is supposed to be the country from whence the Saxons came into England. It is divided into two parts, called North and South Jutland.

To JU'TTY. v. a. (from *jut*.) To shoot out beyond (*Shakspeare*).

JUVENAL (Decius Junius), a celebrated poet born at Aquinum in Italy. He came early to Rome, and passed some time in declaiming; after which he applied himself to write satires, 16 of which are extant. He spoke with virulence against the partiality of Nero for the pantomime Paris, and though all his satire was pointed against this favourite, yet Juvenal lived in security during the reign of Nero. After the death of Nero, he was sent by Domitian, as governor, or rather in exile, on the frontiers of Egypt, in the 80th year of his age. He returned, however, to Rome after the death of Paris, and died in the reign of Trajan, A. D. 128. His writings are fiery and animated. He is particularly severe upon the dissipation of the age he lived in, but the gross manner in which he exposes to ridicule the follies of mankind, rather encourages than disarms the licentious. Juvenal was far more correct than his contemporaries, a circumstance attributed to his matured judgment and experience. He may be called, and with reason, perhaps the last of the Roman poets. After him poetry decayed, and nothing more claims attention as a perfect poetical composition. Among the principal editions of Juvenal, we may specify the following. The Editio Princeps, printed by Viudelin de Spita, at Venice, in 1470; folio. The valuable edition of Jac. Rubeus, Venice, folio, 1475. The Aldine editions in 8vo. of 1501, and 1535. Lusbinus's edition, Hanover, 4to. 1603—13. The Glasgow edition, Foulis, 8vo. 1750. Rupert, Lipsæ, 8vo. 1801. The latter is a very learned and valuable edition, and contains more information respecting

I X I

the author than any other edition extant. The best translation is that of Wm. Gifford, Esq.

JUVENALIA, games and combats instituted by Nero, the first time his beard was shaven.

JUVENILE. *a.* (*juvenilis*, Latin.) Young; youthful (*Bacon*).

JUVENILITY. *s.* (from *juvenile*.) 1. Youthfulness (*Glanville*). 2. Light and careless manner (*Glanville*).

JUVENTAS, in mythology, the goddess whom the Romans supposed to preside over youth.

JUXON (William), archbishop of Canterbury, was born at Chichester, and educated at Merchant Taylors' school, from whence he was removed to St. John's college, Oxford, of which he became fellow, and in 1621 president. In 1627 he was promoted to the deanery of Worcester; in 1633 made clerk of the closet to the King, and the year following bishop of Hereford. His next remove was to the see of London, and in 1635, by the means of archbishop Laud, he was appointed lord treasurer, which gave great offence to the temporal lords; however, his conduct was irreproachable. He attended Charles I. on the scaffold, and at the restoration was made archbishop of Canterbury. He died in 1663, aged 61.

JUXTAPOSITION. *s.* (*juxta* and *positio*, Latin.) Apposition; the state of being placed by each other (*Glanville*).

IVY. In botany. See *HERERA*.

IVY, *Bindweed-leaved*. See *MERISPERMUM*.

IVY, *Ground*. See *GLECHOMA*.

IVY tree of America. See *KALMIA*.

IVY, *Gum*. See *GUMMI Hedera*.

IXIA, in botany a genus of the triandrian monogynian class and order. Natural order *ensatæ*. Irides, *Jussieu*. Essential character: corol one-petalled, tubular; tube straight, filiform; border six-parted, bell-shaped, regular; stigmas three or six, simple. There are fifty-four species. *Ixia* differs from *antholyza* in having the segments of the corol nearly equal; from *gladiolus*, in the situation of the segments of the corol, and in having the tube straight. Almost all the species are natives of the Cape of Good Hope.

IXINK. See *CARLINA GUMMIFERA*.

IXION, in fabulous history, king of the Lapithes, married Dia, the daughter of Deionius, to whom he refused to give the customary nuptial presents. Deionius in revenge took from him his horses: when Ixion, dissembling his resentment, invited his father-in-law to a feast, and made him fall through a trap-door into a burning furnace, in which he was immediately consumed. Ixion being afterwards stung with remorse for his cruelty, ran mad, on which Jupiter in compassion, not only forgave him, but took him up into heaven, where he had the impiety to endeavour to corrupt Juno. Ju-

J Y N

pter to be the better assured of his guilt, formed a cloud in the resemblance of the goddess, upon which Ixion begat the Centaurs: but boasting of his happiness, Jove hurled him down to Tartarus, where he lies fixed on a wheel encompassed with serpents, which turns without ceasing.

IXORA, in Pagan worship, a false god of the East Indians. The Bramins imagine that he is infinite; to illustrate which they say, that Brama, another of their gods, being desirous of seeing Ixora's head, flew up to heaven for that purpose, but found his endeavours vain. On the other hand Vistnou, the god of metamorphoses, willing to find the place where his feet stood, transformed himself into a hog, and made a deep hole in the ground with his snout, but without success. The body of Ixora, they say, is so bulky, that the serpent Baltagu, which surrounds seven worlds, is not long enough to serve him for a bracelet. He is represented standing on a pedestal, his head adorned with long hair, his face white and shining, with three eyes, and a crescent upon his forehead. He has sixteen arms, each of which grasps something: one holds fire, another pieces of money, another a drum, another a rope, another a string of beads, another a stick, another a wheel, another a serpent, another a bell, &c. He has an elephant's skin over his shoulders, and is surrounded with several serpents. He wears also a necklace, at which hangs a little bell. All these particulars are said to be emblematical; thus his sixteen hands denote his great power; the serpents twining about him, the revolution of ages; and the little bell, his great vigilance.

IXORA. In botany a genus of the class tetrandria; order monogynia. Corol one-petalled, funnel-form, long, superior; stamens seated above the mouth of the corol; berry four-seeded. Ten species natives of the East or West Indies, with yellow, white, scarlet, or violet flowers, generally in corymbs and elegantly disposed. The stem is woody, or shrubby; in some species herbaceous: several are propagated in our hot-houses, and considerably contribute to their beauty.

IXWORTH, a town in Suffolk, with a market on Fridays. Lat. 52. 40. N. Lon. 0. 51. E.

IXYS. (*ἰξύς*, corrupted from *ισχύς*, strength.) The loin. See *ISCHYS*.

IYAR. See *JAR*.

JYEPOUR, a city of Hindustan Proper in Agra, capital of a territory of the same name. An observatory was erected here in 1734. Lat. 26. 56. N. Lon. 76. 9. E.

JYNX, or *Yun*, the wryneck, a genus of birds belonging to the order *picæ*; the characters of which are, that the bill is slender, round, and pointed; the nostrils concave and naked; the tongue very long, very slender, cylindric, and terminated by a hard point; and the feet formed for

J Y N

climbing. There is only one species, viz. the torquilla. The colours of this bird are elegantly pencilled, though its plumage is marked with the plainest colours. The wryneck, Mr. Pennant apprehends, is a bird of passage, appearing with us in the spring before the cuckoo. Its note is like that of the kestril, a quick-repeated squeak; its eggs are white, with a very thin shell; it builds in the hollows of trees, making its

I Z Q

nest of dry grass. It has a very whimsical way of turning and twisting its neck about, and bringing its head over its shoulders, whence it had its Latin name torquilla, and its English one of wryneck. See Yew.

IZQUINTENANGO, a town of New Spain, in the province of Chiapa. The country about it produces cotton and a great number of pine-apples. Lat. 16. 0. N. Lon. 93. 45. W.

K

K

K, A double consonant, and the tenth letter of the alphabet.

This consonant has the sound of hard *c*, and is used before *e* and *i*, where, according to the English analogy, *c* would be soft; as in the words *kept*, *king*; at the end of words it is not much used, except after *c*, and chiefly in monosyllables, as *clock*, *back*, &c. It is now properly omitted in many other words, as *music*, *public*, &c. It is also used between a vowel and the silent *e* final, as *cloke*, *broke*, &c. It likewise ends a word after a diphthong, as *look*, *break*, &c. In the present pronunciation, *k* is silent before *n*.

K is borrowed from the Greek *kappa*; and was but little used among the Latins: Priscian looked on it as a superfluous letter, and says, it was never to be used except in words borrowed from the Greek. Dausquius, after Sallust, observes, that it was unknown to the ancient Romans. Indeed we seldom find it in any Latin authors, excepting in the word *kalendæ*, where it sometimes stands in lieu of a *c*. Carthage, however, is frequently spelt on medals with a *K*: *Salvis Jug. et Caes. Fel. Kart.* and sometimes the letter *K* alone stood for *Carthage*. M. Berger has observed, that a capital *K*, on the reverse of the medals of the emperors of Constantinople, signified Konstantinus; and on the Greek medals he will have it to signify ΚΟΛΙΑ ΣΤΡΙΑ, Coele Syria.

Quintilian tells us, that in his time some people had a mistaken notion, that wherever the letter *c* and *a* occurred at the beginning of a word, *k* ought to be used instead of the *c*. See *C*.

Lipsius observes, that *K* was a stigma, anciently marked on the foreheads of criminals with a red-hot iron.

The letter *K* has various significations in old charters and diplomas; for instance, *KR.* stood for *chorus*, *KR.C.* for *cara civitas*, *KRM.* for *carmen*, *KRAM.N.* *carus amicus noster*, *KS.* *chaos*, *KT.* *capite tonsus*, &c.

The French never use the letter *k*, excepting in a few terms of art, and proper names borrowed from other countries. Ablancourt, in his dialogue of the letters, brings in *k* complaining, that it has been often in a fair way to be banished out of the French alphabet, and confined to the countries of the North.

K is also a numeral letter, signifying 250, according to the verse;

K quoque ducentos & quinquaginta tenebit.

When it had a stroke at top, *K̄*, it stood for 250,000.

K on the French coinage denotes money coined at Bourdeaux.

K A B

KAARTA, a kingdom in Africa, through which Mr. Park passed in his route from the Gambia to the Niger. He describes the country as consisting either of sandy plains or rocky hills; but, from his account, the level part seems to be the most extensive. The natives are negroes, of whom many, though converted to the Mahomedan faith, or rather to the ceremonial part of the Mahomedan religion, retain all their ancient superstitions, and even drink strong liquors. They are called *Johers* or *Jowers*, and in Kaarta form a very numerous and powerful tribe. One of these men undertook to conduct our author to Kemmoo, the capital of the kingdom, and alarmed him not a little by his superstitious ceremonies. White men were strangers in the kingdom of Kaarta; and the appearance of our author had on some of the natives the effect which ignorant people, in this country, attribute to ghosts. Kemmoo, the metropolis of this kingdom, lies in lat. 14. 15. N. Lon. 7. 20. W.

KABOBIQUAS, a nation in the south of Africa, who are reported never to have seen a white man, till the year 1785, when they were visited by Mr. Vaillant.

The Kabobiquas have neither the flat nose nor plump cheeks of the Hottentots. Their skin also has not that bastard colour, which being neither black nor white, renders them odious to both races; nor do they besmear their bodies with those disgusting fat substances, on account of which one cannot approach them without being bedaubed with their filth, or acquiring an offensive smell. In stature they are as tall as the Caffres, and their colour is equally black. Their hair, which is exceedingly short, and much curled, is ornamented with small copper buttons, arranged with great art and symmetry. Instead of that apron made of a jackal's skin, employed by the Hottentot to cover what modesty bids him conceal, the Kabobiquas use a round piece of leather, the edge of which is ornamented with a small indented circle of copper, and which is divided into different compartments by rows of glass beads of various colours, all proceeding from the centre, and diverging towards the circumference, like the rays in our images of the sun.

Of the religion of the Kabobiquas, M. Vaillant talks very inconsistently, and like a true philosopher of the French school, says, "Of all the African nations, they are the only people among whom I found any idea, however confused a one, of the existence of a Deity. I do not know whether it be from their own reflection, or the communications of other tribes, that they have acquired this sublime knowledge, which would alone bring

K E M

them near to a level with polished nations; but they believe, as far as I have been able to learn from my people, that beyond the stars there exists a Supreme Being, who made and who governs all things. I must however observe, that on this subject their ideas are vague, barren, and unproductive. They have no conception of the future existence of the soul, or of rewards and punishments in another life; in short, they have neither worship, sacrifices, ceremonies, nor priests, and are total strangers to what we call religion."

This is impossible. A people believing in a Supreme Being, who made and who governs all things, may indeed be without sacrifices, ceremonies, and priests: but such a people cannot avoid wishing, that the Being who governs all things may protect them. Such a wish is a prayer; and surely he who prays is no stranger to religion. M. Vaillant places the country of the Kabobiquas between 23. and 25. S. lat. and 16. 26. and 19. 25. lon. east from Paris.

KADANAUE, in botany, a name for the *ALOE*; which see.

KADESH, KADESH-BARNEA, or *En Mish-pai*, in ancient geography, a city celebrated for several events. At Kadesh, Miriam the sister of Moses died (Numb. xx. 1.) Here it was that Moses and Aaron, showing a distrust in God's power when they smote the rock at the waters of strife, were condemned to die without the consolation of entering the promised land (Numb. xxvii. 14.) This city was given to the tribe of Judah, and was situated about eight leagues from Hebron to the south. Mr. Wells is of opinion, that this Kadesh, which was situated in the wilderness of Zin, was a different place from Kadesh-barnea, in the wilderness of Paran.

KADMONEL, or *CADMONAI*, in ancient geography, a people of Palestine, said to dwell at the foot of Mount Hermon; which lies east, and is the reason of the appellation, with respect to Libanus, Phœnicia, and the north parts of Palestine. Called also *Hevæi* (Moses).

KEMPFERIA. In botany, a genus of the class monandria; order monogynia. Calyx none, or obsolete: corol six-parted; the three larger divisions expanding, one of them two-parted: stigma bilamellate. Two species.

1. *K. Galanga*. Leaves ovate, sessile: root bulbous; stemless; flowers sessile, white with a violet spot in the middle. Corol salver-form, with a curved tube: a native of India. This species is commonly identified, but erroneously with the galangale of the shops. The true galangale is the *Alpinia Galanga* of the East Indies. See *ALPINIA*.

2. *K. Rotunda*. Leaves lanceolate, pectinated, root clustered; florets mixed blue, purple, white and red. A native of India. It is generally said to be the zedoary of the shops; but erroneously; the name zedoary

K A L

being the *Amomum Zedoaria*. See *AMOMUM*.

KAHLER (John), professor of poetry, mathematics, and theology, at Rinletz, and the author of some dissertations on theological and philosophical subjects, was a native of Hesse Cassel, and died in 1729, aged 80.

KAISARTEH, or KAISARIJAH, a town of Asiatic Turkey, in the province of Carmania, and capital of a sangiacat; situated at the foot of a mountain, always covered with snow, about a league and a half, or two leagues in circumference, surrounded with walls, and defended by a castle. It is populous, divided into 180 quarters, in each of which is a mosque, or chapel. The Greeks have a metropolitan and one other church, and the Armenians have three. The principal trade is in Morocco leather. It was known to the ancients under the name of Mazaca, and afterwards that of Cesarea of Cappadocia: 150 miles N. E. of Cogni, and 250 E. S. E. of Constantinople.

KAJEPUT OLEUM. See *CAJEPUT OIL*.

KA'INSI, the Hottentot name of a species of Antelope. See *CAPRA*.

KALE (William), a Dutch painter, born, in 1630, and died in 1693. His usual subjects were vases of gold, silver, or crystal, gems, glasses, and agates, painted with delicacy, and an extraordinary lustre.

KA'LE, in botany. See *BRASSICA*.

KA'LE, *sea*. In botany. See *CRABBE*.

KA'LENDAR. See *CALENDAR*.

KA'LENDIS. See *CALENDIS*.

KA'LI, in botany. See *SALSOLA*.

KA'LI, *Egyptian*. See *MESEMERYANTHAMUM*.

KA'LI *Sal*. See *SALICORNIA*.

KA'LI. (*Kali*, *n. ind.* from *kali* Arabian.) The kali of the pharmacopœias is the vegetable alkali, or potash. See also *ALKALI VEGETABLE* and *MINERAL*, *BARILLA*, *NATRON*, *POTASH*, &c.

KA'LI ACETATUM. (*Terra foliata tartari. Tartarus regeneratus. Arcanum Tartari. Sal diureticus*. A useful diuretic, deobstruent, and eccoprotic preparation of potash.) In the new chemical nomenclature it is called *acetis potassæ*. Externally it is applied dissolved in vinegar to inflammatory swellings of the testicles and other indolent tumours. Internally it is exhibited in physconia abdominalis, pituitous affections of the primæ viæ, rheumatism, dropsies, jaundice, intermittent fevers, hæmorrhoids, and dysury.

K. Citratum. Alkali volatile, succo citri saturatum. This neutral saline liquor, a citrat of potash, is made by saturating prepared kali with lemon juice. It is the base of the saline draught; it possesses nervine and sudorific properties; and is exhibited in rheumatism, catarrh, and most febrile diseases.

K. Purum. Alkali vegetabile fixum causticum. Caustic vegetable alkali. This pro-

K A L

preparation of kali is violently caustic, destroying the living animal fibre with great energy. See ALKALI CAUSTIC.

K. Preparatum. *Sal abynthii*, *Sal Tartari*, *Sal plantarum*. *Alkali vegetabile fixum*. *Carbonas potassæ crystallisatus*. This preparation of potash is in general use to form the kali citratum for the saline draughts. A scruple is commonly directed to be saturated with lemon juice. In this process the kali preparatum, which is a salt composed of potash and carbonic acid, is decomposed. The citric acid having a greater affinity for the potash than the carbonic, seizes it and forms the kali citratum, whilst the carbonic acid flies off in the form of air. The kali preparatum possesses antacid virtues, is an antidote against white arsenic, and may be exhibited with advantage in convulsions and other spasms of the intestines arising from acidity, in calculous complaints, leucorrhœa, scrophula, and aphthous affections.

K. Sulphuratum. See HEPAR SULPHURIS.

K. Tartariatum. *Tartarum sojubile*. *Tartaris tartariatus*: *Sal vegetabilis*, *Alkali vegetabile tartariatum*. Diuretic, deobstruent, and ecoprotic virtues are attributed to this preparation, which is a tartrate of potash.

K. Vitriolatum. *Alkali vegetabile vitriolatus*. *Sal de duobus*, *Arcanum duplicatum*, *Sal polychrestus*, *Nitrum vitriolatum*. This preparation of potash is called *sulphas potassæ* in the new chemical nomenclature. Its virtues are cathartic, diuretic, and deobstruent; with which intentions it is administered in a great variety of diseases, as constipation, suppression of the lochia, fevers, jaundice, dropsies, milk tumours, &c.

KALISCH, or **KALITZ**, a city of Poland, and capital of a palatinate of the same name, in what is called Great Poland, or Western Prussia, on the river Prosna, surrounded with moorasses, walls, and towers. In the year 1655, this town was taken by the Swedes, and near it, in the year 1706, the Swedish army and their general, Marsfield, were totally defeated and taken prisoners, by the confederates, under the command of Augustus II. king of Poland. This palatinate is also called the Palatinate of Guesen, from the city of that name: 57 miles N. E. of Breslau, and 154 S. of Dantzick. Lon. 18. 0. E. Lat. 51. 52. N.

KALM, a mountain of European Turkey, in the republic of Ragusa: 12 miles N. of Ragusa.

KALMIA, American ivy-tree, American dwarf-laurel. In botany, a genus of the class decandria, order monogynia. Calyx five-parted, corol salver-shaped; with the border five-toothed underneath; capsule five-celled. Four species.

1. **K. latifolia**. Broad-leaved kalmia. Leaves ovate-elliptic, ternate and scattered; corymbs terminal. A beautiful shrub rising from six, sometimes to ten or twelve feet

K A L

high: the flowers are white stained with purplish red. A native of Carolina and Virginia. The honey secreted from this and the ensuing species is poisonous: the bees however are very fond of it and do not appear to be affected by it; but their own honey still retains the original bane and often proves fatal to those who eat largely of it.

2. **K. angustifolia**. Narrow-leaved kalmia. Leaves lanceolate, permanent; flowers in lateral corymbs, of a pale-blue tint, and becoming still paler with their age; the shrub rises to nearly sixteen feet. A native of North America.

3. **K. hirsuta**. Bristly kalmia. Leaves opposite and alternate, elliptic, hairy, peduncles axillary, one-flowered, a native of Carolina.

4. **K. glauca**. Glaucous kalmia. Leaves opposite, oblong, smooth, glaucous underneath, revolute at the edge; corymbs terminal; branchlets two-edged, a native of Newfoundland.

KALMUCS, a tribe of Tartars called also Eluths, inhabiting the larger half of what the Europeans call Western Tartary. Their territory extends from the Caspian sea, and the river Yaik or Ural, in 72 degrees of longitude from Ferro, to mount Altay, in 110 degrees, and from the 40th to the 52d degree of north latitude: whence it may be computed about 1930 miles in length from west to east, and in breadth from north to south about 650 miles where broadest. It is bounded on the north by Russia and Siberia, from which it is separated by a chain of mountains; on the east by mount Altay; on the south by the countries of Karazm and the two Bukharas, from which it is also separated partly by a chain of mountains and partly by some rivers. See TARTARY.

Of the Kalmuc Tartars a curious account is given by professor Pallas: They are in general, says he, of a middle size, and it is even rare to see among them a person that is tall; the women especially are of low stature, and have very agreeable features. Their limbs are neatly turned, and very few have any defects contracted in infancy. Their education, being left solely to nature, procures for them a well-formed body and sound constitution. The only defect which is common among them is their having the thighs and legs somewhat bent. A fat person is hardly ever to be met with; the richest and most distinguished, though they lead a life sufficiently indolent, and enjoy abundance of every thing they desire, are never excessively corpulent. Their skin is pretty fair, especially when young; but it is the custom of the lower sort to allow their male children to go quite naked both in the heat of the sun and in the smoky atmosphere of their felt huts: the men too sleep naked, covered only with their drawers; and from these

KALMUCS.

circumstances they acquire that yellowish-brown colour which characterises them. The women, on the contrary, have a very delicate complexion; among those of a certain rank are found some with the most beautiful faces, the whiteness of which is set off by the fine black of their hair; and in this as well as in their features they perfectly resemble the figures in Chinese paintings.

The physiognomy which distinguishes the Kalmucs is pretty generally known. Strangers are made to believe that it is frightfully deformed; and though indeed there are very ugly men to be found, yet in general their countenance has an openness in it that bespeaks a mild, a frank, and social disposition. In many it is of a roundish shape, and exceedingly agreeable; among the women some would be thought beauties even in those European cities where the taste is most scrupulous. The characteristic features of a Kalmuc or Mongul countenance are the following; The interior angle of the eye is placed obliquely downwards towards the nose, and is acute and fleshy; the eyebrows are black, narrow, and much arched; the nose is of a structure quite singular, being generally flat and broken towards the forehead; the cheek-bone is high, the head and face very round; the eye is dark, the lips thick and fleshy, the chin short, and the teeth exceedingly white, continuing so to old age; the ears are of an enormous size, standing out from the head. These characters are more or less visible in each individual; but the person that possesses them all in the highest degree is considered as the most beautifully formed.

Amongst all the Mongul nations, the men have much less beard than in our European countries, and among the Tartars it appears much later. The Kalmucs have most of it; and yet even with them the beard is very scanty and thin, and few have much hair on any other part of the body.

The Kalmucs are exceedingly social and affable. When a troop of Kalmucs, perceive any person at a distance, it is customary for them to detach one of their number to the next eminence, from whence he makes a signal with his cap for the person to draw near. If this signal is not obeyed, the person is considered as an enemy or a robber, and is often pursued as such. They enter willingly into friendships: but these connexions are not quite disinterested; for to give and to receive presents are with them essential articles. A mere trifle, however, is sufficient to induce them to do you all manner of service; and they are never ungrateful as far as they are able. Adversity cannot deprive them of courage, nor alter their good humour. A Kalmuc will never beg if he were in the extremest misery, but rather endeavour to acquire a subsistence by cheating; and when no other way remains, he will hire himself to some

rich individual of his nation, or to some Russian, either as a herdsman, a fisherman, or for any other sort of labour. Very few of the rich value themselves much upon their wealth; but those who do, show no contempt for the poor of their own nation; though the meaner sort pay their court very obsequiously to the rich, who are always surrounded with a swarm of idle dependants.

Nothing can be more prudent than that exercise of hospitality practised by wandering nations; it is of the greatest advantage to those among them who travel across their deserts; and each individual who practises it, may rely on reaping the benefit of it wherever he goes. A Kalmuc provided with a horse, with arms and equipage, may ramble from one place to another for three months together, without taking with him either money or provisions. Wherever he comes he finds either distant relations or friends to whom he is attached by the ties of hospitality, from whom he meets with the kindest reception, and is entertained in the best manner their circumstances afford. Perhaps he lodges in the first unknown cottage he finds upon his road; and scarcely has he entered it, but his wants are supplied with the most affectionate cordiality. Every stranger, of whatsoever nation, never fails to be well received by a Kalmuc; and he may depend upon having his effects in the greatest security the moment he has put himself under the protection of his host: for, to rob a guest, is considered by the Kalmucs as the most abominable of all crimes.

The riches of the Kalmucs, and their whole means of subsistence, depend on their flocks, which many of them reckon by hundreds and even by thousands. A man is thought capable of living on his possessions when he is master of ten cows with a bull, eight mares with a stallion. The animals they have in greatest abundance are horses, horned cattle, and sheep. Camels, which it requires time and pains to rear, cannot multiply much with them: they are besides too delicate; and it is only the rich or the priests who possess any of them. Camels' milk is thick, unctuous, and of a saltish taste, especially when the animals frequent pastures abounding with saline plants; and this last property makes the Kalmucs fond of it to tea. They make use of the hair for stuffing cushions, and for making ropes, packthread, and felt. It may be wrought into the most beautiful camlets, or into the finest and softest cloths. The camels with two bunches are a very uneasy seat to the person who mounts them; their trot is so heavy, and even their walk so rude, that he receives the most violent shocks at every step.

When a Kalmuc horde intends to remove in search of fresh pasture, which in summer necessarily happens every four, six, or eight

days, people are in the first place dispatched to reconnoitre the best place for the khan or prince, for the lama, and for the huts containing the idols. These begin the march, and are followed by the whole troop, each choosing for himself the place he thinks most convenient. The camel that is loaded with the most precious furniture is decorated with little bells; the rest march in a string one behind another, and the bulls with burdens are driven on before. On these days the women and girls dress themselves in their best clothes, and lay on abundance of paint. They have the charge, together with the boys, of leading the flocks and the beasts of burden; and on the road they beguile the tediousness of the journey with their songs.

The Kalmucs are supplied by their flocks with milk, cheese, butter, and flesh, which are the principal articles of their food. With regard to the last, they are so little squeamish, that they not only eat the flesh of their own diseased cattle, but that of almost every sort of wild beast; and the poor will even feed upon carrion. They eat, however, the roots and stalks of many plants; such as the bulbous-rooted chervil and dandelion, &c. which they use both boiled and raw.

Their ordinary drink is the milk of mares or cows; but the former is for several reasons preferred. This, when fresh, has indeed a very disagreeable taste of garlic; but beside that it is much thinner than cow-milk, it takes as it grows sour a very agreeable vinous flavour; it yields neither cream nor curd, but furnishes a very wholesome refreshing beverage, which sensibly inebriates when taken to excess. They never make use of new milk, and still less of milk or of water that has not been boiled. Their milk is boiled as soon as it is taken from the animal; when it is cold, it is poured into a large leathern bag, in which there remains as much of the old milk as is sufficient to turn the new quantity sour, for they never think of cleansing those bags; and as the inside is lined with a crust deposited by the caseous part of the milk and other impurities, it is easy to imagine that a nauseous smell must exhale from them. But this is precisely the circumstance in which the secret consists of communicating to the milk a vinous fermentation.

In summer, and as often as the Kalmucs procure much milk from their flocks, they never fail to intoxicate themselves continually with the spiritous liquor which they know how to distil from it. Mares-milk is the most spiritous; and the quantity meant to be distilled remains twenty-four hours in summer, and three or four days in winter, in those corrupted bags we mentioned, to prepare it for the operation. The cream is left, but the butter which forms at top is taken off and reserved for other purposes. Cow-milk yields one-thirtieth part, and

mares-milk one-fifteenth part of spirit. This liquor is limpid and very watery, and consequently does not take fire, but is capable of being long kept in glass-bottles. The rich Kalmucs increase its strength by a second distillation.

These people are exceedingly fond of tea and tobacco. The former is so dear, as it comes to them from China by the way of Russia, that the poor people supply its place with various wild plants; such as a species of liquorice, the seed of the sharp-leaved dock, the roots of wild angelica, and the seed of the Tartarian maple.

The Kalmucs are excellent horsemen. Their arms are lances, bows and arrows, poniards, and crooked sabres, though the rich have fire-arms. They wear, when at war, coats of mail, which cost 50 horses, and their helmets are gilded at top. They are fond of falconry, and hunting of all sorts is their principal amusement. Their passion for play, especially with those who play cards, is carried to a great excess among them as in any other nation.

The greater part of their time is spent in diversions; and however miserable their manner of life may seem to us, they are perfectly happy with it. They cannot endure for any time the air of a close room; and think our custom of living in houses insupportable. The greatest part of them, notwithstanding the apparent unhealthiness of their way of life, arrive at a vigorous old age; their diseases are neither frequent nor dangerous. Men of 80 or 100 years old are not uncommon; and at that age they can still very well endure the exercise of riding. Simple food, the free air which they constantly breathe, a hardy vigorous constitution, continual exercise without severe labour, and a mind free from care, are the natural causes of their health and longevity.

It is very remarkable, that a migratory people, whose manner of life seems so congruous to the natural liberty of mankind, should have been subjected from time immemorial to the unlimited authority of an absolute sovereign. The Monguls of Asia afford the only instance of it; for neither written records nor ancient tradition have preserved the smallest trace of their ever having enjoyed a state of independence. On the contrary, they acknowledge that they have at all times been subject to khans and princes, whose authority has been transmitted to them by succession, and is considered as a right perfectly established, sacred, and divine.

KALNICK, a strong town of Poland, in the palatinate of Bracklaw. E. lon. 29. 8. N. lat. 48. 57.

KALO, or **KALOO**, a town of Upper Hungary, seated in a lake, 22 miles S. E. of Tockay. E. lon. 21. 54. N. lat. 47. 56.

KALUGA, a government of the Russian empire, formerly a province in the govern-

K A M

ment of Moscow. It contains 12 districts, and its principal town, of the same name, is seated on the river Occa.

KAM. *a.* Crooked (*Shakspeare*).

KAMAKURA, an island of Japan, situated near the south coast of Nippon, scarcely more than a league in circumference; the coasts are so sharp that a crane is made use of to raise the freight from the boats. It is used as a state prison.

KAMINIEC, a town of Poland, and capital of the palatinate of Podolia, with a castle, built on a rock; but more beholden to nature than art for its strength. However, it is one of the best fortifications in Poland. A little below it runs the river Smetricz, which falls into the Dniester. A Popish and an Armenian bishop, and a Castellan, reside in this city; and a court of justice and provincial diet are also held here. This Episcopal see was founded in the year 1375. Here is also a college, which formerly belonged to the Jesuits. In 1651, the Cossacs laid siege to the castle of Kaminnec, but without success. In 1672, the Turks obliged it to surrender, and held it till the peace of Carlowitz, which was concluded in 1699. The whole province is sometimes called Kaminnec: 100 miles W. Braclaw. Lon. 26. 30. E. Lat. 48. 58. N.

KAMISS, an agreeable acescent liquor, prepared by the Tartars from mare's-milk, and of high repute in many parts of Russia. The following is the process as obtained by Grieve from the Beschkir Tartars. Take any quantity of fresh mare's-milk, add to it one sixth part of water, and pour the mixture into a wooden vessel. Use then as a ferment one eighth of the sourest cow's-milk, but a small portion of old kamiss is best; cover the vessel with a thick cloth, and place it in a moderate temperature; when, on reposing twenty-four hours, a thick substance will be collected on the surface, which is to be beaten with a stick until it is ultimately mixed with the fluid part. After reposing another twenty-four hours it is put into a narrow vessel, and stirred till perfectly homogeneous. This is the state in which it is called Kamiss, and has an agreeable taste, which is a compound of sweet and sour. It is stirred every time it is used. Grieve was told that if this be put into close vessels, in a cool place, it will keep three months or more.

The Arabs and Turks make a similar preparation; the former calling it *leban*, the latter *yacourt*.

From kamiss the Tartars also extract an ardent spirit by distillation, and have certainly done so as long as the thirteenth century, since it is noticed by Mano Paolo; to which spirit they give the name of *arti* or *ariti*. Pallas confirms this account; and a dissertation upon the subject was published by Lepectia and other academicians at Strasburg in 1778. From this we learn also that the Tartars, in default of mare's-milk,

K A M

employ cows, though they always prefer the former: the milk must be employed for this purpose with all its constituent parts; for it has been ascertained that when deprived of its butter, or caseous part it gives little or no spirit.

KAMSIN, the name of a hot southerly wind, common in Egypt, of which we find the following description in M. Volney's Travels.—These winds, says he, are known in Egypt by the general name of winds of 50 days; not that they last 50 days without intermission, but because they prevail more frequently in the 50 days preceding and following the equinox. Travelers have mentioned them under the denomination of poisonous winds, or, more correctly hot winds of the desert. Such in fact is their quality; and their heat is sometimes so excessive, that it is difficult to form any idea of its violence without having experienced it; but it may be compared to the heat of a large oven at the moment of drawing out the bread. When these winds begin to blow, the atmosphere assumes an alarming aspect. The sky, at other times so clear in this climate, becomes dark and heavy; the sun loses his splendour, and appears of a violet colour; the air is not cloudy, but grey and thick, and is in fact filled with an extremely subtle dust, which penetrates every where. This wind, always light and rapid, is not at first remarkably hot, but it increases in heat in proportion as it continues. All animated bodies soon discover it by the change it produces in them. The lungs, which a too rarefied air no longer expands, are contracted, and become painful. Respiration is short and difficult; the skin parched and dry, and the body consumed by an internal heat. In vain is recourse had to large draughts of water; nothing can restore perspiration. In vain is coolness sought for; all bodies in which it is usual to find it deceive the hand that touches them. Marble, iron, water, notwithstanding the sun no longer appears, are hot. The streets are deserted, and the dead silence of night reigns every where. The inhabitants of towns and villages shut themselves up in their houses, and those of the desert in their tents or in wells dug in the earth, where they wait the termination of this destructive heat. It usually lasts three days, but if it exceeds that time it becomes unsupportable. Woe to the traveller whom this wind surprises remote from shelter! He must suffer all its horrible effects, which sometimes are mortal. The danger is most imminent when it blows in squalls; for then the rapidity of the wind increases the heat to such a degree as to cause sudden death. This death is a real suffocation; the lungs being empty are convulsed, the circulation is disordered, and the whole mass of blood driven by the heat towards the head and breast; whence the hemorrhage at the nose and mouth which happens after death. This wind is especially destructive to per-

sons of a plethoric habit, and these in whom fatigue has destroyed the tone of the muscles and the vessels. The corpses remain a long time warm, swell, turn blue, and soon become putrid. These accidents are to be avoided by stopping the nose and mouth with handkerchiefs; an efficacious method likewise is that practised by the camels. On this occasion these animals bury their noses in the sand, and keep them there till the squall is over. Another quality of this wind is its extreme aridity; which is such, that water sprinkled on the floor evaporates in a few minutes. By this extreme dryness it withers and strips all the plants; and by exhaling too suddenly the emanations from animal bodies, crisps the skin, closes the pores, and causes that feverish heat which is the constant effect of suppressed perspiration.

KAMTCHATKA, a peninsula of Russia, in the government of Irkutsk, bounded on the north by the province of Ochotsk, on the east and south by the Northern Pacific Ocean, and on the west by the Sea of Ochotsk and the Penzinkoe Gulf; about 600 miles in length, and from 30 to 200 in breadth. Captain King, who visited it in the year 1779, gives a description of the country, of which the following is an extract:—Its southern extremity is Cape Loparka, a word signifying the blade bone of a man, and is so called from its supposed resemblance to it. The shape of the whole peninsula is not unlike that of a shoe, widening from the toe (which we may suppose to be Cape Loparka, toward the middle, and narrowing again toward the heel, a neck of land connecting it with the continent. A chain of high mountains stretches the whole length of the country, from north to south, dividing it nearly into two equal parts, from whence a great number of rivers take their rise, and empty themselves on each side, into the Pacific Ocean and the Sea of Ochotsk. The soil is barren, with not the smallest spot of ground that resembles what is called in England a good green turf; or that seemed as if it could be turned to any advantage either in the way of pasturage, or other mode of cultivation. The face of the country in general was thinly covered with stunted trees, having a bottom of moss, mixed with low weak heath. The whole bore a more striking resemblance to Newfoundland than to any other part of the world I had ever seen. It must, however, be observed, that I saw at Paratounca three or four stacks of very sweet and very fine-looking hay; and Major Behm informed me, that many parts of the peninsula, particularly the banks of the river Kamtchatka, and the Bistráia, produce grass of great height and strength, which they cut twice in the summer; and that the hay is of a succulent quality, and particularly well adapted to the fattening of cattle. It is natural to suppose, that the severity of the climate must be in due proportion to the

general sterility of the soil, of which it is probably the cause. The first time we saw this country was in the beginning of May, 1779, when the whole face of it was covered with snow, from six to eight feet deep. On 15th of June, the thermometer had never risen higher than 58°, nor the barometer than 30.4. The winds blew most invariably from the eastward during our stay, and the south-east was more prevalent than any other. On our return, the 24th of August, the foliage of the trees, and all other sorts of vegetation, seemed to be in the utmost state of perfection. For the remainder of this month and through September, the weather was very changeable, but in no respect severe. But at the beginning of October, the tops of the hills were again covered with new-fallen snow, the wind continuing westerly. In computing the seasons, the spring ought certainly not to be taken into the account. From the middle of June to the middle of September, may be properly said to constitute the summer. October may be considered as an autumnal month; from thence, till the middle of June, it is perfect winter. This peninsula abounds in volcanos, of which only three have, for some time past, been subject to eruptions. The country is likewise said to contain numerous springs of hot water. Of the trees which fell under our notice, the principal are the birch, the poplar, the alder (with the bark of which they stain their leather), many species of the willow, but all small, and two sorts of dwarfish pines or cedars. One of these grows upon the coast, creeping along the ground, and seldom exceeds two feet in height. It was of this sort we made our essence for beer, and found it most excellent for the purpose. The birch was by far the most common tree we saw; and of this we remarked three sorts. Two of them fit for timber, and differing only in the texture and colour of the bark; the third of a dwarfish kind. Of the shrub kind, as juniper, the mountain-ash, wild rose-trees, and raspberry-bushes, the country produces great abundance; together with a variety of berries; blue-berries of two sorts, round and oval, partridge-berries, cran-berries, crow-berries, and black-berries. These the natives gather at proper seasons, and preserve by boiling them into a thick jam, without sugar. They make no inconsiderable part of their winter provisions, and are used as sauce to their dried and salt fish; of which kind of food they are unquestionably excellent correctives. They likewise eat them by themselves, in puddings, and various other ways, and make decoctions of them for their ordinary liquor. We met with several wholesome vegetables in a wild state, and in great quantities, such as wild celery, angelica, chervil, garlic, and onions. Upon some few patches of ground, in the valleys, we found excellent turnips, and turnip-radishes. There are two plants, which, from the great use

KAMTCHATKA.

made of them, merit a particular mention. The first, called by the natives the *saranne*. The plant grows wild, and in considerable abundance: the women are employed in collecting the roots, which are of the bulbous kind, at the beginning of August, which are afterwards dried in the sun, and then laid up for use. It is used in cookery in various ways. When roasted on embers it supplies the place of bread, better than any thing the country affords. After being baked in an oven, and pounded, it becomes an excellent substitute for flour and meal of every sort, and in this form is mixed in all their soups, and most of their other dishes. It is esteemed extremely nourishing; has a pleasant bitter taste, and may be eaten every day without cloying. We used to boil these roots, and eat them as potatoes, either alone, or with our meat, and found them very wholesome and pleasant. The other plant alluded to, is called the sweet grass. This plant was formerly a principal ingredient in the cookery of most of the Kamtchadal's dishes; but since the Russians got possession of the country, it has been almost entirely appropriated to the purpose of distillation. The liquor is of the strength of brandy; and is called by the natives *raka*. Two poods (seventy-two pounds) of the plant yield generally one vedro (twenty-five pints) of *raka*. The nettle, as the country produces neither hemp nor flax, supplies the materials of which are made their fishing-nets; and without which they could not possibly subsist. For this purpose, they cut it down in August; and after hanging it up in bundles in the shade, under their balagans, the remainder of the summer, treat it like hemp. They then spin it into thread with their fingers, and twist it round a spindle, after which they twine several threads together, according to the different purposes for which it may be designed. Though there is little doubt but that many parts of this peninsula would admit of such cultivation as might contribute considerably to the comfort of the inhabitants, yet its real riches must always consist in the number of wild animals it produces; and no labour can ever be turned to so good account as what is employed upon their furreries. The animals, therefore, which supply these, come next to be considered; and these are, the common fox; the stoat, or ermine; the sable; the arctic fox; the varying hare; the mountain rat, or earless marmot; the weasel; the glutton, or wolverine; the argali, or wild sheep; rein-deer; bears; wolves; dogs. The coast and bays of this country are frequented by almost every kind of northern sea-fowl; and among the rest are the sea-eagles, but not, as at Oonalaska, in great numbers. The rivers inland (if I may judge from what I saw in our journey to Bolcheretok) are stored with numerous flocks of wild ducks of various species; in the woods through which we passed, were seen eagles

of a prodigious size: this country likewise affords woodcocks, snipes, and two sorts of grouse; or moor game. Swans are also said to be in great plenty. Fish may be considered as the staple article of food with which Providence hath supplied the inhabitants of this peninsula; who, in general, must never expect to draw any considerable part of their sustenance either from grain or cattle. The present inhabitants of Kamtchatka are of three sorts. The natives, or Kamtchadales; the Russians and Cosacks; and a mixture of these two by marriage. Mr. Steller, who resided some time in this country, and seems to have taken great pains to gain information on this subject, is persuaded, that the true Kamtchadales are a people of great antiquity, and have for many ages inhabited this peninsula; and that they are originally descended from the Mungaliens, and not either from the Tongusian Tartars, as some, or the Japanese as others, have imagined. Volodimir Atlasoff, a Cosack, stands for the first acknowledged discoverer of Kamtchatka. This person was sent, in the year 1697, from the fort Yakutsk, to the Anadirsk, in the quality of commissary, with instructions to call in the assistance of the Koriacs, with a view to the discovery of countries beyond their's, and to the subjecting them to a tribute. In 1699, he penetrated, with about sixty Russian soldiers, and the same number of Cosacks, into the heart of the peninsula, gained the Tigil, and from thence, levying a tribute in furs in his progress, crossed over to the river Kamtchatka, on which he built the higher Kamtchatka ostrog, called Verchnoi, where he left a garrison of sixteen Cosacks, and returned to Yakutsk in 1700, with an immense quantity of rare and valuable tributary furs. The Russian government established over this country is mild and equitable, considered as a military one, in a very high degree. The natives are permitted to choose their own magistrates from among themselves, in the way, and with the same powers, they had ever been used. One of these, under the title of *toion*, presides over each ostrog; is the referee in all differences; imposes fines, and inflicts punishments for all crimes and misdemeanors; referring to the governor of Kamtchatka such only as he does not choose from their intricacy or heinousness to decide upon himself. The *toion* has likewise the appointment of a civil officer, who is called a corporal, who assists him in the execution of his office, and in his absence acts as his deputy. By an edict of the late empress no crime whatsoever can be punished with death. But we were informed, that in cases of murder (of which there are very few) the punishment of the knot is administered with such severity, that the offender, for the most part, dies under it. The only tribute exacted (which can be considered as little more than an acknowledgment of the Russian dominion over them) con-

K A N

ists, in some districts, of a fox's skin, in others of a sable's, and, in the Kurile Isles, of a sea-otter's; but as this is much the most valuable, one skin serves to pay the tribute of several persons. The totons collect the tribute in their respective districts. Besides the mildness of their government, the Russians have a claim to every praise for the pains they have bestowed, and which have been attended with great success, in converting them to Christianity, there remaining at present, very few idolaters among them. The religion taught is that of the Greek church. Schools are likewise established in many of the ostroms, where the children of both the natives and Cossacks are gratuitously instructed in the Russian language. The commerce of this country, as far as concerns the exports, is entirely confined to furs, and carried on principally by a company of merchants, instituted by the empress. The articles of importation are principally European, but not confined to Russian manufactures; many are English and Dutch; several likewise come from Siberia, Bukharia, the Calmucs, and China. They consist of coarse woollen and linen cloths, yarn stockings, bonnets, and gloves; thin Persian silks, cottons, and pieces of nankeen, silk and cotton handkerchiefs, brass coppers and pans, iron stoves, files, guns, powder and shot; hardware, such as hatchets, bills, knives, scissars, needles, looking glasses, flour, sugar, tanned hides, boots, &c. There are six vessels (of forty to fifty tons burthen) employed by the empress between Ochotzk and Bolcheretsk; five of which are appropriated to the transporting of stores and provisions from Ochotzk to Bolcheretsk, except that once in two or three years some of them go round to Awatska, and the Kamtschatka river; the sixth is only used as a packet-boat, and always kept in readiness, and properly equipped for conveying dispatches. Long. 176. 48. to 180. 50. E. Ferro. Lat. 51. 10. to 61 N. according to the Russian map; according to captain King, the Long. of the southern extremity 156. 15. Greenwich. Lat. 52. to 61. N.

KAMTCHATKA, a river of Russia, in the peninsula of Kamtschatka, which runs into the North Pacific Ocean, twenty miles S. Lower Kamtschatkoi.

KAMTCHATSKOI, a cape of Russia, on the east coast of Kamtschatka: forty miles E. Niznei Kamtschatkoi.

KAMTCHATSKOI (*Niznei*, or *Lower*), a town of Russia, in the peninsula of Kamtschatka, where there are barracks and an hospital: 184 miles NNE. Verchnei Kamtschatkoi, Lon. 178. E. Ferro. Lat. 56. 40. N.

KAMTCHATSKOI (*Verchnei*, or *Upper*), a town of Russia, in the peninsula of Kamtschatka: sixty miles NNE. Bolchoretzkoi. Lon. 175. 25. E. Ferro. 53. 50. N.

KAN, or **KHAN**, the name of an officer in Persia, answering to that of governor in

K A N

Europe. Thus the Persians have *kans* of provinces, &c.

KANDEL Indian: in botany, *khizophora*. **KANGAROO**, or **KANGUROO**, in Mastiology. See *MACROPSUS*.

KANJOW, a strong town of Poland, in the Ukraine, and in the palatinate of Kiow. It is near the river Dnieper, 62 miles S. by E. of Kiow, and 100 N. E. of Bracklaw.

KANISCA, a strong town of Lower Hungary, capital of the county of Salawar. It was taken by the Imperialists in 1690, and is seated on the river Drave, 54 miles S. W. of Alba Regalis, and 100 S. by E. of Vienna. Long. 17. 40. E. Lat. 46. 43. N.

KANTCHEOU-FOU, a flourishing town of China, in the province of Kiang-si. Its rivers, port, riches, and population, all contribute to attract strangers. A day's journey from this city is a very rapid current, almost twenty leagues in length, which flows with great impetuosity over a number of scattered rocks that are level with the water. Travellers here are in great danger of being lost, unless they take care to be conducted by one of the pilots of the country: after this passage, the river becomes twice as large as the Seine at Rouen; it is continually covered with loaded barks and other vessels under sale. Near the walls of the city is a very long bridge, composed of one hundred and thirty boats joined together by strong iron chains. The custom-house is upon this bridge, where a receiver constantly resides to visit all barks, and examine if they have paid the duties imposed on the commodities with which they are loaded. Two or three moveable boats are so placed, that by their means the bridge can be opened or shut, to give or refuse a passage; and no barks are ever permitted to pass until they have been examined. In the territory belonging to this city, grow a great number of those valuable trees from which varnish distils. Its district is extensive, and contains twelve cities of the third class.

KANT, **IMMANUEL**, an eminent German metaphysician, and most voluminous writer; was born at Konigsberg, April 22, 1724, and educated first at the college Fredericianum, and afterwards at the university of Konigsberg. He lived to attain the age of eighty; dying Feb. 12, 1804; but his life was marked with few vicissitudes, and signalized by few events, except those which determined the publication of his different productions, and his election to the professorship of logic and metaphysics in the university of Konigsberg. His first treatise appeared at Konigsberg in 1746, 8vo: pp. 270, in the German language, with two plates. In this juvenile production, which is modestly entitled *Reflections*, he successively combats the hypotheses of Leibnitz and Descartes, the former of whom had introduced the simple proposition, "that the mere velocity of bodies, even such as are in

K A N T.

actual motion, serves as a rule for ascertaining their power;" and the latter had erroneously adopted the square of velocities in such computation. At this time, Kant was in the twenty-second year of his age. After an interval of nine years, he published his General History of Nature, or Theory of the Celestial Bodies, founded on Newtonian Principles; dedicated to the late Frederick the Great of Prussia; of which a new and improved edition, by the author, lately appeared in Germany. In the same year, 1755, he completed the following Latin treatises; in which he gave the first specimens of his philosophical and critical talents:—*Principiorum metaphysicorum nova elucidatio*; and *Disertatio de principis primis cognitionis humanae*; both 4to. Regiomonti. These were succeeded by his *Monadologia Physica*, 4to. 1756. Soon after their appearance, Kant presented the world with an ingenious and elaborate History of the most remarkable Events produced by the Earthquake which convulsed an extensive Part of the Globe, towards the Close of the Year 1755; 4to. Königsberg, 1756.—Next, in the order of time, are his *New Theory of Motion and Rest*, illustrated with Experiments on this Subject in Natural Philosophy, 8vo. 1758:—*Reflections upon Opticism*, 4to. 1759:—*An Outline of a Course of Lectures on Physical Geography*; with an Attempt to solve the Problem, Whether Westerly Winds are, for this Reason, accompanied with Moisture in Prussia; because they blow over an extensive Sea, 4to. Königsberg, 1759:—*Demonstration of the Sophistical Subtlety contained in the four Syllogistic Figures*, 8vo. 1762:—*An Attempt towards introducing the Proposition of Negative Magnitudes into Philosophy*, 8vo. 1763:—*Inquiries into the Perspicuity of the Principles relative to Natural Religion and Morals*; or, an Essay on the Evidence required in Metaphysical Sciences; being an Answer to the Prize Question proposed by the Royal Academy of Sciences at Berlin, for the Year 1763:—*On the only possible Method of proving the Existence of the Deity*, 8vo. Königsberg, 1763:—*Observations on the Effect of the Beautiful and the Sublime*, 8vo. Königsberg, 1764:—*Dreams of a Ghost-seer (Kantianic)*, illustrated by *Dreams in Metaphysics*, 8vo. 1764:—*Remarks serving to explain the Theory of Winds*, 4to. 1765.—These eleven treatises, last mentioned, are printed in the German language.

After a period of five years, Kant produced the outline of what is now called the *Critical System*; the principles of which are contained in the following work: *De mundi sensibilis atque intelligibilis forma et principiis*, 4to. Regiomonti, 1770. His next work was entitled, *Prolegomena*; or, introductory Observations applicable to every future System of Metaphysics that may deserve the Name of a Science; 8vo. pp. 222; Riga, 1783. This is a concise and perspi-

cuous abstract of the preceding critique; in an analytical method, which the author has here adopted, with a view to return by the same path on which he had before advanced synthetically.—*Reflections upon the Foundation of the Powers and Methods which Reason is entitled to employ in judging of its Stability*; 8vo. Königsberg, 1784.—*Ideas for an Universal History, in a Cosmopolitical View*; and *Reply to the Question, What is Illumination of Mind?* These two essays were originally inserted in the *Berlin Monthly Magazine* for November and December, 1784.—*Fundamental Principles of the Metaphysics of Morals*, 8vo. Riga, 1785 (2nd edit. 1792):—*On the Volcanoes in the Moon*, *ibid.* for March, 1785:—*On the Injustice of printing spurious Editions of Books*, *ibid.* for May, 1785:—*Definition of the Idea connected with the Expression, "A Race of Men;"* *Berlin Monthly Magazine* for November, 1785:—*On the probable Origin of Human History*, *ibid.* for Jan. 1786:—*What is understood by the Expression, to become familiar with the Origin of our Thoughts?* *ibid.* for October, 1786.—*Metaphysical Principles of Natural Philosophy*, 8vo. Riga, 1786; (2nd edit. 1787. pp. 182):—*Some Remarks on Mr. Jacob's Examination of a Work written by M. Mendelssohn, and entitled "Morning Hours,"* published in 1786, and reprinted in Kant's *Miscellaneous Works*, vol. III. pp. 89 to 98.—*Fundamental Principles of the Critique of Taste*, 8vo. Riga, 1787:—*A Treatise concerning the use of Theological Principles in Philosophy*; published in the *German Mercury* for January and February, 1788.—*Critique of Practical Reason*, 8vo. Riga, 1788. 2nd edit. 1792):—*On the Failure of all Philosophical Attempts made by Leibnitz, in his work entitled Theodicea*; *Berlin Monthly Magazine* for September, 1791:—*On the Radical Evil in Human Nature*; *ibid.* for April, 1792:—*On the common-place Assertion, that a Thing may be true in Theory, but is not applicable to Practice*; *ibid.* for September, 1793.—*Religion considered within the Limits of mere Reason*; Königsberg, 1793 (2nd edit. enlarged, p. 340, 1794).—*Some Observations respecting the Influence of the Moon on the Weather*; *Berlin Monthly Magazine* for May, 1794.—The following treatises having partly appeared in different periodical collections, and partly in distinct publications, we shall merely translate their titles:—*On the End or Termination of all Things*; 1795:—*Epistle to Sommering, respecting the Organ of the Soul*; 1796.—*On the Peculiarity of the haughty Tone lately raised in Philosophical Discussions*; 1796:—*Proposals for deciding a Mathematical Dispute which had arisen from Misunderstanding*; 1796:—*Annunciation of the approaching Conclusion of a Treaty for perpetual Peace in Philosophy*; 1796:—*On the supposed Right of speaking Falsehood from philanthropic Motives*; 1797:—*Declaration*

on Mr. Schlettwein's literary Challenge directed to Kant; on the 11th of May, 1797:—On the Art of Book-making; in two Letters addressed to M. Frederic Nicolai, the Author and Publisher: 1797:—On the Power of the Mind to overcome morbid Sensations by mere Resolution; in Reply to the Aulic Counsellor and Professor Hufeland; 1797:—Answer to the reiterated Question, Whether the Human Race is in a progressive State of Improvement? 1798.—Contest between the Faculties; namely, 1, between the Theological and Philosophical Faculties; 2, between the Juridical and Philosophical Faculties; and 3, between the Medical and Philosophical Faculties; 1798.

Beside these smaller tracts, Professor Kant has published various other performances, which are not contained in the collection of his miscellaneous works above quoted; and have been separately printed. Of this class are, his Project for a perpetual Peace; a Philosophical Attempt; 8vo. pp. 104; Königsberg, 1795; and which has also been translated into French and English:—Metaphysical Elements of Jurisprudence; 8vo. pp. 299; Königsberg, 1797:—Metaphysical Elements of Ethics, or Doctrinal Virtue (*Tugendlehre*); 8vo. Königsberg, 1797:—Declaration upon Mr. Schlettwein's Challenge in a Letter from Greifswalde:—On the Power of the Mind in subduing the Sensations of Pain:—In 1798, On Book-making, in two Letters to Mr. Frederick Nicolai:—Question renewed, Whether the Human Race is in a continued State of Improvement?—Explanatory Observations on the Civil Law for the Possessors of the first Edition:—The Dispute of the Faculties:—A Pragmatic View of Anthropology. In this latter work he takes an almost formal leave of the public as an author, consigning his papers over to the revision of others. After which he gave up all his official situations, and in consequence of his infirmities retired into perfect solitude. He had now been a writer sixty years; and had written upwards of sixty different works, including those which were afterwards collected from his papers. These were in 1801; Logic, or a Guide to Lecturing:—1802, Physical Geography:—1803, On giving Instruction:—1804, Upon the Prize Question of the Royal Academy at Berlin, What is the actual Progress made in Metaphysical Sciences since Leibnitz and Wolf?

The most prominent feature in Kant's intellectual character, was the accuracy with which he analysed the most complex ideas. Nothing escaped the scrutiny of his intellectual eye. Whatever is perceivable to others in the moral and physical world, became manifest to him. He discovered therefore so easy, the incongruities of other men's sentiments, and traced, with unspeakable precision, their errors to the true source. He had likewise an astonishing faculty of unfolding the most abstruse prin-

ciples, and digesting single and individual sentiments into a systematic order. Herein consisted the originality of his mind. As to his manner of explaining his own ideas, it was commonly pedantic, and affected; often indeed were his sentiments conveyed in such a strange jargon, that his readers had at once to learn a new language and a new metaphysics.

KANTIAN PHILOSOPHY, KANTISM, or CRITICAL PHILOSOPHY, is the name of a system of metaphysical science, invented by Immanuel Kant: a system which was long generally admired on the continent of Europe, though it now sways a very doubtful sceptre, even in Germany.

Besides employing a vast number of words of his own invention, derived from the Greek language, Kant uses expressions, which have long been familiar to metaphysicians, in a sense different from that in which they are generally received: and hence a large portion of time is requisite to enable the most sagacious mind to ascertain with precision the import of his phraseology.

1. The difficulty of comprehending this philosophy has contributed, we believe, more than any thing else, to bring it into vogue, and to raise the fame of its author. Men are ashamed, after so laborious and fatiguing a study, to acknowledge that all their labour has been thrown away; and vanity prompts almost every man to raise the importance of that branch of science which is understood but by a few, and in which he is conscious that his own attainments have been great. "We acknowledge, however, that in the system of Kant there is displayed much genius, combination, and systematic arrangement; but this only affords one of the many reasons which it presents, for our regretting that the author has not directed his mind to more useful researches, and that he has wasted the strength of his genius in rendering uncertain the most comfortable truths, and in giving the appearance of novelty to opinions for the most part taught long before his day."

2. The following analysis will sufficiently enable any one, at all conversant with metaphysical science, to form a judgment of this celebrated system; and our correspondent, on whose word the reader may rely, assures us, that, in detailing the principles of Kant, he has taken special care to exhibit them with the utmost possible exactness, having several times preferred the obscurity of the author's reasonings and language, to the danger of a false, though more perspicuous, interpretation.

3. "Kant divides all our knowledge into that which is *a priori*, and that which is *a posteriori*. Knowledge *a priori* is conferred upon us by our nature. Knowledge *a posteriori* is derived from our sensations, or from experience; and it is by our author denominated *empyric*. One would at first be induced, by this account of the origin of human knowledge, to believe that Kant intended to revive the system of innate ideas; but we very quickly discover that such is not his system. He considers all our knowledge as acquired. He maintains, that experience is the occasional cause or productrix of all our knowledge; and that without it we could not have a single idea. Our ideas *a priori*, he says, are produced with experience, and could not be produced without it; but they are not produced by

KANTISM.

4. or do not proceed from it. They exist in the mind; they are the forms of the mind. They are distinguished from other ideas by two marks, which are easily discerned; i. e. they appear universal and necessary; or, in other words, they admit of no exception, and their converse is impossible. Ideas which we derive from experience have no such characters. We can suppose, that we have seen, or felt, or heard once; we may see, or feel, or hear again; but we do not perceive any impossibility in its being otherwise. For instance, a house is on fire in my view: I am certain of this fact, but it affords me no general or necessary knowledge. It is altogether *a posteriori*; the materials are furnished by the individual impression which I have received; and that impression might have been very different.

"But if I take twice two small balls, and learn to call twice two four, I shall be immediately convinced, that any two bodies whatever, when added to any two other bodies, will constantly make the sum of bodies four. Experience has indeed afforded me the opportunity of acquiring this knowledge; but it has not given it to me, for how could experience prove to me that this truth shall never vary? Experience must always be limited; and therefore cannot teach us that which is necessary and universal. It is not experience which discovers to us, that we shall always have the surface of the whole pyramid by multiplying its base by the third part of its height; or that two parallel lines, extended in *infinitum*, shall never meet.

"All the truths of pure mathematics are, in the language of Kant, *a priori*. Thus, that a straight line is the shortest of all possible lines between two fixed points, that the three angles of a triangle are always equal to two right angles; that we have the same sum, whether we add 5 to 7 or 7 to 5; and that we have the same remainder when we subtract 5 from 10 as when we subtract 10 from 15—are so many propositions, which are true *a priori*.

4. "Pure knowledge *a priori*, is that which is absolutely without any mixture of experience. Two and two men make four men, is a truth, of which the knowledge is *a priori*, but it is not pure knowledge, because the truth is particular. The ideas of substance, and of cause and effect, are *a priori*; and when they are separated from the objects to which they refer (we suppose from this or that particular object), they form, in the language of Kant, void ideas. It is our knowledge *a priori*, i. e. that knowledge which precedes experience as to its origin, which renders experience possible. Our faculty of knowledge has an effect on our ideas of sensation analogous to that of a vessel, which gives its own form to the liquor with which it is filled. Thus, in all our knowledge *a posteriori*, there is something *a priori* derived from our faculty of knowledge. All the operations of our minds; all the impressions which our external and internal senses receive and retain, are brought into effect by the conditions, the forms, which exist in us by the pure ideas *a priori*, which alone render all our other knowledge certain.

5. "Time and space are the two essential forms of the mind; the former for impressions received by the internal sense; the second for those received by our external senses. Time is necessary in all the immediate (perhaps intuitive) perceptions of objects; and space in all external perceptions.

6. "Extension is nothing real but as the form of our sensations. If extension were known to us only by experience, it would then be possible to conceive that there might be sensible objects without space.

7. "It is by means of the form space that we are enabled, *a priori*, to attribute to external objects impenetrability, divisibility, mobility, &c.; and it is by means of the form time that we attribute to any thing duration, succession, simultaneity, permanence, &c.

8. "Arithmetic is derived from the form of our internal sense, and geometry from that of our external.

9. "Our understanding collects the ideas received by the impressions made on our organs of sense, confers on these ideas unity by a particular force (we suppose energy) *a priori*; and thereby forms the representation of each object. Thus, a man is successively struck with the impressions of all the parts which form a particular garden. His understanding unites these impressions, or the ideas resulting from them; and in the unity produced by that uniting act, it acquires the idea of the garden. If the objects which produce the impressions afford also the matter of the ideas, then the ideas are *empyric*; but if the objects only unfold the forms of the thought, the ideas are *a priori*. The act of the understanding which unites the perceptions of the various parts of an object into the perception of one whole, is the same with that which unites the attribute with its subject.

10. "Judgments are divided into two species; analytic and synthetic. An analytic judgment is that in which the attribute is the mere development of the subject, and is found by the simple analysis of the perception; as bodies are extended; a triangle has three sides.

11. "A synthetical judgment is that where the attribute is connected with the subject by a cause (or basis) taken from the faculty of knowledge, which renders this connection necessary: as, a body is heavy; wood is combustible; the three angles of a triangle are equal to two right angles. These are synthetical *a priori* and *a posteriori*; and the former being formed by experience, we have the sure means of avoiding deception.

"It is a problem, however, of the utmost importance, to discover how synthetic judgments *a priori* are possible. How comes it, for example, that we can affirm that all the radii of a circle are equal, and that two parallel lines will never meet? It is by studying the forms of our mind that we discover the possibility of making these affirmations. In all objects there are things which must necessarily be thought (be supplied by thought); as, for example, that there is a substance, an accident, a cause, and certain effects.

12. "The forms of the understanding are, quantity, quality, relation, modality.

"Quantity, Kant distinguishes into general, particular, and individual; quality, into affirmation, negation, infinite; relation, into categorical, hypothetic, and disjunctive; and modality, into problematic, certain, and necessary. He adds also to these properties of the four principal forms of the understanding, a table of categories, or fundamental ideas *a priori*.

13. "Quantity, gives unity, plurality, totality. Quality, gives reality, negation, limitation. Relation, gives inherence, substance, cause,

KANTISM.

dependence, community, reciprocity. Modality, gives possibility, impossibility, existence, nothing, necessity, accident. These categories can only be applied to experience. When, in the consideration of an object, we abstract all that regards sensation, there remain only the pure ideas of the understanding, or the categories, by which a thing is conceived as a thing.

"Pure reason is the faculty of tracing our knowledge *a priori*, to subject it to principles, to trace it from its necessary conditions, till it be entirely without condition, and in complete unity. This pure reason has certain fundamental rules, after which the necessary connection of our ideas is taken for the determination of the objects in themselves; an illusion which we cannot avoid, even when we are acquainted with it. We can conclude from what we know to what we do not know; and we give an objective reality to these conclusions from an appearance which leads us on.

14. "The writings of Kant are multifarious; but it is in his work entitled the "Critique of Pure Reason," that he has chiefly expounded his system. This work is a treatise on a pretended science, of which Kant's scholars consider him as the founder, and which has for its objects the natural forces, the limits of our reason, as the source of our pure knowledge *a priori*, the principles of all truth. Kant does not propose to give even an exposition of these branches of knowledge, but merely to examine their origin; not to extend them, but to prevent the bad use of them, and to guard us against error. He denominates this science transcendental criticism; because he calls all knowledge, of which the object is not furnished by the senses, and which concerns the kind and origin of our ideas, transcendental knowledge. The "Criticism of Pure Reason," which gives only the fundamental ideas and maxims *a priori*, without explaining the ideas which are derived from them, can lead (says Kant) to a complete system of pure knowledge, which ought to be denominated transcendental philosophy, of which it (the Criticism, &c.) presents the architectonic plan, i. e. the plan regular and well disposed.

"The work entitled "The Critique of Pure Reason," is divided into several parts or sections, under the ridiculous titles of *Æsthetic* transcendental, of transcendental logic; of the pure ideas of the understanding; of the transcendental judgment; of the paralogism of pure reason, of the ideal transcendental; of the criticism of speculative theologies, of the discipline of pure reason, &c.

15. "But to proceed with our abstract of the system. We know objects only by the manner in which they affect us; and as the impressions which they make upon us are only certain apparitions or phenomena, it is impossible for us to know what an object is in itself. In consequence of this assertion, some have supposed that Kant is an idealist, like Berkeley and so many others, who have thought that sensations are only appearances, and that there is no truth but in our reason; but such is not the opinion of Kant. According to him, our understanding, when it considers the apparitions or phenomena, acknowledges the existence of the objects in themselves, inasmuch as they serve for the bases of those apparitions; though we know nothing of their reality, and though we can have no certainty but in experience.

"When we apply the forms of our understanding, such as unity, totality, substance, causality, existence, to certain ideas which have no object in space and time, we make a fallacious and arbitrary application. All these forms can bear only on sensible objects, and not on the world of things in itself, of which we can think, but which we can never know. Beyond things sensible we can only have opinions or a belief of our reason.

16. "The motives to consider a proposition as true, are either objective, i. e. taken from an external object, so that each man shall be obliged to acknowledge them; and then there is a truth evident and susceptible of demonstration, and it may be said that we are convinced; or the motives are subjective, i. e. they exist only in the mind of him who judges, and he is persuaded.

"Truth, then, consists in the agreement of our notions with the objects, in such a manner as that all men are obliged to form the same judgment; belief consists in holding a thing for true in a subjective manner, in consequence of a persuasion which is entirely personal, and has not its basis in an object submitted to experience.

17. "There is a belief of doctrine, of which Kant gives, as an example, this assertion:—'there are inhabitants in the planets.' We must acknowledge, (he adds) that the ordinary mode of teaching the existence of God belongs to the belief of doctrine, and that it is the same with the immortality of the soul. The belief of doctrine (he continues) has in itself something staggering; but it is not the same with moral belief. In moral belief there is something necessary; it is (says he), that I should obey the law of morality in all its parts. The end is strongly established; and I can perceive only one condition, by means of which this end may be in accord with all the other ends, i. e. that there is a God. I am certain that no man knows any other condition which can conduct to the same unity of end under the moral law; which law is a law of my reason. I will consequently believe certainly the existence of God, and a future life; because this persuasion renders immovable my moral principles—principles which I cannot reject without rendering myself contemptible in my own eyes. I wish for happiness, but I do not wish for it without morality; and as it depends on nature, I cannot wish it with this condition, except by believing that nature depends on a Being who causes this connection between morality and happiness. This supposition is founded on the want (or necessity) of my reason, and not on my duty.

18. "We have, however, no certainty (says Kant) in our knowledge of God, because certainty cannot exist except when it is founded on an object of experience. The philosopher acknowledges, that pure reason is too weak to prove the existence of a being beyond the reach of our senses. The necessity of believing in God is therefore only subjective, although necessary and general for all those beings who conform to their duty. This is not knowledge, but only a belief of reason, which supplies the place of a knowledge which is impossible.

"The proofs of natural theology (says our philosopher) taken from the order and beauty of the universe, &c. are proofs only in appearance. They resolve themselves into a bias of our reason to suppose an infinite intelligence as

KANTISM.

the author of all that is possible; but from this bias it does not follow that there really is such an author. To say, that whatever exists must have a cause, is indeed a *maxim a priori*; but it is a maxim applicable only to experience, for one knows not how to subject to the laws of our perceptions that which is absolutely independent of them. It is as if we were to say, that whatever exists in experience must have an experience, but the world, taken as a whole, is without experience as well as its cause. It is much better to draw the proof of the existence of God from morality, than to weaken it by such reasoning. This proof is relative. It is impossible to know that God exists; but we can comprehend how it is possible to act morally on the supposition of the existence (although incomprehensible) of an intelligent Creator—an existence which practical reason forces theoretical reason to adopt. This proof not only persuades, but even acts on the conviction, in proportion as the motives of our actions are conformable to the law of morality.

"Religion ought to be the means of virtue and not its object. Man has not in himself the idea of religion as he has that of virtue. The latter has its principle in the mind; it exists in itself, and not as the means of happiness; and it may be taught without the idea of a God, for the pure law of morality is *a priori*."

19. "He who does good by inclination does not act morally. The converse of the principle of morality is to make personal happiness the basis of the will. There are compassionate minds which feel an internal pleasure in communicating joy around them, and who thus enjoy the satisfaction of others; but their actions, however just, however good, have no moral merit, and may be compared to other inclinations; to that of honour (for example), which, whilst it meets with that which is just and useful, is worthy of praise and encouragement, but not of any high degree of esteem. According to Kant, we ought not even to do good, either for the pleasure we feel in doing it, or in order to be happy, or to render others happy; for any one of these additions (perhaps motives) would be empiric, and impair the purity of our morals. A reasonable being ought to desire to be exempted from all inclinations, and never to do his duty but for his duty's sake."

"We ought to act after the maxims derived *a priori* from the faculty of knowledge, which carry with them the idea of necessity, and are independent of all experience; after the maxims which, it is to be wished, could be erected into general laws for all beings endowed with reason."

20. If this be a correct view of the object, and the results of the critical philosophy, we confess ourselves unable to discover any motive which should induce our countrymen, in their researches after truth, to prefer the dark lantern of Kant to the luminous torch of Bacon. The metaphysical reader will perceive, that, in this abstract, there is little which is new except the phraseology; and that what is new is either unintelligible or untenable.

21. The distinction between knowledge *a priori*, and knowledge *a posteriori*, is as old as speculation itself; and the mode in which Kant illustrates that distinction differs not from the illustrations of Aristotle on the same subject. The *Stagyrite* talked of general forms, or formal

causes, in the mind, as well as the professor at Königsberg; and he or his disciples (for we quote from memory) compared them to the form of the statue in the rough block of marble. As that form is brought into the view of the spectator by the chisel of the statuary, so, said the peripatetics, are the general forms in the mind brought into the view of consciousness by sensation and experience.

Such was the doctrine of Aristotle and his disciples, and such seems to be the doctrine of Kant and his followers; but it is either a false doctrine, or, if it be true, a doctrine foolishly expressed. A block of marble is capable of being cut into any form that the statuary pleases; into the form of a man, a horse, an ox, an ass, a fish, or a serpent. Not one of these forms, therefore, can be inherent in it, or essential to it, in opposition to the rest; and a general form, including all the animals under it, is inconceivable and impossible. In like manner, the human mind is capable of having the ideas of a circle, a triangle, a square, of black, white, red, of sour, sweet, bitter, of the odour of a rose, and the stench of a dunghill, of proportion, of musical sounds, and of a thousand other things. None of these ideas, therefore, can be essential to the mind in opposition to the rest; and every man, who is not an absolute stranger to the operations of his own intellect, knows well that he cannot think of a thousand things at once; or, to use the language of philosophers, have in his mind a general idea, comprehending under it a thousand things so discordant as colours and sounds, figures, and smells. If, therefore, Kant means to affirm, with Plato, that, previous to all experience, there are actually in the mind general forms, or general ideas, to which sensation, or experience, gives an opportunity of coming into view, he affirms what all men of reflection know to be false. If he means only to affirm, what seems to have been the meaning of Aristotle, that particular sensations give occasion to the intellect to form general ideas, he expresses himself indeed very strangely; but his doctrine on this subject differs not essentially from that of Locke and Reid, and many other eminent metaphysicians of modern times.

22. But when Kant says that his ideas *a priori* are universal, and necessary, and that their converse is impossible, he seems by the word idea to mean what more accurate writers express by the term proposition. There are indeed two kinds of propositions, of which both may be true, though the one kind expresses necessary and universal truths, and the other such truths as are contingent and particular. Propositions directly contrary to those which express particular and contingent truths may be easily conceived; whilst such as are contrary to necessary and universal truths are inconceivable and impossible; but we doubt whether any idea, in the proper sense of the word, has a contrary, or, as he expresses it, a converse. Nothing is not contrary to substance, nor black contrary to white, nor sour contrary to sweet, nor an inch contrary to an ell. Nothing is the negation of substance, and black the negation of white; sour is different from sweet, and an inch is less than an ell; but between these different ideas we perceive no contradiction.

That Kant uses the term idea instead of proposition, or some word of similar import, is farther evident from his instances of the house on

KANTISM.

fire, and the manner in which we learn that any two bodies added to any two other bodies will constantly make the sum of four bodies. If it be his will to use the terms *a priori* and *a posteriori* in the sense in which other metaphysicians use the terms necessary and contingent, we can make no other objection to his distinction between these two propositions, but that it is expressed in very improper language. The house might certainly be on fire or not on fire; but twice two bodies must always make the sum of four bodies, and cannot possibly make any other sum.

The truth of this last proposition (he says) we cannot have learned from experience, because experience, being always limited, cannot possibly teach us what is necessary and universal. But this is egregious trifling. The experience employed here is not limited. A child unquestionably learns the import of the terms of numeration, as he learns the import of all other terms, by experience. By putting two little balls to two little balls, he learns to call the sum four balls. After two or three lessons of this kind, with different bodies, his own reflection suggests to him, that the sum four has no dependence upon the shape or consistence of the bodies, but merely upon the individuality of each or their numerical difference; and individuality, or numerical difference, is as completely exemplified in two bodies of any kind as in two thousand.

23. All the truths of pure mathematics (says Kant) are *a priori*. If he means that they are all necessary, and that the contrary of any one of them is inconceivable, he affirms nothing but what is true, and has been known to all mathematicians these two thousand years. But, if he means that they are innate truths, not discovered by induction or ideal measurement, his meaning is demonstrably false (see INDUCTION).—When he says, that it is not experience which discovers to us that we shall always have the surface of the pyramid, by multiplying its base by the third part of its height, he is right, if by experience he means the actual measurement of all possible pyramids; but surely he cannot mean that the truth of this measurement is innate in the mind, for it is in fact not a true but a false measurement. The base of a pyramid multiplied by the third part of its height, gives, not the surface, but the solid content of the pyramid; and he who understands the proposition on which this truth is immediately built, knows perfectly that Euclid proved it by a series of ideal measurements of those particulars in which all pyramids necessarily agree.

Kant seems often to confound sensation with experience; and if by experience he means sensation, when he says that pure knowledge, *a priori*, is that which is absolutely without any mixture of experience, he talks nonsense; for the most spiritual notions which men can form are derived from the operations of the mind on ideas of sensation. To the rest of the paragraph, respecting pure knowledge, we have hardly any objection to make. Locke, the great enemy of innate ideas, taught, before Kant was born, that our knowledge depends upon our organization and the faculties of our minds, as much as upon impressions made on the senses *ab extra*; that if our organs of sense were different from what they are, the taste of sugar might be bitter, and that of wormwood sweet; and that if we had not memory, and could not modify and

arrange our ideas, all progress in knowledge would be impossible.

24. When our author talks of time and space, as the two essential forms of the mind, we are not sure that we understand him. A conscious intelligence may be conceived which has no ideas either of space or of time; and he who can affirm, that if extension were known to us only by experience, it would be possible to conceive sensible objects without space, has never attended to the force of what philosophers call the association of ideas in the mind. But what is here meant by sensible objects? Are they objects of touch, taste, or smell? Objects of touch cannot indeed be conceived without space; but what extent of space is suggested by the taste of sugar or the odour of a rose?

When Kant talks of the form space enabling us to attribute to external objects impenetrability, mobility, &c. he talks at random; and another man may, with as much propriety, and perhaps more truth, affirm the converse of his propositions, and say, that it is the impenetrability and mobility, &c. of external objects that enable us to form the idea called space, and the succession of some objects, compared with the permanence of others, that enables us to form the notion or mode called time.

25. On the two or three next paragraphs, it is not worth while to detain the reader with many remarks. They abound with the same uncouth and obscure phraseology, and the same idle distinctions between ideas *a priori* and *a posteriori*. In No. 11, he affirms, that the three following propositions (a body is heavy, wood is combustible, and the three angles of a triangle are equal to two right angles) are all necessary judgments. In one sense this affirmation is true, and in another it is false. We cannot, without speaking unintelligibly, give the name body to any substance which is not heavy; and we are not acquainted with any kind of wood which is not combustible, but surely it is not impossible to conceive a substance extended and divisible, and yet not heavy, to which the name body might be given without absurdity, or to conceive wood as incombustible as the mineral called asbestos. That the three angles, however, of a plane triangle can be either more or less than equal to two right angles, is obviously impossible, and must be perceived to be so by every intelligence from the Supreme down to the human. The three propositions, therefore, are not of the same kind, and should not have been classed under the same genus of necessary synthetic judgments.

In the critique of pure reason, Kant seems to teach that all demonstrative science must proceed from general principles to particular truths. Hence his forms of the understanding, and his categories, which, according to one of his pupils, (Dr. Willich,) "lie in our understanding as pure notions *a priori*, or the foundation of all our knowledge. They are necessary forms, radical notions, of which all our knowledge must be compounded." But this is directly contrary to the progress of the human mind, which, as we have shewn in the article INDUCTION, already referred to, proceeds, in the acquisition of every kind of knowledge, from particular truths to general principles. This transcendental philosophy of Kant's, therefore, inverts the order of nature, and, as little calculated to promote the progress of science as the syllogistic system

of Aristotle, which was likewise built on categories or general forms. His transcendental æsthetic, which, according to Dr. Willrich, is the knowledge *a priori* of the rules of sensation, seems to be a contradictory expression, as it implies that a man may know the laws of sensation, without paying the smallest attention to the organs of sense.

That we know objects only by the manner in which they affect us, and not as they are in themselves, is a truth admitted, we believe, by all philosophers, and certainly by Locke and Reid; but when Kant says that we know nothing of the reality of the objects, which affect our senses, he seems to be singularly paradoxical. Berkeley himself, the most ingenious idealist that ever wrote, contends strenuously for the existence of a cause of our sensations distinct from our own minds, and because he thinks

no matter a cause inadequate to this effect, he concludes, that every sensation of which we are conscious is a proof of the immediate agency of the Deity. But Kant makes the existence of God and of matter equally problematical. Indeed he says expressly, that beyond things sensible we can only have opinions or belief, but things sensible, as every one knows, are nothing more than the qualities of objects.

Our philosopher's proof of a God is nothing more than his persuasion that happiness is connected with virtue by a Being upon whom nature depends, and he says expressly, that this proof carries conviction to the mind in proportion as the motives of a man's actions are conformable to the law of morality. This being the case, the reader cannot be much surprised, when he is informed that several of Kant's disciples on the continent have avowed themselves Atheists or Spinozists.

Among his categories, or fundamental ideas, which are necessarily formed in the mind, he expressly reckons cause and effect: but in various articles of this work, it has been proved beyond the possibility of contradiction, that no sensible object is the true metaphysical cause of any one event in nature; and indeed Kant himself is at much pains to shew that his categories or ideas *a priori* are not ideas of sensation. There must, therefore, upon his own principles, be causes which are not the objects of sense or experience; and by tracing these causes backward, if there be a succession of them, we must arrive at one self-existent cause, by a demonstration as complete as that by which Euclid proves the equality of the three angles of a plane triangle to two right angles. We have no other evidence for the truth of geometrical axioms than the laws of human thought, which compel us to perceive the impossibility of such propositions being false. According to our philosopher, we have the very same evidence for the reality of causes and effects which are not the objects of sense. The consequence is obvious. (*Sup. En. Brit.*)

A very luminous and masterly account of the Kantian philosophy, with a triumphant refutation of its principal sophisms, written, we believe, by Sir James Mackintosh, the learned recorder of Bombay, are given in the second number of the *Edinburgh Review*. We have deeply regretted that the dissertation to which we now advert, was extended to a greater length than was commensurate with our narrow limits.

KAOLIN, in the arts, the name of an earth used in the manufacture of oriental porcelain china. A specimen of this earth was brought from China, and examined by Reaumur, who found it to be infusible by fire. He thought it was a talcy earth; but Mr. Macquer says, it is more probably of an argillaceous nature, from its forming a tenacious paste, with the other ingredient called petunse, which has no tenacity. A French chemist, M. Bomaire, analyzed it, and found it was a compound earth consisting of clay, to which it owed its tenacity; of calcareous earth, which gave it a mealy appearance; of sparkling crystals of mica; and of small gravel, or particles of quartz-crystals. He found a similar earth upon a stratum of granite, and conjectures it may be a decomposed granite.

KAOUTCHOU. See CAOUTCHOU.

KAPI, a term in the eastern countries for gate. As *alla kapi*, the gate of God.

KAPOSWAR, a fort of Lower Hungary, so called from the river Thapos, that washed its walls. Lon. 18. 13. E. Lat. 46. 31. N.

KARAITES. See CARAITES.

KARAT. See CARACT.

KAREK, or **GABAK**, a small island in the Persian Gulf, where the Dutch have made a settlement: celebrated for its pearl fishery. Long. 67. 15. E. Ferro. Lat. 28. 45. N.

KARENDAR, a town of Persia, in the province of Chorasán: seventy leagues N. Herat.

KAREPOS, a town of Russia, in the government of Archangel: sixty miles N.E. Archangel.

KARGALDZIN, a lake of Russian Tartary, sixty miles in circumference; 340 miles S. Orenburg.

KARLE, a Saxon word used in our law, sometimes simply for a man; and sometimes, with an addition, for a servant or clown. Thus the Saxons call a seaman buscarle, and a domestic servant huscarle. From hence comes the modern word *churl*.

KARLSRUH, a handsome town of Germany, in the circle of Suabia, and territory of the margrave of Baden Durlach, who has here a magnificent palace. The town is built on a regular plan, and the houses are all as uniform as the streets. It is 12 miles N. by E. of Baden.

KARMATIANS, a sect of Mohammedans, who once occasioned great disorders in the empire of the Arabs.

KASAN, a large country of the Russian empire, lying on both sides of the river Volga: It was formerly an independent kingdom, subject to the Kalmuc Tartars, to whom the Great Dukes of Moscow, with the other petty principalities of Russia, were tributary. But Ivan Vassilievitch I. the founder of the Russian greatness, toward the end of the 15th century rescued his country from the Tartar yoke; and in 1552, the second duke of the same name

K A T

conquered Kasan, which now forms the three Russian governments of Kasan, Simbirsk, and Penza.

KASAN, the capital of the Russian government of the same name, seated on the rivulet Casanka, where it falls into the Volga. It is 414 miles E. by N. of Moscow. E. Lon. 49. 35. N. Lat. 55. 23.

KASSON, a populous kingdom in North Africa, of which the capital Kooniakary is placed by Major Rennel in 14. 33. N. Lat. and 8. 43. W. Lon. The king who reigned when Mr. Park was in the country was extremely kind to our traveller, though his son plundered him unmercifully, like other rapacious chiefs of that savage country. From the top of a high hill, at some distance from the capital, "I had (says Mr. Park) a most enchanting prospect of the country. The number of towns and villages, and the extensive cultivation around them, surpassed every thing I had yet seen in Africa. A gross calculation may be formed of the number of inhabitants in this delightful plain, by considering that the king of Kasson can raise 4000 fighting men by the sound of his war drum."

At Teesee, a large unwall'd town, where our author resided for some days, he had an opportunity of observing the customs of the inhabitants, who consisted partly of Pagans, and partly of Bushreens, *i. e.* of negroes converted to Mahomedanism. Though these people possess both cattle and corn in abundance, rats, moles, squirrels, snakes, locusts, &c. are eaten without scruple by the highest and lowest. Another custom, still more extraordinary, is, that no woman is allowed to eat an egg. This prohibition, whether arising from ancient superstition, or from the craftiness of some old Bushreen who loved eggs himself, is rigidly adhered to; and nothing will more affront a woman of Teesee than to offer her an egg. The custom is the more singular, as the men eat eggs without scruple in the presence of their wives, and Mr. Park never observed the same prohibition in any other of the Mandingo countries.

KASTRIL, or KESTRIL. See FALCO.

KATTEGATTE, a noted sea lying between part of Jutland and the coast of Sweden, and towards the latter covered with a great number of isles. It is almost closed at the extremity by the low Danish islands of Sealand and Funen, which had in old times been (with Sweden) the seat of the Suiones. Between the first and the coast of Sweden is the famous sound, the passage tributary to the Danes by thousands of ships. These islands were of old called *Codonania*, and gave to the Kattegatte the name of *Sund Codanus*. Its greatest depth is 35 fathoms; it decreases as it approaches the sound; which begins with 16 fathoms, and near Copenhagen shallows even to four. The Roman fleet, under the command of Germanicus, sailed, according to Pliny,

K A U

round Germany, and even doubled the *Cimbrium Promontorium*, and arrived at the islands which fill the bottom of the Kattegatte; either by observation or information, the Romans were acquainted with 23. One they called *Glessaria*, from its amber, a fossil abundant to this day on part of the south side of the Baltic. A Roman knight was employed by Nero's master of the gladiators to collect in these parts that precious production, by which he became perfectly acquainted with this country.

KATUKA RETULA PODA. In amphibiology, a species of Indian viper (coluber), systematically denominated Coluber Russellii, as being, in the first instance, minutely described by Dr. Russell. The plates of its belly are a hundred and sixty-one; the caudal scales a hundred and ten. A brownish-yellow snake, with acutely-ovate, blackish, dorsal spots, edged with white, and smaller ovate lateral ones: length about four feet: the under part of the body is white, with a few dusky spots; the head is rather large, snout obtuse, mouth wide, fangs large, and poisonous; and, as in other poisonous serpents, double; a smaller fang being situated close to the larger, on each side.

This species is as common in India as the Coluber Naja, or Cobra de Capello; but from its not being publicly exhibited, less generally known. Its bite proves fatal to chickens in thirty-eight seconds; and to a dog in twenty-six minutes. A rabbit exposed to the same animal, after he had bitten a chicken and two dogs, died in less than an hour.

The poison of the Katuka, like that of the Cobra de Capello, has little or no taste when diluted; is neither acid nor alkaline; and in many other qualities bears a resemblance to the Cobra de Capello, and especially that variety of it called the *Coodum Nagon*. See COLUBER.

KATZENAUGE. In mineralogy cat's-eye. *Oeil de Chat*: a species of Felspar, for which see FELDSPATUM. It consists of about ninety-five in a hundred parts of silice, the rest being alumine, and lime, with a very small proportion (usually 0. 25.) of oxyd of iron. Of its geognostical situation we have no certain knowledge. It is brought to Europe from Ceylon, and the Malabar coast, sometimes from Siberia. It is set in rings, and is in considerable estimation.

KAUFFBEUREN, a free and imperial town of Germany, in the circle of Suabia and territory of Kempton. The inhabitants consist of papists and protestants. It is seated on the river Wardach, 18 miles N. E. of Kempton, and 30 S. by W. of Augsburg. E. Lon. 10. 43. N. Lat. 47. 58.

KAUFFMAN (Angelica), a celebrated painter; was born at Coire, the capital of the Grisons, October 30, 1740. She was the only daughter of John Joseph Kauffman, of Swarthemberg, and of Cleophe Lucin, of

K A U F F M A N.

the same place. Her father was a painter of some consideration, and her mother a woman highly respectable for her domestic virtues.

In her very infancy Angelica evinced a strong disposition for the arts of design; for nothing gave her so much delight as examining and copying prints. Her inclination did not escape the observation of her father: her infant genius was accordingly fostered by him, with instruction in some principles of the art; and so rapid was her proficiency, that, when only between eight and nine years of age, she already began to paint, first in crayons and then in oil. In these pursuits she laboured under an insurmountable difficulty, as, by the decorums of her sex, she was prevented from resorting to academies, and from thus forming her judgment and taste by naked living figures. But this circumstance by no means discouraged her. By drawing after the most correct models, and by the assiduous study of the works of the best artists, she compensated the unavoidable deficiency of academic instruction. And this, perhaps, ultimately proved an advantage to her; since, free from the danger of taking a bias to any peculiar method, she became more adapted to form an exclusive and original character in painting.

When it had been determined that she should pursue painting as a profession, she was sent to Italy, to study the works of the ancient masters. She first visited Florence, to examine the collection of that once splendid gallery; thence she proceeded to Rome. What length of time she remained at those places we are unable to state; but probably her stay was not long, as she came over to England in the year 1765. Shortly after her arrival in this country, she was elected a member of the Royal Academy, an honour to which few of her sex have attained, and which affords a striking proof of her proficiency in the art.

She resided in England sixteen years, and it was during this interval that she painted those subjects by which she is best known to the British public, and on which her reputation is, perhaps, principally founded. Many of the subjects which have called forth the talents of our finest engravers were furnished by her, and to her pencil also several of our most splendid publications owe some of their most pleasing embellishments.

In the year 1781, she quitted England, and remained for a short time in Germany: she thence passed into Italy, and finally settled at Rome, where the last years of her life were passed in the exercise of her profession, and in the enjoyment of that universal admiration which her talents had inspired.

Her celebrity, however, could not, it seems, altogether exempt her from the evils resulting from the revolutionary disorders

of Europe. During the predatory incursions of the French into Italy, in the year 1798, in which private and public property became their indiscriminate plunder, she was obliged to compound with those worse than vandal invaders, for the paintings in her possession which were done for some English friends, by paying for their preservation a sum of about 40*l*.

Although it is unnecessary to enter here into a detailed account of all her pictures, yet we cannot satisfy ourselves without specifying a few. On her return to Rome, in 1784, she executed two pictures, which had been requested of her by the emperor Joseph. For the subject of one of those performances, she selected Eneas doing the honours of the funeral of young Pallas, after the battle against the Tyrrhenians; and for that of the other, Arminius when, having defeated the Romans, with the death of Quintilius Varus, returning to his forest loaded with Roman trophies, he is met by his wife and other young women, spreading flowers in his path, and presenting him with laurel crowns. The two pictures, by the means of cardinal Herzan, imperial plenipotentiary in Rome, were sent to the emperor, who, in return, wrote with his own hand to the cardinal a letter, expressing the highest degree of satisfaction and acknowledgment. "As a token," said he, "of my gratitude, I join to this letter a snuff-box and a medal, which your eminence will have the goodness to present in my name to Angelica. I desire you likewise to inform her, that the two works are already placed in the imperial gallery; for, I wish that, as well as myself, all my subjects may admire her superior talents."

These two great historical paintings occupied Angelica during the whole year 1785, and more than one half of the next, but not exclusively; for, in that interval, she executed the commission of the late empress Catherine of Russia, for a large picture representing Servius Tullius, the sixth king of the Romans, when, in his childhood, falling asleep in the apartments of the elder Tarquin, a bright flame was seen on his head, and queen Tanaquil and her maids of honour wishing to extinguish it, were prevented by Tarquin, who regarded that phenomenon as a harmless presage of his future greatness. In that interval, also, and in the course of 1787, she finished a picture for king Stanislaus of Poland, the subject of which was, Virgil reading to Augustus and Octavia the sixth book of the *Eneid*, and the empress fainting at the recital of the passage in which the name of young Marcellus is introduced.

We shall take no notice of some other equal or inferior works which this artist executed from 1788 to 1790, for they do not materially add to her merit and fame. We shall, however, mention, as the last of her great historical paintings, that which,

K A U

towards the close of 1790, in consequence of a commission from Pius VI. she made for the celebrated sanctuary of our Lady at Loretto. The subject was the blessed Virgin, in her childhood, pouring from a little vessel some water on a young lily, and, her face turned towards heaven, contemplating a ray of light descending on her head; whilst her parents, Joachim and Anne, surprised at the phenomenon, seem to offer their pious thanks to God. Pius VI. was so satisfied with this performance, that, in 1792, he issued orders that it should be executed, as it usually was, in mosaic, for the church of Loretto.

We cannot close the account of this extraordinary woman, without giving some hints concerning the rank which she occupies among painters—at least among those of her own sex. In the golden age of arts in Italy, and in the subsequent century also, seven female painters flourished. Lavinia Fontana, Artemisia Gentileschi, Chiara Varottil, Giovanna Carzoni, Maria Tintoretto (the daughter of the great painter of this name) Sophonisba Anguissiola, and Elizabeth Sirani. None of these ever rose to the highest degree of merit; none, at least, were able to enter into competition with their contemporary great painters of the other sex; none of them, consequently, can rival the merit of Angelica Kauffman! In the last century, Rosalba Carriera (better known only by her christian name, Rosalba) was justly considered as a female painter until then unknown in the history of the art, and capable of coming into competition with any painter of the other sex. In the line of crayons and of miniature she had only a few rivals: in the clearness and liveliness of her colours she was admirable. As far, therefore, as a generic comparison can be made, this is the only female painter who can balance the merit and fame of the subject of our memoir. We shall decline any decision on this head: but supposing the question should be never decided, Angelica may be satisfied with her share of glory, if one person only of her sex be brought into competition with her, in the whole history of the art of painting among the moderns.

Maria Angelica Kauffman died at Rome on the 5th of November, 1807, aged 67 years and six days. She was of a middle size, and well proportioned, with a round face, bright eyes, and expressive countenance. In her youth she had been uncommonly handsome, and even in her advanced age she preserved a cheerful and prepossessing look. She was of an excellent moral character; was always sober and retired, and, in her leisure hours, only indulged in the society of her relations and friends. She had no issue by her husband, Mr. Zucchi; and leaving behind her a considerable fortune, she disposed of a part of it in favour of a pious foundation in Coire, and of

K A Z

another part in favour of her collateral relations. During the three weeks of the illness which preceded her decease, she received the sacraments, according to the ritual of the Roman catholic church. After death, such honours were paid to her remains as to add, if possible, to her fame, and to reflect great credit on the inhabitants of Rome. She was buried with solemn pomp in her parish church of St. Andrew delle Fratte. The funeral ceremony was chiefly directed by the excellent sculptor the Chevalier Canova, and was attended by all the academicians of St. Luke, and all the literary corporations.

To KAW. *v. n.* (from the sound.) To cry as a raven, crow, or rook (*Locke*).

KAW. *s.* (from the verb.) The cry of a raven or crow (*Dryden*).

KAY, QUAY, or KLY. See KEY.

KAY (William), a portrait and historical painter, born at Breda, in 1520 and died in 1568. His death was occasioned by grief, caused by the duke of Alva's sentencing count Egmont and Hoorn to death at the very time when he was sitting to him for his picture.

KAYE'S ISLAND, an island in the North Pacific Ocean, near the west coast of North America, about thirty miles in length, and four in breadth, discovered and named by captain Cook, the south-west point situated in Long. 216. 58. E. Greenwich. Lat. 59. 49. N.

KAYLE. *s.* (*quille*, French.) 1. Ninepin; kettlepins, of which skittles seems a corruption (*Carew*).

KEYSERBERG, or Kaiserberg, a town of France, in the department of the Upper Rhine, and chief place of a canton, in the district of Colmar: one league and three quarters NW. Colmar, and five SE. St. Diey.

KAYSERHEIM, a princely abbey of Germany, in the circle of Swabia, near Donauwert, separated from Bavaria, and joined to the circle of Swabia in the year 1757, founded in the year 1126. It pays as an annual contribution, 300 florins, and is taxed to the imperial chamber 338 rixdollars, twenty-three krutzers.

KAZAN, a city of Russia, and capital of a government to which it gives name, situated on the Volga. In the Turkish and Tartarian languages, Kazan signifies a cauldron large enough to contain victuals for many persons; and this name the Crim and Budziak Muses give to the families of their subjects or vassals, about ten men being reckoned to a Kazan. This city consists of a strong fort, built with stone, the Wooden Tower, as it is called, and several adjoining slobodes, or suburbs; and among these there is one inhabited by Tartars, in which are four metsheds. Here are several churches, almost all of them built with stone, and eleven convents in and near the town. In the fort is the government's chancery, which

K E C

is under the direction of the governor and deputy-governor. The governor of the fort has all the garrisons and regiments within the government under his command. The garrison of the city consists of three regiments, for the service of which a very good hospital is provided. Kazan is also an archbishop's see. At one end of the town is a cloth manufacture, and all the cloth is bought up at a set price by the crown, in order to clothe the soldiers. In the convent of Sibandowo, which stands on the river Kazanka, about two wersts from the town, is a school, where the children of Tartars are taught the Russian and Latin languages, the principles of the Christian religion, and the elements of philosophy, in order to qualify them as preachers for the conversion of the nations to which they belong. In 1719, and 1752, this city was totally destroyed by fire. The Russians first made themselves masters of this important place on the third of October, 1552; 400 miles E. Moscow, and 660 S.E. Petersburg. Long. 66. 49. E. Ferro. Lat. 55. 45. N.

KEALLES, small fragments resembling chips or broken pieces of stone of various kinds; some of lime-stone, others of free-stone, and others of rag-stone, found mixed among the earth, of the upper stratum in many parts of this kingdom, and giving that soil the name of *kealy*; hence, some of these pieces of *keale* are thin and flat like bits of slate.

KEBLA, or **KERLAH**, called also **KERLEH**, **KIBLEH**, and **ALKEBLA**, among the Muslims, denotes that point, or quarter, to which they turn themselves when they say their prayers.

Mahomet, at first, durst not propose any other kebla to his followers than the temple of Jerusalem, which was the kebla of the Jews and Christians. In the course of time, however, being willing to bring them off from any communication, in matters of religion, with the Jews and Christians, he appointed them, in the Koran, to turn themselves, at prayer, towards the temple of Mecca: from which time they called those two temples the keblatan, or two keblas.

Ricaut adds, that it is not the temple of Mecca, properly speaking, that the Turks call kebla, but rather the large square tower in the middle of the amphitheatre of that temple.

The kebla of the Jews was the temple at Jerusalem; that of the Sabians, the meridian; and that of the Magians the rising sun. To this the prophet Ezekiel refers chap. viii. 16.

KEBLA is also used for an altar, or rather a niche, as Ricaut calls it, which the Mahometans have in all their mosques, and which is placed very exactly on that side towards the temple of Mecca.

To **KECK**. *v. a.* (*kecken*, Dutch.) To heave the stomach; to reach at vomiting (*Bacon*).

K E E

To **KE'CKLE**. *v. a.* To defend a castle round with rope (*Answorth*).

KE'CKSY. *s.* (commonly *kex*, *cigue*, Fr. *cicuta*, Lat.) Hemlock (*Shakspeare*).

KE'CKY. *a.* (from *kex*.) Resembling a *kex* (*Grew*).

KEDAR, in ancient geography, a district in the desert of the Saracens, on the north of Arabia Felix.

KEDES, in ancient geography, a city of refuge in the tribe of Naphthali, on the confines of Tyre and Galilee.

To **KEDGE**. *v. a.* (*kaghe*, a small vessel, Dutch.) To bring a ship up or down a narrow river against the wind (*Harris*).

KE'DGER. *s.* (from *kedge*.) A small anchor used in a river.

KEDGING, in the sea-language, is when a ship is brought up or down a narrow river by means of the tide, the wind being contrary. To do this, they use to set their four-course, or fore-top-sail and mizen, that so they may flat her about; and if she happen to come too near the shore, they let fall a kedge-anchor, with a hawser fastened to it from the ship, in order to turn her head about; which work is called *kedging*.

KEDRON, or **CEDRON**, in ancient geography, a town which, from the defeat and pursuit of the Syrians (1 Mac. xvi.), appears to have stood on the road which led from the Higher India to Azotus: in that war it was burnt by the Jews.

KEDRON, or **CEDRON**, in ancient geography. St. John calls it a brook, but Josephus a deep valley between Jerusalem and Mount Olivet to the east; called also Kedron from its blackness. Maundrel says that in his time it was a brook only in winter, or in rainy weather.

KE'DLACK. *s.* A weed that grows among corn; charlock (*Tusser*).

KEE. The provincial plural of *cow*, properly *kine*.

KEEL, the lowest piece of timber in a ship, running her whole length from the lower part of her stern to the lower part of her stern-post. Into it are all the lower futlocks fastened; and under part of it a false keel is often used.

By comparing the carcass of a ship to the skeleton of a human body, the keel appears as the back bone, and the timbers as the ribs. Accordingly, the keel supports and unites the whole fabric, since the stem and stern-posts, which are elevated on its ends, are, in some measure, a continuation of the keel, and serve to connect and enclose the extremities of the sides by transoms; as the keel forms and unites the bottom by timbers.

The keel is generally composed of several thick pieces placed lengthways, which, after being scarfed together, are bolted and clinched upon the upper side.

KEEL. Carina. In botany, the lower petal of a papilionaceous corol, enclosing

K E E

the stem, and is usually shaped like a boat.

KEEL, *n.* *Carina*. Having a longitudinal prominence upon the back. Applied to the leaf, calyx and nectary.

To **KEEL**, *v. a.* (coelan, Saxon.) To scum.

KEELFAT, *n.* (coelan, Saxon.) to cool, and fat or vat, a vessel.) Cooler; tub in which liquor is let to cool.

KEEL hauling, a punishment inflicted for various offences in the Dutch navy. It is performed by suspending the culprit by a rope from one yard-arm, with a weight of lead or iron upon his legs, and having another rope fastened to him, leading under the ship's bottom, and through a block at its opposite yard-arm; he is then repeatedly and suddenly let fall from the one yard-arm into the sea, where, passing under the ship's bottom, he is hoisted upon the opposite side of the vessel to the other.

KEPLERS, among seamen, are small tubs, which hold stuff for the caulking of ships.

KEELSON, a principal timber in a ship, fayed within-side cross all the floor-timbers; and being adjusted to the keel with suitable scarfs, it serves to strengthen the bottom of the ship.

KEEN, *a.* (cene, Saxon.) 1. Sharp; well edged; not blunt (*Dryden*). 2. Severe; piercing (*Ellis*). 3. Eager; vehement (*Tatler*). 4. Acrimonious; bitter of mind (*Swift*).

To **KEE**, *v. a.* To sharpen (*Thomson*).

KEENERS. The name of the Irish Singing mourners. The Irish have always been remarkable for their funeral lamentations, and once were celebrated for their musical art in their last sad offices to their departed friends. Formerly these duties were performed by dressing the body of the deceased in grave clothes, ornamenting it with flowers, and placing it on a bier; when the relations and keeners ranging themselves in two divisions, one at the head, and the other at the feet of the corpse, the chief bard of the head chorus, softly accompanied by the harp, sung the first stanza of the Caoinan, or funeral song; this being ended, the foot semichorus began the lamentation, or Ullaloo, in which they were answered by the head semichorus, and then both united in one general chorus. After this, the chief bard of the foot semichorus began the second Gol, or lamentation, in which he was answered by that of the head; and then, as before, both united in the general full chorus. Thus, alternately, were the song and chorusses solemnly performed during the night. But whatever merit or decorum there might formerly be in these vocal obsequies of the Irish, they have at present little to boast either of melody, harmony, or dignity. The keeners now generally consist of a motley multitude of men, women, and children, and the Caoinan is degenerated into a wild and hideous howl (*Bosby*).

K E E

KEENLY, *ad.* (from *keen*.) Sharply; vehemently; eagerly; bitterly.

KEENNESS, *s.* (from *keen*.) 1. Sharpness; edge (*Shakspeare*). 2. Rigour of weather; piercing cold. 3. Asperity; bitterness of mind (*Clarendon*). 4. Eagerness; vehemence.

To **KEEP**, *v. a.* (cepan, Saxon, *kepen*, old Dutch.) 1. To retain; not to lose (*Temple*). 2. To have in custody (*Knolles*). 3. To preserve; not to let go (*Chronicles*). 4. To preserve in a state of security (*Addison*). 5. To protect; to guard (*Genesis*). 6. To restrain from flight (*Icts*). 7. To detain, or hold as a motive (*Dryden*). 8. To hold for another (*Milton*). 9. To tend; to have care of (*carew*). 10. To preserve in the same tenour or state (*Addison*). 11. To regard; to attend (*Dryden*). 12. To not suffer to fall (*Psalms*). 13. To hold in any state (*Locke*). 14. To retain by some degree of force in any place or state (*Sidney*). 15. To continue any state or action (*Knolles*). 16. To preserve in any state (*Ecclus*). 17. To practise; to use habitually (*Pope*). To copy carefully (*Dryden*). 19. To serve or solemnize any time (*Milton*). To observe; not to violate (*Shakspeare*). 21. To maintain; to support with necessities of life (*Milton*). 22. To have in the house (*Shakspeare*). 23. Not to intermit (*Ecclus*). 24. To maintain; to hold (*Jayward*). 25. To remain in; not to leave a place (*Shakspeare*). 26. No; to reveal; not to betray (*Yillotson*). 27. To restrain; to withhold (*Boyle*). 28. To debar from any place (*Milton*). 29. To **KEEP** back. To reserve; to withhold (*Jeremiah*). 30. To **KEEP** back. To withhold; to restrain (*Psal*). 31. To **KEEP** company. To frequent any one; to accompany (*Donne*). 32. To **KEEP** company with. To have familiar intercourse (*Broome*). 33. To **KEEP** in. To conceal, not to tell (*Addison*). 34. To **KEEP** in. To restrain; to curb (*Locke*). 35. To **KEEP** off. To bear at distance. 36. To **KEEP** off. To hinder (*Locke*). 37. To **KEEP** up. To maintain without abatement (*Addison*). 38. To **KEEP** up. To continue; to hinder from ceasing (*Taylor*). 39. To **KEEP** under. To oppress; to subdue (*Atterbury*).

To **KEEP**, *v. n.* 1. To remain by some labour or effort in a certain state (*Pope*). 2. To continue in any place or state; to stay (*Sidney*). 3. To remain unhurt; to last (*Sidney*). 4. To dwell; to live constantly (*Shakspeare*). 5. To adhere strictly (*Addison*). 6. To **KEEP** on. To go forward (*Dry*). 7. To **KEEP** up. To continue unsubdued.

KEEP, *s.* (from the verb.) 1. Custody; guard (*Dryden*). 2. Guardianship; restraint (*Ascham*).

KEEP, in ancient military history, a kind of strong tower, which was built in the centre of a castle or fort, to which the besieged retreated, and made their last efforts of defence.

K E E

Of this description is the keep of Windsor Castle.

KEEPER. s. (from *keep*.) 1. One who holds any thing for the use of another (*Sidney*). 2. One who has prisoners in custody (*Dryden*). 3. One who has the care of parks, or beasts of chase (*Shakspeare*). 4. One that has the superintendence or care of any thing (*Kings*).

KEEPER OF THE GREAT SEAL, is a lord by his office, and styled lord keeper of the great seal of Great Britain; he is always one of the privy counsel. All grants, charters, and commissions of the king under the great seal pass through the hands of the lord-keeper; for without that seal many of those grants, &c. would be of no force. The king being, in the interpretation of the law, a corporation, he therefore passes nothing but by the great seal, which is also said to be the public faith of the kingdom, being in the highest esteem and reputation. Whenever there is a lord-keeper, he is invested with the same place, authority, pre-eminence, jurisdiction, or execution of laws, as the lord chancellor of Great Britain is vested with. The lord-keeper is constituted by the delivery of the great seal, &c.

KEEPER of the Privy seal, is also a lord by his office, through whose hands all grants, pardons, &c. pass before they come to the great seal; and even some things pass his hands which do not pass the great seal at all. The officer is also one of the privy-council, yet was anciently called clerk of the privy seal. His duty is to put the seal to no grant, &c. without a proper warrant; nor with warrant where it is against law, or inconvenient, but shall first acquaint the king therewith.

KEEPERS, in sporting are officers of various descriptions, neither servants of the crown nor of individuals: whence we have forest-keepers, park-keepers, and game-keepers. It is the province of the first to protect and superintend the deer in any one of his majesty's forests, to which he is appointed, and to enforce the laws enacted for their preservation, against depredators of every description. Park-keepers are retained in the service of noblemen and gentlemen who have parks stocked with deer, having the same perquisites and privileges as those employed in the service of the crown; their employment is principally to superintend, preserve, and regulate the stock, as well as to kill Bucks, Does, and Fawns, according to the season, when required for the table; which can never be done by any park-keeper of the crown, without the receipt of a proper warrant previously issued from superior authority for that purpose. Game-keepers are employed in various forests, parks, chases, free-warrens, and manors, the property of the crown, to furnish a constant supply of Game for his majesty's table and household, so as to prevent too great an influx at one time, and too short a

K E I

supply at another. Every lord actually possessing a manor within any part of the kingdom, has also the power of appointing a person, under the denomination of a game-keeper, to protect, ~~and to~~ or kill any kind of game upon the particular manor for which he is appointed; and to execute and enforce all such other manorial rights and privileges within the department, as may appertain to his delegation; he first conforming to the legal prescription, before he can be confirmed, or qualified to act in the office to which he has been deputed.

KEEPERSHIP. s. (from *keeper*.) Office of a keeper.

KEEPING, in painting denotes the representation of objects in the same manner that they appear to the eye at different distances from it; for which the painter should have recourse to the rules of perspective. There are two instances in which the famous Raphael Urbin has transgressed these rules: in one of his cartoons, representing the miraculous draught of fishes, the men in each of the two boats appear of full size, the features of their faces being strongly marked; and the boats are represented so small, and the men so big, that any one of them appears sufficient to sink either of the boats by his own bare weight: and the fowls on the shore are also drawn so big, as to seem very near the eye of the observer, who could not possibly, in that case, distinguish the features of the men in the distant boats. Or, supposing the observer to be in either of the boats, he could not see the eyes or beaks of the fowls on the shore. The other instance occurs in his historical picture of our Saviour's transfiguration on the mount. See **CARTOONS**.

KEFFEILL, in Mineralogy. See **MEERS-CHARM**.

KEG, a small barrel, commonly used to contain small fish, as herrings, anchovies, &c.

KEHL, or **KEIL**, once an important fortress of Germany, in the circle of Suabia. It is seated on the Rhine, opposite Strasburg, to which when the latter was an imperial city it belonged. It was also strongly fortified by the French, who took possession of it in 1684. Being ceded to the empire at the peace of Ryswick, the emperor consigned it to the house of Baden, reserving to himself, however, the right of a garrison. During the time of the French revolution this fortress changed masters several times; but after 1801, it was demolished in compliance with the terms of the treaty of peace. Lon. 7. 45. E. Lat. 48. 40. N.

KEILL, (Dr. John), a celebrated astronomer and mathematician, was born at Edinburgh in 1671, and studied in the university of that city. In 1694 he went to Oxford, where, being admitted of Balliol college, he began to read lectures according to the Newtonian system in his private chamber in that college. He is said to have been the first who taught

K E I

Sir Isaac Newton's principles by the experiments on which they are founded: and this, it seems he did by an apparatus of instruments of his own providing; by which means he acquired a great reputation in the university. The first specimen he gave the public of his skill in mathematical and philosophical knowledge, was his Examination of Dr. Burnet's Theory of the Earth, with Remarks on Mr. Whiston's theory: and these theories being defended by their respective inventors, drew from Mr. Keill An Examination of the Reflections on the Theory of the Earth, together with A Defence of the Remarks on Mr. Whiston's New Theory. In 1701 he published his celebrated treatise entitled *Introductio ad veram physicam*, which only contained 14 lectures; but in the following editions he added two more. This work has been translated into English, under the title of *An Introduction to Natural Philosophy*. Afterwards being made fellow of the Royal Society, he published, in the Philosophical Transactions, a paper on the laws of attraction; and being offended at a passage in the *Acta Eruditorum* of Leipsic, warmly vindicated against Mr. Leibnitz, Sir Isaac Newton's right to the honour of the first invention of his method of fluxions. In 1709 he went to New England as treasurer of the Palatines; and soon after his return in 1710, he was chosen Savilian professor of astronomy at Oxford. In 1711, being attacked by Leibnitz, he entered the lists with that mathematician, in the dispute concerning the invention of fluxions. Leibnitz wrote a letter to Dr. Hans Sloane, then secretary to the Royal Society, requiring Keill, in effect, to make him satisfaction for the injury he had done him in his paper relating to the passage in the *Acta Eruditorum*: he protested, that he was far from assuming to himself Newton's method of Fluxions; and therefore desired that Keill might be obliged to retract his false assertion. On the other hand, Keill desired that he might be permitted to justify what he had asserted. He made his defence to the approbation of Newton, and other members of the Society. A copy of this was sent to Leibnitz; who, in a second letter, remonstrated still more loudly against Keill's want of candour and sincerity; adding, that it was not fit for one of his age and experience to engage in a dispute with an upstart, who acted without any authority from Newton, and desiring that the Royal Society would enjoin him silence. Upon this, a special committee was appointed; who, after examining the facts, concluded their report with "Reckoning Mr. Newton the inventor of Fluxions; and that Mr. Keill, in asserting the same, had been no ways injurious to Mr. Leibnitz." The whole proceedings may be seen in Collins's *Commercium Epistolicum*, with many valuable papers of Newton, Leibnitz, Gregory, and other mathematicians. In the mean time Keill behaved himself with great firmness

K E L

and spirit; which he also shewed afterwards in a Latin epistle, written in 1720, to Bernoulli, mathematical professor at Basil, on account of the same usage shewn to Newton: in the title page of which he put the arms of Scotland, viz, a Thistle, with this motto, "*Nemo me impune lacessit*."

About the year 1711, several objections being urged against Newton's philosophy, in support of Des Cartes's notion of a plenum, Keill published a paper in the *Philos. Trans.* on the Rarity of Matter, and the Tenacity of its Composition. But while he was engaged in this dispute, queen Anne was pleased to appoint him her Decipherer; and he continued in that place under king George the First till the year 1716. The university of Oxford conferred on him the degree of M. D. in 1713; and, two years after, he published an edition of *Commandine's Euclid*, with additions of his own. In 1718 he published his *Introductio ad Veram Astronomiam*: which was afterwards, at the request of the duchess of Chandos, translated by himself into English; and, with several emendations, published in 1721, under the title of *An Introduction to True Astronomy*, &c. This was his last gift to the public: being this summer seized with a violent fever, which terminated his life Sept. 1, in the 50th year of his age.

His papers in the *Philos. Trans.* above alluded to, are contained in volumes 26 and 29.

KEILL (Dr. James), an eminent physician and philosopher, and younger brother of Dr. John Keill above mentioned, was also born in Scotland, in 1673. Having travelled abroad, on his return he read lectures on Anatomy with great applause in the universities of Oxford and Cambridge, by the latter of which he had the degree of M. D. conferred upon him. In 1703 he settled at Northampton as a physician, where he died of a cancer in the mouth in 1719. His publications are

1. An English translation of Lemery's Chemistry. 2. On Animal Secretion, the quantity of blood in the human body, and on Muscular Motion. 3. A treatise on Anatomy. 4. Several pieces in the *Philos. Trans.* volumes 25 and 30.

KEISERSBERG, a town of Alsace in France, and in the bailiwick of Haguenau, which has belonged to the French ever since the year 1548. It is seated in a pleasant country, in E. lon. 7. 25. N. lat. 49. 10.

KEISERSLAUTERN, a town of Germany, in the Lower Palatinate, belonging to the elector Palatine; seated on the river Lauter, in E. lon. 7. 51. N. lat. 49. 20.

KEISERSTOUL, a town of Switzerland in the county of Baden, with a bridge over the Rhine, and a castle. It belongs to the bishop of Constance, and is situated in E. lon. 8. 40. N. lat. 47. 10.

KELL. *s.* A sort of pottage; a soup made with shreaded greens (*Ainsworth*).

K E L

KELLS. The omentum; that which inwraps the guts (*Wiseman*).

KELLINGTON, or **CALLINGTON**, a borough in Cornwall, with a good market on Wednesday. It is 12 miles S. of Launceston, and 217 W. by S. of London. W. lon. 4. 35. N. lat. 50. 30.

KELLS, a fair and post-town of Ireland, in the county of Meath and province of Leinster, 31 miles from Dublin. It is a borough likewise, and returns two members to parliament; patron earl of Bective. This place gives title of viscount to the family of Cholmondeley. Near it is Headfort, the magnificent seat of Lord Bective. This town is pleasantly situated on the river Blackwater, and has four fairs. It was anciently called Kenanus, and afterwards Kenlis. In former ages it was one of the most famous cities in the kingdom; and on the arrival of the English was walled and fortified with towers. In 1178 a castle was erected where the market-place now is; and opposite to the castle was a cross of an entire stone, ornamented with bas-relief figures and many curious inscriptions in the ancient Irish character. Within a small distance was the church of St. Senan; and on the south of the church-yard is a round tower, which measures 99 feet from the ground, the roof ending in a point; and near the top were four windows opposite to the cardinal points. There was a celebrated monastery founded here in 550 for regular canons, and dedicated to the Virgin Mary. It owed its origin to St. Columb, to whom the site of the abbey was granted by Dermond Mac Carval, or Dermond the son of Kervail, king of Ireland. An Episcopal see was afterwards erected here, which in the 13th century was united to that of Meath. A priory or hospital was also erected by Walter de Lacie, lord of Meath, in the reign of Richard I. for cross-bearers or crouched friars following the order of St. Augustin. There was likewise a perpetual chantry of three priests or chaplains in the parish church of St. Columb in Kells to celebrate mass daily; one in the Rood chapel, another in St. Mary's chapel, and a third in the chapel of St. Catharine the virgin.

KELLY (Hugh), an Irish writer, was born in 1739, and bred to the business of a staymaker, which profession he quitted in London, and became writer to an attorney. Afterwards he turned author with considerable success, and died in 1777. His works are, 1. *False Delicacy*. 2. *A Word to the Wise*. 3. *The School for Wives*. 4. *The Romance of an Hour*; Comedies. 5. *Clementina*, a tragedy. 6. *Thespis*, a poem in the manner of Churchill's *Rosciad*. 7. *Memoirs of a Magdalen*, a novel. 8. *The Bahler*, a collection of essays.

KELP. See **SALICORNIA**.

KELP. In chemistry Carbonat of Soda: a salt found to exist both in the mineral and

K E L

vegetable kingdoms of nature. When mineral it is met with either dissolved in the water of certain hot springs, as those of Carlsbad in Bohemia and Rykum in Iceland, or of certain lakes, as the natron lakes of Egypt and Hungary: or it occurs in the state of a solid salt as the fossile natron of Tripoli called Irona. In the vegetable kingdom it has been proved to exist ready formed in the *salsola soda*, and in all probability is contained in all those succulent saline plants that grow in places impregnated with muriat of soda. See **CARBONAT** and **SODA**.

KELP *Salicornia* is thrown on the rocks and shores in great abundance, and in the summer months is raked together and dried as hay in the sun and wind, and afterwards burned to the ashes called *kelp*, for the glass makers. The process of making it is thus: the rocks, which are dry at low water, are the beds of great quantities of sea-weed; which is cut, carried to the beach, and dried: a hollow is dug in the ground three or four feet wide; round its margin are laid a row of stones, on which the sea-weed is placed, and set on fire within; and quantities of this fuel being continually heaped upon the circle, there is in the centre a perpetual flame, from which a liquid like melted metal drops into the hollow beneath: when it is full, as it commonly is ere the close of day, all heterogeneous matter being removed, the kelp is wrought with iron rakes, and brought to an uniform consistence in a state of fusion. When cool, it consolidates into a heavy dark-coloured alkaline substance, which undergoes in the glass-house a second vitrification, and assumes a perfect transparency. The progress by which thus a parcel sea-weed, formerly the slimy bed of seals or dreary shelter of shell-fish, is converted into a crystal lustre for an assembly-room, or a set of glasses for his majesty's table, is a metamorphosis that might be a subject for an entertaining tale.

KELSO, a town of Scotland, in the county of Roxburg, situated on the river Tweed, at its conflux with the Tiviot, with a bridge across the Tweed, built in the year 1756, and another, either built or intended to be built, over the Tiviot. It is governed by a baron-bailly, and fifteen stent-masters; the former, and seven of the latter, appointed by the duke of Roxburg, who is lord of the manor. The office of the stent-masters is under the authority of the baron-bailie, to levy a stent, or rate, on the inhabitants, for the supply of water, repairing the streets, &c. It contains 376 houses, and about 3550 souls. There are some manufactures of flannels, linen, stockings, and shoes. During the wars between the English and the Scotch, Kelso was burned down three times by the former. In the latter end of the 17th century it was destroyed by an accidental fire, and in the middle of the last by another. At present it is a handsome town, with a large market-place, and four principal streets,

K E M

with two small ones. Here are the remains of a celebrated abbey, founded by St. David, king of Scotland, in the 12th century: forty-two English miles SSE, Edinburgh, and 338 N. London. Lon. 1. 20. W. Lat. 55. 38. N.

KELSON. See **KEELSON**.

To **KEMB**, *v. a.* [cæmhan, Saxon.] To separate or disentangle by a denticulated instrument; to comb (*Ben Johnson*).

KEMPEN, a town of Germany, in the electorate of Cologne; seated on the river Niers, 30 miles N. W. of Cologne. E. lon. 6. 30. N. lat. 51. 18.

KEMPIS (Thomas A), a pious and learned regular canon, was born at the village of Kemp, in the diocese of Cologne, in 1380; and took his name from that village. He performed his studies at Deventer, in the community of poor scholars established by Gerard Groot; and there made a great progress in the sciences. In 1399 he entered the monastery of the regular canons of Mount St. Agnes, near Zwol, of which his brother was prior. Thomas à Kempis there distinguished himself by his eminent piety, his respect for his superiors, his charity to his brother canons, and his continual application to labour and prayer. He died in 1471, aged 70. The best editions of his works, which consist of sermons, spiritual treatises, and lives of holy men, are those of Paris in 1649, and of Antwerp in 1607. The famous and well-known book *De Imitatione Christi*, which has been translated into almost all the languages of the world, though it has almost always been numbered among the works of Thomas à Kempis, is also found printed under the name of Gerson; and on the credit of some MSS. has been since ascribed to the abbot Gerson of the order of St. Benedict. This has occasioned a violent dispute between the canons of St. Augustin and the Benedictines: but while devout Christians find spiritual comfort in the work, the name of the writer is of small importance.

KEMPTER, an imperial town of Germany, in the circle of Suabia, situated on the river Iler. This town asserts that it is of greater antiquity than the imperial abbey which stands near it; and the latter again maintains that the town owes its walls and its very appearance of a town to the abbots, and was for a long time subject to them, not the least shadow of their independency appearing before the thirteenth century. In 1225, this town, for the sum of 80,000 gold guilders, purchased to itself all rights, prerogatives, profits, and perquisites, particularly all tolls and taxes, belonging to the abbey, both within and without the town; which compact received the sanction not only of the emperor Charles V. but also of all his successors, and likewise that of the see of Rome. By virtue thereof, the abbey is to build on its ground no more than what is absolutely necessary, and for its own service; and not to fortify the abbey, or raise

K E N

any structures conducive thereto; nor within a mile of the town of Kempton, to hold, or cause to be held, any market, either public or private. In the year 1633, the town was taken, sword in hand, by the imperialists, with the slaughter of at least two thirds of the burghers. Its assessment in the matricula of the diet and circle was, in the year 1683, reduced from one hundred and fifty-six florins to fifty-two. To the imperial chamber at Wetzlar it pays forty rix-dollars, fifty-four kruitzers. It has no villages, but is possessed of lands, monies, tithes, and other incomes: thirty six miles S. Augsburg, and forty-four SE. Ulm. Lon. 10. 33. E. Lat. 47. 47. N.

To **KEN**, *v. a.* (cennan, Saxon.) 1. To see at a distance; to descry (*Addison*). 2. To know: obsolete (*Gay*).

KEN, *s.* (from the verb.) view; reach of sight (*Shakspeare. Locke*).

KEN (Thomas), an excellent English bishop, was born at Berkhamstead in Hertfordshire, in 1637. He was educated at Winchester school, and then removed to New college, Oxford; where he was elected fellow, and took his degrees. About 1680 he was appointed chaplain to the princess of Orange, whom he accompanied to Holland. He afterwards attended Lord Dartmouth to Tangier, and on his return was made chaplain to Charles II. whom he visited on his death-bed, but was superseded by the Romish clergy. At this time he was made bishop of Bath and Wells, in which station his conduct was most exemplary. He opposed the designs of James to introduce popery, and was one of the seven bishops committed to the Tower for opposing the dispensing power. Yet he could not bring himself to transfer his allegiance from that monarch to William, on which account he was deprived. He then retired to the seat of lord Weymouth in Wiltshire, where he composed several pious works, and also an epic poem, entitled, Edmund. Queen Anne granted him a pension of 200l. a year. He died at Longleat in 1710. His works are in 4 v. 8vo.

KEN, a river of Scotland, which rises in the south-west part of Dumfriesshire, passes the Dalry, New Galloway, &c. in Kircudbrightshire, and joins the Dee in Kenmorr Loch.

KEN, a river of England, which rises about three miles east from Ambleside, in the county of Westmoreland, and runs into the Irish Sea, about six miles WNW. from Lancaster.

KEN, a river of England, in the county of Devon, which runs into the Ex, near its mouth.

KENDAL, a market town of Westmoreland, with a market on Saturday, and two fairs, on May 6, for horned cattle, and November 8, for horned cattle, horses, and sheep. It is so called from its situation on the river Can, or Ken, and is a large town, well built and populous, driving a consider-

able trade in the woollen manufactures, as well as in stockings, cotton, &c. It had formerly a strong castle, parts of whose walls are yet standing. It has now a large church, and twelve chapels of ease. It was made a corporation first by queen Elizabeth, and afterwards by king James I. It consists of a mayor, twelve aldermen, twelve common council-men, and a recorder. Here is a good free school, well endowed, with exhibitions to Queen's college, Oxford. This town is built in form of a cross, having two chief streets, or rather four, which meet at the middle of the town, placed at right angles.

The tradesmen are divided into companies, namely, the mercers, sheermen, cordwainers, tanners, glovers, tailors, pewterers, &c. each of which have a place to meet in, to transact what relates to each particular company. By the late inland navigation it has communication with the rivers Mersey, Dee, Ribble, Ouse, Trent, Derwent, Severn, Humber, Thames, Avon, &c. which navigation, including its windings, extends above 500 miles in the counties of Lincoln, Nottingham, York, Lancaster, Chester, Stafford, Warwick, Leicester, Oxford, Worcester, &c. Here are kept the sessions of the peace for this part of the county, called the barony of Kendal; and there is a very great market on Saturday, with all kinds of provisions and woollen yarn, which the girls bring hither in large bundles. The river here, which runs half through the town in a stony channel, abounds with trout and salmon; and on the banks of it live the dyers and tanners.

The number of inhabitants in Kendal amounted to 6892 in the year 1800: since then there has been a small increase. Kendal is 258 miles NN. W. of London.

KE'NNEL. *s.* (*chenil*, French.) 1. A cot for dogs (*Sidney*). 2. A number of dogs kept in a kennel (*Shakespeare*). 3. The hole of a fox or other beast. 4. (*kennel*, Dutch; *chenil*, French.) The watercourse of a street (*Abuthnot*).

To KE'NNEL. *v. n.* (from the noun.) To lie; to dwell: used of beasts, and of man in contempt (*L'Estrange*).

KENNEL, a place or dwelling-house for hounds; and in a metaphorical sense, the pack of hounds itself.

To make a complete kennel, three points ought indispensably to be observed; sweet air, fresh water, and the morning-sun, for which the following rules may be useful:

Let the court be large, for the more spacious it is, the better it will be for the hounds to refresh themselves in; and let it be well walled, or fenced about, to prevent their getting out, yet the walling not so high as to keep out the sun or wind.

Let the water, if possible, run through some part of the court or yard; or for want thereof, have a well with a stone trough about a foot and a half high, always kept with fresh water, so that the hounds may drink at pleasure; and at one

end of the trough let there be a hole to let out the water for cleansing it.

Let the kennel be built in the highest part of the court, in which there should be two rooms, one of them larger than the other, with a large chimney to make a fire when requisite.

This room should be raised about three feet from the ground, and in the floor there should be two gutters for the conveyance of the urine.

There should be dispersed up and down a variety of small bodsteads, raised a foot from the floor, with holes pierced through the planks for draining away their urine.

The other room is for the huntsman to keep his poles, whips, liams, medicines, and other necessaries in: there should be a copper for the boiling and dressing their food, when they come home wet and weary; at which times they should be cherished as instruments of recreation and profit, that they may delight in your service while they partake of your bounty.

For the sake of health there should be two kennels. In the winter season, if there be but one, it can be cleaned but seldom; and even then the hounds must be often comfortless, from the dampness necessarily resulting from the cleaning. Cleanliness nevertheless is so essentially necessary in every department of a kennel, that no continuance of health in the hounds, or excellence in the field, can be expected without it. These animals are innately clean; and will never, if they can avoid it, dung near where they lie. Air, fresh straw, and ample room for the occasional expansion of their weary limbs, are requisite for the invigoration of the frame, and the preservation of health. Hounds confined in a body are more liable to disease than if single, and in a state of unrestrained liberty; hence the necessity for counteraction, by every means the most prudent precaution can suggest. Hounds thus subject to disease, under the best and most judicious management, must be evidently much more so if surrounded with filth and an unventilated atmosphere.

The most renowned kennels in this kingdom were those of the late Duke of Richmond, the late Duke of Bedford, and of Sir William Rowley. The superb kennel of the Duke of Richmond is said to have cost 10,000l.; in the construction of which his grace is said to have been his own architect; to have dug his own flints, burnt his own lime, made his own bricks, and framed the wood-work in his own shops. The dog kennel stands alone, in the park; and forms a grand and striking object from the principal rooms of the mansion; the materials are flints, finished at all the angles by a light grey brick, like the Lynton white-stock.

The building is divided into five compartments; two of them 36 feet by 15, and the other three 30 by 15; these are called kennels, to which are annexed two feeding-rooms, 28 by 15. In each kennel there are openings at top, for the admission of external air when necessary, and stoves to temper the air when too cold. There are also supplies of water, and drains emptying into what is termed a stank, at a considerable depth below, full of rain-water, from the surface of which to the rise of the arch is eleven feet; so that no inconvenience arises from smell, while the whole can be occasionally cleared off by drains and dung-pits to more dependent depths, where it becomes contributory to the purposes of agriculture. Round the whole building is a pave-

K E N N E L.

ment five feet wide; airing-yards, places for breeding, and other conveniences, making a part of the building. To complete the general intention, the huntsman and whippet-in have each a part of a kitchen, and sleeping-room, appropriate to their own uses.

The Duke of Bedford's was an establishment upon a scale far too extensive for minute description, as it includes tennis-court, riding-house, &c. &c. in one stone-fronted building, of 266 feet in length; with two wings of stables, containing stalls for thirty-six hunters, and eleven loose houses for horses sick or lame. Of all this mass of building the dog-kennel, properly so called, is 405 feet long, having the boiling-house in the centre, with feeding-rooms adjoining, and a granary behind. On the right of the centre are apartments for two kennel-keepers, two long lodging-rooms for the hunting hounds, with flues running along the walls, to preserve an equal temperature in the severity of the winter season; spacious yards to each, furnished with a fountain in the middle, for the dogs to drink at; and water-cocks fixed at proper distances, to cleanse the pavement, when it may be required: adjoining to these, are seven hospitals for sick and lame hounds, with yards to each. On the left are divisions for litter, straw, &c. eleven apartments for bitches and puppies, with yards to each; eleven ditto for bitches in pup, with yards also; and a large division for bitches at heat. In the front is a large reservoir of water, which supplies the fountains, and different cocks in the several yards within. Behind the whole is a large airing-ground, flesh-house, and a variety of other conveniences. The huntsman's dwelling-house is a handsome building adjoining. The number of hunting hounds kept in the kennel are usually from sixty to seventy couple.

The kennel of Sir William Rowley is upon a much less scale than the two already described, but replete with every convenience that an establishment upon a small scale can possibly require: it is situate about half a mile from the family mansion, from the garden of which it forms a picturesque object. It is erected in a valley of the park, a spot well adapted to the purpose, being equally defended from the cutting easterly winds, and the heat of the sun in its meridian, by a thick skirting of park and forest trees. Not having the advantage of a rivulet to water the courts, that want is amply supplied by a pump, which, by means of different cocks, turns the water to every part of the premises. The hunting-kennel, or principal lodging-room, is 20 feet by 18 in the clear, 18 feet high, and paved with flag-stones. The beds, or benches, which cover almost the whole area, are admirably contrived, being lathed like bedsteads, made to fold up with joints, for the convenience of washing the floor beneath them. This room, by means of a flue of peculiar construction, is heated to any required temperature; and the hounds, after severe chases, and in wet weather, are rendered dry and comfortable in a much less time than they could be by any other method.

There is also a kennel, or lodging-room, for the young hounds, of the same dimensions, and possessing the same conveniences, except the flue, which here would have been superfluous: several small kennels for bitches in a state of breeding, as well as a proportional number for those with puppies; a paved court to the hunting-kennel; a feeding-house; one-half of which

is open, the other under cover: a paved court to the kennel for the young hounds: a pump, and stone water cisterns: a large grass-yard for airing the hounds belonging to the hunting-kennel, containing about an acre and three-quarters, in which is a variety of lime, chestnut, and other trees, forming an excellent shade during the summer season. The young hounds have a similar convenience, and have also twelve small kennels for puppies, well constructed for the purpose. The hunting-hounds generally consist of about thirty-six couple, and the whole establishment is conducted with admirable order, and reflects high credit upon its liberal and spirited owner.

Next to the choice of a judicious and convenient kennel, the management and feeding of the hounds becomes a matter of most serious consideration. The feeder should be a servant of strict sobriety, industry, and punctuality; of great humanity, and personal fidelity to his employer; as upon him in a great degree depends the health and preservation of the hounds. Mr. Beckford observes, and it is a proof of his practical knowledge and personal experience, that no part of a hunting establishment goes on so well as when the master becomes a frequent superintendant of his own concerns. He says, as the sport in the field depends on the exquisite sense of smelling so peculiar to the hound, so care should be taken to preserve it; and that cleanliness is the surest means. The keeping of the kennel sweet and clean, cannot therefore be too strongly impressed upon the mind of the feeder, who, if he seem habitually disposed to deviate from this point, is not at all calculated for the office he has undertaken.

The preparation for feeding, such as boiling the meat, mixing the meal, and getting it ready at stated hours, is a matter that the huntsman will of course take care to fulfil with punctuality; but there are other considerations, equally important and equally entitled to attention: Hounds cannot be properly fed by a single person; two at least are unavoidably necessary; and those two should be the feeder and the huntsman; as hounds should be drafted and fed according to their state of flesh and condition. Some are much more voracious than others, and will require a greater portion of food; some again look and work well, with half the quantity: the eye of the huntsman should discriminate between these descriptions; without which attention the pack will never be of equal appearance. When any of the bounds are observed to be low in flesh, off their appetites, bad feeders, or kept under by the old and master hounds, it will be matter of advantage to draft them, and let them feed under less restraint. Young and impatient feeders fall into the very common fault of feeding hounds with their meat too hot: it is a prevalent and injurious error that cannot be too soon abandoned.

Mr. Beckford is of opinion, that hounds poorer than the rest should be fed a second time; and that those which are become too fat should be drafted off, and not permitted to fill themselves. All hounds, and particularly young ones should be often called over in kennel, that their names may become familiar to them; this will teach them obedience, and is a lesson that should be especially practised at the time of feeding. The whole pack should be let out into the airing ground, to empty themselves after feeding, to

KEN

prevent an unnecessary accumulation of filth and fetid effluvia in the kennel. It is a custom with some, to shut up the hounds for two or three hours after they return from hunting, before they are fed; but it is a cruel and injurious custom; they should have their meat ready for feeding immediately on their return, and afterwards rest undisturbed upon a full stomach. Plenty of vegetables boiled in the copper with meat once a week, is the ration in most kennels. It is also customary to throw in a pound or two of sulphur, in proportion to the number, particularly in the summer season, when there is a greater tendency in the blood to morbid affections, and particularly to cutaneous diseases.

During the hot months, when hounds do not work, they require but a small proportion of substantial food, compared to what is necessary in the severity of the hunting season; flesh may then be given very sparingly, and the less it is used in the summer the better. Various opinions have been offered as to the best food for hounds in general, but experience sufficiently proves that no one kind should be exclusively adhered to; as the hounds are always in better health where an occasional change is allowed. Horse-flesh, sheep's trotters, raspings, greaves, bullocks' paunches (in a scarcity of flesh), oat-meal, and barley-meal, should constitute the principal articles; and these act much more profitably and advantageously when used in a state of nearly equal proportions, than when given separately.

Mr. Beckford says, his feeder, who was a good one, and of much experience, mixed his meal in equal quantities; that the oatmeal he boiled for half an hour, and then added the barley-meal raw, and stirred both together: his reason for boiling one and not the other, was, that boiling made the oat-meal thick, and the barley-meal thin; and hence when he fed with the barley-meal only, he never put it into the copper, but mixed it up with scalding liquor, in a tub or hog-head, kept for that purpose. Nice observation should be made upon the state of the bitches at all times; and upon the least indication of their going to heat, they should be instantly removed; a few hours delay may be the destruction of some of the best hounds in the kennel. After their return on a hunting-day, the feeder should also observe whether there be any hounds that have sustained injuries in the feet by thorns, flints, &c. in which case a fomentation of warm pot-liquor or bran and water, followed by a washing with cold vinegar, or salt and water, will generally effect a speedy cure. Hounds seriously lame, or sick, should be separated from the rest, and placed where they can be more at ease, and have better attention.

KENNET, applied to the fox in fox-hunting, is the spot to which, after his nocturnal depredations, he retires about the dawn of day. Being found by the hounds in drawing covert, he is said to be unkenneled, and the chase then begins. When safe in some burrow, or hole, below the surface, he is said to lie at earth.

KENNET (Dr. WATTS), a learned English writer, and bishop of Peterborough, in the eighteenth century, bred at St. Edmund-hall, Oxford; where he soon distinguished himself by his vigorous application to his studies, and by his translations of several books into English, and other pieces which

KEN

he published. In 1695 our author published his *Parochial Antiquities*. A sermon preached by him on the 30th of January, 1703, at Aldgate, exposed him to great clamour. It was printed under the title of *A dispassionate Inquiry into the Cause of the Civil War*. In 1706 he published a case of Impropriations, and two other tracts on the same subject. In 1708, he published the third volume of *The Complete History of England* (the two former volumes compiled by Mr. Hughes). In 1709, he published a *Vindication of the Church and Clergy of England* from some late Reproaches rudely and unjustly cast upon them; and a true Answer to Dr. Sacheverel's Sermon. When the great point in Dr. Sacheverel's trial, the change of the ministry, was gained, and very strange addresses were made upon it, there was to be an artful address from the bishop and clergy of London, and they who would not subscribe it were to be represented as enemies to the queen and the ministry. Dr. Kennet fell under this imputation. He was exposed to great odium as a low-church man, on account of his conduct and writings. In 1713, he presented the Society for propagating the Gospel with a great number of books suitable to their design; published his *Bibliothecæ Americane Primordia*, and founded an antiquarian and historical library at Peterborough. In 1715, he published a sermon, intitled *The Witchcraft of the present Rebellion*, and afterward several other pieces. In 1717, he was engaged in a dispute with Dr. William Nicholson, bishop of Carlisle, relating to some alterations in the bishop of Bangor's famous sermon; and disliked the proceedings of the Convocation against that bishop. Upon the death of Dr. Cumberland, bishop of Peterborough, he was promoted to that see, to which he was consecrated in 1718. He sat in it more than ten years, and died in 1728. He was an excellent philologist, a good preacher, whether in English or Latin, and well versed in the histories and antiquities of our nation.

KENNET (Basil), a learned English writer, and brother to the preceding, was educated at Corpus Christi College, in the University of Oxford, where he became fellow. In 1706, he went over chaplain to the English factory at Leghorn, where he met with great opposition from the Papists, and was in danger from the Inquisition. He died in the year 1714. He published *Lives of the Greek Poets*; the *Roman Antiquities*; a volume of Sermons preached at Leghorn; a translation into English of Puffendorf's *Treatise of the Law of Nature and Nations*. He was a man of most exemplary integrity, generosity, piety, and modesty.

KENNET, a river, which rises among the chalky hills in the middle of Wilts, and flows to Newbury in Berks, where it becomes navigable, and below which it is augmented by the Lamborn. It then keeps

along the southern edge of the county, till, turning up to Reading, it mingles with the Thames: Pope has celebrated this river, as

“The Kennet swift, for silver eels renown’d.”

KENNICOTT (Dr. Benjamin), well known in the learned world for his elaborate edition of the Hebrew Bible and other valuable publications, was born at Totness in Devonshire, in the year 1718. With the rank and character of his parents we are entirely unacquainted; but it is certain they were unable to satisfy that thirst for knowledge which they could not but discover in their son. Some opportunities of early improvement must, however, have been afforded him, or (which we sometimes see) the natural vigour of his mind must have superseded the necessity of them. In the year 1744 he entered at Wadham College; nor was it long before he distinguished himself in that particular branch of study in which he afterwards became so eminent. His two dissertations, on the Tree of Life, and the Oblations of Cain and Abel, came to a second edition so early as the year 1747, and procured him the singular honour of a bachelor's degree conferred on him gratis by the university a year before the statutable time. The dissertations were gratefully dedicated to those benefactors whose liberality had opened his way to the university, or whose kindness had made it a scene not only of manly labour, but of honourable friendship. With such merit and such support, he was a successful candidate for a fellowship of Exeter College; and soon after his admission into that society, he distinguished himself by the publication of several occasional sermons. In the year 1753 he laid the foundation of that stupendous monument of learned industry, at which the wise and the good will gaze with admiration, when prejudice, and envy, and ingratitude, shall be dumb. This he did by publishing his first dissertation on the state of the printed Hebrew Text, in which he proposed to overthrow the then prevailing notion of its absolute integrity. The first blow, indeed, had been struck long before, by Capellus, in his *Critica Sacra*, published after his death by his son, in 1659;—a blow which Baxter, with all his abilities and dialectical skill, was unable to ward off. But Capellus having no opportunity of consulting manuscripts, though his arguments were supported by the authority of the Samaritan Pentateuch, of parallel passages, and of the ancient versions, could never absolutely prove his point. Indeed the general opinion was, that the Hebrew manuscripts contained none, or at least very few and trifling variations from the printed text: and with respect to the Samaritan Pentateuch, very different opinions were entertained. Those who held the Hebrew verity, of course considered the Samaritan as corrupt in every sense where it differed from the Hebrew;

and those who believed the Hebrew to be incorrect, did not think the Samaritan of sufficient authority to correct it. Besides, the Samaritan itself appeared to a very great disadvantage; for no Samaritan manuscripts were then known, and the Pentateuch itself was condemned for those errors which ought rather to have been ascribed to the incorrectness of the editions. In this dissertation, therefore, Dr. Kennicott proved that there were many Hebrew manuscripts extant, which, though they had hitherto been generally supposed to agree with each other, and with the Hebrew text, yet contained many and important various readings; and that from those various readings considerable authority was derived in support of the ancient versions. He announced the existence of six Samaritan manuscripts in Oxford only, by which many errors in the printed Samaritan might be removed; and he attempted to prove, that even from the Samaritan, as it was already printed, many passages in the Hebrew might undoubtedly be corrected. This work, as it was reasonable to expect, was examined with great severity both at home and abroad. In some foreign universities the belief of the Hebrew verity, on its being attacked by Capellus, had been insisted on as an article of faith—*Ista Capelli sententia adeo non approbata fuit Fidei sociis, ut potius Helvetii theologi, et speciatim Geneveses, anno 1678, peculiari casone caverint, ne quis in ditione sua minister ecclesie recipiatur, nisi fidei publicæ, textum Hebræum, ut Mædie est in exemplaribus Masoreticis, quod consonantes et vocales, divinum et authenticum esse (Wolfii Biblioth. Heb. tom. ii. 27).* And at home this doctrine of the corrupt state of the Hebrew text was opposed by Comings and Bate, two Hutchinsonians, with as much violence as if the whole truth of the revelation were at stake.

The next three or four years of Dr. Kennicott's life were principally spent in searching out and examining Hebrew manuscripts, though he found leisure not only to preach, but to publish several occasional sermons. About this time Dr. Kennicott became one of the king's preachers at Whitehall; and in the year 1750 we find him vicar of Culham in Oxfordshire. In January 1760 he published his second dissertation on the state of the Hebrew Text; in which, after vindicating the authority and antiquity of the Samaritan Pentateuch, he disarmed the advocates for the Hebrew verity of one of their most specious arguments. They had observed, that the Chaldee Paraphrase having been made from Hebrew manuscripts near the time of Christ, its general coincidence with the present Hebrew Text must evince the agreement of this last with the manuscripts from which the paraphrase was taken. Dr. Kennicott demonstrated the fallacy of this reasoning, by showing that the Chaldee Paraphrase had been frequently

corrupted, in order to reconcile it with the printed text; and thus the weapons of his antagonists were successfully turned upon themselves. He appealed also to the writings of the Jews themselves on the subject of the Hebrew Text, and gave a compendious history of it from the close of the Hebrew canon down to the invention of printing, together with a description of 103 Hebrew manuscripts which he had discovered in England, and an account of many others preserved in various parts of Europe. A collation of the Hebrew manuscripts was now loudly called for by the most learned and enlightened of the friends of biblical criticism; and in this same year (1760) Dr. Kennicott emitted his proposals for collating all the Hebrew manuscripts prior to the invention of printing, that could be found in Great Britain and Ireland, and for procuring at the same time as many collations of foreign manuscripts of note as the time and money he should receive would permit. His first subscribers were, the learned and pious Archbishop Secker, and the delegates of the Oxford press, who, with that liberality which has generally marked their character, gave him an annual subscription of 40*l*. In the first year the money received was about 500 guineas; in the next it rose to 800, at which sum it continued stationary till the tenth year, when it amounted to 1000. During the progress of the work the industry of our author was rewarded by a canonry of Christ Church. He was also presented, though we know not exactly when, to the valuable living of Mynhenyote, in Cornwall, on the nomination of the Chapter of Exeter. In 1776 the first volume was published, and in 1780 the whole was completed. If now we consider that above 600 manuscripts were collated, and the whole work occupied 20 years of Dr. Kennicott's life, it must be owned that sacred criticism is more indebted to him than to any scholar of any age. Within two years of his death, he resigned his living in Cornwall, from conscientious motives, on account of his not having a prospect of ever again being able to visit his parish. Although many good and conscientious men may justly think, in this case, that his professional labours carried on elsewhere might properly have entitled him to retain this preferment, and may apply this reasoning in other cases; yet a conduct so signally disinterested deserves certainly to be admired and celebrated. Dr. Kennicott died at Oxford, after a lingering illness, September 18, 1783; and left a widow, who was sister to the late Edward Chamberlayne, Esq. of the treasury. At the time of his death he was employed in printing Remarks on Select Passages in the Old Testament, which were afterwards published, the volume having been completed from his papers.

KENNINGTON, a village of Surrey, in the parish of Lambeth. Here is a barn,

called the Long Barn, the remains of a royal palace, which was the residence, in particular of Edward the Black Prince. Kennington Common is the place of execution for the county of Surry.

KENO. See **KINO**.

KENRICK (William), an English writer, was born at Watford in Hertfordshire, and bred to the business of a rule-maker, which profession he abandoned for that of literature. To improve himself he went to Leyden, and afterwards settled in London, where he published, in 1759, Epistles, philosophical and moral, in verse. In 1766 appeared his comedy of Falstaff's Wedding, which, it must be admitted, is an admirable imitation of Shakspeare. He was for some time a writer in the Monthly Review, but having had a difference with the principal, he set up another, called The London Review, by way of opposition. He was also the first editor of the Morning Chronicle; but here, on account of some squabble, he broke off his engagement, and commenced a newspaper of his own. He translated Rousseaue's Emilius and Eloisa, and other works, from the French, and published several original pieces. He died in 1777.

KENSINGTON, a village of England, in which is a royal palace, purchased by William III. of the Earl of Nottingham, and greatly improved by the queens Mary, Anne, and Caroline. It bears no external marks of magnificence, though some of the apartments are grand, and furnished with a few good paintings by capital masters. Genteel families reside there by permission of the king. The gardens are upwards of three miles in circumference: two miles west of London.

KENSINGTON, a town of United America in the state of New Hampshire: 13 miles S. W. of Portsmouth.

KENT, a county of England, bounded on the north by the Thames and the German Ocean, on the east and south east by that ocean and the straits of Dover, on the south by Sussex and the English Channel, and on the west by Surrey. From east to west it is 58 miles, and from north to south 36. It is divided into five lathes, containing 61 hundreds, two cities, 29 market-towns, and 408 parishes; and sends 14 members to parliament. It contains about 1,248,000 acres of land; and in 1801 had 307,624 inhabitants, of whom nearly 77,000 were capable of bearing arms. In the soil and face of the country there is a great diversity. The banks of the Thames are low and marshy, but backed by a range of chalky eminences, sometimes rising to a moderate height. This kind of hard chalky soil, inclining to barrenness, extends to the north east extremity of the county, and thence round to Dover, exhibiting its nature in the lofty white cliffs, which here bound the island, and produce that striking appearance at sea which gave it the name of Albion. The south part of

Kent, called the Weald, is a flat, woody tract, of a clayey soil; fertile, but unwholesome on account of its moisture. The midland and western districts are a mixture of hill and vale, arable and pasture, equal in pleasantness to any part of England. This county produces, beside the usual objects of agriculture, large quantities of hops; fruit of various kinds, especially cherries and apples, of which there are large orchards for the London markets; madder for dyeing; timber in the woody parts; and birch twigs, for brooms, which form no inconsiderable article of commerce for the metropolis. The country inland from Dover, consisting chiefly of open downs, is excellent for the feeding of sheep, and many bullocks are fattened to an extraordinary size in Romney Marsh. The principal rivers, beside the Thames, are the Medway, Darent, Stour, Cray, and Rother. Maidstone is the county town. The hop-grounds of the parishes between Sandwich and Canterbury are those which produce the fine East Kent hops, so much sought after by the London brewers. But the principal hop-plantations are about Canterbury and Maidstone. In the neighbourhood of Maidstone are a great number of small fields, of from one to ten acres, and somewhat more, planted with fruit of different kinds, cherries, apples, and filberts, for which the rocky soil of the neighbourhood seems particularly adapted. The western part of this county consists of a great variety of soils and systems of management. It is much more enclosed than the eastern part, and produces more timber and underwood. The cities of Kent are Canterbury and Rochester. The towns are Maidstone, Dover, Romney, Sandwich, Hithe, Queenborough, Chatham, Woolwich, Greenwich, Deal, Tunbridge, Folkstone, Gravesend, Ashford, Dartford, Appledore, Cranbrook, Eltham, Bromley, Sevenoaks, Wye, Tenterden, Smarden, Goudhurst, Lenham, Malling, Lydd, Margate, Wrotham, Ramsgate, Elham, Milton, Faversham, West-erham, Deptford, Sittingburn, Northfleet, Crayford, and Folkingham. Two members are returned for each of the first eight, and four for the county.

Kent, a county of United America, in the state of Rhode Island.

Kent, a county of United America, in the state of Delaware.

Kent, a county of United America, in the state of Maryland.

KENTISH-TOWN, a village of Middlesex, three miles north of London, near Hampstead, much improved of late by several handsome houses belonging to the citizens of London, &c.

KENTAIFFA MOUNTAINS, a ridge of mountains, in the south part of Tibet, bordering on Hindostan Proper. On the west side of this ridge are the two heads of the Ganges, and from its east side issues the Burrametree.

KENTUCKY, one of the United States of America, bounded by Great Sandy Creek on the north, by the Ohio on the north west, by N Carolina on the south, and by the Cumberland mountain on the east. It is upwards of 250 miles in length, and 200 in breadth, and is divided into fourteen counties, Lincoln, Fayette, Bourbon, Mercer, Jefferson, Nelson, Maddison, Woodford, Mason, Washington, Clark, Scott, Logan, and Franklin. It contains 73,677 inhabitants, of whom 12,430 are slaves. The principal rivers are the Ohio, Kentucky, Licking River, Red River, Elkhorn, Dick's River, Green River, Cumberland River, and Great Kenhaway or New River. These are all navigable for boats almost to their sources, without rapids, for the greatest part of the year. The soil is amazingly fertile, and scarcely any such thing as a marsh or swamp is to be found. The air is more temperate and healthy than the other settled parts of America; and snow seldom falls deep or lies long. The country, in general, may be considered as well-timbered, producing large trees of many kinds, and to be exceeded by no country in variety. Those which are peculiar to Kentucky are the sugar-tree, which grows in great plenty, and furnishes excellent sugar; and the honey-locust, which is surrounded by large thorny spikes, bearing broad and long pods in form of peas, has a sweet taste, and makes excellent beer. Here are also the coffee-tree, the papwa, cucumber, black mulberry, wild cherry, buckeye, and some other kinds of trees not common elsewhere. Here is great plenty of fine cane, on which the cattle feed, and grow fat: it grows from three to twelve feet high, with joints at eight or ten inches distance along the stalk, from which proceed leaves resembling those of the willow. Where no cane grows, there is abundance of wild rye, clover, and buffalo-grass, covering vast tracts of country, and affording excellent food for cattle. The fields are covered with abundance of herbage not common to other countries; and all the year, excepting the winter months, the plains and vallies are adorned with variety of flowers. Iron ore and lead are found in abundance; and there are many large caves, some of which extend several miles under a fine lime-stone rock, supported by curious arches and pillars. The waters produce plenty of fish and fowl, and especially on the Ohio, the geese and ducks are amazingly numerous. The land fowls are turkies; a species of grouse, which the inhabitants call pheasants; and quails, to which they give the name of partridges. Serpents are not numerous, and are such as are to be found in other parts of the continent, except the bull, the horned, and the mockason snakes. Among the native animals is the buffalo, whose flesh is excellent meat; and there are still to be found many deer, elks, and beavers. Here are also panthers, wild cats, wolves, hawks, otters, minks,

foxes, rabbits, squirrels, racoons, ground hogs, pole-cats, and opossums. Most of the species of the domestic quadrupeds have been introduced since the settlement, such as horses, cows, sheep, and hogs. Lexington is the capital.

KENTUCKY, a river of North America, which rises with three heads from a mountainous part of the country of the same name. Its north branch, which interlocks with Cumberland River, falls into the Ohio in lat. 38. 27. N. It is amazingly crooked for upward of 200 miles in length; and its banks may rather be called precipices, for, almost every where they consist of three or four hundred feet of a solid perpendicular limestone rock; in some parts of a fine white marble, curiously arched, pillared, or blocked up into fine building stones. It is only at particular places that this river can be crossed, the best of which is near Loestown.

KEPLER (John), a very eminent astronomer and mathematician, was born at Wîel, in the county of Wirtemberg, in 1571. He was the disciple of Mæstlinus, a learned mathematician and astronomer, of whom he learnt those sciences, and became afterwards professor of them to three successive emperors, viz. Matthias, Rudolphus, and Ferdinand the 2nd.

To this sagacious philosopher we owe the first discovery of the great laws of the planetary motions, viz. that the planets describe areas that are always proportional to the times; that they move in elliptical orbits, having the sun in one focus; and that the squares of their periodic times, are proportional to the cubes of their mean distances; which are now generally known by the name of Kepler's Laws. But as this great man stands as it were at the head of the modern reformed astronomy, he is highly deserving of a pretty large account, which we shall extract chiefly from the words of that great mathematician Mr. Mac-laurin.

Kepler had a particular passion for finding analogies and harmonies in nature, after the manner of the Pythagoreans and Platonists; and to this disposition we owe such valuable discoveries, as are more than sufficient to excuse his conceits. Three things, he tells us, he anxiously sought to find out the reason of, from his early youth; viz. Why the planets were six in number? Why the dimensions of their orbits were such as Copernicus had described from observations? And what was the analogy or law of their revolutions? He sought for the reason of the two first of these, in the properties of numbers and plane figures, without success. But at length reflecting, that while the plane regular figures may be infinite in number, the regular solids are only five, as Euclid had long ago demonstrated: he imagined, that certain mysteries in nature might correspond with this remarkable limitation inherent in the essences of things; and the rather, as he found that the Pythagoreans had made great use of those five regular solids in their philosophy. He therefore endeavoured to find some relation between the dimensions of these solids and the intervals of the planetary spheres; thus, imagining that a cube, inscribed in the sphere of Saturn, would touch by its six planes the sphere of Jupiter; and that the other four regular solids in like manner filled the intervals that are between the spheres of

the other planets: he became persuaded that this was the true reason why the primary planets were precisely six in number, and that the author of the world had determined their distances from the sun, the centre of the system, from a regard to this analogy. Being thus possessed, as he thought, of the grand secret of the Pythagoreans, and greatly pleased with his discovery, he published it in 1596, under the title of *Mysterium Cosmographicum*; and was for some time so charmed with it, that he said he would not relinquish the honour of having invented what was contained in that book, for the electorate of Saxony.

Kepler sent a copy of this book to Tycho Brahe, who did not approve of those abstract speculations concerning the system of the world, but wrote to Kepler, first to lay a solid foundation in observations, and then, by ascending from them, to endeavour to come at the causes of things: Tycho however, pleased with his genius, was very desirous of having Kepler with him to assist him in his labours: and having settled, under the protection of the emperor, in Bohemia, where he passed the last years of his life, after having left his native country on some ill usage, he prevailed upon Kepler to leave the university of Gratz, and remove into Bohemia with his family and library, in the year 1600. But Tycho dying the next year, the arranging the observations devolved upon Kepler, and from that time he had the title of mathematician to the emperor all his life, and gained continually more and more reputation by his works. The emperor Rudolph ordered him to finish the tables of Tycho Brahe, which were to be called the Rudolphine Tables. Kepler applied diligently to the work: but unhappy are those learned men who depend upon the good humour of the intendants of the finances; the treasurers were so ill affected towards our author, that he could not publish these tables till 1627. He died at Ratisbon in 1630, where he was soliciting the payment of the arrears of his pension.

Kepler made many important discoveries from Tycho's observations, as well as his own. He found, that astronomers had erred, from the first rise of the science, in ascribing always circular orbits and uniform motions to the planets; that, on the contrary, each of them moves in an ellipse which has one of its foci in the sun: that the motion of each is really unequable, and varies so, that a ray supposed to be always drawn from the planet to the sun describes equal areas in equal times.

It was some years later before he discovered the analogy there is between the distances of the several planets from the sun, and the periods in which they complete their revolutions. He easily saw, that the higher planets not only moved in greater circles, but also more slowly than the nearer ones; so that, on a double account, their periodic times were greater. Saturn for example, revolves at a distance from the sun nine times and a half greater than the earth's distance from it; and the circle described by Saturn is in the same proportion: but as the earth revolves in one year, so, if their velocities were equal, Saturn ought to revolve in nine years and a half; whereas the periodic time of Saturn is about 30 years. The periodic times of the planets increase, therefore, in a greater proportion than their distances from the sun: but yet not in so great a proportion as the squares of those distances; for

K E P L E R.

if that were the law of the motions (the square of time and a half being 904), the periodic time of Saturn ought to be above 90 years: A mean proportion between that of the distances of the planets, and that of the squares of those distances, is the true proportion of the periodic times; as the mean distance between the sun and a half and its square 904 gives the periodic time of Saturn to years. Kepler, who had committed several mistakes in determining this analogy, hit upon it at last, May the 15th, 1618; for he is so particular as to mention the precise day when he found that "the squares of the periodic times were always in the same proportion as the cubes of their mean distances from the sun."

When Kepler saw, according to better observations, that his disposition of the five regular solids among the planetary spheres was not agreeable to the intervals between their orbits, he endeavoured to discover other schemes of harmony. For this purpose, he compared the motions of the same planet at its greatest and least distances, and of the different planets in their several orbits, as they would appear viewed from the sun; and here he fancied that he found a similitude to the divisions of the octave in music. These were the dreams of this ingenious man, which he was so fond of, that, hearing of the discovery of four new planets (the satellites of Jupiter) by Galileo, he owns that his first reflections were from a concern how he could save his favourite scheme, which was threatened by this addition to the number of the planets. The same attachment led him into a wrong judgment concerning the sphere of the fixed stars: for, being obliged, by his doctrine, to allow a vast superiority to the sun in the universe, he restrains the fixed stars within very narrow limits. Nor did he consider them as suns, placed in the centres of their several systems, having planets revolving round them, as the other followers of Copernicus have concluded them to be, from their having light in themselves, from their immense distances, and from the analogy of nature. Not contented with these harmonies, which he had learned from the observations of Tycho, he gave himself the liberty to imagine several other analogies, that have no foundation in nature, and are overthrown by the best observations. Thus from the opinions of Kepler, though most justly admired, we are taught the danger of espousing principles, or hypotheses, borrowed from the abstract sciences, and of applying them with such freedom to natural inquiries.

Kepler's great sagacity, and continual meditations on the planetary motions, suggested to him some views of the true principles from which these motions flow. In his preface to the Commentaries concerning the planet Mars, he speaks of gravity as of a power that was mutual between bodies, and tells us, that the earth and moon tend towards each other, and would meet in a point, so many times nearer to the earth than to the moon, as the earth is greater than the moon, if their motions did not hinder it. He adds, that the tides arise from the gravity of the waters towards the moon. But not having notions sufficiently just of the laws of motion, it seems he was not able to make the best use of these thoughts; nor does it appear that he adhered to them steadily, since in his Epitome of Astronomy, published many years after, he proposes a physical account of the planetary motions, derived from different principles.

He supposes, in that treatise, that the motion of the sun on his axis, is preserved by some inherent vital principle; that a certain virtue, or immaterial image of the sun, is diffused with his rays into the ambient spaces, and, revolving with the body of the sun on his axis, takes hold of the planets, and carries them along with it in the same direction, like as a loadstone turned round near a magnetic needle, makes it turn round at the same time. The planet according to him, by its inertia, endeavours to continue in its place, and the action of the sun's image and this inertia are in a perpetual struggle. He adds, that this action of the sun, like his light, decreases as the distance increases; and therefore moves the same planet with greater celerity when nearer the sun, than at a greater distance. To account for the planet's approaching towards the sun as it descends from the aphelion to the perihelion, and receding from the sun while it ascends to the aphelion again, he supposes that the sun attracts one part of each planet, and repels the opposite part; and that the part attracted is turned towards the sun in the descent, and the other towards the sun in the ascent. By suppositions of this kind he endeavours to account for all the other varieties of the celestial motions.

But, now that the laws of motion are better known than in Kepler's time, it is easy to shew the fallacy of every part of this account of the planetary motions. The planet does not endeavour to stop in consequence of its inertia, but to persevere in its motion in a right line. An attractive force makes it descend from the aphelion to the perihelion in a curve concave towards the sun; but the repelling force, which he supposed to begin at the perihelion, would cause it to ascend in a figure convex towards the sun. There will be occasion to shew afterwards, from Sir Isaac Newton, how an attraction or gravitation towards the sun, alone produces the effects, which, according to Kepler required both an attractive and repelling force; and that the virtue which he ascribed to the sun's image, propagated into the planetary regions, is unnecessary, as it could be of no use for this effect, though it were admitted. For now his own prophecy, with which he concludes his book, is verified; where he tells us, that "the discovery of such things was reserved for the succeeding ages, when the author of nature would be pleased to reveal these mysteries."

The works of this celebrated author are many and valuable; as, 1. His *Cosmographical Mystery*, in 1596. 2. *Optical Astronomy*, in 1604. 3. *Account of a New Star in Sagittarius*, 1605. 4. *New Astronomy; or, Celestial Physics*, in *Commentaries on the planet Mars*. 5. *Dissertations; with the Nuncius Siderius of Galileo*, 1610. 6. *New Gauging of Wine Casks*, 1615. Said to be written on occasion of an erroneous measurement of the wine at his marriage by the revenue officer. 7. *New Ephemerides*, from 1617 to 1620. 8. *Copernican System*, three first books of the, 1618. 9. *Harmony of the world*; and three books of *Comets*, 1619. 10. *Cosmographical Mystery*, 2d edition, with Notes, 1621. 11. *Copernican Astronomy*; the three last books, 1622. 12. *Logarithms*, 1624; and the Supplement in 1625. 13. His *Astronomical Tables*, called the *Rudolphine Tables*, in honour of the emperor Rudolphus, his great and learned patron, in 1627. 14. *Epitome of the Copernican Astronomy*, 1630. Beside these, he wrote several

K E R

pieces on various other branches, as Chronology, Geometry of Solids, Trigonometry, and an excellent treatise of Dioptrics, for that time.

A very interesting account of the Astronomical Discoveries of Kepler was published in 1804, by the late Dr. Small of Dundee.

KEPLER'S *Laws*, are those laws of the planetary motions discovered by Kepler. These discoveries in the mundane system, are commonly accounted two, viz. 1st, That the planets describe about the sun, areas that are proportional to the times in which they are described, namely, by a line connecting the sun and planet; and 2d, That the squares of the times of revolution, are as the cubes of the mean distances of the planets from the sun. Kepler discovered also that the orbits of the planets are elliptical.

These discoveries of Kepler, however, were only found out by many trials, in searching among a great number of astronomical observations and revolutions, what rules and laws were found to obtain. On the other hand, Newton has demonstrated, a priori, all these laws, shewing that they must obtain in the mundane system, from the laws of gravitation and centripetal force; viz. the first of these laws resulting from a centripetal force urging the planets towards the sun, and from the centripetal force being in an inverse ratio of the square of the distance. And the elliptic form of the orbits, from a projectile force regulated by a centripetal one.

KEPLER'S *Problem*, is the determining the true from the mean anomaly of a planet, or the determining its place, in its elliptic orbit, answering to any given time; and so named from the celebrated astronomer Kepler, who first proposed it. See *ANOMALY*.

The general state of the problem is this: to find the position of a right line, which, passing through one of the foci of an ellipsis, shall cut off an area which shall be in any given proportion to the whole area of the ellipsis; which results from this property, that such a line sweeps areas that are proportional to the times.

Many solutions have been given of this problem, some direct and geometrical, others not. viz. by Kepler, Bulliald, Ward, Newton, Keill, Machin, &c. See *Newton's Princip.* lib. 1. prop. 31, *Keill's Astron. Lect.* 23, *Philos. Trans.* abr. vol. 8. p. 73. *Hellins in Phil. Trans.* and *Ivory in the Edinburgh Transactions*.

KE'PT. The pret. and part. pass. of *keep*.

KERA'NA. The name of a wind instrument forming a kind of long trumpet, much used by the Persians. Every evening at sun-set, and two hours after midnight, they sound the Kerana, together with hautboys, timbrels, drums, and other instruments.

KERATOPHYTUM. See *GORGONIA*.

KERCHE'IF. *s.* (*courchief*, Chaucer; *couvre*, to cover, and *chief*, the head.) 1. A head-dress (*Shakspeare*). 2. Any loose cloth used in dress (*Hayward*).

KERCHE'IFED. } *a.* (from *kerchief*.)

KERCHE'IFT. } Dressed; hooded (*Mil.*)

KERCOLANG, an island of Asia, in the Indian Ocean. It is between 80 and 100 miles in circumference, and, in general, of a very good height. The face of the country seems to be steep hills and extensive valleys, and every part to be covered with trees and verdure, with some pleasant cul-

K E R

tivated grounds. The houses stand on posts, and appear to be well-built, and neatly thatched. Their fishing-hooks and lines are mostly European; and the inhabitants are Malays. Their clothing, in general, is made of a coarse kind of calico, though some wear silk. Many of them have a kind of turban on their head; and a few have been seen with Chinese pointed hat. They are a mild and apparently quiet people: and the confidence they put in strangers proves that the latter are not unwelcome guests. Lon. 126. 31. E. Lat. 4. 28. N.

KERF. *s.* (*ceopran*, Saxon, to cut.) The sawnaway slit between two pieces of stuff (*Moxon*).

KERGUELEN'S *Land*, an island in the Southern Ocean, visited by Captain Cook in 1779. From its sterility, it might properly have been called the Island of Desolation: but Captain Cook was unwilling to rob M. Kerguelen of the honour of its bearing his name. Mr. Anderson, who accompanied Captain Cook in this voyage, says, that no place hitherto discovered in either hemisphere affords so scanty a field for the naturalist as this spot. Some verdure indeed appeared, when at a small distance from the shore, which might raise the expectation of meeting with a little herbage; but all this lively appearance was occasioned by one small plant, resembling saxifrage, which grew upon the hills in large spreading tufts, on a kind of rotten turf, which, if dried, might serve for fuel, and was the only thing seen here that could possibly be applied to that purpose. Lon. 69. 37. E. Lat. 40. 3. S.

KERI-CETIB are various readings in the Hebrew Bible: *keri* signifies that which is read: and *cetib* that which is written. For where any such various readings occur, the wrong reading is written in the text, and that is called the *cetib*; and the true reading is written in the margin with *p* under it, and called the *keri*. It is generally said by the Jewish writers, that these corrections were introduced by Ezra; but it is most probable that they had their original from the mistakes of the transcribers after the time of Ezra, and the observations and corrections of the Masorites. Those Keri-cetibs which are in the sacred books written by Ezra himself, or which were taken into the canon after his time, could not have been noticed by Ezra himself; and this affords a presumption, that the others are of late date. These words amount to about 1000; and Dr. Kennicott, in his *Dissertatio Generalis*, remarks, that all of them, excepting fourteen, have been found in the text of manuscripts.

KERMAN, a province of Persia, lying on the gulph of Persia. Here are sheep, which after grazing from January to May, have their fleeces full off their back, and become as naked as sucking pigs; and the inhabitants drive a great trade in their wool. Kerman is the capital.

K E R

KERMAH, a town of Persia, capital of a province of the same name. It is 120 miles north of Bombay. Lon. 57. 35. E. Lat. 29. 40. N.

KERMES, (*Kermes*, from *chermah*, Arab.) *Gramm. tinctorium*. *Coccus baphica*. Round reddish grain, about the size of peas, found in Spain, Italy, and the south of France, adhering to the branches of the scarlet oak. They are the nidus of a minute red animalcule, called *Coccus ilicis* of Linnæus. The *confectio alkermes*, now obsolete, was prepared with these, and possessed corroborant and adstringent virtues. See **KERMES**.

KERMES Oak, in botany. See **QUERCUS**.

KERMES Mineral, in the medical vocabulary, the *coccus ilicis* R. C.; which appears to be that used by all ancient nations; and Professor Tyschen even supposes it was known to Moses under the name of *tola*. It was employed for giving the ground to clothes intended to be dyed with the rich purple. To the Greeks and Romans it was known by the name of *coccum squarulinum*, *coccus bapcticus* or *baptica*, *insectorius*, *grana tinctorium*; and the preference was given to that collected in Galatia and Armenia. It therefore appears to have been one of the most ancient of all the dyeing drugs, and that which produces the colour called *coccus* by the Romans, and originally known in England by the name of scarlet.

Kermeh, or *kermes*; its Arabic name, imports a little worm; whence the terms *carmine*, *cramousi*, and *crimson*: for carmine was formerly prepared from the kermes, or *coccus ilicis*, though now more generally obtained from the *coccus cacti*, or modern cochineal. From the Latin term *coccus* arose this Spanish diminutive, which is equally applicable to both the above insects, though in the present day more generally appropriated to the *coccus* of the opuntia, cactus, or nopal. In the middle ages the kermes was denominated *vermiculum* (little worm), whence *vermeil*, or *vermilion*, although these terms are now transferred to pulverized cinnabar; from an animal to a mineral red.

For the etymology of the kermes, see **COCCUS**.

It is the female alone, and in her impregnated state that forms the true kermes; as it is the female cochineal insect alone in her impregnated state that forms the true cochineal. In this state she becomes extremely sluggish, and pertinaciously adheres to the leaves of the quercus ilicis, or holm-oak. At this period she loses the form of an insect, and appears like a small roundish grain, about the size of a pea, of a reddish brown colour, in which is inclosed a very great quantity of eggs of a deeper red colour. From this peculiar form the kermes was, for a long time, taken for the seeds, or an excrescence of the tree on which it lived; whence these seeds were called *grana* of kermes. It is now known to have ad-

K E R

hered to the common opinion, although he supposes that the protuberance, be it what it might, would ultimately produce a worm "*coccum ilicis celerrime in vermiculum se mutan.*"

The first who has spoken of this insect with any precision is Peter de Quinquernan, Bishop of Senez, in a work entitled *De Laudibus Provinciæ*, published in 1550. Its history may likewise be seen written by Nissolle, in the *Mem. del Acad. des Sciences* for 1714, and more particularly in the *Mémoires des Insectes de Reaumer*, tom. iv.

The kermes is fixed to the bark of the shrub by a cottony down, the production of the insect. Chaptal has observed that this down, as well as that afforded by all other insects of this genus, possesses several characters of the caoutchouc, or Indian rubber; that it is insoluble in alcohol; that it melts at a boiling heat, and that it burns on the coals with a flame.

According to the manner of collecting this insect, we are informed by Berthollet, to whom Chaptal sent the account, that a single person is able to gather one or two pounds per day. They begin to collect towards the middle of the month of May, when the insect has attained its ordinary size; and the harvest continues till the middle of June, and sometimes longer. They are generally collected by women. At the beginning, from the juice of the fresh kermes weighing heavier than at the end, when it is drier and light, it only sells for 15 or 20 sous per pound, whilst when the harvest is nearly over, it fetches from 30 to 40. Those who buy it are obliged, as soon as possible, to prevent the hatching of the eggs. In order, therefore, to destroy the young, they steep the kermes for ten or twelve hours in vinegar, or expose it to the vapours, which only takes up half an hour. It is then dried on linen cloths. This process gives it a vinous red colour.

According to Lewis and Berthollet, fresh kermes, or the living insects, by expression afford a red juice, which has rather an agreeable odour, and a somewhat bitter, rough and pungent taste. In its dried state, it imparts the same odour and flavour to watery and spiritous liquors, to which it communicates its deep red colour. The extracts obtained from their tinctures by inspissation, retain their colour and lose very little of their savour, but the aqueous extract loses all its smell. The mordants for this colouring matter of kermes are alum and tartar. In order to prepare the wool for the kermes dye, it is to be boiled in water with about one-fifth its weight of alum, and half as much tartar, for two hours, and then left in the same liquor for four or five days; when being rinsed, it is dyed in the usual way, with about 12 ounces of kermes for every pound of wool. These scarlets were called grain-colours, from the insect being mistaken for a grain, and Venice

scarlet, from being chiefly manufactured at Venice. Wool prepared with a nitro muriatic solution of tin (as is done for the cochineal scarlet) and dyed with kermes, takes a kind of aurora or reddish-orange colour. The red colour that kermes communicates to wool has less splendour than the scarlet of the cochineal; which last has been generally preferred to it, since the art has been known of using the solution of tin. But although the kermes red or scarlet is less vivid, it is more durable than that of cochineal, and much less liable to be changed by soap, acid, mud, &c.; hence grease spots may be effaced without changing it. The fine blood reds seen at this time on old tapestries in different parts of Europe, as for instance, those at Brussels observed by Hellot, and at the other manufactories of Flanders, were all dyed from kermes with the aluminous basis on woollen yarn, and they are still unfaded, having scarcely lost any of their liveliness; although many of them have stood between two and three hundred years. From the solidity of this dye, it is to be regretted that it is abandoned by the dyers, some indeed mix a small quantity of it with the cochineal, as it gives a greater body to the colour; but it diminishes its bloom. According to Berthollet, the colour produced by half kermes and half madder is called scarlet in half grain: this mixture affords a very permanent dye, but is not lively; and inclines a little to the blood red. The turbans manufactured at Orleans for the Levant are said to be dyed in this way; although a little Brasil wood is probably added. Dyers have only been able to give silk with kermes a dull reddish colour. According to Bancroft, cotton prepared with the aluminous mordant, and dyed with kermes, exhibits a fine red, inclining to the crimson shade; but this will gradually though slowly discharge, and the colour be weakened in washing. This chemist is in hopes of succeeding in fixing the colour of kermes more permanently on cotton.

KERN. *s.* (Irish.) Irish foot-soldier; an Irish boor (*Philips*).

KERN *s.* A handmill consisting of two pieces of stone, by which corn is ground.

To KERN. *v. a.* (probably from kernel) 1. To harden as ripened corn (*Curew*). 2. To take the form of grains; to granulate (*Grew*).

KE'RNEL. *s.* (cýnnel, a gland, Saxon.) 1. The edible substance contained in a shell. 2. Any thing included in a hùsk or integument (*Denham*). 3. The seed of pulpy fruits (*Bacon*). 4. The central part of any thing upon which the ambient strata are concreted (*Arbutnoot*). 5. Knobby concretions in children's flesh.

To KE'RNEL. *v. n.* (from the noun.) To ripen to kernels (*Mortimer*).

KE'RNELLY. *a.* (from *kernel*.) Full of kernels; having the quality or resemblance of kernels.

KERNELWORT, in botany. See *SCROBULARIA VULGARIS*.

KERRY, a county of Ireland, in the province of Munster, 57 miles long and 45 broad;

bounded on the E. by the counties of Limerick and Cork, on the W. by the Atlantic Ocean, on the N. by the Shannon, which separates it from Thomond, and on the S. by Desmond and the ocean. It is a mountainous country, but in many places are good corn-fields. It contains 84 parishes, and sends eight members to parliament. Ardserf is the capital.

KERSEY, a kind of coarse woollen cloth, made chiefly in Kent and Devonshire.

KERSEYMERE, a finer kind of woollen cloth, principally used in making waistcoats and breeches.

KERTSCH, a fortress, situate on the E. coast of the Crimea, near the N. entrance of the straits of Caffa. This fortress, and that of Yenikale, are of the greatest importance, as they command the passage which forms the communication between the sea of Asoph and the Black Sea.

KESITAH. This word is to be met with in Genesis and in Job, and is translated in the Septuagint and Vulgate, sheep or lambs. But the Rabbins and modern interpreters are generally of opinion, that *kesitah* signifies rather a piece of money. Bochart and Eugubinus are of opinion the Septuagint meant *mina*, and not lambs; in Greek *hecatominon*, *ἑκατομνιον*, instead of *ταύτα αμνών*. Now a *mina* was worth 60 Hebrew shekels, and consequently 6l. 6s. 10d. sterling. M. de Pelletier of Rouen is of opinion, that *kesitah* was a Persian coin, stamped on one side with an archer (*kesitah* or *keseth* in Hebrew signifying a bow), and on the other with a lamb.

KESSEL (John van), an eminent painter, born at Antwerp in 1626. He became exceedingly famous as a painter of flowers, birds, and insects, which he executed according to the different seasons of the year. His pieces of this kind are very scarce and dear. He was also eminent in portrait painting, and his manner very much resembled that of Vandyck.

KESSEL (Ferdinand van), the son of the above, born at Breda in 1660. He painted in the same line as his father, though not equal to him. John Sobieski king of Poland gave him apartments in his palace.

KESSEL (N. van), nephew of the last-mentioned, was born at Antwerp in 1684. He painted conversations in the style of Teniers, with great life and humour. He inherited his uncle's fortune, which he dissipated in extravagance, and died in poverty.

KESSEL, a town of Prussian Guelderland, with a handsome castle, seated on the Maese, between Ruremond and Venlo. Lon. 5. 49 E. Lat. 51. 16 N.

KESSELDORF, a village of Upper Saxony, three miles below Dresden, remarkable for a victory gained by the king of Prussia over the Saxons in 1745.

KEST. The preterit tense of *cast* (*Fairfax*).

KESTEVEN, one of the three divisions of Lincolnshire, containing the W. part of the county, from the middle to the S. extremity. Part of the town of Lincolnshire are in this division.

K E T

fact; the air of which, however, is more salubrious than that of the district of Holland: and the soil is more fruitful.

KESTRIL, in ornithology. See **FALCO**.

KESWICK, a town in Cumberland, with a market on Saturday; seated in a vale surrounded by hills, near the rapid river Greeta, 25 miles N.W. of Kendal, and 287 N.N.W. of London. Lon. 3. 16 W. Lat. 58. 35 N.

KESWICK, (Vale of), a delightful spot in the southern part of Cumberland, lately much visited by the admirers of nature. Here is the lake of Keswick, or, more properly, the lake of Derwent-water. To the N. of this romantic piece of water soars the lofty mountain Skiddaw, one of the most distinguished in England, and the haunt of eagles and other birds of prey. To the S. is the dreary region of Borrowdale. The water of the Derwent-water is subject to violent agitations, and often without any apparent cause. It has one peculiar characteristic; namely, that it retains its form, viewed from any point, and never assumes the appearance of a river.

KETCH, a vessel equipped with two masts, viz. the main-mast and the mizen-mast, and usually from 100 to 250 tons burthen. Ketches are principally used as yachts for conveying princes of the blood, ambassadors, or other great personages, from one place to another. Ketches are likewise used as bomb vessels, and are therefore furnished with all the apparatus necessary for a vigorous bombardment.

KETCHES (Bomb), are built remarkably strong, as being fitted with a greater number of riders than any other vessel of war; and indeed this reinforcement is absolutely necessary to sustain the violent shock produced by the discharge of their mortars, which would otherwise in a very short time shatter them to pieces.

KETTERING, a town of Northamptonshire, with a market on Friday. It is pleasantly seated on an ascent, and is a pretty good place, with a session-house for the justices, where they sometimes meet. It is 12 miles N. E. of Northampton, and 75 N.W. of London. Lon. 0. 59 E. Lat. 52. 20 N.

KETMIA BLADDER, in botany. See **HIBISCUS**.

KETTLE *s.* (cettl, Saxon.) A vessel in which liquor is boiled (*Dryden*)

KETTLED RUM. *s.* (kettle and drum.) A drum of which the head is spread over a body of brass (*Shakspeare*).

KETTLEWELL (John), a pious English divine, born at North Allerton in Yorkshire, in 1653. He was educated at St. Edmund's hall, Oxford, and afterwards was chosen fellow of Lincoln college, Oxford, where he became an eminent tutor. In 1681 he published his book, entitled, Measures of Christian Obedience, which brought him considerable reputation, and the vicarage of Colchist in Warwickshire, given him by lord Digby. At the revolution he refused the oaths to William and Mary, and in consequence was deprived of his preferment. He then settled in London,

K E Y

where he was held in great esteem by all good men. He died in 1695. His works have been published in two volumes folio, with a fine character of the author by Mr. Nelson.

KETTON, a village in the county of Rutland, about 6 miles west of Stamford, celebrated for its stone quarries, from which the stones with which King's College chapel, Cambridge, and other buildings of that age, were erected.

KETTON STONE, in mineralogy. See **MARMOR**.

KEVELS in ship-building, a frame composed of two pieces of timber, whose lower ends rest in a sort of step or foot, nailed to the ship's side, from whence the upper ends branch outward into arms or horns, serving to belay the great ropes by which the bottoms of the main-sail and fore-sail are extended.

KEW, a village of Surrey, on the banks of the Thames, about seven miles W. by S. of London. It was formerly a hamlet of Kingston; but in 1709 an act of parliament was obtained, forming Kew and Petersham into one vicarage. Here is Kew House, a royal palace, celebrated for its fine gardens, and his majesty's exotic garden. The last has been brought to great perfection by the introduction of many new plants from Africa and New South Wales; and is known throughout all Europe by the late Mr. Aiton's Hortus Kewensis. From Kew to Brentford is a handsome stone bridge of seven arches over the Thames, built in 1789, from a design of the late Mr. Paine. Kew gardens are open to the public every Monday, from midsummer to the end of autumn.

KEXHOLM, a town of Russia, in the government of Viborg. The town is built on two islands at the mouth of a river, on the side of lake Ladoga. The houses are of wood, but the town is well fortified, and defended with a citadel: forty miles E.N.E. Viborg, and sixty-eight N. Petersburg. Lon. 30. 25 E. Lat. 61. 0 N.

KEY, an instrument for the opening of locks. (See **LOCK**.) L. Molinus has a treatise on keys, *De clavibus veterum*, printed at Upsal: he derives the Latin name *clavis* from the Greek *κλειω*, *claudio*, I shut; or from the adverb *clam*, privately; and adds, that the use of keys is yet unknown in some parts of Sweden. The invention of keys is owing to one Theodore of Samos, according to Pliny and Polydore Virgil: but this must be a mistake, the use of keys having been known before the siege of Troy; mention even seems made of them in the 19th chapter of Genesis.

KEY, or **KEY-STONE** OF AN ARCH OR VAULT, is the last stone placed a-top thereof; which being wider and fuller at the top than bottom, wedges, as it were, and binds all the rest. The key is different in the different orders: in the Tuscan and Doric it is a plain stone, only projecting; in the Ionic it is cut and waved somewhat after the manner of consoles; in the Corinthian and Composite it is a console enriched with sculpture, foliages, &c.

K E Y.

KEY is also used for ecclesiastical jurisdiction; particularly for the power of excommunicating and absolving. The Romanists say, the pope has the power of the keys, and can open and shut paradise as he pleases; grounding their opinion on that expression of Jesus Christ to Peter, "I will give thee the keys of the kingdom of heaven." In St. Gregory we read, that it was the custom heretofore for the popes to send a golden key to princes, wherein they inclosed a little of the filings of St. Peter's chains kept with a world of devotion at Rome; and that these keys were worn in the bosom, as being supposed to contain some wonderful virtues.

KEY is also used for an index or explanation of a cipher. See **CIPHER**.

KEY or **QUAY**, a long wharf, usually built of stone, by the side of a harbour or river, and having several storehouses for the convenience of lading and discharging-merchant ships. It is accordingly furnished with posts and rings, whereby they are secured; together with cranes, capsterns, and other engines, to lift the goods into or out of the vessels which lie along side. The verb *cajare*, in old writers, according to Scaliger, signifies to keep in or restrain; and hence came our term key or quay, the ground where they are made being bound in with planks and posts.

KEYS are also certain sunken rocks lying near the surface of the water, particularly in the West Indies.

KEY, in music, is a certain fundamental note, or tone, to which the whole piece, be it concerto, sonata, cantata, &c. is accommodated; and with which it usually begins, but always ends.

To get an idea of the use of the key, it may be observed, that as in an oration there is a subject, viz. some principal person or thing to which the discourse is referred, and which is always to be kept in view, that nothing unnatural, and foreign to the subject, may be brought in; so in every regular piece of music there is one note, viz. the key, which regulates all the rest. The piece begins and ends in this; and this is, as it were, the musical subject, to which a regard must be had in all the other notes of the piece. Again, as in an oration there are several distinct articles, which refer to different subjects, yet so as they have all a visible connection with the principal subjects, which regulates and influences the whole; so in music there may be various subaltern subjects, that is, various keys, to which the different parts of the piece may belong: but then they must be all under the influence of the first and principal key, and have a sensible connection with it.

To give a more distinct notion of the key, we must observe, that the octave contains in it the whole principles of music, both with respect to consonance or harmony, and succession or melody; all the intervals in the regular octave being constituted of whole tones, except two which are semitones: and if either scale be continued to a double octave, there will, in that

case, be seven different orders of the degrees of an octave, proceeding from the seven different letters, with which the terms of the scale are marked. Any given sound, therefore; i. e. a sound of any determinate pitch or tune, may be made the key of the piece, by applying it to the seven natural notes arising from the division of an octave, introducing the semitonic intervals at the proper place in the octave, and repeating the octave above or below, at pleasure. The given note is applied as the principal note or key of the piece, by making frequent closes or cadences upon it; and, in the progress of the melody, no other but those seven natural notes can be admitted, while the piece continues in that key, every other note being foreign to the fundamental, or key.

Now a piece of music may be carried through several keys; i. e. it may be given in one key, and be led out of that into another, by introducing some note foreign to the first, and so on to another: but a regular piece must not only return to the first key, but those other keys, too, must have a particular connection with the first. It may be added, that those other keys must be some of the natural notes of the principal key, though not any of them at pleasure.

As to the distinctions of keys, we have already observed, that to constitute any given note or sound a key, or fundamental note, it must have the seven essential or natural notes added to it; out of which, or their octaves, all the notes of the piece must be taken, while it keeps within the key, i. e. within the government of that fundamental. It is evident, therefore, there are but two different species of keys, which arise according as we join the greater or less third, these being always accompanied with the sixth or seventh of the same species; the third *g*, for instance, with the sixth and seventh *g*; and the third *f*, with the sixth and seventh *f*.

This distinction is expressed under the names of sharp or major key, which is that with the third *g*, &c.; and the flat or minor key, which is that with the third *f*, &c.; whence it is plain, that how many different closes soever there be in a piece, there can be but two keys, if we consider the essential difference of keys; every key being either flat or sharp, and every sharp key being the same, as to melody, as well as every flat one.

It must be observed, however, that in common practice the keys are said to be different, when nothing is considered but the different tune, or pitch of the note, in which the different closes are made. In this sense, the same piece is said to be in different keys, according as it is begun in different notes, or degrees of tune.

Hence arises a farther subdivision of keys into natural and artificial.

A natural key is that in which the distinction of major or minor may be observed, without the addition of either sharp or flat. there are only two natural keys, viz. A the natural flat key, because from A to C is a minor third, A to F a minor sixth, &c.; and C the natural sharp key, because the interval from C to E is a

KEY

and added, &c. The semi-tonic intervals in the natural keys always being from B to C and from E to F.

An artificial key is that in which the distinction of minor and major cannot be observed or marked without the addition of sharp or flat.

This is again divided into perfect and imperfect.

A perfect artificial key can preserve its distinction of flat and sharp, and yet lie upon a natural note; as a flat key with B flat and E flat, which key is in G natural.

An imperfect artificial key cannot preserve the distinction of minor or major, without lying upon some flattened or sharpened note: such is a major key with B flat and E flat, which key is in B flat. See Plate 93.

When keys are transposed by the addition of sharps, the first sharp will be applied to the note F a fourth above or a fifth below C the natural sharp key; and this will have the effect of throwing the two semitonic intervals, and consequently transposing the key, a fifth higher, or a fourth lower, to G. The second sharp must be added to the note C a fourth above or a fifth below this new key G; the two sharps together will have the effect of transposing the key another fifth higher, or a fourth lower, that is to say, from G to D; and so on; every new sharp being placed at a fourth higher than the one last added; and thus raising the key a fifth above the latter.

When keys are transposed by means of flats, the first is applied to B the note between A and C the natural flat and sharp keys; and it has the effect of raising the key a fourth, namely the minor key to D, the major to F. The second flat is applied to E the note between the two keys last mentioned; and the two additional flats together transpose the keys to G and B; and so on.

The number of flats and sharps requisite to produce major keys upon all the 12 notes of the chromatic octave, may be ascertained from the table below; and their actual places may be readily determined from the preceding observations and table in pl. 93.

0 sharp . . .	C	0 flat.
7 sharps . . .	C [#] or D ^b *	5 flats
2 sharps . . .	D	
9 sharps . . .	D [#] or E ^b *	3 flats.
4 sharps . . .	E	
11 sharps . . .	F	1 flat.*
6 sharps . . .	F [#] or G ^b *	6 flats.
1 sharp . . .	G	
8 sharps . . .	G [#] or A ^b *	4 flats.
3 sharps . . .	A	
10 sharps . . .	A [#] or B ^b *	2 flats.
5 sharps . . .	B	
0 sharp . . .	C	0 flat.

In the above the tones usually employed are marked with an asterisk. Thus, it may be easily conceived that by employing D[#] under this form we should have nine sharps which would give two notes with double sharps, viz. F[#] and C[#], so that the gamut would be D[#], E[#] or F, F[#] or G, G[#], A[#], B[#] or C, C[#] or D, D[#]; which, as is manifest, it

KEY

would be exceedingly difficult to execute: but, by taking E^b instead of D[#], we have only 3 flats; which renders the gamut much simpler, as it then becomes

E^b, F, G, A^b, B^b, C, D, E^b.

It is almost superfluous to remark, since it will be very obvious from an inspection of the last preceding table, that in every artificial sharp key the number of flats and the number of sharps requisite to make the gamut perfect amount together to twelve, the number of semitones in the chromatic octave. The reason of this it would be easy to shew; but we have not room to dilate upon matters of mere speculation.

Keys also denote those little pieces in the fore-part of an organ, spinette, hapsichord, or piano-forte; by means whereof the jacks are played, so as to strike the strings of the instrument; and wind is given to the pipes, by raising and sinking the sucker of the sound board.

In large organs there are several sets of these keys, some to play the small second organ, some for the main organ, some for the trumpet, and some for the echoing trumpet. In some there are but a part that play, the rest being for ornament. There are twenty slits in large keys, which make the half notes.

M. Bulouski, of Doulez, pretends to have invented a new kind of keys, much preferable to the common ones. With these, he says, he can express sounds, which follow each other in a continual geometrical proportion, and so can furnish all the sounds in music, and by consequence all the imaginary intervals and concords; whereas the common keys do but yield some of them.

KEYAGE. *s.* (from *key*.) Money paid for lying at the key or quay (*Answorth*).

KEYHOLE. *s.* (*key* and *hole*.) The perforation in the door or lock through which the key is put (*Prior*).

KEYNSHAM, a town of Somersetshire, 116 miles from London. It is a great thoroughfare in the lower road between Bath and Bristol. It is called proverbially *smoky* Keynsham, and with equal reason might it be called *foggy*. It has a fine large church, a stone bridge of 15 arches over the Avon to Gloucestershire, and another over the river Chew. Its chief trade is making. It has a charity school, a weekly market, and three fairs.

KEYSLER (John George), a learned German antiquarian, was born at Thourneau in 1689. After studying at the university of Halle, he was appointed preceptor to Charles Maximilian and Christian Charles, the young counts of Giech Buchan; with whom he travelled through the chief cities of Germany, France, and the Netherlands, gaining great reputation among the learned as he went along, by illustrating several monuments of antiquity, particularly some fragments of Celtic idols lately discovered in the cathedral of Paris. Having acquitted himself of this charge with great honour, he procured, in 1716, the education of two grandsons of Baron Bernstorff, first minister of state to his Britannic majesty, as

elector of Brunswick-Lunenburgh. However, obtaining leave in 1718 to visit England, he was elected a fellow of the Royal Society for a learned essay *De Dea Nehelennia numine veterum Walachorum topico*: he gave also an explanation of the ancient monument on Salisbury plain called Stone-henge, with a Dissertation on the Consecrated Mistletoe of the Druids. Which detached essays, with others of the same kind, he published on his return to Hanover, under the title of *Antiquitates selectæ Septentrionales et Celticæ*, &c. He afterwards made the grand tour with the young barons, and to this tour we owe the publication of his travels; which were translated into English, and published in 1756, in 4 vols. 4to. Mr. Keyser on his return spent the remainder of his life under the patronage of his noble pupils, who committed their fine library and museum to his care, with a handsome income. He died in 1743.

KIA-KING-FOU, a city in China, in the province of Tche-kiang, remarkable for its streets ornamented by beautiful piazzas, that shelter passengers from the sun and rain. Seven cities of the third class are dependent upon it.

KIANG-NAN, a province of China, bounded on the north by Chan-tong, on the east by the sea, on the south by Tche-kiang and Kiang-si, and on the West by Ho-nan, and Hou-quang. Here the ancient emperors always kept their court, till they were obliged for reasons of state to remove nearer Tartary, and choose Peking for the place of their residence. It is of vast extent, and contains fourteen cities of the first order, and ninety-three of the second and third order. These cities are very populous, and of the greatest note in the empire, especially for commerce; it is the rendezvous of all the great barks, for the country is full of lakes, rivers and canals, either natural or the effect of labour, which communicate with the great river Yang-tse-kiang, that crosses the province; here are few mountains, but towards the south. The silks, the japaned goods, the ink, the paper, and in general every thing that comes, as well from Nan-king as from the other cities of the province, which carry on a surprising commerce, is much more esteemed, and bears a greater price, than what is brought from the other provinces: there are many salt-works along the sea coast, and the salt they produce is distributed almost through the empire: here also is found a great quantity of marble. In short, this province is so plentiful and rich, that it pays the emperor annually about 32,000,000 crowns, without reckoning the dues of imports and exports, for the receipt whereof several officers are established. Nan-king is the capital.

KIANG-NANG. See **NAN-KING**

KIANG-SI, a province of China, bounded on the N. by Kiang-nan, on the W. by Hou-quang, on the S. by Quang-tong, and on the E. by Fo-kien and Tche-kiang. The mountains that lie to the S. are almost inaccessible; but there are fine valleys among them. It is

watered by lakes and rivers; and has many mines of gold, silver, lead, iron, &c. It contains 13 cities of the first rank, and 78 of the second and third. The attack in this province is excellent; and its porcelain is the finest and most valuable of the empire. Nan-tchang-fou is the capital.

KIANGARI, a town of Turkey in Asia, chief place of a sangiacat, in Natolia. It is defended by a castle, on a rock; and is 256 miles E.S.E. of Constantinople. Lon. 34. 19 E. Lat. 39. 54 N

KIBES See **CHILBLAINS**.

KIBED. *a* (from *kibe*.) Troubled with kibes.

To KICK. *v. a.* (*kauchen*, Germ.) To strike with the foot (*Swift*).

To KICK. *v. n.* To beat the foot in anger or contempt (*Tillotson*).

KICK. *s* (from the verb.) A blow with the foot (*Dryden*).

KICK (Cornelius), a flower painter of Amsterdam, born in 1635, and died in 1678. His manner of painting was delicate, and his colouring brilliant, shewing all the freshness of nature.

KICKER. *s.* (from *kick*.) One who strikes with his foot.

KICKSHAW. *s.* (a corruption of *quelque chose*, something.) 1. Something uncommon or fantastical; something ridiculous (*Milton*). 2. A dish so changed by the cookery that it can scarcely be known (*Fenton*).

KICKSY-WICKSEY. *s.* (from *kick* and *wince*.) A made word in ridicule and disdain of a wife (*Shakspeare*).

KID. *s.* (*kid*, Danish) 1. The young of a goat (*Spenser*). 2. (from *cidwlen*, Welsh, a faggot.) A bundle of heath or furze.

To KID. *v. a.* (from the noun.) To bring forth kids.

KIDDER. *s.* An engrosser of corn to enhance its price (*Answorth*).

KIDDER (Richard), a learned English prelate, was born in Suffolk, and educated at Emanuel college, Cambridge, by which society he was preferred to a living in Huntingdonshire, from whence he was ejected for nonconformity in 1662, but afterwards he thought proper to comply, and obtained the rectory of Raine in Essex. In 1674 he was presented to the living of St. Martin, Outwich, London; and in 1689 was made dean of Peterborough. On the deprivation of Dr. Ken, bishop of Bath and Wells, he was promoted to that see, which he held to his death in 1713. This circumstance was occasioned by a stack of chimneys falling during a great storm, and which killed him and his lady in b.d. He is well known as the writer of a most elaborate work, entitled, *A Demonstration of the Messias*, in 1 vol. folio and 3 in 8vo.

KIDDERMINSTER, a corporate town in Worcestershire, with a market on Thursday. It is seated under a hill, on the river Stour, and is the principal manufacturing place in the county. Its former trade of stuffs is much declined, on account of the general use of cotton.

son goods; but its carpet manufactory has greatly increased. It is the first market in England for pile or plush carpets, which, for beauty of colour and patterns, exceed any other. These are frequently called Wilton, from having been first made at that town. The worsted slag trade has also been introduced here, and employs many looms. It is 14 miles S.E. of Bridgenorth, and 125 N.W. of London. Lon. 2. 18 W. Lat. 52. 28 N.

KIDDLE, or **KIDEL**, (*kidellus*), a dam or weir in a river with a narrow cut in it, for the laying of pots or other engines to catch fish. The word is ancient; for in *Magna Charta*, cap. 24. we read, "Omnes kidelli deponantur per Thamesiam & Medweyam, & per totam Angliam, nisi per costeram maris." And by king John's charter, power was granted to the city of London, "de kidellis amovendis per Thamesiam & Medweyam." A survey was ordered to be made of the weirs, mills, stanks, and kidells, in the great rivers of England, 1 Hen. IV. Fishermen of late corruptly call these dams *kettles*; and they are much used in Wales and on the sea-coasts of Kent.

To **KIDNAP**. *v. a* (from *kind*, Dutch, a child, and *nep*.) To steal children; to steal human beings.

KIDNAPPER. *s.* (from *kidnap*.) One who steals human beings.

KIDNAPPING, is the forcible taking and carrying away a man, woman, or child, from their own country, and sending them to another. This is an offence at common law, and punishable by fine, imprisonment, and pillory.

By stat. 11 and 12 W. III. c. 7, if any captain of a merchant vessel shall during his being abroad force any persons on shore, and wilfully leave them behind, or refuse to bring home all such men as he carried out, if able and desirous to return, he shall suffer three months imprisonment. Exclusive of the above punishment for this as a criminal offence, the party may recover upon an action for compensation in damages for the civil injury.

KIDNEY. See **KIDNEYS**.

KIDNEY, in ludicrous or familiar language, signifies sort, or kind, as, "He is of the right kidney."

KIDNEY-BEAN, in botany. See **PHASEOLUS**.

KIDNEY-BEAN (Carolina). See **GLYCINE**.

KIDNEY-BEAN TREE. See **GLYCINE**.

KIDNEY VETCH. See **ANTHYLLIS**.

KIDNEY-WORT. See **SAXIFRAGA**.

KIDNEY-SHAPED LEAF. In botany, folium reniforme. Roundish and hollowed at the base without angles. Applied also to the anther and seed, which being solid bodies, have really the form of a kidney; whereas a leaf, being a plane surface, resembles the section of a kidney. This distinction is to be observed in several other cases.

KIDNEYS. *Renes*. Two abdominal viscera, shaped like a kidney-bean, that secrete the urine. They are situated on each lumbar region, near the first lumbar vertebra, behind the

peritoneum, and are composed of three substances; a cortical, which is the external, and very vascular; a tubulose, which consists of small tubes; and a papillous substance, which is the innermost. The kidneys are generally surrounded with more or less adipose membrane, and have also a proper membrane, membrana propria, which is closely accreted to the cortical substance. The renal arteries, called also emulgentes, proceed from the aorta. The veins evacuate their blood into the ascending cava. The absorbents accompany the blood-vessels, and terminate in the thoracic duct. The nerves of the kidneys are branches of the eighth pair and great intercostals. The excretory duct of this viscus is called the ureter. It commences at the middle or pelvis of the kidney, where the blood-vessels enter it, and is at first a large membranous bag, which diminishes like a funnel, till it becomes a long narrow canal. The ureters convey the urine from the kidney to the bladder, which it perforates obliquely.

KIDWELLY, a town of Carmarthenshire, in S. Wales, with a market on Tuesday. It is seated on a creek of the Bristol Channel, near the mouth of the Towy. From this town a canal has been cut to some collieries, whence coal is brought down and exported. It is eight miles S. of Carmarthen, and 224 W. by N. of London. Lon. 13. 15 W. Lat 54. 44 N.

KIEL, a strong, rich, and considerable town of Germany, capital of the duchy of Holstein, with a castle, and a university. It stands upon a small peninsula in a bay of the Baltic, and has a very commodious harbour for ships of the largest size. Lon. 10. 0 E. Lat 54. 20 N.

KIERINGS (Alexander), a landscape painter of Utrecht, born in 1590, and died in 1646. His views were copied from nature, and he finished them with amazing patience, even the bark and the fibres of the trees being distinctly marked.

KIFFFKIL, in oryctology. This mineral is dug up near Conie in Naotlia, and is employed in forming the bowls of Turkish tobacco pipes. The sale of it supports a monastery of dervises established near the place where it is dug. It is found in a large fissure six feet wide, in grey calcareous earth. The workmen assert that it grows again in the fissure, and puffs itself up like froth. This mineral, when fresh dug, is of the consistence of wax; it feels soft and greasy; its colour is yellow; its specific gravity 1.600: when thrown on the fire it sweats, emits a fetid vapour, becomes hard, and perfectly white.

According to the analysis of Klaproth, it is composed of

80.50 silica
17.25 magnesia
25.00 water
5.00 carbonic acid
.50 lime

98.25

KIGGELARIA. In botany, a genus of the class dicocia, order dodecandria. Calyx.

KIL

five-parted; petals five; with five three-lobed glands. Male: anthers perforated at the top. Fem.: Styles five; capsule one-celled, five-valved, many seeded. One species, a Cape tree with a grey bark; leaves lanceolate, serrate, glabrous; seeds immersed in the pulp. It is reared in our own hot-houses, and is propagated by seeds, cuttings, or layers.

KIGHLEY, a town in the west riding of Yorkshire, six miles to the south-east of Skipton in Craven. It stands in a valley surrounded with hills, at the meeting of two brooks, which fall into the river Aire one mile below it. Every family is supplied with water brought to or near their doors in stone troughs from a never-failing spring on the west side of it. The parish is six miles long and two broad, and is 60 miles from the east and west seas; yet at the west end of it near Camel-Cross is a rising ground, from which the springs on the east side of it run to the east sea, and those on the west to the west sea. By the late inland navigation, this town has a communication with the rivers Mersey, Dee, Ribble, Ouse, Trent, Derwent, Severn, Humber, Thames, &c. which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, Lancaster, Westmoreland, Chester, Stafford, Warwick, Leicester, Oxford, Worcester, &c.

KIKEKUNEMALO. A pure resin, very similar to copal, but of a more beautiful whiteness and transparency. It is brought from America, where it is said to be used medicinally in the cure of hysteria, tetanus, &c. It forms the most beautiful of all varnishes.

KILBEGGAN, a post, fair, and borough-town of Ireland, in the county of Westmeath and province of Leinster, 44 miles from Dublin. Previously to the union it returned two members to parliament. It is seated on the river Brosna, over which there is a bridge. There was here a monastery founded in 1200, and dedicated to the Virgin Mary, and inhabited by monks from the Cistercian abbey of Melefont. The fairs are two.

KILDA (St.), a small island of Scotland, one of the Hebrides, 18 leagues to the W. of N. Uist. A great number of the poor people in this island live chiefly by fishing and catching wild fowls. In the latter employment, they are incredibly adventurous; being often let down by a rope from the summit of high precipitous rocks, where they clamber among the rugged cliffs, in search of the eggs and nests of various birds. But the more safe and common method of catching these fowls is, by spreading a large net over the face of the rock where they lodge, in which great numbers are at once entangled, and lowered down into a boat. St. Kilda is the most westerly island of Great Britain.

KILDERKIN. (from *kinderkin*, a baby, Dutch.) A kind of liquid measure, containing two firkins, or 48 gallons, beer-measure, or 16 ale-measure.

KILGARREN, a town in Pembrokeshire, with a market on Wednesday. It had for-

KIL

merly a castle, now in ruins; and near it is a remarkable salmon-leap, where that fish is caught in great abundance. Above this place, are large works for fabricating tin plates. It is seated on the Tyvy, 30 miles N. of Pembrokeshire, and 227 W.N.W. of London. Lon. 4. 40 W. Lat. 54. 4 N.

KILHAM, a town in the E. riding of Yorkshire, with a market on Saturday, 36 miles N.E. of York, and 200 N. of London. Lon. 0. 16 W. Lat. 54. 5 N.

KILIA, a fortified town of Turkey in Europe, in Bessarabia; seated on an island, at the mouth of the Danube. It was taken by the Russians in 1790, but restored at the subsequent peace. It is 86 miles S.W. of Bialogorod, and 200 N.E. of Constantinople. Lon. 28. 46. E. Lat. 45. 22 N.

KILKENNY, a county of Ireland, bounded on the north by Queen's county, on the east by Carlow and Wexford, on the south by Waterford, and on the west by Tipperary; about thirty-five miles from north to south, and nineteen from east to west. It contains 127 parishes, about 17,570 houses, and upwards of 95,000 inhabitants: the surface is generally level, and the soil fertile in corn, equal to most other parts of Ireland. The principal rivers are the Barrow, which bounds it on the east, the Suir, which forms its southern boundary, and divides it from Waterford, and the Nore, which crosses it from north to south. Sixteen members were sent to the Irish parliament by this county, the city of Kilkenny, and the boroughs of St. Canice, Gowran, Knocktopher, Thomastown, Innistoghe, and Callen.

KILKENNY, a city of Ireland, and capital of the county to which it gives name; situated on the river Nore, over which are two handsome bridges: the borough of St. Canice or Irish Town is joined to it, and both together form one large town. It is the see of a bishop, founded in the fifth century. The cathedral is small, the houses are decorated with a beautiful black and white marble, dug from quarries near the town: considerable manufactures of blankets and coarse woollen cloths are carried on here. The number of inhabitants is about 16,000: sixty-five miles N.E. Cork, and fifty-six S.S.W. Dublin. Lon. 7. 15 W. Lat. 52. 38 N.

KILKENNY COAL, in mineralogy. See BITUMEN.

To KILL, v. a. (anciently *to quell*; *epellan*, Saxon; *kelen*, Dutch.) 1. To deprive of life; to put to death, as an agent (*Mac*). 2. To destroy animals for food (*Shaksp*). 3. To deprive of life as a cause or instrument (*Bac*). 4. To deprive of vegetative or other motion, or active qualities (*Floyer*).

KILLALA, a town of Ireland, in the county of Mayo, the see of a bishop, founded about the middle of the fifth century, and united with Achonry, situated on a fine bay of the Atlantic to which it gives name. This bay is near six miles from east to west, and five from north to south. Killala is not a town of consequence: twenty-three miles N. Castlebar.

KIL

and twenty-six W. Sligo. Lon. 9. 3 W. Lat. 54. 12 N.

KILLALOE, a town of Ireland, in the county of Clare, the see of a bishop, founded in the fifth century. In the twelfth century it was united with the bishopric of Roscrean, and in the year 1752, the bishopric of Killfenora was annexed to it. It is situated on the Shannon, by which it is separated from the county of Tipperary, with a bridge of communication: twenty miles E. Ennis, and eleven N. N. E. Limerick.

KILLARD POINT, a cape of Ireland, on the east coast of the county of Down, in the English Channel, six miles E. from Downpatrick. Lon. 5. 27 W. Greenwich. Lat. 54. 22 N.

KILLARNEY, a town of Ireland, in the county of Kerry: thirty-six miles W. Cork, and fifty S.W. Limerick. Lon. 9. 27 W. Lat. 51. 2 N.

Near Killarney is a large and beautiful lake, called the Lake of Killarney, or Lough Lean, 12 or 14 miles long, and in many places four miles broad. The views in sailing over, or coasting along this lake, are very picturesque, and often sublime; and the variety furnished by the numerous little islands on the lake adds greatly to the general effect.

KILLAS, in mineralogy. See **ARDESTA**.

KILLER *s.* (from *kill*.) One that deprives of life (*Sidney Walter*).

KILLICRANKIE, a noted pass in Perthshire, near the junction of the Tunnel with the Garry. It is the grand entrance into the Highlands in those parts, and is formed by the lofty mountains impending over the Garry, which rushes through in a deep and rocky channel, overhung with trees. In the last century, this was a pass of much difficulty and danger—a path hanging over a tremendous precipice threatened destruction to the least false step of the traveller. At present, a fine road gives an easy access to the remote Highlands; and the two sides are joined by a fine arch. Near the north end of this pass, in its open and unimproved state, king William's army, under general Mackey, was defeated, in 1689, by the Highlanders, commanded by viscount Dundee, who was killed in the moment of victory.

KILLIGREW (William), eldest son of Sir Robert Killigrew, knight, was born in 1603. He was gentleman-usher of the privy-chamber to king Charles I. and on the Restoration to Charles II. When the latter married the princess Catherine of Portugal, he was created vice-chamberlain; in which station he continued 22 years, and died in 1693. He was the author of four plays, which, though now thrown aside, were much applauded by the poets of that time, particularly by Mr. Waller; and in the decline of life he published some pious reflections on the instability of human happiness when our views are not directed to a future state.

KILLIGREW (Thomas), brother of the former, was born in 1611, and in process of time

KIL

distinguished himself by his uncommon natural parts. He was page of honour to king Charles I. and groom of the bed-chamber to Charles II. with whom he suffered many years exile; during which he applied his leisure hours to the study of poetry, and to the composition of several plays. After the Restoration he continued in high favour with the king, and had frequently access to him when he was denied to the first peers in the realm; and being a man of great wit and liveliness of parts, and having from his long intimacy with that monarch, and being continually about his person during his troubles, acquired a freedom and familiarity with him which even the pomp of majesty afterwards could not check in him, he sometimes, by way of jest, which king Charles was ever fond of, if genuine, even though himself was the object of the satire, would adventure bold truths which scarcely any one besides would have dared even to hint at. One story in particular is related of him, which, if true, is a strong proof of the great lengths he would sometimes proceed in freedom of this kind, and is as follows:—When the king's unbounded passion for women had given his mistress such an ascendancy over him, that, like the effeminate Persian monarch, he was much fitter to have handled a distaff than to wield a sceptre, and for the conversation of his concubines utterly neglected the most important affairs of state, Mr. Killigrew went to pay his majesty a visit in his private apartments, habited like a pilgrim who was bent on a long journey. The king, surprised at the oddity of his appearance, immediately asked him what was the meaning of it, and whether he was going? “To hell,” bluntly replied the wag. “Prythee (said the king), what can your errand be to that place?” “To fetch back Oliver Cromwell (rejoined he), that he may take some care of the affairs of England; for his successor takes none at all.” Killigrew died in 1682.

KILLIGREW (Anne), “a Grace for beauty, and a Muse for wit,” as Mr. Wood says, was the daughter of Dr. Henry Killigrew, brother of the two foregoing, and was born a little before the Restoration. She gave early indications of genius, and became eminent in the arts both of poetry and painting. She drew the duke of York and his duchess, to whom she was maid of honour, as well as several other portraits and history-pieces; and crowned all her other accomplishments with unblemished virtue and exemplary piety. Mr. Dryden seems quite lavish in her praise, though Wood assures us he has said no more of her than she was equal if not superior to. This amiable young woman died of the small-pox in 1685; and the year after her poems were published in a thin 4to volume.

KILLILEAGH, a borough of Ireland, in the county of Down, seated on an arm of Strangford Lough, where ships may be sheltered from all winds. It suffered much in the war of 1641; but it is now a thriving place, with a linen and thread manufactory. Here

K I L

is a castle, formerly the seat of the family of Hamilton, now earls of Clanbrassil; and the celebrated sir Hans Sloane was born in this town. It is 80 miles N. by E. of Dublin. Lon. 5. 32 W. Lat. 54. 23 N.

KILLINHAULE, a town of Ireland, in the county of Tipperary, 14 miles N. of Clonmell. Lon. 7. 26 W. Lat. 52. 27 N.

KILLONY, a town of Ireland, in the county of Sligo, six miles S. of Sligo. Lon. 8. 25 W. Lat. 54. 11. N.

KILLOUGH, or **PORT ST. ANN**, a seaport of Ireland, in the county of Down, situate on the N. of St. John's Point, in the Irish Sea. A rock stands in the middle of the entrance of its harbour, covered at half flood. Here is a manufacture of salt. It is 76 miles N. by E. of Dublin.

KILLYBEGS, a borough of Ireland, in the county of Donegal, with a spacious harbour on the N. side of Donegal Bay. It is 12 miles N.W. of Ballyshannon. Lon. 8. 6 W. Lat. 54. 40 N.

KILMAC-THOMAS, a town of Ireland, in the county of Waterford, 12 miles S.E. of Waterford. Lon. 7. 10 W. Lat. 52. 14 N.

KILMAINHAM, a town of Ireland, about half a mile from Dublin. It has a session-house and a gaol; and here the quarter sessions are held for the county of Dublin, and the knights for the shire elected. It was sometimes the seat of government, before the castle at Dublin was appropriated to that purpose.

KILMALLOCK, a borough of Ireland, in the county of Limerick, 18 miles S. of Limerick. Lon. 8. 34 W. Lat. 52. 24 N.

KILMARNOCK, a populous town in Ayrshire, noted for its manufacture of gloves, carpets, stockings, nightcaps, bonnets and other woollen goods. It is 15 miles S.W. of Glasgow.

KILMORE, a town of Ireland, in the county of Cavan, with a bishop's see, three miles S.W. of Cavan. Lon. 7. 11 W. Lat. 54. 2 N.

KILN. *s.* (*cylu*, Saxon.) A stove; a fabric formed for admitting heat, in order to dry or burn things contained in it (*Bacon*).

Brigadier General Dirom of Mount Annan, in Scotland, built some lime-kilns in 1801; of which he published an account in the third volume of the Transactions of the Highland Society.

"These kilns were constructed with a view to save fuel, to calcine the stone equally, and to give the burner the command of the heat." To accomplish these objects the two kilns were built circular, and adjoining each other, but instead of being open at the top, as the common lime-kiln is, they were covered with an arched dome, a door being left on one side at the springing of the arch, to put in the charge, and a chimney being carried out on the opposite side at the same height to convey away the smoke. The walls were built in the usual manner with stone work and were lined with brick, an interval of about four inches

K I M

being left between, which was filled with rubble and small stones without mortar; this was done to form a non-conductor of heat by admitting a circulation of air, in order to prevent the kiln from bursting by the expansion caused by the heat; and the whole was bound with frames of wood strongly fastened together at the distance of about six feet from the ground, and the same interval from each other. The charging doors were made circular and were shut by a frame of iron filled with fire-bricks, and hung on a hinge or bolt; the grate at the bottom was made with the four middle bars to draw out, the better to let down the calcined stone or lime-shells, when the kiln was choaked or did not draw freely: a damper was also put in the flue of the chimney to regulate the draught, and within the dome a flue was carried from each side of the charging door to the commencement of the chimney, to intercept the ascent of the smoke in some degree when the door was opened for charging. These kilns were not intended to be wrought by drawing and filling at the same time, as is done in common kilns; for then the advantage would be lost which arises from confining the heat in calcining the stone; but it was intended that one should be filled and kept shut, while the other was drawing, and so they were to be filled and drawn alternately.

It appeared to General Dirom that the current of air being regulated by means of the door below and the damper above, the burner may admit of such a column, as might enable him to work the kiln as quickly as may be done, without waste of fuel and without melting or vitrifying the stone; or he may lengthen the process by lessening the draught of air through the kiln. As the expense of the kilns here described was about 300l. it is very justly observed that they can be recommended only where the demand for lime is considerable, and the saving of fuel an object of importance; the saving of this article not being more, if so much, as one third of what would be necessary in open kilns.

These kilns, however, are constructed on correct mechanical and chemical principles, and if the effect fell short of the general's just expectations the cause ought rather to be attributed to the ill-management of the persons employed, than to any defect in the kilns themselves. The value of lime calcined with a very great degree of heat is well known to all persons concerned in masonry, and every improvement of kilns, which increases the heat during calcination, may be considered an important discovery. It is to be feared that the great expense of building lime-kilns in the mode proposed will preclude the general adoption of the plan.

To **KYLNDRY**. *v. n.* (*kiln* and *dry*) To dry by means of a kiln (*Morimer*).

KILT, for *killed* (*Spenser*).

KI'MBO. *a.* (*a schenbo*, Italian.) Crooked; bent; arched (*Arbutnot*).

KIMBOLTON a town in Huntingdonshire, with a market on Friday. The castle

(The seat of the duke of Manchester) has been much improved. Queen Catherine after her divorce from Henry VIII. resided some time in this castle. It is eight miles N. W. of St. Neot's, and 64 N. by W. of London. Lon. 0. 18 W. Lat. 52. 15 N.

KIMI, a town of Sweden, capital of a province of the same name, in E. Bothnia, at the mouth of the Kumi, which here falls into the gulf of Bothnia, 10 miles S.E. of Tornea.

KIMPOLUNG, a town of Turkey in Europe, in Moldavia, on the river Moldavia, 92 miles N. E. of Coloswar.

KIN, a town of Persia, in the province of Segestan, situate at the foot of a chain of mountains, near the lake Zare, 320 miles E. of Isfahan.

KIN. *s.* (cýne, Saxon.) 1. Relation either of consanguinity or affinity (*Bacon*). 2. Relatives; those who are of the same race (*Dryden*). 3. A relation; one related (*Dantes*). 4. The same general class (*Boyle*). 5. A diminutive termination from *kind*, a child, Dutch: as, *manikin*, *muikin*, *winkin*.

KINA KINA. See CINCCHONA.

KINBURN, a fortress of the Russian empire, at the mouth of the Dniester, opposite Oczakow. In the last war with Russia, the Turks made several attacks upon it by land and sea, but were finally repulsed.

KINCARDINE-ON-DEAL, a village in Aberdeenshire, seated on the river Dea, 23 miles W. of Aberdeen.

KINCARDINESHIRE, or MEARNS, a county of Scotland, bounded on the N. and N.W. by Aberdeenshire, on the E. by the German Ocean, and on the S.W. by Angusshire. Its length along the coast 30 miles, its greatest breadth 20. The only borough in it is Inverurie.

KIND *a.* (from *ýenne*, relation, Saxon.) 1. Benevolent, filled with general good-will (*South*). 2. Favourable; beneficent (*Luke*).

KIND. *s.* (cýnne, Saxon.) 1. Race; general class (*Homer*). 2. Particular nature (*Baker*). 3. Natural state (*Arbutnot*). 4. Nature, natural determination (*Shakspeare*). 5. Manner, way (*Bacon*). 6. Sort (*Bac*).

To KINDELE. *v. a.* (cýnnu, Welsh; cýn-
telan, Saxon.) 1. To set on fire, to light; to make to burn (*King Charles*). 2. To inflame the passions; to exasperate, to animate; to fire the mind (*Daniel*).

To KINDELE. *v. n.* 1. To catch fire (*Isa*). 2. (from *cennan*, Saxon.) To bring forth.

KINDLER. *s.* (from *kindle*.) One that lights; one who inflames (*Gay*).

KINDLY. *ad.* (from *kind*.) Benevolently; favourably; with good-will (*Shakspeare*).

KINDLY. *a.* (from *kind*.) 1. Homogeneous; congenial; kindred; of the same nature (*Hammond*). 2. Bland, mild; softening (*Dryden*).

KINDNESS. *s.* (from *kind*.) Benevolence; beneficence; good-will; favour (*Collier*).

KINDRED. *s.* (cýnnene, Saxon.) 1. Relation by birth or marriage; cognation; con-

sanguinity; affinity (*Dryden*). 2. Relations; kin (*Shakspeare*). 3. Relatives (*Denham*).

KINDRED. *a.* Congenial; related; cognate (*Dryden*).

KINE *s.* plur. from *cow*.

KINETON, a town in Warwickshire, with a market on Tuesday. King John kept his court in a castle here. It is 10 miles S.S.E. of Warwick, and 88 N.W. of London. Lon. 1. 24 W. Lat. 52. 11 N.

KING, a monarch or potentate who rules singly and sovereignly over a people. Camden derives the word from the Saxon *cýning*, which signifies the same: and that from *cýn* power, or *ken* knowl'dge, wherewith every monarch is supposed to be invested. The Latin *rex*, the Scythian *rex*, the Punic *resch*, the Spanish *rey*, and the French *roy*, come all, according to Postel, from the Hebrew *רַשָּׁא* *rasch*, chief, head.

kings were not known amongst the Israelites till the reign of Saul. Before him they were governed at first by elders as in Egypt; then by princes of God's appointment, as Moses and Joshua; then by judges till the time of Samuel; and last of all by kings, as we read in scripture.

Most of the Grecian states were governed at first by kings, who were chosen by the people to decide differences and execute a power which was limited by laws. They commanded armies, presided over the worship of the gods, &c. This royalty was generally hereditary; but if the vices of the heir to the crown were odious to the people, or if the oracle had so commanded, he was cut off from the right of succession, yet the kings were supposed to hold their sovereignty by the appointment of Jupiter. The ensign of majesty was the sceptre, which was made of wood adorned with studs of gold, and ornamented at the top with some figure, commonly that of an eagle, as being the bird of Jove.

Rome also was governed at first by kings who were elected by the people, with the approbation of the senate and concurrence of the augurs. Their power extended to religion, the revenues, the army, and the administration of justice. The monarchical form of government subsisted 244 years in Rome, under seven kings, the last of whom was Tarquinius Superbus.

Lawyers say, the king of England, or of the British empire, is a mixed person, a priest as well as a prince: at his coronation he is anointed with oil, as the priests and kings of Israel were, to intimate, that his person is sacred.

Among the Greeks, the king of Persia had anciently the appellation of the great king; the king of France had that of the most Christian king, and the king of Spain that of catholic king. See CATHOLIC.

The king of the Romans is a prince chosen by the emperor, as a coadjutor in the government of the empire.

The kings of England, by the Lateran coun-

all under pope Julius II. had the title of Christianissimus conferred on them; and that of defender of the faith was added by pope Leo X. though it had been used by them some time before.

The title of grace was first given to our kings about the time of Henry IV. and that of majesty first to Henry VIII. before which time our kings were called grace, highness, &c.

In all public instruments and letters, the king styles himself *nos*, we; though till the time of king John, he spoke in the singular number.

The Hungarians formerly gave the name king to their queen Mary, to avoid the infamy which the laws of that country cast upon those who are governed by women: accordingly, she bore the title of king Mary, till her marriage with Sigismund, at which time she took the title of queen.

The laws make it high-treason barely to imagine or intend the death of the king; and, because the destruction of the king may ensue that of his great counsellors or officers, it is felony in any of the king's servants to conspire even that; though in other capital cases, it is a rule, that *voluntas non reputabitur pro facto*; and an Englishman shall not, in any other case, be put to death, unless the deed follow the intent. The king's office (as he promises at his coronation) is to preserve the rights and privileges of the church, the prerogative of the crown, the laws and customs of the realm, &c. or, as Fortescue has it, he is *pugnare bella populi sui, & ens rectissime judicare*.

The king is considered by the laws of England as the head and supreme governor of the national church. 26 Hen. VIII. cap. 1. 1 Eliz. cap. 1. In virtue of this authority, he convenes, prorogues, restrains, regulates, and dissolves, all ecclesiastical synods or convocations.

He has the supreme right of patronage, called patronage paramount, over all the ecclesiastical benefices in England. He has power, by his prerogative, without any act of parliament, to make war or peace, conclude leagues and treaties, grant safe-conducts, give commissions for raising and regulating fleets and armies, as well as for erecting manning, and governing forts, and other places of strength, to appoint ports and havens, to erect beacons, light-houses, and sea-marks, to prohibit the exportation of arms or ammunition out of the kingdom, dispose of magazines, castles, ships, public moneys, &c. He has the sole power of sending ambassadors to foreign states, and of receiving ambassadors at home. He convokes, adjourns, prorogues, and dissolves parliaments; and may refuse his assent to any bill passed by both houses, without giving his reasons for it.

He may increase the number of members of either house at pleasure, by creating new peers, and bestowing privileges on other towns for sending burgesses to parliament. But this part of the prerogative of increasing the number of parliament-men, in the lower house, seems to be given up by the late kings,

while the number of peers has been considerably increased by them. The king is entrusted with the sole power of conferring dignities and honours, so that all degrees of nobility, knighthood, and other titles, are received by immediate grant from the crown; either expressed in writing, by writs or letters patent, as in the creation of peers and baronets; or by corporeal investiture, as in the creation of a simple knight. And as the king may create new titles, so he may create new offices, but with this restriction, that he cannot create new offices with new fees annexed to them, nor annex new fees to old offices; for this would be a tax upon the subject, which cannot be imposed but by act of parliament. The king has also the prerogative of conferring privileges upon private persons; such as granting place or precedence to any of his subjects; such is also the power to enfranchise an alien, and make him a denizen. Such is likewise the prerogative of erecting corporations.

The king is also the arbiter of commerce. Under this branch of the prerogative he has power to establish public marts, or places of buying and selling; such as markets and fairs, with the tolls belonging to them; and likewise to regulate weights and measures; to give money, which is the medium of commerce, authority, or to make it current; and the coining of money is the act of the sovereign power, and the settling of the denomination or value for which the coin is to pass current. The king may also at any time decay or cry down any coin of the kingdom, and make it no longer current.

Debts due to him are always to be satisfied in the first place, in case of executorship, &c. and till his debt is discharged, he may protect the creditor from the arrests of others. He may distrain for the whole debt on a tenant that holds but part of the land; is not obliged to demand his rent as others are, may sue in what court he pleases, and distrain where he lists. In all doubtful cases, *semper præsumitur pro rege*: no statute restrains him, unless he be particularly named. In all cases where the king is plaintiff, his officers may enter with an arrest; and, if entrance be denied, break open a house, and seize the party; though in other cases a man's house is his castle, and has a privilege to protect him against all arrests.

He has custody of the persons and estates of idiots and lunatics; he is *ultimus hæres regni*, and to him revert all estates, when no heir appears. All treasure-trove (i. e. money, plate, or bullion, found, and the owners not known) belongs to him; so all waifs, strays, wrecks, lands recovered from the sea, gold and silver mines, royal fishes, &c. belong to him. See REVENUE. He can unite, separate, enlarge, or contract, the limits of bishoprics, or ecclesiastical benefices, and by his letters erect new bishoprics, colleges, &c. See REGALIA.

He can dispense with the rigour of the ecclesiastical laws, except those which have been confirmed by an act of parliament, or declared

KING.

by the bill of rights; as, for a husband to be a priest, for a bishop to hold a benefice in commendam, &c. He has also power to dispense with several acts of parliament, and penal statutes, by a non-obstante, where himself is alone concerned; to moderate the rigour of the law, according to equity; to pardon a man condemned by law, except in appeals of murder, and in case of impeachments by the house of commons; and to interpret by his judges, in statutes and cases not defined by law.

But though he be intrusted with the whole executive power of the law, yet he cannot sit in judgment in any court; for justice must be administered according to the powers committed and distributed to the several courts.

The law esteems him God's viceregent on earth, and ascribes various perfections to him, not belonging to any other man. "*Rex est vicarius,*" says Bracton, "*et minister Dei in terra. Omnis quidem sub eo est, et ipse sub nullo, nisi tantum sub Deo.*" He is said to have imperial dignity, and in charters before the Conquest is frequently styled *basileus*, and *imperator*, the titles respectively assumed by the emperors of the East and West. His realm is declared to be an empire, and his crown imperial, by many acts of parliament, particularly the statutes 24 Hen. VIII. cap. 12 and 25 Hen. VIII. cap. 28 which at the same time declare the king to be the supreme head of the realm in matters both civil and ecclesiastical, and consequently inferior to no man upon earth, dependent on no man, and accountable to no man. See also 24 Geo. II. cap. 24 5 Geo. III. cap. 27. Hence it is that no suit or action can be brought against the king, even in civil matters, because no court can have jurisdiction over him. The law also ascribes to the king, in his political capacity, absolute perfection. The king can do no wrong, by which ancient and fundamental maxim we are not to understand, that every transaction of government is of course just and lawful, but that whatever is exceptionable in the conduct of public affairs is not to be imputed to the king, nor is he answerable for it personally to his people; and farther, that the prerogative of the crown extends not to do any injury; it is created for the benefit of the people, and therefore cannot be exerted to their prejudice. In the king there is no folly or weakness; no injustice or error, and, therefore, if the crown should be induced to make an improper grant of any franchise or privilege, the law declares that the king was deceived in his grant, and thereupon such grant is rendered void, merely upon the foundation of fraud and deception, either by or upon those agents whom the crown has employed. Yet, notwithstanding this personal perfection which the law ascribes to the sovereign, the constitution has allowed a latitude of supposing the contrary, in respect to both houses of parliament; each of which, in its turn, hath exerted the right of remonstrating and complaining to the king even of those acts of royalty, which are most properly his own; such as messages

signed by himself, and speeches delivered from the throne; nevertheless, for the sake of freedom of debate, these acts of state are usually supposed to proceed from the advice of the administration. In the king likewise there can be no negligence or *laches*, and, therefore, no delay will bar his right: *nullum tempus occurrit regi*. In the king also there can be no infamy, stain, or corruption of blood:

By his crown he is, *ipso facto*, cleared of all attainder; no non-age or minority are allowed in him; and his very grants of lands, though held in his natural capacity, cannot be avoided by non-age. Nay more, the law ascribes a kind of perpetuity, or immortality, to him: *rex Angliæ non moritur*. His death is termed his *demise*, because the crown is thereby demised to another.

He is said not to be liable to death, as being a corporation of himself, that lives for ever. There is no interregnum, but the moment one king dies, his heir is king, fully and absolutely, without any coronation, ceremony, &c. If, however, the throne becomes empty or vacant, whether by abdication, as in the time of James II., or by failure of all heirs, the two houses of parliament may, it is said by Blackstone, dispose of it.

The preamble to the bill of rights expressly declares, that the lords spiritual and temporal, and commons, assembled at Westminster, lawfully, fully, and freely represent all the estates of the people of this realm. The lords are not less the trustees and guardians of their country than the members of the House of Commons. It was justly said, when the royal prerogatives were suspended, during his Majesty's illness in 1788, that the two houses of Parliament were the organs by which the people expressed their will: and in the House of Commons, on the 16th of December, in that year, two declaratory resolutions were accordingly passed, importing, 1. The interruption of the royal authority; 2. That it was the duty of the two Houses of Parliament to provide the means of supplying that defect. On the 23d of the same month a third resolution passed, empowering the Lord Chancellor of Great Britain to affix the great seal to such bill of limitations as might be necessary to restrict the power of the future regent to be named by Parliament. This bill was accordingly brought forward, not without considerable opposition to its provisions, as well from private motives, as on forcible political grounds; and at length, happily for the public, arrested in its progress, by the providential recovery of his Majesty, in March 1789. It is observable, however, that no bill was ever afterwards introduced to guard against a future emergency of a similar nature: on the grounds, undoubtedly, of delicacy to a monarch universally beloved; in the hope of the improbability that such a circumstance should recur in future: and in the confidence of the omnipotence of Parliament, if necessarily called upon again.

The law attributes a kind of ubiquity to the king; he is in a manner every where, in all

KING.

seats of judicature, which he alone has the right of creating, and therefore cannot be removed. The power of issuing proclamations is vested in the king alone, considered as the fountain of justice.

Some things, however, there are which the king cannot do; viz. he cannot divest himself, or successors, of any part of his regal prerogative, authority, &c. There are several things also which he cannot do *salvo jure, salvo jureamento, et salva conscientia sua*: in particular, there are two things which he cannot do without the consent of parliament; viz. make new laws, or raise new taxes.

The coronation oath is conceived in the following terms:

The archbishop or bishop shall say, Will you solemnly promise and swear to govern the people of this kingdom of England, (*quære* Great Britain. See statute 5 Ann. c. 8, sect. 1. and this dictionary, title Scotland) and the dominions thereto belonging, according to the statutes in parliament agreed on; and the laws and customs of the same? The king or queen shall say, I solemnly promise so to do. Archbishop or bishop, Will you to your power cause law and justice, in mercy, to be executed in all your judgments? King or queen, I will. Archbishop or bishop, Will you to the utmost of your power maintain the laws of God, the true profession of the gospel, and the protestant reformed religion established by the law? and will you preserve unto the bishops and the clergy of this realm, and to the churches committed to their charge, all such rights and privileges as by law do or shall appertain unto them or any of them? King or queen, All this I promise to do. After this the king or queen, laying his or her hand upon the Holy Gospels, shall say, The things which I have here before promised I will perform and keep, so help me God. And then shall kiss the book. It is also required, both by the Bill of Rights, 1 William and Mary, statute 2, c. 2, and the act of settlement, 12 and 13 William III. c. 2, that every king and queen, of the age of twelve years, either at their coronation, or on the first day of the first parliament, upon the throne in the House of Peers (which shall first happen) shall repeat and subscribe the declaration against Popery, according to 30 Charles II. statute 2, c. 1.

The above is the form of the coronation oath, as it is now prescribed by our laws, the principal articles of which appear to be at least as ancient as the mirror of justices (c. 1. sect. 2.); and even as the time of Bracton. See 1. 3. tr. 1. c. 9. The act of union, statute 5 Ann. c. 8, recites and confirms two preceding statutes; the one of the parliament of Scotland, the other of the parliament of England; which enact, the former, that every king, at his accession, shall take and subscribe an oath to preserve the protestant religion, and presbyterian church government in Scotland; the latter, that at his coronation he shall take and subscribe a similar oath to preserve the settlement of the church of England, within England,

Ireland, Wales, and Berwick, and the cities, towns, and boroughs therein belonging.

Upon the whole, therefore, it seems clear, that whatever may have become of the nominal, the real power of the crown has not been too far weakened by any transactions in the last century. Much is indeed given up; but much is also acquired. The stern commands of prerogative have yielded to the milder voice of influence: the slavish and exploded doctrine of non-resistance has given way to a military establishment by law; and to the disuse of parliaments has succeeded a parliamentary trust of an immense perpetual revenue. When, indeed, by the free operation of the sinking fund, our national debts shall be lessened; when the posture of foreign affairs, and the universal introduction of a well planned and national militia, will suffer our formidable army to be thinned and regulated, and when (in consequence of all) our taxes shall be gradually reduced; this adventitious power of the crown will slowly and imperceptibly diminish, as it slowly and imperceptibly rose. But till that shall happen, it will be our especial duty, as good subjects and good Englishmen, to reverence the crown, and yet guard against corrupt and servile influences from those who are intrusted with its authority; to be loyal, yet free, obedient, and yet independent.

King at Arms, or of Arms, is an officer of great antiquity, and anciently of great authority, whose business is to direct the heralds, preside at their chapters, and have the jurisdiction of armoury. In England there are three kings of arms, viz. garter, clarenceux, and norroy.

Garter, principal King at Arms, was instituted by Henry V. His business is to attend the knights of the garter at their assemblies, to marshal the solemnities at the funerals of the highest nobility, and to carry the garter to kings and princes beyond the sea; on which occasion he used to be joined in commission with some principal peer of the kingdom. See GARTER.

Clarenceux King at Arms, is so called from the duke of Clarence, to whom he first belonged. His office is to marshal and dispose the funerals of all the inferior nobility, as baronets, knights, esquires, and gentlemen, on the south side of the Trent. See CLARENCEUX.

Norroy King at Arms, is to do the same on the north side of the river Trent. Clarenceux and Norroy are also called provincial heralds, in regard they divide the kingdom between them into provinces. By charter, they have power to visit noblemen's families, to set down their pedigrees, distinguish their arms, appoint persons their arms, and with Garter to direct the other heralds. Anciently the kings at arms were created and solemnly crowned by the kings of England themselves, but of later days, the earl marshal has a special commission at every creation to personate the king.

Lyon King at Arms, for Scotland, is the second king at arms for Great Britain; he is invested and crowned with great solemnity. To

K I N G.

him belongs the publishing king's proclamations, marshalling funerals, reversing arms, &c. See *LYON*.

KING (Dr. John), a learned English bishop in the 17th century, bred at Westminster school, and afterward at Christ-church, Oxford. He was appointed chaplain to queen Elizabeth. In 1605 he was made dean of Christ-church, and was for several years vice-chancellor of Oxford. In 1611 he was advanced to the bishopric of London. Besides his Lectures upon Jonah, delivered at York, he published several sermons. King James I. used to style him the king of preachers; and lord chief justice Coke often declared, that he was the best speaker in the star-chamber in his time. He was so constant in preaching after he was a bishop, that, unless he was hindered by want of health, he omitted no Sunday wherein he did not visit some pulpit in London or near it. Soon after his death, the Papists reported, that he died a member of their church. But the filsty of this story was sufficiently exposed by his son Dr. Henry King, in a sermon at St. Paul's cross soon after, by bishop Godwin in the Appendix to his *Commentarius de præsulibus Angliæ*, printed in 1622; and by Mr. John Gee, in his book, entitled, *The Foot out of the Snare*.

KING (Dr. Henry), bishop of Chichester, eldest son of the former, was born in 1591, and educated at Oxford. He became an eminent preacher, and chaplain to king James I. and Charles I. In 1638 he was made dean of Rochester; and in 1641 was advanced to the see of Chichester. Upon the breaking out of the civil wars, and the dissolution of episcopacy, he was treated with great severity by the friends to the parliament; but recovered his bishopric at the restoration. This worthy prelate, who had a most amiable character, died in 1669, and was interred at his cathedral of Chichester, where a monument was erected to his memory. He published, 1. The psalms of David turned into metre. 2. Poems, elegies, paradoxes, and sonnets. 3. Several sermons, and other works.

KING (Edward), an ingenious and promising young man, who was fellow of Christ college, Cambridge, in 1633, and was drowned not long after, in his passage from Chester to Ireland, which melancholy event occasioned Milton's beautiful poem entitled *Lycidas*. Some of Mr. King's poems are in Nichols's collection of the poets.

KING (Dr. William), an ingenious English writer, was born in London in 1663, and educated at Westminster school, from whence he was elected to Christ church, Oxford, where he was admitted a student in 1686, and entered upon the law line. His first performance was a *Vindication of the Character of Wickliffe* from the aspersions of Varillas. In 1692 he took his degrees of B. and D. L. L. and the same year was admitted an advocate of doctor's commons. In 1694 he published *Animadversions on Lord Melesworth's pretended Account of Denmark*, for which he was appointed secretary to the princess Anne.

In 1699 he joined in the controversy relative to Phalaris's Epistles, and was rather rudely handled by Dr. Bentley on that occasion. Being of an indolent but pleasant humour, he neglected business, and involved himself in embarrassments, to relieve himself from which he accepted the offer of preferment in Ireland, where he was judge of the high court of admiralty, commissioner of prizes, and keeper of the records in Birmingham's tower. However, with all these advantages he returned to England not much richer than he went in 1708. He interested himself very warmly in favour of Dr. Sacheverel, and wrote some humorous pamphlets on that memorable affair. In 1711 he was appointed Gazette writer, but the fatigues of the office obliged him to resign it in 1712, in which year he died, and was buried in the cloisters of Westminster-abbey. Dr. King was a writer of considerable humour both in prose and verse, and was greatly esteemed by Dr. Swift, and the most eminent writers of that age. Besides his fugitive pieces, which have been collected into three volumes 8vo, he published an *Historical Account of the Heathen Gods*, 12mo. (*Watkins*).

KING (Dr. William), archbishop of Dublin, was born at Antrim in Ireland, in 1650, and brought up at Trinity college, Dublin. He resisted popery so ably in the reign of James II. that, at the revolution, he was made dean of St. Patrick's, and in 1690 bishop of Derry. The year following he published *The State of the Protestants in Ireland*, which occasioned considerable observation, and was very serviceable to king William. In 1694 he printed his *Discourse concerning the Inventions of Men in the Worship of God*, which brought him into a controversy with Mr. Boyse, a dissenting minister at Dublin. In 1702 appeared his greatest work, entitled *De Origine Mali*, which was animadverted on by Boyle, Leibnitz, and other writers: this year he was promoted to the see of Dublin, where he died in 1729. The late bishop Law published a corrected and enlarged edition of the archbishop's book on the *Origin of Evil*, in English, with notes. (*Watkins*).

KING (Peter), chancellor of England, was born at Exeter in 1609. His father was a grocer in that city, and intended his son for the same business; but his passion for learning rendered him superior to trade, and he was suffered to follow his inclination. Mr. Locke, who was his uncle, left him half his library at his death, and this, doubtless, was of great service to him. By the advice of that great man he went to Leyden; at his return from whence he entered himself a student of the Inner Temple, where he applied to the law with great assiduity. While he was thus employed he did not neglect other studies, particularly that of ecclesiastical history, for in 1691 he published, but without his name, *An Inquiry into the Constitution, Discipline, Unity, and Worship of the Primitive Church*, that flourished within the first 300 Years after Christ, 8vo. In 1699 he was chosen into parliament for

K I N G.

Bees-Alston, in Devonshire. In 1702 appeared his *History of the Apostles Creed*, a work of great learning and excellence. In 1708 he was chosen recorder of London, and knighted the same year. The following year he was appointed one of the managers of the house of commons on the trial of Dr. Sacheverel. At the accession of George I. he was made chief justice of the court of common pleas. In 1725 he was created a peer by the title of lord King, baron of Ockham in Surrey, and shortly after appointed lord chancellor. He resigned the seals in 1733, and died the same year, leaving behind him four sons and two daughters.

KING (William), an English civilian and ingenious writer, born at Stepney in 1685, and educated at Balliol college, Oxford. In 1718 he was chosen principal of St. Mary hall, but, on offering himself a candidate to represent the university in parliament, he resigned that place. Being disappointed in his expectation he went to Ireland, but how long he remained there is not said. While he was in Ireland he wrote a satirical poem, entitled, *The Toast*, under the name of Scheffer a Laplander. In 1749 he spoke the oration in the theatre at Oxford, on the dedication of Radcliffe's library, for which he is finely complimented by Mr. Warton, in his *Triumphs of Isis*. Dr. King was a zealous tory, and generally looked upon as disaffected to the Brunswick family, which brought upon him, from various quarters, a torrent of abuse. He published several curious tracts of his own, and also the first five volumes of South's Sermons. He died in 1763.

To KING. v. a. (from the noun.) 1. To supply with a king (*Shakspeare*). 2. To make royal, to raise to royalty (*Shakspeare*).

KINGS (books of), two canonical books of the Old Testament, so called, because they contain the history of the kings of Israel and Judah, from the beginning of the reign of Solomon, down to the Babylonish captivity, for the space of near six hundred years. The first book of Kings contains the latter part of the life of David, and his death; the flourishing state of the Israelites under Solomon, his building and dedicating the temple of Jerusalem, his shameful defection from the true religion, and the sudden decay of the Jewish nation after his death, when it was divided into two kingdoms: the rest of the book is taken up in relating the acts of the four kings of Judah and eight of Israel. The second book, which is a continuation of the same history, is a relation of the memorable acts of sixteen kings of Judah, and twelve of Israel, and the end of both kingdoms, by the carrying of the ten tribes captives into Assyria by Salmanassar, and the other two into Babylon by Nebuchadnezzar.

It is probable that these books were composed by Ezra, who extracted them out of the public records, which were kept of what passed in that nation.

KING'S-COUNTY, a county of the province of Leinster in Ireland, taking its name from king Philip of Spain, husband to queen Mary. It is bounded on the north by West Meath; on the south by Tipperary and Queen's county, from which it is divided by the Barrow; and part of Tipperary and Galway on the west, from which it is separated by the Shannon. It is a fine fruitful country, containing 257,510 Irish plantation acres, 50 parishes, 11 baronies, and two boroughs, and returned six members to parliament. It is about 47 miles long, and 17 broad, and the chief town is Philipstown.

KING'S EVIL. See **SCROPHULA**.

KING GEORGE'S SOUND. See **NOOTKA SOUND**.

KING'S BENCH. See **BENCH**.

KING'S HOUNDS. The stag-hounds belonging to the royal establishment, continued through every successive reign without variation. The kennel in which they are kept is situate near the race-course upon Ascot Heath; two short miles distant from which is Swinley Lodge, the official residence of the Master of the Stag Hounds, an appointment generally conferred upon a peer, with a salary of 2000*l.* per annum. The presence of the Master of the Stag Hounds in the field is not a matter of necessity, except when his majesty hunts, and then his personal attendance is indispensable; his badge of office is a pair of gold dog couples, which hang suspended from a belt on his left side. The huntsman has a handsome residence at the kennel, with a salary of 125*l.* a year; to whom there are allowed six assistants (called yeomen pricklers), each having a salary of 104*l.* with the royal livery richly ornamented, and an annual supply of saddles, bridles, horse-cloths, and stable appendages, but they are obliged to find their own horses.

The hunting season commences on Holyrood-Day, the 25th of September, and continues every Tuesday and Saturday till the first week in May; with the exception of Christmas and Easter weeks, when the hounds hunt three times in each. Holyrood-Day and Easter-Monday are the two grand days of the year for company, and the field is then exceedingly numerous. His majesty has also a pack of harners, which are kept at the Little Park Lodge near Windsor, and with these he hunts constantly in Windsor Great Park, and the surrounding neighbourhood; these are, however, a private concern of the king's, and not included in the regular crown establishment.

KING'S PLATE. The plates thus denominated are a free gift from his majesty of 100 guineas each; originally granted to certain towns as a mean of exciting emulation, and improving the breed of horses in general. Newmarket, as the spot of chief celebrity, is particularly honoured, having two king's plates in the first Spring, and one in the first October meeting. King's plates are also given at New-

THE KING'S PLATE.

castle-upon-Tyne, Carlisle, Winchester, Exeter, Bath, Salisbury, London, Newmarket, Leicester, Lincoln, York, Canterbury, Warwick, Lichfield, Richmond, (Yorkshire), Lincoln, Salisbury, Ayr, Carlisle, and Ascot-Heath; the whole of which, except the last, are run for by horses or mares of different ages, carrying such weights as shall be appointed by the Master of the Horse, or whosoever he may delegate for that purpose.

The King's plate of 100 guineas, given at Ascot, and always run for on the first day (invariably Whit-Tuesday fortnight), is only for horses which have regularly hunted with his majesty's stag hounds the preceding season, and must have been well up with the hounds, at their pursuing, taking, or killing, ten deer, as an indispensable qualification. At the conclusion of the chase, when the deer is secured, those who intend to qualify for the plate apply to the huntsman, and a ticket is delivered to the rider, bearing the arms of the Master of the Stag Hounds, and the seal of the royal hunt; ten tickets being thus obtained, the horse has secured his qualification, and may be withdrawn from the field, and is not obliged to appear again till the day of entrance at Sunning-Hill Wells; where and when the tickets must be produced, in proof of a due qualification to start. For the accommodation of sportsmen in general, horses of all ages are permitted to run, carrying the following weights: four years old, 11st. 2lb. five years old, 11st. 9lb. six years old, 11st. 12lb. and aged 12st. Mares allowed 4lb. The best of three four-mile heats.

The following rules are, by his majesty's command, to be strictly observed by the owners and riders of all such horses, mares, or geldings, as shall run for the king's plates at Newmarket.

King's Plate Articles.—Every person that putteth in a horse, mare, or gelding, for the said plate, is to shew such horse, mare, or gelding, with the marks, name, and name of the owner, to be entered at the king's stables in Newmarket the day before they run, and shall then produce a certificate under the hand of the breeder, specifying his exact age the grass before.

Every horse, mare, or gelding, that runneth, is to start between the hours of one and four in the afternoon; and to be allowed half an hour between each heat to rub.

Every horse, mare, or gelding, that runneth on the wrong side the posts or flags, or is distanced in any of the heats, shall have no share of the said plate, nor be suffered to start again.

The horse, mare, or gelding, that winneth any two heats, winneth the plate; but if three several horses, mares, or geldings, win each of them a heat, then those three, and only they, to run a fourth; and the horse, mare, or gelding, that winneth the fourth heat, shall have the plate.

And each horse, mare, or gelding's place, as he or they come in by the ending-post each heat, as first, second, or third, &c. shall be

determined by such judges as shall be appointed for that purpose by the Master of the Horse. And in case any horse, mare, or gelding, shall be then, or after prove to be, above the age certified the grass before, the owner or owners of such horse, mare, or gelding, shall be rendered incapable of ever running for any of the king's plates hereafter.

As many of the riders as shall cross, jostle, or strike, or use any other foul play, to be judged by such person or persons as shall be appointed by the master of the horse, such rider shall be made incapable of ever riding any horse, mare, or gelding, for any of his majesty's plates hereafter; and such owners shall have no benefit of that plate; but such owners may be permitted to run any horse, mare, or gelding, for any other of his majesty's free plates in future.

Every rider shall, immediately after each heat is run, be obliged to come to the ending-post with his horse, mare, or gelding, then and there to alight, and not before, and there to weigh to the satisfaction of the judges appointed for that purpose.

And in case of neglect or refusal thereof, such winners and riders shall be immediately declared incapable of running or riding any more for this or any of his majesty's plates in future.

And should any difference arise relating to their ages, or in their running, or to these his majesty's orders, the same to be determined by such person, or persons, as shall be appointed by the master of the horse. And these articles are to continue in force, unless altered by command of his majesty.

For the better and more certain prevention of any fraud, or misapplication, the winner of a king's plate is to receive from the clerk of the course a certificate signed by the steward of the race where such plate is won, countersigned by himself also, which being presented to the lord lieutenant of the county, it obtains his signature likewise: when thus sanctioned, it becomes payable at sight to bearer (if properly endorsed by the winner) at the office of the clerk of his majesty's stables, in the King's Mews, London. The lord lieutenant of a county being out of the kingdom, the signature of any person regularly deputed by him is sufficient. The certificate of winning the plate at Ascot requires only the signature of the master of his majesty's stag hounds, instead of the lord lieutenant of the county.

KINGCRAFT. *s.* (*king and craft.*) The art of governing (*King James*).

KINGCUP. *s.* (*king and cup.*) A flower (*Gay*).

KINGDOM. *s.* (*from king.*) 1. The dominion of a king; the territories subject to a monarch (*Shakspeare*). 2. A different class or order of beings: as, the *mineral*, the *vegetable*, and the *animal* kingdom (*Locke*). 3. A region; a tract (*Shakspeare*).

KINGHORN, a parliament town in the county of Fife in Scotland, on the Frith of Forth, directly opposite to Lenth. Here is a

K I N

KNIGHTS of, thread-socks knit by the women; the men, being chiefly mariners, are employed in coasting ships, in the fishery, or the passage-boats from hence to Leith, from which the town of Kinghorn derives considerable advantage. This place gives a second title to the earl of Strathmore.

KINGLIKE, *KINGLY*, *a.* (from *king*.)

1. Royal; sovereign; monarchical (*Shaksp.*).
2. Belonging to a king (*Shaksp.*). 3. Noble; august; magnificent (*Sidney*).

KINGLY, *ad.* With an air of loyalty; with superior dignity (*Milton*).

KING-PIECE or **KING-POST**, is a piece of timber set upright in the middle, between two principal rafters, and having struts or braces going from it to the middle of each rafter.

KINGSBRIDGE, a town of Devonshire, 217 miles from London. It is a pretty place, with a harbour for boats, a free-school, a market, and a fair.

KING'S FERRY, in Kent, the common way from the main land into the isle of Sheppey; where a cable of about 140 fathoms in length, fastened at each end across the water, serves to get the boat over by hand. For the maintenance of this ferry, and keeping up the highway leading to it through the marshes for above a mile in length, and for supporting a wall against the sea, the land occupiers tax themselves yearly one penny per acre for fresh marsh land, and one penny for every ten acres of salt marsh land. Here is a house for the ferry-keeper, who is obliged to tow all travellers over free, except on these four days, viz. Palm Monday, Whit Monday, St. James's day, and Michaelmas day, when a horseman pays two-pence, and a footman one penny. But on Sundays, or after eight o'clock at night, the ferry-keeper demands sixpence of every horseman, and two-pence of every footman, whether strangers or the land occupiers.

KINGSHIP, *s.* (from *king*.) Royalty, monarchy (*King Charles*).

KINGSTON, a town of United America, in the state of New York, situated on the Hudson's River, eighty miles N. New York, and thirty-eight S. Albany.

KINGSTON, a town of United America, in the state of North Carolina: thirty-two miles W. Newbern.

KINGSTON, a town of United America, in the state of South Carolina: eighty-two miles N.E. Charlestown. Lon. 78. 51 W. Lat. 33. 52 N.

KINGSTON, a seaport town on the south coast of the island of Jamaica, built in the year 1692-3, on the north side of a beautiful harbour, after the destruction of Port Royal. Mr. Edwards, in his History of the West Indies, says, "It contains 1665 houses, besides negro huts and warehouses. The number of white inhabitants, in the year 1788, was 6539, of free people of colour 3280, of slaves 16,659, total number of inhabitants, of all complexions and conditions, 26,478. It is a place of great trade and opulence. Many of the houses in the upper part of the town are extremely mag-

K I N

nificent, and the markets for butcher's meat, turkeys, poultry, fruits, and vegetables, are inferior to none. I can add, too, from the information of a learned and ingenious friend, who kept comparative registers of mortality, that since the surrounding country is become cleared of wood, this town is found to be as healthful as any in Europe: ten miles E. Spanish Town. Lon. 76. 33 W. Greenwich. Lat. 18. N.

KINGSTON UPON HULL. See **HULL**.

KINGSTON UPON THAMES, a town of England, in the county of Surry, situated on the river Thames, as its name imports, and once the residence of the Saxon kings, several of whom were crowned here. The lent assizes for the county are held here. It once returned members to the British parliament, but was disfranchised by the desire of the inhabitants. Here is a weekly market on Saturday: eighteen miles N.N.E. Guildford, and eleven and a half S.W. London.

KINGTON, or **KYNETON**, a pretty large town in Herefordshire, 140 miles from London. It is situated on the river Arrow, and is inhabited chiefly by clothiers, who drive a considerable trade in narrow cloth. It has a charity-school, a market, and three fairs.

KING-TE-TCHING, a town of China, in the province of Kiang-si. This town, where the best makers of china-ware live, is as populous as the greatest cities of China, and wants nothing but walls to make it a city. These places are called *tching*, that are of great resort and commerce, but not walled. They compute in this town more than 1,000,000 of souls. They consume here every day more than 10,000 loads of rice, and above 1000 hogs, without mentioning other animals which they feed upon. The lodgings of the great merchants take up a vast space, and contain a prodigious number of workmen. King-te-tching is a league and a half long, standing on the side of a fine river; the streets are very long, and cut and cross one another at certain distances; all the ground is made use of, so that the houses are too much confined, and the streets too narrow, in going through them, one seems to be in the middle of a fair, and hears on all sides the noise the porters make to clear the way. Strangers are not permitted to lie at King-te-tching; they must either pass the night in their barks, or lodge with their acquaintance, who pass their word for their conduct. 655 miles S. Peking. Lon. 134. 40 E. Ferro. Lat. 29. 23 N.

KINNOR. See **CHINNOR**.

KINO. (*kino*, Indian.) *Gummi gambiense*. *Gummi rubrum adstringens gambiense*. The tree from which this resin is obtained, though not botanically ascertained, is known to grow on the banks of the river Gambia, in Africa. On wounding its bark the fluid kino immediately issues drop by drop, and by the heat of the sun, is formed into hard masses. It is very like the resin called *Sanguis draconis*; is much redder, more firm, resinous, and adstringent than catechu. It is now in common use, and

KIP

is the most efficacious vegetable adstringent, or styptic, in the materia medica.

KINOLI, a town of Asiatic Turkey, in the province of Natolia, on the coast of the Black Sea: sixteen miles N.W. Sinob.

KINROSS, a town of Scotland, in the county of the same name, on the river Leven, before it enters Loch Leven. The principal trade is in the linen manufacture and cutlery: ten miles S Perth, and eighteen N N.W. Edinburgh.

KINROSSSHIRE, a county of Scotland, bounded on the north-east, east, and south by the county of Fife, on the other by part of the county of Perth; almost circular, and about thirty miles in circumference. Kinross is the principal town.

KINSALIE, a town of Ireland, in the county of Cork, situated at the mouth of the river Bandon, which forms a fine harbour, called the Harbour of Kinsale, and is navigable for large sloops near twelve miles above the town, though a bar prevents large men of war coming into the basin. In this port there is a dock furnished with stores for the use of the navy. The entrance of the harbour is defended by a fort, which, having been constructed in the reign of Charles II. is called Charlesfort, and in which there is always a good garrison. The town, which contains at least 10,000 inhabitants, is built on the side of Compass-hill, and close to the water's edge: twelve miles S. Cork. Lon. 8. 30 W. Greenwich. Lat. 51. 43 N.

KINSFOLK. *s.* (*kin* and *folk*.) Relations; those who are of the same family (*Spectator*).

KINSIMA, or **THE ISLAND OF GOLD**, an island of Japan.

KINSMAN. *s.* (*kin* and *man*.) A man of the same race or family (*Addison*).

KINSWOMAN. *s.* (*kin* and *woman*.) A female relation (*Dennis*).

KINTORE, a royal borough of Aberdeenshire in Scotland, situated on the river Don, in lon. 2. 5 W. lat. 57. 38. N. It gives the title of earl to a branch of the noble family of Keith, but in other respects is inconsiderable.

KINTYRE. See **CANTIRE**.

KIOF, a town of Poland, in a palatinate of the same name, with an archbishop's see, and a castle. It is the capital of the Russian government of Kiof, and carries on a considerable trade. It is divided into the Old and New Town, and seated on the W. side of the Dnieper, 180 miles N.E. of Kamienieck, and 335 E. by S. of Warsaw. Lon. 31. 51 E. Lat. 50. 30 N.

KIOF, or **KIOW**, a government of the Russian empire, being part of the Ukraine, or Little Russia. It lies on the E. side of the Dnieper, although Kiof, the capital, is on the W. side. It was once a duchy, belonging to the great dukes of Russia, and Kiof was their capital.

KIPPIS (Andrew, D.D. F.R. and A.S.), was born at Nottingham, March 28 (O.S.) 1725. His father, a respectable tradesman of that town, was descended from the Rev. Ben-

KIP

jamin King of Oakham, Rutlandshire, an ejected minister; and his mother, Ann Ryther, was the grand-daughter of the Rev. John Ryther, who was ejected from the church of Fernby, in the county of York. In the year 1730, he lost his father, and went to reside with his grandfather, Andrew Kippis of Seaford in Lincolnshire. He received his classical education at the grammar school in that town; but what contributed most to his future eminence, was the friendship of the Rev. Mr. Merrill, who was equalled by few of his contemporaries in various branches of learning, particularly in his acquaintance with the classics, his knowledge of ancient and modern history, and his refined taste in the belles lettres. Dr. Kippis frequently said, that it was impossible for him to express his obligations to this friend of his youth. In 1741 he removed to Northampton, and commenced his academical studies under Dr. Doddridge. After a residence of five years at the academy, he was invited by several congregations to become their minister. Though he was pressed to settle at Dorchester, and had been chosen their minister, he gave the preference to an invitation from Boston in Lincolnshire, where he went to reside in September 1746. Here he continued four years; and in November 1750, accepted the pastoral charge of a congregation at Dorking in Surry. The congregation meeting in Princes-street, Westminster, having been without a minister about two years, he was chosen, in June 1753, to succeed the Rev. Dr. Obadiah Hughes. On the 21st of September following, he married, at Boston, Miss Elizabeth Bott, one of the daughters of Mr. Isaac Bott, a merchant of that place; and in the month of October fixed his residence in Westminster. In June 1767, he received the degree of D.D. from the University of Edinburgh, on the unsolicited recommendation of the late learned professor Robertson. He was elected a member of the Society of Antiquaries on the 19th of March 1778; and on the 17th of June 1779, he was chosen a Fellow of the Royal Society. In both Societies he had the honour of being in the council two years.

The powers of mind which he derived from nature, and which he had cultivated with unremitting diligence and peculiar success, were not to be confined to the narrow limits of private life and the duties of the pastoral charge, however important; they were designed for more extensive and important services to his country and to mankind. The interests of literature, science, and religion, have received from the exertion of his talents as a writer the most essential advantages. His first efforts in literature were made in the Gentleman's Magazine, a periodical publication called the Library, and the Monthly Review; to each of which he contributed many important articles, especially in the historical and philological departments of the last. He was the author of three tracts, viz. A Vindication of the Protestant Dissenting Ministers, &c.; Observations on the late Contests in the Royal Society;

Kame and insipid work; and *Considerations on the Treaty with America, &c.* His improved edition of Dr. Doddridge's *Lectures* is a work of great value, though it is certainly overladen with references; and the *History of Knowledge, Learning, and Taste, in Great Britain*, prefixed to the *New Annual Register*, merits, and has received, the approbation of the public. His *Life of Dr. Doddridge* is an interesting piece of biography; but inferior to that by Job Orton. He published at different times several single sermons, among which, that on the death of his friend the Rev. Mr. Laugher, is intitled to high praise. The greater part of these he republished, with other practical discourses, in the year 1794: but the work which, next to the studies immediately connected with his office as a Christian minister, engaged his principal attention, and by which he has long been distinguished, is, the improved edition of the *Biographia Britannica*. In this great national publication, the correctness of his judgment, the extent of his information, his indefatigable researches and unremitting assiduity, his peculiar talent of appreciating the merits and analyzing the labours of the most eminent writers, and his unbiassed fidelity, and impartial decision on the characters of the philosopher, statesman, poet, scholar, and divine, are strongly displayed, and universally acknowledged. His style, formed on the models of Sir William Temple and Addison, is remarkable for its elegance and purity; though it is often cold and feeble, force being in such cases sacrificed to verbal correctness, the attention being more bent towards the latter than towards the former. Dr. Kippis died Oct. 8, 1795. He will long be remembered as a man of learning and taste; but had he thought more, and read less, he would have attained still higher eminence.

KIRBY. See **KIRKBY**.

KIRCH (Christian Frederick), of Berlin, a celebrated astronomer, was born at Guben in 1694. He acquired great reputation in the observatories of Dantzic and Berlin. Godfrey Kirch his father, and Mary his mother, also acquired considerable reputation by their astronomical observations. This family corresponded with all the learned societies of Europe, and their astronomical works are in great repute.

KIRCHER (Athanasius), a famous philosopher and mathematician, was born at Fulde in 1601. He entered into the society of the Jesuits in 1618, and taught philosophy, mathematics, the Hebrew and Syriac languages, in the university of Wirtsburg, with great applause, till the year 1631. He retired to France on account of the ravages committed by the Swedes in Franconia, and lived some time at Avignon. He was afterwards called to Rome, where he taught mathematics in the Roman college, collected a rich cabinet of machines and antiquities, and died in 1680, in the 80th year of his age.

The quantity of his works is immense, amounting to 22 volumes in folio, 11 in quarto, and three in octavo; enough to employ

a man for a great part of his life even to transcribe them. Most of them are rather curious than useful; many of them visionary and fanciful; and it is not to be wondered at, if they are not always accompanied with the greatest exactness and precision. The principal of them are, 1. *Prelusiones Magneticæ*. 2. *Primitivæ Gnomonicæ Catoptricæ*. 3. *Ars magna Lucis et Umbrae*. 4. *Musurgia Universalis*. 5. *Obeliscus Pamphilus*. 6. *Oedipus Ægyptiacus*; four volumes folio. 7. *Itinerarium Extaticum*. 8. *Obeliscus Ægyptiacus*; four volumes folio. 9. *Mundus Subterraneus*. 10. *China Illustrata*.

KIRIATHAIM, in ancient geography, one of the towns built by the Reubenites; reckoned to the tribe of Reuben (Joshua, xiii.), twelve miles to the west of Midaba. The ancient residence of the giants called Emun.

KIRIATH-ARBA. See **HEBRON**.

KIRIATH-BAAL, or **CARIATH-BAAL**, called also **KIRIATH-JEARIM**, the city of the woods; one of the cities of the Gibeonites belonging to the tribe of Judah, nine miles from Aelia, in the road to Diospolis. It was also called Baala (Joshua). The ark of the covenant, after its recovery from the Philistines, stood for some time in this city (1 Sam. vii).

KIRK, a Saxon term, signifying the same with church. The word is now used in that sense in Scotland.

KIRK-SESSIONS, the name of a petty ecclesiastical judicatory in Scotland. Each parish, according to its extent, is divided into several particular districts; every one of which has its own elder and deacon to oversee it. A consistory of the ministers, elders, and deacons of a parish form a kirk-session. These meet once a week, the minister being their moderator, but without a negative voice. It regulates matters relating to public worship, elections, catechising, visitations, &c. It judges in matters of less scandal; but greater, as adultery, are left to the presbytery, and in all cases an appeal lies from it to the presbytery. Kirk-sessions have likewise the care of the poor and poor's-funds.

KIRKBY LONSDALE, a town of England, in the county of Westmoreland, situated in a valley, on the river Lune, with a weekly market on Thursday: twelve miles S.E. Kendal, and 250 N.N.W. London. Lon. 2. 57 W. Lat. 54. 3 N.

KIRKBY MORESIDE, a town of England, in the county of York, with a weekly market on Wednesday: twenty-eight miles N. York, and 225 N. London. Lon. 1. 3 W. Lat. 54. 26 N.

KIRKBY STEVEN, or **STEVEN CHURCH**, a town of England, in the county of Westmoreland, on the west side of the river Eden, near the borders of Yorkshire, with a weekly market on Monday: twenty-four miles N.N.E. Kendal, and 281 N.N.W. London. Lon. 2. 30 W. Lat. 54. 26 N.

KIRKCALDY, a seaport in Fifeshire, on the frith of Forth, with a dockyard for small vessels, and a silk manufacture. It is ten

K I R

miles N. of Leith. Lon. 3. 8 W. Lat. 56. 8 N.

KIRKCUDBRIGHT, a seaport in Kirkcudbrightshire, at the mouth of the river Dee. It has a fine harbour, which will admit ships of any burden to come up to the town, and yet has but an inconsiderable trade. It is 60 miles W. of Carlisle, and 83 S W. of Edinburgh. Lon. 4 8 W. Lat. 55 0 N.

KIRKCUDBRIGHTSHIRE, a county or stewartry of Scotland, which once formed, with Wigtonshire, the ancient province of Galloway. It is 45 miles long and 30 broad, bounded on the N E. by Ayrshire and Dumfriesshire, on the S. by Solway Frith and the Irish Sea, and on the W. by Wigtonshire and Ayrshire. In 1793, the number of inhabitants in this county was 27000.

KIRKHAM, a town in Lancashire, with a market on Tuesday. It has a considerable manufactory of sail cloth, and is seated at the mouth of the Ribble, 18 miles S. of Lancaster, and 213 N.N.W. of London. Lon. 2 38 W. Lat. 53 45 N.

KIRKLEES, a village in the W. riding of Yorkshire, situate on the Calder, three miles from Huddersfield. In the park near it, is the monument of the famous Robin Hood; and on the adjacent moor are two hills, called Robin Hood's butts.

KIRKLAND (Dr Thomas), an eminent physician, and member of the royal medical society at Edinburgh, and the medical society at London. He died at Ashby de la Zouch in Leicestershire, in 1798, aged 78. He was a zealous enquirer after science, and a successful practitioner. He published some valuable works: one in particular, entitled, *An Enquiry into the present State of Medical Surgery*.

KIRKOSWOLD, a town in Cumberland, with a market on Thursday; seated on a hill, near the river Eden, nine miles N. by E. of Penrith, and 292 N.W. of London. Lon. 2 48 W. Lat. 54 41 N.

KIRKPATRICK, a town in Dumbartonshire, lying E. of Dumbarton. It is said to be the birthplace of the tutelary saint of Ireland. The vestiges of the Roman wall, built by Antoninus, extend from the mouth of Clyde at this place, to the truth of Foith. It is called, by the country people, Graham's Dile.

KIRKWALL, a borough of Scotland, capital of Mainland, the principal of the Orkney Islands. It is built on an inlet of the sea on the E. side of the island; and the most striking object is the stately cathedral of St. Magnus. It is 30 miles N.E. of Thurso, in Caithnessshire. Lon. 2. 57 W. Lat. 58. 54 N.

KIRN, a town of Germany, in the circle of Upper Rhine, situate on the Nahe, 17 miles W. of Creutznach. Lon. 7. 6 E. Lat. 49. 50 N.

KIRSTENIUS (Peter), an eminent physician, and professor at Upsal in Sweden, was born at Breslaw in Silesia, in 1577. He made an astonishing progress in all parts of learning, particularly in the sciences connected with phy-

K I S

sic. He was profoundly skilled in Arabic, besides which he understood twenty-five other languages. He died in 1640. His works are numerous; the chief are, 1. *Grammatica Arabica*, 1608; 2. *Vitæ quatuor evangelistarum*; & antiquissimo codice MS. *Arabico erudæ*, 1600, folio.

KIRTLE, a term used for a short jacket; also for a quantity of flax about a hundred-weight.

KIRTON, or **KIRKTON**, a town of Lincolnshire, 151 miles from London. It had its name from its kirk or church, which is truly magnificent. It has a market and two fairs. This place is famous for the pippin, which, when grafted on its stock, is called the rennet. It gives names to its hundreds, in which are four villages of the same name.

To KISS, *v. a.* (*cusan*, Welsh; *xow*) 1. To touch with the lips (*Sidney*). 2. To treat with fondness (*Shakspeare*). 3. To touch gently (*Shakspeare*).

Kiss, *s.* (from the verb.) Salute given by joining lips (*Dryden*).

KISSER, *s.* (from *kiss*) One that kisses.

KISSER, the ancient Colonia Assuras in Africa, as appears from many inscriptions still to be met with in the place. Here is a triumphal arch done in a very good taste; there is also a small temple of a square figure, having several instruments of sacrifice carved upon it, but the execution is much inferior to the design, which is very curious. The town is situated in the kingdom of Tunis, on the declivity of a hill, above a large fertile plain; which is still called the plain of Surso, probably from its ancient name Assuras.

KISSING, by way of salutation, or as a token of respect, has been practised in all nations. The Roman emperors saluted their principal officers by a kiss. Kissing the mouth or the eyes was the usual compliment upon any promotion or happy event. Soldiers kissed the general's hand when he quitted his office. Fathers, amongst the Romans, had so much delicacy, that they never embraced their wives in the presence of their daughters. Near relations were allowed to kiss their female kindred on the mouth: but this was done in order to know whether they smelt of wine or not; because the Roman ladies, in spite of a prohibition to the contrary, were found sometimes to have made too free with the juice of the grape. Slaves kissed their master's hand, who used to hold it out to them for that purpose. Kissing was a customary mode of salutation amongst the Jews, as we may collect from the circumstance of Judas approaching his Master with a kiss. Relations used to kiss their kindred when dying, and when dead; when dying, out of a strange opinion that they should imbibe the departing soul; and when dead, by way of valedictory ceremony.

KISSING CURVES. See **OSCULATORY CURVES**.

KISSINGCRUST, *s.* (*kissing* and *crust*.) Crust formed where one loaf in the oven touches another (*King*).

K I T

KISTI, one of the seven Caucasian nations, that inhabit the countries between the Black Sea and the Caspian. This nation extends from the highest ridge of Caucasus, along the Sandsha rivulets. They are bounded on the W. by Little Cibarba, to the E. by the Tartars and Lesguis, and to the S. by the Lesguis and Georgians. They consist of sixteen different districts or tribes, which are generally at variance with each other, and with their neighbours. Those belonging to the districts of Wapi, Angusht, and Snakht, submitted to Russia in 1770. The Tshetshen tribe is so numerous and warlike, and has given the Russians so much trouble, that its name is usually given by them to the whole Kisti nation. The Ingush, who are capable of arming above 5000 men, live in villages near each other: they are diligent husbandmen, and rich in cattle. Many of their villages have a stone tower, which serves in time of war as a retreat to their women and children, and a magazine for their effects. These people are all armed, and have the custom of wearing shields. Their religion is very simple, but has some traces of Christianity. They believe in one God, whom they call Dufé, but have no saints or religious persons. They celebrate Sunday, not by any religious ceremony, but by resting from labour. They have a fast in spring, and another in summer, but observe no ceremonies either at births or deaths. They allow of polygamy, and eat pork.

KISNA, a river of Hindustan, which rises on the E. side of the Gauris, forms the boundary between the Deccan and the Peninsula, and falls into the Bay of Bengal, S. of Masulipatan.

KISTNAGHERI, a town and fortress of the peninsula of Hindustan, in Mysore. This town was attacked by the British troops under colonel Maxwell, in 1789. he carried the lower fort a id suburb, without much difficulty; but the garrison in the upper fort made so desperate a resistance, that, after two hours vigorous assault, he found it necessary to desist from the attempt. It is 54 miles S.E. of Bangalore, and 60 W.S.W. of Arcot.

KIT *s.* (*kutte*, Dutch.) 1. A large bottle (*Skinney*). 2. A small wooden vessel.

KIT, in music, the name of a small violin of such form and dimension as to be capable of being carried in a case or sheath in the pocket. Its length, measuring from the extremities, is about 16 inches, and that of the bow about 17. Small as this instrument is, its powers are co-extensive with those of the violin.

KIT-KAT CLUB, an association of above 30 noblemen and gentlemen of distinguished merit, formed in 1703, purely to unite their zeal in favour of the Protestant succession in the house of Hanover. Their name was derived from Christopher Kat, a pastry-cook, near the tavern where they met in King's-street, Westminster, who often supplied them with tarts.

KITAIBELIA. In botany, a genus of the class monadelphia, order polyandria. Calyx double, the outermost seven or nine-

K L E

cleft; capsules one-seeded, clustered in a five-lobed head. One species, a native of Hungary; viscid-hairy; with white axillary flowers, binate or ternate.

KITCHEN. *s.* (*kegin*, Welsh, *kyshen*, Erse.) The room in a house where the provisions are cooked (*Hooker*).

KITCHENGARDEN. *s.* Garden in which esculent plants are produced. See **GARDENING**.

KITCHENMAID. *s.* A maid under the cook-maid.

KITCHENSTUFF. *s.* The fat of meat scummed off the pot, or gathered out of the dripping-pan (*Down*).

KITCHENWENCH. *s.* Scullion; maid employed to clean the instruments of cookery (*Shakspeare*).

KITCHENWORK. *s.* Cookery; work done in the kitchen.

KITE. *s.* (*cya*, Saxon.) 1. A bird of prey that infests the farms, and steals the chickens. See **FALCO**. 2. A name of reproach denoting rapacity (*Shakspeare*). 3. A fictitious bird made of paper (*Gon. of the Tongue*).

KITTEN. *s.* (*kattchen*, Dutch. It is probable that the true singular is *kitt*, the diminutive of *cat*, of which the old plural was *kitten*, or *youn*; *cats*.) A young cat (*Prior*).

To KITTEN. *v. n.* (from the noun.) To bring forth young cats (*Shakspeare*).

KITTIWAKE, in ornithology. See **LARUS**.

KITTERY, a town of the United States, in the district of Maine. It is famous for ship-building, and seated on the E. side of the mouth of Piscataqua River.

KITZINGEN, a town of Franconia, on the Maine. It is large and handsome, and owes its rise to a noble convent of Benedictines, founded in the year 745, by duke Pepin. It is 10 miles E.S.E. of Wurtzburg, and 34 N.N.W. of Anspach. Lon. 10. 4 E. Lat. 49. 40 N.

KIUN-TCHIEOU-FOU, the capital of the island of Hainan, seated on its N. coast, opposite to the province of Quang-tong, in China. It stands on a promontory, and ships often anchor at the bottom of its walls. Its district contains three cities of the second, and ten of the third class.

KIUTAJA, or **CUTAJA**, a town of Turkey in Asia, the residence of the beglerbeg of Natolia. Near it are some warm baths, much esteemed in several disorders. It is situate at the foot of a mountain, near the river Pursak, 130 miles S.S.E. of Constantinople. Lon 30 44 E. Lat. 39 14 N.

KLEINHOFFIA. In botany, a genus of the class didceandria, order monogynia. Calyx five-lobed, petals five; nectary campanulate, five-toothed, bearing the stamens, seated on the column of the germ; germ pedicelled; capsule five-angled, five-celled, inflated, the cells one-seeded. One species, a tree of Java and Amboina, with racemed, numerous, bright, purple flowers.

KLEINIA. In botany, a genus of the class

K L O

syngenesia, order *polygamia equalis*. Receptacle naked; down simple; calyx simple, equal, many-leaved. Four species; natives of India or America.

KLETTENBERG, a town of Switzerland, seated on the Aar, three miles from Waldschut. The spiritual jurisdiction belongs to the bishop of Constance; the sovereignty to the cantons. Lon. 8. 12 E. Lat. 47. 35 N.

To **KLICK**. *v. n.* (from *clack*.) 1. To make a small sharp noise. 2. To steal away suddenly with a snatch.

KLINGSTADT, a celebrated painter, was born at Riga in Livonia, in 1687, and died at Paris in 1734. He excelled in miniature painting, particularly in pictures on snuff-boxes, for which he had extravagant prices.

KLOCKER (David), an historical and portrait painter, was born at Hamburg in 1629. He travelled into Italy to improve himself, after which he settled at Stockholm, where he was greatly patronised by the king, so that few of his paintings are to be seen out of that country. He died in 1698.

KLOPSTOCK (Frederic Theophilus), a most eminent and deservedly celebrated German poet, was born at Quedlinburg, July 2, 1724. During the first thirteen years of his life he lived in his father's house, under the care of a private tutor. The next three years he passed at a public school at Quedlinburg, preparatory to his introduction to college, which he entered at the age of sixteen. His father, who had hitherto proceeded on a system of indulgence, and had allowed him to devote much of his time to athletic exercises and sports, now represented to him the necessity of applying assiduously to his studies. This counsel was not lost upon him. He soon "acquired a perfect knowledge of the classics, entered into all the beauties of the ancient authors, and while he followed with rapture the bold flights of their original genius, he fed a flame within himself which was soon to burst forth in full lustre." Virgil was his favourite author, and he chose him for his model, in the resolution he formed, after trying the strength of his wing in short poetical excursions, of producing an epic poem; a species of composition hitherto unknown in Germany. The indignation he felt at some Frenchman, who denied to the Germans any talent for poetry, concurred with more legitimate motives in provoking him to this grand effort. After much doubt and hesitation as to a subject, he at last formed the plan of his *Messiah*: and this choice, it appears, he made before he was acquainted with the *Paradise Lost*, a poem of which he became afterwards a most passionate admirer. In speaking of his project to his friend Bodmer, he observes: "How happy shall I be, if by the completion of the *Messiah* I may contribute somewhat to the glory of our great and divine religion! How sweet and transporting is this idea to my mind! That is my great reward."

For his poetical talent Klopstock was evidently indebted to nature, and not to cultivation.

K L O

In his early years he had scarcely any access to poetical writings. His father's library did not contain a single poet, though it contained many Bibles. This blessed book his taste soon distinguished from all others. While yet a child he made it his constant companion, and thus became thoroughly acquainted with the figurative language with which it abounds. The magnificent descriptions and glowing imagery contained in the book of Job and in the Prophets, laid strong hold on his mind; nor was he less affected by those pathetic passages which represent fallen man as finding mercy at the hands of his offended God; while the view he obtained from Scripture of the greatness and glory of the Messiah excited lively feelings of love and grateful adoration. "From this turn of mind sprung a style of writing full of poetry, before he had ever seen a verse, or knew any thing of prosody."

At nineteen Klopstock entered the university of Jena, but, disgusted with the scholastic theology and metaphysical subtleties which formed its chief pursuits, he removed to the university of Leipsic. While at Jena, he composed the first three books of the *Messiah*, in hexameter verse, being the first attempt which had been made to introduce that metre into the German language. It was first communicated to some literary friends at Leipsic, whose admiration animated him to prosecute the plan he had sketched out, although the public taste was not yet prepared to relish the lofty flights of his genius. In the course of three or four years, however, this poem awakened an extraordinary degree of interest in Germany. Both its friends and enemies were numerous. Preachers quoted it from the pulpit; Christians loved it, because it served to excite their devout feelings; the Swiss critics, especially Bodmer, extolled it with enthusiasm; and at length its intrinsic excellence overcame all opposition.

The Danish minister, Count Bernstorff, being much struck with his poem, recommended him, about this time, to the king of Denmark, by whom he was invited to reside at Copenhagen, on a pension, which relieved him, for the remainder of his life, from pecuniary care, and left him at liberty to pursue his studies. In his way to Copenhagen, in 1751, he passed through Hamburg, and there first saw the lovely Margareta Möller; this lady soon consoled him for a former severe disappointment, and in about three years more made him the happiest of men. An account of the commencement and progress of their acquaintance is given by Mrs. Klopstock herself, in a letter to Mr. Richardson, the English novelist, a letter which is published in Richardson's *Correspondence*, as well as in Miss Smith's *Memoirs of Klopstock*. This letter was written in March 1758, after she and Klopstock had been married four years. She died Nov. 28th the same year. This affliction was deeply felt by Klopstock, whose letters to his friends for a long time after the event evince the tenderest affection, and profoundest grief, attempered only by a perfect resignation.

K L O

to the will of God. After the death of his wife, Klopstock continued to reside at Copenhagen till the year 1771, when he removed to Hamburg, where he lived during the residue of his life, except for about a year, which he passed at the court of Baden. In 1791, when in his 68th year, he married a near relation of his first wife, to whom he was indebted for much of the comfort he enjoyed in his declining years. "To the close of life he retained his poetical powers; and his sacred harp still sent forth strains of sublime and heart-felt piety." He died at Hamburg in 1803, in the 80th year of his age, "with a firm expectation of happiness beyond the grave." Our readers will be anxious to learn something of the last hours of this extraordinary man, and we are willing to gratify them.

"His strong feelings of religion," we are told, "shed a lustre on his last moments, when he displayed a noble example of what he had often sung in his divine poems. He preserved his gentle animation, his fervent piety, and the admirable serenity of his mind, till the close of life. To the last his heart was as warm as ever; and the hopes which had supported him through all his trials continued unshaken to his last moments. He spoke of death with the most cheerful composure. The pleasing images of immortality sung by his own lofty muse recurred to his mind in the moment of trial, and whispered comfort to his spirit as it fled.—His soul had been undismayed at the symptoms of decay which increased every year. His strength was greatly diminished in the winter of 1802, but he was still pleased with the visits of his friends."

"In the last weeks of his life he secluded himself entirely, even from those who were most dear to him. He sent them many kind messages, but declined seeing them. Tranquility of mind, resignation to the will of God, warm emotions of gratitude for the happiness he had enjoyed in life, gentle endurance of the pains of death, a calm prospect of the grave, and joyful expectations of a higher existence, these were now his sensations. The fair form of the Angel of Death, the exalted view of a better world, which had fired the lofty-minded youth to compose his sacred hymns, these now hovered round the head of the aged dying saint. In the 12th canto of the Messiah, he has sung the happy close of a virtuous life with unparalleled grandeur of description. Such Christian triumph attended him in the hard struggles of dissolution, which grew more painful on a nearer approach. In the last and severest conflict he raised himself on his couch, folded his hands, and with uplifted eyes pronounced the sacred words so finely illustrated in one of his Odes. 'Can a woman forget her child, that she should not have pity on the fruit of her womb? Yee, she may forget, but I will not forget thee!' The struggle was now over, he fell into a gentle slumber, and awoke no more!" Smith's Memoirs of Klopstock, p. 32, 34.

K N A

Klopstock's poetry is marked by exuberance of imagination and of sentiment. His sublimity, which is nearly unparalleled, carries his readers above themselves into new regions which the poet has created for them. The author of the Messiah doubtless ranks among the highest class of poets, and has justly attained the appellation of the Milton of Germany. His odes and lyric poems are much admired by all readers of correct and pure taste; and his dramatic works display great force and dignity, but seem better adapted to the closet than the theatre. He was also an admirable prose writer, as is fully proved by his Grammatical Dialogues; and by his letters, many of which are exquisitely tender and delicate. He had not the vivacity of Burns or of Cowper, in his epistolary compositions; but he abhorred every thing like the too frequent impurity of the former, while in sweetness and dignity he often excelled the latter. In short, he deserves to be celebrated, not only as a poet of first rate genius; but as one who avoided the fatal errors for which genius is but too often urged as an apology: for Klopstock was also a most ardent friend, affectionate husband, amiable man, and sincere Christian; and on these accounts we have thought him entitled to a wider space in our pages than we should otherwise have been inclined to assign him.

To KNAB. *v. a.* (*knappen*, Dutch.) To bite; to bite something brittle (*L'Estrange*). 4

To KNA'BBLE. *s.* (from *knab*.) To bite idly, or wantonly, to nibble (*Brown*).

KNACK. *s.* (*cnapunge*, skill, Saxon.) 1. A little machine, a petty contrivance; a toy (*Shakspeare*). 2. A readiness; an habitual facility; a lucky dexterity (*Ben Jonson*). 3. A nice trick (*Pope*).

To KNACK. *v. n.* (from the noun.) To make a sharp quick noise, as when a stick breaks.

KNA'CKER. *s.* (from *knack*.) 1. A maker of small work (*Mortimer*). 2. A rope-maker (*Answorth*).

KNAG. *s.* (*knag*, a wart, Dutch.) A hard knot in wood.

KNA'GGY. *a.* (from *knag*.) Knotty; set with hard rough knots

KNAP. *s.* (*cnap*, Welsh; *cnæp*, Saxon.) A protuberance; a swelling prominence (*Baron*).

To KNAP. *v. a.* (*knappen*, Dutch.) 1. To bite; to break short (*Common Prayer*). 2. (*knæp*, Erse.) To strike so as to make a sharp noise like that of breaking (*Bacon*).

To KNAP. *v. n.* To make a short sharp noise (*Wiceman*).

KNAPDALE, one of the divisions of Argyleshire in Scotland.

To KNA'PPLE. *v. n.* (from *knæp*.) To break off with sharp quick noise (*Answorth*).

KNAPSACK, (from *knappen*, to eat), in a military sense, a rough leather bag which a soldier carries on his back, and which contains all his necessaries. Square knapsacks are most convenient; and should be made with a divi-

K N A

sion to hold the shoes, black-ball and brushes, separate from the linen. White goat-skins are the best.

KNAPTON (George), an English portrait painter in crayons, was the scholar of Richardson, and surveyor and keeper of the king's pictures. He died at Kensington in 1778, aged 80.

KNAPWEED, in botany. See **CENTAUREA**.

KNARE. *s.* (*knor*, German.) A hard knot.

KNARESBOROUGH, a town in the West Riding of Yorkshire, distant 199 miles from London, is an ancient borough by prescription, called by foreigners *the Yorkshire Spaw*. It is almost encompassed by the river Nid, which issues from the bottom of Craven-hills; and had a priory, with a castle, long since demolished, on a craggy rock, whence it took the name. The town is about three furlongs in length, and the parish is famous for several medicinal springs near each other, and yet of different qualities. See **HARROGATE**.

The dropping or petrifying well is romantically situated by the side of the river, opposite the ruins of the castle; it is the most noted petrifying spring in England, the water drops from a spongy rock. The ground which receives the water before it joins the well is for 12 yards long become a solid rock. From the well it runs into the Nid, where the spring water has made a rock that stretches some yards into the river. The adjacent fields are noted for liquorice, and a soft yellow marl, which is rich manure. The town is governed by a bailiff. Its baths are not so much frequented since Scarborough Spaw came in vogue. It has a good market and six fairs. Here are stone bridges over the river, and several interesting remains of antiquity, as Sir Robert's Chapel, &c.

KNAVE, an old Saxon word, which had at first a sense of simplicity and innocence, for it signified a *boy*: Sax. *cnapa*, whence a *knave-child*, i. e. a boy, distinguished from a girl, in several old writers. afterwards it was taken for a servant-boy, and at length for any servant-man. Also it was applied to a minister or officer that bore the shield or weapon of his superior; as *field-knave*, whom the Latins called *armiger*, and the French *escuyer*, 14 Edw. III. c. 3. And it was sometimes of old made use of as a titular addition, as *Joannes C. filius Wilhelmi C. de Dirlu, knave*, &c. 22 Hen. VII. c. 37. The word is now perverted to the hardest meaning, viz. *a false deceitful fellow*.

KNAVE, on the cards. See **CARDS**.

KNAVERY. *s.* (from *knave*.) 1. Dishonesty; tricks, petty villany (*Dryd.*). 2. Mischievous tricks or practices (*Shakspeare*).

KNA'VISH. *a.* (from *knave*.) 1. Dishonest, wicked; fraudulent (*Pope*). 2. Waggish, mischievous (*Shakspeare*).

KNA'VISHLY. *ad.* 1. Dishonestly, fraudulently. 2. Waggishly, mischievously.

KNAUTIA. In botany, a genus of the class tetrandria, order monogynia. Common calyx oblong simple, five or ten-flowered, proper, simple superior; corollas irregular:

K N E

receptacle naked. Four species: annuals of the Levant, with red or bluish flowers.

To KNEAD. *v. a.* (*cnædan*, Saxon.) To beat or mingle any stuff or substance (*Donne*).

KNEADING TROUGH. *s.* (*knead* and *trough*) A trough in which the paste of bread is worked together (*Exodus*).

KNEADING, the act of pressing and mixing with the hand, or any instrument better calculated to produce an intimate union of its parts, any kind of moist earth, clay, or dough. The term however is most usually applied to the latter substance as practised by the bakers, who, in undertaking the mixture of flour into bread in a large way, find it necessary to use a wooden implement or lever, which being fastened at one end by a moveable hinge, is worked up and down so as to press and knead the dough previous to its being formed into loaves. This machine however is but ill adapted for the purpose; a more ingenious one, first described in the Transactions of the Patriotic Society at Milan, is described in the second volume of Gregory's Mechanics.

KNEE. *s.* (*cnæop*, Saxon.) 1. The joint where the leg is joined to the thigh. See **ANATOMY**, **GENU**, and **PATELLA**. 2. A piece of timber growing crooked, and so cut that the trunk and branch make an angle (*Moxon*).

To KNEE. *v. a.* (from the noun.) To supplicate by kneeling (*Shakspeare*).

KNEE, a crooked piece of timber, having two branches or arms, and generally used to connect the beams of a ship with her sides or timbers. The branches of the knees form an angle of greater or smaller extent, according to the mutual situation of the pieces which they are designed to unite. One branch is securely bolted to one of the deck-beams, and the other in the same manner strongly attached to a corresponding timber in the ship's side. Besides the great utility of knees in connecting the beams and timbers into one compact frame, they contribute greatly to the strength and solidity of the ship, in the different parts of her frame to which they are bolted, and thereby enable her with great firmness to resist the effects of a turbulent sea.

KNEE-HOLM, KNEE-HOLLY. See **RUSCUS**.

KNEED. *a.* Having knees.

KNEED, or **KNEE-JOINTED**, in botany. See **GENICULATE**.

KNE'EDEEP. *a.* (*knee* and *deep*.) 1. Rising to the knees. 2. Sunk to the knees (*Dryd.*).

To KNEEL. *v. n.* (from *knee*.) To perform the act of genuflexion; to bend the knee (*Shakspeare*).

KNE'EPAN. *s.* (*knee* and *pan*.) A little round bone at the knee. See **PATELLA**.

KNE'ETRIBUTE. *s.* (*knee* and *tribute*.) Genuflexion, worship or obeisance shown by kneeling (*Milton*).

KNEL. *s.* (*cnwl*, Welsh, a funeral pile; *cnýllan*, to ring, Saxon.) The sound of a bell rung at a funeral (*Cowley*).

KNELLER (Sir Godfrey), a painter, whose fame is well established in these kingdoms.

KN I

He was born at Lubrook in 1648; and received his first instructions in the school of Rembrandt, but became afterwards a disciple of Ferdinand Bol. When he had gained as much knowledge as that school afforded him, he travelled to Rome, where he fixed his particular attention on Titian and the Caracci. He afterwards visited Venice, and distinguished himself so effectually in that city by his historical pictures and portraits of the noble families there, that his reputation became considerable in Italy. By the advice of some friends he came at last to England, where it was his good fortune to gain the favour of the duke of Monmouth: by his recommendation, he drew the picture of King Charles II. more than once; who was so taken with his skill in doing it, that he used to come and sit to him at his house in Covent-garden piazza. The death of Sir Peter Lely left him without a competitor in England, and from that time his fortune and fame were thoroughly established. No painter could have more incessant employment, and no painter could be more distinguished by public honour. He was state-painter to Charles II. James II. William III. queen Anne, and George I. equally esteemed and respected by them all. The emperor Leopold made him a knight of the Roman empire, and king George I. created him a baronet. Most of the nobility and gentry had their likenesses taken by him, and no painter excelled him in a sure outline, or in the graceful disposition of his figures: his works were celebrated by the best poets in his time. He built himself an elegant house at Whinton near Hampton-court, where he spent the latter part of his life, and died in 1726.

KNIFE. The pretit of *knov*.

KNIFE. *s. plur knives.* (*cuip*, Saxon) An instrument edged and pointed, wherewith meat is cut, and animals killed. Knives are said to have been first made in England in 1563, by one Matthews, on Fleet bridge, London. See also **FORK**.

KNIGHT, *eques*, among the Romans, a person of the second degree of nobility, following immediately that of the senators. See **EQUESTRIAN ORDER**, and **EQUITES**.

KNIGHT, or *Cnecht* (Germ.) in feudal history, was originally an appellation or title given by the ancient Germans to their youth after being admitted to the privileges of bearing arms. The passion for arms among the Germanic states, as described by Dr. Stuart in his *View of Society in Europe*, was carried to extremity. It was amidst scenes of death and peril that the young were educated: it was by valour and feats of prowess that the ambitious signalized their manhood. All the honours they knew were allotted to the brave. The sword opened the path to glory. It was in the field that the ingenious and the noble flattered most their pride, and acquired an ascendancy. The strength of their bodies, and the vigour of their counsels, surrounded them with warriors, and lifted them to command.

But, among these nations, when the individual felt the call of valour, and wished to try

KN I

his strength against an enemy, he could not of his own authority take the lance and the javelin. The admission of their youth to the privilege of bearing arms, was a matter of too much importance to be left to chance or their own choice. A form was invented by which they were advanced to that honour.

The council of the district, or of the canton to which the candidate belonged, was assembled. His age and his qualifications were inquired into; and if he was deemed worthy of being admitted to the privileges of a soldier, a chieftain, his father or one of his kindred adorned him with a shield and the lance. In consequence of this solemnity, he prepared to distinguish himself; his mind opened to the cares of the public; and the domestic concerns, or the offices of the family from which he had sprung, were no longer the objects of his attention. To this ceremony, so simple and so interesting, the institution of knighthood is indebted for its rise.

Knighthood, however, as a system, known under the denomination of Chivalry, is to be dated only from the 11th century. All Europe being reduced to a state of anarchy and confusion on the decline of the house of Charlemagne, every proprietor of a manor or lordship became a petty sovereign, the mansion-house was fortified by a moat, defended by a guard, and called a castle. The governor had a party of 700 or 800 men at his command, and with these he used frequently to make excursions, which commonly ended in a battle with the lord of some petty state of the same kind, whose castle was then pillaged, and the women and treasures borne off by the conqueror. During this state of universal hostility, there were no friendly communications between the provinces, nor any high roads from one part of the kingdom to another: the wealthy traders, who then travelled from place to place with their merchandise and their families, were in perpetual danger, the lord of almost every castle extorted something from them on the road; and at last, some one more rapacious than the rest, seized upon the whole of the cargo, and bore off the women for his own use.

Thus castles became the warehouses of all kinds of rich merchandise, and the prisons of the distressed females whose fathers or lovers had been plundered or slain, and who being therefore seldom disposed to take the thief or murderer into favour, were in continual danger of a rape.

But as some are always distinguished by virtue in the most general defection, it happened that many lords insensibly associated to repress these sallies of violence and rapine, to secure property, and protect the ladies. Among these were many lords of great fields, and the association was at length strengthened by a solemn vow, and received the sanction of a religious ceremony. As the first knights were men of the highest rank, and the largest possessions, such having most to lose, and the least temptation to steal, the fraternity was regarded with

KNIGHT.

a kind of reverence, even by those against whom it was formed. Admission into the order was deemed the highest honour; many extraordinary qualifications were required in a candidate, and many new ceremonies were added at his creation. After having fasted from sun-rise, confessed himself, and received the sacrament, he was dressed in a white tunic, and placed by himself at a side table, where he was neither to speak, to smile, nor to eat; while the knights and ladies, who were to perform the principal parts of the ceremony, were eating, drinking, and making merry at the great table. At night his armour was conveyed to the church where the ceremony was performed; and here having watched it till the morning, he advanced with his sword hanging about his neck, and received the benediction of the priest. He then kneeled down before the lady who was to put on his armour, who being assisted by persons of the first rank, buckled on his spurs, put a helmet on his head, and accoutred him with a coat of mail, a cuirass, bracelets, cuisses and gauntlets.

Being thus armed cap à-pie, the knight who dubbed him struck him three times over the shoulder with the flat side of his sword, in the name of God, St. Michael, and St. George. He was then obliged to watch all night in all his armour, with his sword girded, and his lance in his hand. From this time the knight devoted himself to the redress of those wrongs which "patient merit of the unworthy takes;" to secure merchants from the rapacious cruelty of banditti, and women from ravishers, to whose power they were, by the particular confusion of the times, continually exposed.

From this view of the origin of chivalry, it will be easy to account for the castle, the moat, and the bridge, which are found in romances; and as to the dwarf, he was a constant appendage to the rank and fortune of those times, and no castle therefore could be without him. The dwarf and the buffoon were then introduced to kill time, as the card-table is at present. It will also be easy to account for the multitude of captive ladies whom the knights, upon seizing a castle, set at liberty; and for the prodigious quantities of useless gold and silver vessels, rich stuffs, and other merchandise, with which many apartments in these castles are said to have been filled.

The principal lords who entered into the confraternity of knights used to send their sons to each other to be educated, far from their parents, in the mystery of chivalry. These youths, before they arrived at the age of 21, were called *bachelors*, or *les chevaliers*, inferior knights, and at that age were qualified to receive the order.

So honourable was the origin of an institution, commonly considered as the result of caprice and the source of extravagance; but which, on the contrary, rose naturally from the state of society in those times, and had a very serious effect in refining the manners of the European nations. Valour, humanity, courtesy, justice, honour, were its character-

istics: and to these were added religion; which, by infusing a large portion of enthusiastic zeal, carried them all to a romantic excess, wonderfully suited to the genius of the age, and productive of the greatest and most permanent effects both upon policy and manners. War was carried on with less ferocity, when humanity, no less than courage, came to be deemed the ornament of knighthood, and knighthood a distinction superior to royalty, and an honour which princes were proud to receive from the hands of private gentlemen: more gentle and polished manners were introduced, when courtesy was recommended as the most amiable of knightly virtues, and every knight devoted himself to the service of a lady: violence and oppression decreased, when it was accounted meritorious to check and to punish them: a scrupulous adherence to truth, with the most religious attention to fulfil every engagement, but particularly those between the sexes as more easily violated, became the distinguishing character of a gentleman, because chivalry was regarded as the school of honour, and inculcated the most delicate sensibility with respect to that point; and valour seconded by so many motives of love, religion, and virtue, became altogether irresistible.

That the spirit of chivalry sometimes rose to an extravagant height, and had often a pernicious tendency, must however be allowed. In Spain, under the influence of a romantic gallantry, it gave birth to a series of wild adventures which have been deservedly ridiculed: in the train of Norman ambition, it extinguished the liberties of England, and deluged Italy in blood; and at the call of superstition, and as the engine of papal power, it desolated Asia under the banner of the cross. But these ought not to be considered as arguments against an institution laudable in itself, and necessary at the time of its foundation: and those who pretend to despise it, the advocates of ancient barbarism and ancient rusticity, ought to remember, that chivalry not only first taught mankind to carry the civilities of peace into the operations of war, and to mingle politeness with the use of the sword; but roused the soul from its lethargy, invigorated the human character even while it softened it, and produced exploits which antiquity cannot parallel. Nor ought they to forget, that it gave variety, elegance, and pleasure to the intercourse of life, by making woman a more essential part of society; and is therefore intitled to our gratitude, though the point of honour, and the refinements in gallantry, its more doubtful effects, should be excluded from the improvement of modern manners. For,

To illustrate this topic more particularly, we may observe, that women, among the ancient Greeks and Romans, seem to have been considered merely as objects of sensuality, or of domestic conveniency: they were devoted to a state of seclusion and obscurity, had few attentions paid them, and were permitted to take as little share in the conversation as in the general

KNIGHT.

commerce of life. But the northern nations, who paid a kind of devotion to the softer sex, even in their native forests, had no sooner settled themselves in the provinces of the Roman empire, than the female character began to assume new consequence. Those fierce barbarians, who seemed to thirst only for blood, who involved in one undistinguishing ruin the monuments of ancient grandeur and ancient ingenuity, and who devoted to the flames the knowledge of ages, always forbore to offer any violence to the women. They brought along with them the respectful gallantry of the north, which had power even to restrain their savage ferocity; and they introduced into the west of Europe a generosity of sentiment, and a complaisance towards the ladies, to which the most polished nations of antiquity were strangers.—These sentiments of generous gallantry were fostered by the institution of chivalry, which lifted woman yet higher in the scale of life. Instead of being nobody in society, she became its *primum mobile*. Every knight devoting himself to danger, declared himself the humble servant of some lady, and that lady was often the object of his love. Her honour was supposed to be intimately connected with his, and her smile was the reward of his valour: for her he attacked, for her he defended, and for her he shed his blood. Courage animated by so powerful a motive, lost sight of every thing but enterprise: incredible toils were cheerfully endured, incredible actions were performed, and adventures seemingly fabulous were more than realised. The effect was reciprocal. Women, proud of their influence, became worthy of the heroism which they had inspired: they were not to be approached but by the high-minded and the brave; and men then could only be admitted to the bosom of the chaste fair, after proving their fidelity and affection by years of perseverance and of peril.

Again, as to the change which took place in the operations of war, it may be observed, that the perfect hero of antiquity was superior to fear, but he made use of every artifice to annoy his enemy: impelled by animosity and hostile passion, like the savage in the American woods, he was only anxious of attaining his end, without regarding whether fraud or force were the means. But the true knight or modern hero of the middle ages, who seems in all his encounters to have had his eye on the judicial combat or judgment of God, had an equal contempt for stratagem and danger. He disdained to take advantage of his enemy: he desired only to see him, and to combat him upon equal terms, trusting that heaven would declare in behalf of the just; and as he professed only to vindicate the cause of religion, of injured beauty, or oppressed innocence, he was further confirmed in his enthusiastic opinion by his own heated imagination. Strongly persuaded that the decision must be in his favour, he fought as if under the influence of divine inspiration rather than of military ardour. Thus the system of chivalry, by a singular combination of manners, blended the heroic and sanc-

tified characters, united devotion and valour, zeal and gallantry, and reconciled the love of God and of the ladies.

Chivalry flourished most during the time of the croisades. From these holy wars it followed, that new fraternities of knighthood were invented: hence the knights of the Holy Sepulchre, the Hospitaliers, Templars, and an infinite number of religious orders. Various other orders were at length instituted by sovereign princes: the Garter, by Edward III. of England; the Golden Fleece, by Philip the Good, duke of Burgundy; and St. Michael, by Louis XI. of France. From this time ancient chivalry declined to an empty name; when sovereign princes established regular companies in their armies, knights-bannerets were no more, though it was still thought an honour to be dubbed by a great prince or victorious hero; and all who professed arms without knighthood assumed the title of esquire.

There is scarce a prince in Europe that has not thought fit to institute an order of knighthood; and the simple title of knight, which the kings of Britain confer on private subjects, is a derivation from ancient chivalry, although very remote from its source. See KNIGHT-BACHELOR.

KNIGHT-SERVICE (*servitium militare*, and in law-French *chivalry*); a species of tenure, the origin and nature of which are explained under the articles CHIVALRY, and FEODAL SYSTEM. The knights produced by this tenure differed most essentially from the knights described in the preceding article; though the difference seems not to have been accurately attended to by authors. The one class of knights was of a high antiquity; the other was not heard of till the invention of a fee. The adorning with arms and the blow of the sword made the act of the creation of the ancient knight; the new knight was constituted by an investment in a piece of land. The former was the member of an order of dignity which had particular privileges and distinctions; the latter was the receiver of a feudal grant. Knighthood was an honour; knight-service a tenure. The first communicated splendor to an army; the last gave it strength and numbers. The knight of honour might serve in any station whatever; the knight of tenure was in the rank of a soldier.—It is true at the same time, that every noble and baron were knights of tenure, as they held their lands by knight-service. But the number of fees they possessed, and their creation into rank, separated them widely from the simple individuals to whom they gave out grants of their lands, and who were merely the knights of tenure. It is no less true, that the sovereign, without conferring nobility, might give even a single fee to a tenant; and such vassals *in capite* of the crown, as well as the vassals of single fees from a subject, were the mere knights of tenure. But the former, in respect of their holding from the crown, were to be called to take upon themselves the knight-

KNIGHT.

hood of honour; a condition in which they might rise from the ranks, and be promoted to offices and command. And as to the vassals *in capite* of the crown who had many fees, their wealth of itself sufficiently distinguished them beyond the state of the mere knights of tenure. In fact, they possessed an authority over men who were of this last description; for, in proportion to their lands were the fees they gave out and the knights they commanded.

By the tenure of knight-service, Judge Blackstone observes, the greatest part of the lands in England were holden, and that principally of the king *in capite*, till the middle of the last century, and which was created, as Sir Edward Coke expressly testifies, for a military purpose, viz. for the defence of the realm by the king's own principal subjects, which was judged to be much better than to trust to mercenaries or foreigners. The description here given is that of knight-service proper, which was to attend the king in his wars. There were also some other species of knight-service, so called, though improperly, because the service or render was of a free and honourable nature, and equally uncertain as to the time of ending as that of knight-service proper, and because they were attended with similar fruits and consequences. Such was the tenure by *render-serjeanty, per annuum servitium*, whereby the tenant was bound, instead of serving the king generally in his wars, to do some special honorary service to the king in person; as to carry his banner, his sword, or the like; or be his butler, champion, or other officer at his coronation. It was, in most other respects, like knight-service, only he was not bound to pay aid or escuage; and when tenant by knight-service paid five pounds for a relief on every knight's fee, tenant by grand-serjeanty and one year's value of his land, were it much or little. Tenure by *copage*, which was to render a horn when the Scots or other enemies entered the land, in order to warn the king's subjects, was (like other services of the same nature) a species of grand serjeanty.

These services, both of chivalry and grand-serjeanty, were all personal, and uncertain as to their quantity or duration. But the personal attendance in knight-service growing troublesome and inconvenient in many respects, the tenants found means of compounding for it, by first sending others in their stead, and in process of time making a pecuniary satisfaction to the lords in lieu of it. This pecuniary satisfaction at last came to be levied by assessments, at so much for every knight's fee; and therefore this kind of tenure was called *scutagium* in Latin, or *servitium scuti*, *scutum* being then a well-known denomination of money; and in like manner it was called, in our Norman French, *escuage*; being indeed a pecuniary instead of a military service. The first time this appears to have been taken was in the 5 Hen. II. on account of his expedition to Toulouse; but it soon came to be so universal, that personal attendance fell quite into disuse. Hence we find in our ancient histo-

ries, that, from this period, when our kings went to war, they levied scutages on their tenants, that is, on all the landholders of the kingdom, to defray their expences and to hire troops, and these assessments in the time of Henry II. seem to have been made arbitrarily, and at the king's pleasure. Which prerogative being greatly abused by his successors, it became matter of national clamour; and king John was obliged to consent, by his *magna charta*, that no scutage should be imposed without consent of parliament. But this clause was omitted in his son Henry III.'s charter; where we only find, that scutages or escuage should be taken as they were used to be taken in the time of Henry II.; that is, in a reasonable and moderate manner. Yet afterwards, by statute 25 Edw. I. c. 5. and 6 and many subsequent statutes, it was enacted, that the king should take no aids or tasks but by the common assent of the realm. Hence it is held in our old books, that escuage or scutage could not be levied but by consent of parliament, such scutages being indeed the groundwork of all succeeding subsidies, and the land-tax of later times.

Since, therefore, escuage differed from knight-service in nothing but as a compensation differs from actual service, knight-service is frequently confounded with it. And this Littleton must be understood, when he tells us, that tenant by homage, fealty, and escuage, was tenant by knight-service: that is, that this tenure (being subservient to the military policy of the nation) was respected as a tenure in chivalry. But as the actual service was uncertain, and depended upon emergencies, so it was necessary that this pecuniary compensation should be equally uncertain, and depend on the assessments of the legislature suited to those emergencies. For had the escuage been a settled invariable sum, payable at certain times, it had been neither more nor less than a mere pecuniary rent; and the tenure, instead of knight-service, would have then been of another kind, called socage.

By the degenerating of knight-service, or personal military duty, into escuage or pecuniary assessments, all the advantages (either promised or real) of the feudal constitutions were destroyed, and nothing but the hardships remained. Instead of forming a national militia composed of barons, knights, and gentlemen, bound by their interest, their honour, and their oaths, to defend their king and country, the whole of this system of tenures now tended to nothing else but a wretched means of raising money to pay an army of occasional mercenaries. In the mean time the families of all our nobility and gentry groaned under the intolerable burthens which (in consequence of the fiction adopted after the conquest) were introduced and laid upon them by the subtlety and finesse of the Norman lawyers. For, besides the scutages to which they were liable in defect of personal attendance, which, however, were assessed by themselves in parliament, they might be called upon by the king or lord

KNIGHT.

paramount for aids, whenever his eldest son was to be knighted, or his eldest daughter married; not to forget the ransom of his own person. The heir, on the death of his ancestor, if of full age, was plundered of the first emoluments arising from his inheritance, by way of *relief* and *primer seisin*; and if under age, of the whole of his estate during infancy. And then, as sir Thomas Smith very feelingly complains, "when he came to his own, after he was out of wardship, his woods decayed, houses fallen down, stock wasted and gone, lands let forth and ploughed to be barren," to make amends, he was yet to pay half a year's profits as a fine for suing out his livery; and also the price or value of his marriage, if he refused such wife as his lord and guardian had bartered for, and imposed upon him, or twice that value, if he married another woman. Add to this, the untimely and expensive honour of knighthood, to make his poverty more completely splendid. And when, by these deductions, his fortune was so shattered and ruined, that perhaps he was obliged to sell his patrimony, he had not even that poor privilege allowed him, without paying an exorbitant fine for a licence of alienation.

A slavery so complicated and so extensive as this, called aloud for a remedy in a nation that boasted of her freedom. Palliatives were from time to time applied by successive acts of parliament, which assuaged some temporary grievances. Till at length the humanity of king James I. consented, for a proper equivalent, to abolish them all, though the plan then proceeded not to effect, in like manner as he had formed a scheme, and began to put it in execution, for removing the feudal grievance of heritable jurisdictions in Scotland, which has since been pursued and effected by the statute 20 Geo. II. c. 43. King James's plan for exchanging our military tenures seems to have been nearly the same as that which has been since pursued, only with this difference, that by way of compensation for the loss which the crown and other lords would sustain, an annual fee-farm rent should be settled and inseparably annexed to the crown, and assured to the inferior lords, payable out of every knight's fee within their respective seignories. An expedient, seemingly much better than the hereditary excise which was afterwards made the principal equivalent for these concessions. For at length the military tenures, with all their heavy appendages, were destroyed at one blow by the statute 12 Car. II. c. 24. which enacts, "that the court of ward or liveries, and all wardships, liveries, primer seisins, and ousterli mains, values and forfeitures of marriages, by reason of any tenure of the king or others, be totally taken away. And that all fines for alienations, tenures by homage, knights-service, and escuage, and also aids for marrying the daughter or knighting the son, and all tenures of the king *in capite*, be likewise taken away. And that all sorts of tenures, held of the king or others, be turned into free and common socage; save only tenures in frankal-

moign, copyholds, and the honorary services (without the slavish part) of grand-serjeanty." A statute which was a greater acquisition to the civil property of this kingdom than even magna charta itself: since that only pruned the luxuries that had grown out of the military tenures, and thereby preserved them in vigour; but the statute of king Charles extirpated the whole, and demolished both root and branches.

KNIGHTS-ERRANT. During the prevalence of chivalry, the ardour of redressing wrongs seized many knights so powerfully, that, attended by esquires, they wandered about in search of objects whose misfortunes and misery required their assistance and succour. And as ladies engaged more particularly their attention, the relief of unfortunate damsels was the achievement they most courted. This was the rise of knights-errant, whose adventures produced romance. These were originally told as they happened. But the love of the marvellous came to interfere; fancy was indulged in her wildest exaggerations; and poetry gave her charms to the most monstrous fictions, and to scenes the most unnatural and gigantic. See **KNIGHT**.

KNIGHT-BACHELOR. See **BACHELOR**.

KNIGHT-BARONET. See **BARONET**.

KNIGHTS OF THE SHIRE, or KNIGHTS OF PARLIAMENT. are two gentlemen of worth, chosen on the king's writ in *pleno comitatu*, by such of the freeholders of every county as can expend 40s. per annum, to represent such county in parliament. These, when every man who held a knight's fee *in capite* of the crown was customarily constrained to be a knight, were of necessity to be *milites gladio cincti*, for so the writ runs to this day; but now custom admits esquires to be chosen to this office. They must have at least 500l. per annum, and their expences are to be defrayed by the county, though this be seldom now required.

KNIGHT-MARSHAL. an officer in the king's household, who has jurisdiction and cognizance of any transgression within the king's household and verge, as also of contracts made there, whereof one of the house is party.

KNIGHTS, in a ship, two short thick pieces of wood, commonly carved like a man's head, having four shivers in each, three for the hal-yards, and one for the top to run in one of them stands fast bolted on the beams abaft the fore-mast, and is therefore called the *fore-knight*; and the other, standing abaft the main-mast, is called the *main-knight*.

To KNIGHT. v. a. (from the noun) To create one a knight (*Wotton*).

KNIGHTLY. a. (from *knight*) Befitting a knight; beseeeming a knight (*Sadler*).

KNIGHTHOOD. s. (from *knight*) The character or dignity of a knight (*Ben Jonson*).

KNIGHTLESS. a. (from *knight*) Unbecoming a knight; obsolete (*Spenser*).

To KNIT. v. a. preterit *knt*, or *knitted*. (certain, Saxon) 1. To make or unite by texture without a loom (*Walter*). 2. To tie

K N O

Shakspeare). 3. To join; to unite (*Wise-man*). 4. To contract (*Addison*). 5. To tie up (*Acts*).

To KNIT. v. n. 1. To weave without a loom (*Dryden*). 2. To join; to unite: not used (*Shakspeare*).

KNIT. s. (from the verb.) Texture (*Shakspeare*.)

KNITTELFELDT, a town of Germany, in the duchy of Sturia, on the river Muehr: twenty miles S.W. Pruck, and seventy-eight S.W. Vienna. Lon. 32. 43 E. Ferro. Lat. 47. 19 N.

KNITTER. s. (from *knit*.) One who weaves or knits (*Shakspeare*).

KNITTINGNEEDLE. s. (*knit* and *needle*.) A wire which women use in knitting (*Arbutnot*).

KNIT'TLE. s. (from *knit*.) A string that gathers a purse round (*Ainsworth*).

KNITTLINGEN, a town of Germany, in the circle of Swabia, and duchy of Wurtemberg; the birth-place of Faust, one of the first printers: twenty-two miles S. Heidelberg, and nineteen N.W. Stuttgart.

KNOB. s. (*knoop*, Dutch.) A protuberance; any part bluntly rising above the rest (*Ray*).

KNOB'BED. a. (from *knob*.) Set with knobs; having protuberances (*Grew*).

KNOB'BINESS. s. (from *knobby*.) The quality of having knobs.

KNOB'BY. a. (from *knob*.) 1. Full of knobs. 2. Hard; stubborn (*Howel*).

To KNOCK. v. n. (enucian, Saxon.) 1. To clash; to be driven suddenly together (*Bentley*). 2. To beat, as at a door for admittance (*Dryden*). 3. **To KNOCK under.** A common expression, denoting that a man yields or submits.

To KNOCK. v. a. 1. To affect or change in any respect by blows (*Pope*). 2. To dash together, to strike, to collide with a sharp noise (*Howe*). 3. **To KNOCK down.** To fell by a blow. 4. **To KNOCK on the head.** To kill by a blow; to destroy (*South*).

KNOCK. s. (from the verb.) 1. A sudden stroke; a blow (*Brown*). 2. A loud stroke at a door for admission (*Dryden*).

KNOCKER. s. (from *knock*.) 1. He that knocks. 2. The hammer which hangs at the door for strangers to strike (*Pope*).

KNOCTOPHER, a borough and market town of Ireland, in the county of Kilkenny and province of Leinster, sixty-three miles from Dublin. It returns two members to parliament; patronage in the families of Langrishe and Ponsonby.

To KNOLL. v. a. (from *knell*.) To ring the bell, generally for a funeral (*Shakspeare*).

To KNOLL. v. n. To sound as a bell (*Shakspeare*).

KNOLL. s. A little hill (*Ainsworth*).

KNOP. s. (a corruption of *knap*.) Any tufty top (*Ainsworth*).

KNOT. s. (*cnotta*, Saxon.) 1. A complication of a cord or string not easy to be disentangled (*Addison*). 2. Any figure of which the lines frequently intersect each other (*Prior*).

K N O

3. Any bond of association or union (*Shakspeare*). 4. A hard part in a piece of wood caused by the protuberance of a bough, and consequently by a transverse direction of the fibres. A joint in an herb (*Wisdom*). 5. Difficulty; intricacy (*South*). 6. Any intrigue, or difficult perplexity of affairs (*Dryden*). 7. A confederacy; an association; a small band (*Ben Jonson*). 8. A cluster; a collection (*Dryden*).

To KNOT. v. a. (from the noun.) 1. To complicate in knots (*Sedley*). 2. To entangle; to perplex. 3. To unite (*Bacon*).

To KNOT. v. n. 1. To form buds, knots, or joints in vegetation (*Mortimer*). 2. To knit knots for fringes.

KNOT, in ornithology. See **TRINGA**.

KNOT. Nodus. In botany. A protuberant joint in the stem of some plants, particularly in corn and grasses. An admirable provision to strengthen their otherwise weak hollow culms.

KNOT-GRASS. In botany. See **POLYGONUM**.

KNOTLESS. Enodis. In botany. Without knots. Continuous absque articulis. Applied to a stem. In this application there is a confusion between *nodus* and *articulus*, and the latter is put for the knot itself; whereas in another place Linnæus puts it for the space between the knots. See **JOINT**.

KNOTTED, or KNOTTY. Nodosus. Having knots or swelling joints. The terms articulate, geniculate, and nodose, do not seem to be well distinguished by Linnæus. The first appears to mean jointed in general; the last, jointed with a swelling or protuberance. The difference between this and the second has been already explained under **GENICULATE**.

KNOTTINESS. s. (from *knotty*.) Fullness of knots; unevenness; intricacy (*Peucham*).

KNOTTY. a. (from *knot*.) 1. Full of knots (*Shakspeare*). 2. Hard; rugged (*Rowe*). 3. Intricate; perplexed; difficult; embarrassed (*Bacon*).

KNOUT, the name of a punishment inflicted in Russia, with a kind of whip called knout, and made of a long strap of leather prepared for this purpose. With this whip the executioners dexterously carry off a slip of skin from the neck to the bottom of the back laid bare to the waist, and, repeating their blows, in a little while rend away all the skin off the back in parallel strips. In the common knout the criminal receives the lashes suspended on the back of one of the executioners: but in the great knout, which is generally used on the same occasions as racking on the wheel in France, the criminal is raised into the air by means of a pulley fixed to the gallows, and a cord fastened to the two wrists tied together; a piece of wood is placed between his two legs also tied together, and another of a crucial form under his breast. Sometimes his hands are tied behind over his back; and when he is pulled up in this position, his shoulders are dislocated.

To KNOW. v. a preter. I *knew*, I have *known*. (*cnapan*, Saxon.) 1. To perceive with

K N O

certainty, whether intuitive or discursive (*Locke*). 2. To be informed; to be taught (*Milton*). 3. To distinguish (*Locke*). 4. To recognise (*Milton*). 5. To be no stranger to (*Shakspeare*). 6. To converse with another sex (*Genesi*). 7. To see with approbation (*Hosea*).

To Know. v. n. 1. To have clear and certain perception; not to be doubtful (*Acts*). 2. Not to be ignorant (*Bacon*). 3. To be informed (*Boyle*). 4. **To Know for.** To have knowledge of (*Shakspeare*). 5. **To Know of.** To take cognisance of (*Shakspeare*).

KNOWABLE. a. (from *know*). Cognoscible; possible to be discovered or understood (*Bentley*).

KNOWER. s. (from *know*.) One who has skill or knowledge (*Glanville*).

KNOWING. a. (from *know*.) 1. Skilful; well instructed; remote from ignorance (*Boyle*). 2. Conscious; intelligent (*Hutchmore*).

KNOWING. s. (from *know*.) Knowledge. (*Shakspeare*).

KNOWINGLY. ad. (from *knowing*.) With skill; with knowledge (*Atterbury*).

KNOWLEDGE. s. (from *know*) 1. Certain perception; indubitable apprehension (*Locke*). 2. Learning; illumination of the mind (*Shakspeare*). 3. Skill in any thing (*Kings*). 4. Acquainted with any fact or person (*Sidney*). 5. Cognisance; notice (*Ben Jonson*). 6. Information; power of knowing (*Sidney*).

KNOWLEDGE, according to Mr. Locke, consists in the perception of the connection and agreement, or disagreement and repugnancy of our ideas: and so it stands contradistinguished from ignorance. Whatever comes short of intuition and demonstration, is but faith or opinion, not knowledge. As we are invincibly conscious to ourselves of a different perception, when we look on the sun in the day, and think on it by night, we may add to the two former sorts of knowledge this also of the existence of particular external objects by that consciousness we have of the actual entrance of ideas from them; so that there is a third degree of knowledge, which may be called sensitive.

Knowledge also may be usefully distinguished into three kinds; historical, philosophical, and mathematical.

Historical knowledge, is merely the knowledge of facts, or of what is or happens in the material world, or within our own minds. Thus, that the sun rises and sets, that trees bud in the spring, that we remember, will, &c., are instances of historical knowledge.

Philosophical knowledge, is the knowledge of the reasons of things, or of what is or happens. Thus he has a philosophical knowledge of the motion of rivers, who can explain how it arises from the declivity of the bottom, and from the pressure which the lower part of the water sustains from the upper. So likewise the shewing how, and by what reason, desire or appetite arises from the perception or ima-

K N O

gination of its object, would be philosophical knowledge.

Mathematical knowledge, is the knowledge of the quantity of things, that is, of their proportions or ratios to some given measure. Thus he who knows the proportion of the meridian heat of the sun at the summer solstice to its meridian heat at the winter solstice, might so far be said to have a mathematical knowledge of the sun's heat. So likewise he has a mathematical knowledge of the motion of a planet in its orbit, who can distinctly shew how, from the quantity of the impressed and centripetal force, the velocity of the planet is produced; and how, from the action of this double force, the elliptical figure of the orbit arises.

These three kinds of knowledge differ evidently, it being one thing to know that a thing is; another, the reason why it is; and a third, to know its quantity or measure.

It is also evident, that historical knowledge, though extensively useful, and the foundation of the rest, is the lowest degree of human knowledge. Those who aim at the greatest certainty ought to join mathematical with philosophical knowledge. Nothing can more evidently shew that an effect arises from a certain cause, than the knowledge that the quantity of the effect is proportional to the force of the cause. Besides, there are many things in nature, the reasons of which depending on certain figures or quantities, are not assignable but from mathematical principles.

KNOWLEDGE (Degrees of) As to the different degrees, or clearness of our knowledge, it seems to lie in the different way which the mind has of perceiving the agreement or disagreement of any of its ideas. When the mind perceives this agreement or disagreement of two ideas immediately by themselves, without the intervention of any other, we may call it intuitive knowledge; in which case the mind perceives the truth, as the eye doth light, only by being directed towards it. Thus the mind perceives that white is not black; that three are more than two, and equal to one and two. This part of knowledge is irresistible; and, like the bright sun-shine, forces itself immediately to be perceived, as soon as ever the mind turns its view that way. It is on this intuition that all the certainty and evidence of our other knowledge depends: which certainly every one finds to be so great, that he cannot imagine, and therefore cannot require a greater. The next degree of knowledge is, where the mind perceives not this agreement, or disagreement, immediately, or by the juxtaposition, as it were, of the ideas; because those ideas, concerning whose agreement, or disagreement, the inquiry is made, cannot, by the mind, be so put together, as to shew it. In this case, the mind is obliged to discover the agreement, or disagreement, which it searches for, by the intervention of other ideas: and this is that which we call reasoning.

KNOWLEDGE.

Thus, if we would know the agreement, or disagreement, in bigness, between the three angles of a triangle and two right angles, we cannot do it by an immediate view and comparison of them, because the three angles of a triangle cannot be brought together at once, and compared with any other one or two angles; and so of this the mind has no immediate or intuitive knowledge. But we must find out some other angles, to which the three angles of a triangle have equality; and, finding those equal to two right ones, we come to know the equality of these three angles to two right ones.

Those intervening ideas, which serve to shew the agreement of any two others, are called proofs: and where the agreement, or disagreement, is by this means plainly and clearly perceived, it is called demonstration: and a quickness in the mind to find those proofs, and to apply them right, is that which is called sagacity.

This knowledge, though it be certain, is not so clear and evident as intuitive knowledge; it requires pains and attention, and steady application of mind, to discover the agreement, or disagreement, of the ideas it considers; and there must be a progression by steps and degrees, before the mind can, in this way, arrive at any certainty.

Before demonstration, there was a doubt, which in intuitive knowledge, cannot happen to the mind, that has its faculty of perception left in a degree capable of distinct ideas, no more than it can be a doubt to the eye (that can distinctly see white and black), whether this ink and paper be all of a colour. Now, in every step that reason makes in demonstrative knowledge, there is an intuitive knowledge of that agreement, or disagreement, it seeks, with the next intermediate idea, which it uses as a proof; for, if it were not so, that yet would need a proof, since, without the perception of such agreement, or disagreement, there is no knowledge produced.

By which it is evident, that every step in reasoning, that produces knowledge, has intuitive certainty; which, when the mind perceives, there is no more required, but to remember it, to make the agreement, or disagreement, of the ideas, concerning which we inquire, visible and certain. This intuitive perception of the agreement, or disagreement, of the intermediate ideas in each step and progression of the demonstration, must also be exactly carried in the mind; and a man must be sure, that no part is left out, which, because in long deductions the memory cannot easily retain, this knowledge becomes more imperfect than intuitive, and men often embrace falsehoods for demonstrations.

It has been generally taken for granted, that mathematics alone are capable of demonstrative certainty: but to have such an agreement, or disagreement, as may be intuitively perceived, being, as we imagine, not the privilege of the ideas of number, extension, and figure alone, it may, possibly, be the want of due method

and application in us, and not of sufficient evidence in things, that demonstration has been thought to have so little to do in other parts of knowledge. For, in whatever ideas the mind can perceive the agreement, or disagreement, immediately, there it is capable of intuitive knowledge; and, where it can perceive the agreement, or disagreement, of any two ideas, by the intuitive perception of the agreement, or disagreement, they have with any intermediate ideas, there the mind is capable of demonstration, which is not limited to the ideas of figure, number, extension, or their modes.

On this branch of the subject it may be inferred.

1. That we can have no knowledge farther than we have ideas.

2. That we have no knowledge farther than we can have perception of the agreement, or disagreement, of our ideas, either by intuition, demonstration, or sensation.

3. We cannot have an intuitive knowledge, that shall extend itself to all our ideas, and all that we would know about them; because we cannot examine and perceive all the relations they have one to another by juxtaposition, or in immediate comparison one with another. Thus, we cannot intuitively perceive the equality of two extensions, the difference of whose figures makes their parts incapable of an exact immediate application.

4. Our rational knowledge cannot reach to the whole extent of our ideas; because, between two different ideas which we would examine, we cannot always find such proofs, whereby we can connect one to another with an intuitive knowledge in all the parts of the deduction.

5. Sensitive knowledge, reaching no farther than the existence of things actually present to our senses, is yet much narrower than either of the former.

6. From all which it is evident, that the extent of our knowledge comes not only short of the reality of things, but even of the extent of our own ideas. We have the ideas of a square, a circle, and equality; and yet, perhaps, shall never be able to find a circle equal to a square.

The affirmations or negations we make concerning the ideas we have, being reduced by Mr. Locke to these four, viz, identity, co-existence, relation, and real existence, he examines how far our knowledge extends to each of these.

1. As to identity and diversity, our intuitive knowledge is so far extended as our ideas themselves, and there can be no idea in the mind which it does not presently, by an intuitive knowledge, perceive to be what it is, and to be different from any other.

2. As to the agreement or disagreement of our ideas of co-existence, our knowledge herein is very defective, though the greatest and most material part of our knowledge concerning substances consists in it.

As to the powers of substances, which

KNOWLEDGE

make a great part of our enquiries about them, our knowledge reaches little further than experience, because they consist in a texture and motion of parts which we cannot by any means come to discover.

3. As to the third sort, the agreement or disagreement of our ideas in any other relation; this is the largest field of knowledge, and it is hard to determine how far it may extend. This part depending on our sagacity in finding intermediate ideas, that may show the habitudes and relations of ideas, it is difficult to tell when we are at an end in such discoveries.

4. As to the fourth part of knowledge, viz. of the real actual existence of things, we have an intuitive knowledge of our own existence, a demonstrative knowledge of the existence of God, and a sensitive knowledge of the objects that present themselves to our senses. See **EXISTENCE**.

KNOWLEDGE (reality of). It is evident, that the mind knows not things immediately, but by the intervention of the ideas it has of them. Our knowledge, therefore, is real only so far as there is a conformity between our ideas, and the reality of things. But how shall we know when our ideas agree with things themselves? It is answered, There are two sorts of ideas, that we may be assured agree with things: these are,

1. Simple ideas, which, since the mind can by no means make to itself, must be the effect of things operating upon the mind in a natural way, and producing therein those perceptions, which, by the will of our Maker, they are ordained and adapted to. Hence it follows, that simple ideas are not fictions of our fancies, but the natural and regular production of things without us, really operating upon us, which carry with them all the conformity our state requires, which is to represent things under those appearances they are fittest to produce in us. Thus the idea of whiteness, as it is in the mind, exactly answers that power which is in any body to produce it there; and this conformity between our simple ideas, and the existence of things, is sufficient for real knowledge.

2. All our complex ideas, except only those of substances, being archetypes of the mind's own making, and not referred to the existence of things, as to their originals, cannot want any conformity necessary to real knowledge; for that which is not designed to represent any thing but itself, can never be capable of a wrong representation. Here the ideas themselves are considered as archetypes, and things are no otherwise regarded than as conformable to them. Thus the mathematician considers the truth and properties belonging to a rectangle, or circle, only as they are ideas in his own mind, which possibly he never found existing mathematically, that is, precisely true; yet his knowledge is not only certain, but real, because the things are no farther concerned, nor intended to be meant by any such propositions, than as things really agree to those archetypes in the mind.

3. But the complex ideas, which we refer to archetypes without us, may differ from them, and so our knowledge about them may come short of being real: and such are our ideas of substances. These must be taken from something, that does or has existed, and not be made up of ideas arbitrarily put together, without any real pattern. Herein, therefore, is founded the reality of our knowledge concerning substances, that all our complex ideas of them must be such, and such only, as are made up of such simple ones as have been discovered to co-exist in nature: and our ideas, being thus true, though not, perhaps, very exact copies, are the subject of real knowledge of them. Whatever ideas we have, the agreement we find they have with others, will be knowledge. If those ideas be abstract, it will be general knowledge; but to make it real concerning substances, the ideas must be taken from the real existence of things. Wherever, therefore, we perceive the agreement, or disagreement, of our ideas, there is certain knowledge; and wherever we are sure those ideas agree with the reality of things, there is certain, real knowledge.

KNOWLEDGE (method of improving or enlarging). It being the received opinion amongst men of letters, that maxims are the foundation of all knowledge, and that sciences are each of them built upon certain præcognita, from whence the understanding is to take its rise, and by which it is to conduct itself in its enquiries in the matters belonging to that science; the beaten road of the schools has been to lay down, in the beginning, one or more general propositions, called principles, as foundations whereon to build the knowledge that was to be had of that subject.

That which gave occasion to this way of proceeding was, the good success it seemed to have in mathematics, which, of all the sciences, have the greatest certainty, clearness, and evidence in them. But, if we consider it, we shall find, that the great advancement and certainty of real knowledge men arrive to in these sciences, was not owing to the influence of those principles, but to the clear, distinct and complete ideas, their thoughts were employed about, and to the relation of equality and excess, so clear between some of them, that they had an intuitive knowledge, and by that a way to discover it in others, and this is without the help of those maxims. For is it not possible for a lad to know that his whole body is bigger than his little finger, but by virtue of this axiom, the whole is bigger than a part; nor be assured of it till he has learned that maxim? Let any one consider which is known first and clearest by most people, the particular instance, or the general rule; and which it is that gives life and birth to the other: these general rules are but the comparing our more general and abstract ideas, which ideas are made by the mind, and have names given them, for the easier dispatch in its reasonings: but knowledge began in the mind, and was founded on particulars, though afterwards

K N O W L E D G E.

perhaps, no notice be taken thereof, it being natural for the mind to lay up those general notions, and make the proper use of them, which is to disturb the memory of the cumbersome load of particulars. The way to improve in knowledge is, not to swallow principles with an implicit faith, and without examination, which would be apt to mislead men, instead of guiding them into truth; but to get and fix in our minds clear and complete ideas, as far as they are to be had, and to annex to them proper and constant names: and thus barely by considering our ideas, and comparing them together, observing their agreement, or disagreement, their habitudes and relations, we shall get more true and clear knowledge by the conduct of this one rule, than by taking up principles, and thereby putting our minds into the disposal of others.

We must therefore, if we will proceed as reason advises us, adapt our methods of enquiry to the nature of the ideas we examine, and the truth we search after. General and certain truths are only founded in the habitudes and relations of abstract ideas; therefore a sagacious, methodical application of our thoughts for the finding out these relations, is the only way to discover all, that can with truth and certainty, be put into general propositions. By what steps we are to proceed in these, is to be learned in the schools of the mathematicians, who, from very plain and easy beginnings, by gentle degrees, and a continued chain of reasonings, proceed to the discovery and demonstration of truths, that appear at first sight above human capacity. This may reasonably be said, that if other ideas, that are real as well as nominal essences of their species, were pursued in the way familiar to mathematicians, they would carry our thoughts farther, and with greater evidence and clearness, than probably we are apt to imagine.

In our knowledge of substances, we are to proceed in quite a different method; the bare contemplation of their abstract ideas, which are but nominal essences, must carry us but a very little way in the search of truth and certainty: here experience will teach us what reason cannot; and it is by trying alone that we can certainly know what other qualities co-exist with those of our complex idea; for instance, whether that yellow, heavy, fusible body we call gold, be malleable or not, which experience, however it prove in that particular body we examine, makes us not certain that it is so in all, or any other yellow, heavy, fusible bodies, but that which we have tried; because it is no consequence, one way or other, from our complex idea. As far as our experience reaches, we may have certain knowledge, and no farther. It is not denied, but that a man accustomed to rational and regular experiments, shall be able to see farther into the nature of bodies, and their unknown properties, than one that is a stranger to them; but this is only judgment; and opinion, not knowledge and certainty.

The ways to enlarge our knowledge, as far as

we are capable, seem to be these two: the first is, to get and settle in our minds, as far as we can, clear, distinct, and constant ideas of those things we would consider and know, for it being evident, that our knowledge cannot exceed our ideas, where they are either imperfect, confused or obscure, we cannot expect to have certain, perfect, or clear knowledge. The other art is, of finding out the intermediate ideas, which may shew us the agreement or repugnancy of other ideas, which cannot be immediately compared.

That these two, (and not relying on maxims, and drawing consequences from some general propositions) are the right method of improving our knowledge in the ideas of other modes, besides those of quantity, the consideration of mathematical knowledge will easily inform us; where, first, we shall find, that he, who has not clear and perfect ideas of those angles or figures, of which he desires to know any thing, is utterly thereby incapable of any knowledge about them. Suppose a man not to have an exact idea of a right angle, scalenum, or trapezium, and it is clear, that he will in vain seek any demonstration about them.

And farther, it is evident, that it was not the influence of maxims or principles that led the masters of this science into those wonderful discoveries they have made: let a man of good parts know all the maxims of mathematics ever so well, and contemplate their extent and consequences as much as he pleases, he will, by their assistance, scarce ever come to know, that the square of the hypotenuse in a right-angled triangle, is equal to the squares of the two other sides. This, and other mathematical truths, have been discovered by the thoughts otherwise applied. The mind had other objects, other views before it, far different from those maxims, which men, well enough acquainted with those received axioms, but ignorant of their method who first made those demonstrations, can never sufficiently admire.

Our knowledge, as in other things, so in this also, has so great a conformity with our sight, that it is neither wholly necessary, nor wholly voluntary. Men, who have senses, cannot choose but receive some ideas by them; and, if they have memory, they cannot but retain some of them; and if they have any distinguishing faculty, cannot, but perceive the agreement or disagreement, of some of them, one with another. As he that has eyes, if he will open them by day, cannot but see some objects, and perceive a difference in them; yet he may choose whether he will turn his eyes towards an object, curiously survey it, and observe accurately, all that is visible in it. But what he doth see he cannot see otherwise than he doth; it depends not on his will to see that black, which appears yellow. Just thus it is with our understanding: all that is voluntary in our knowledge, is the employing or withholding any of our faculties, from this or that sort of objects, and a more or less accurate survey of them; but, they being employed, our will hath

KNO

no power to determine the knowledge of the mind one way or another; that is done only by the objects themselves, as far as they are clearly discovered. Thus, he that has got the ideas of numbers, and has taken the pains to compare one, two, or three, to six, cannot choose but know they are equal. He also, that hath the idea of an intelligent, but weak and frail being, made by, and depending on, another, who is eternal, omnipotent, and perfectly wise and good, will as certainly know, that man is to honour, fear, and obey God, as that the sun shines when he sees it. But yet, be those truths ever so certain, ever so clear, he may be ignorant of either or both of them, who will not take the pains to employ his faculties as he should, to inform himself about them.

On this most interesting subject, we would beg to recommend to the younger part of our readers, Watts's *Improvement of the Mind*, and Locke's *Conduct of the Understanding*. We have here adopted Locke's theory and his mode of reasoning; not because we think them free from objection, but because in our opinion the principles of metaphysics are as yet too much afloat, to permit us to give any other theory a decided preference. See *METAPHYSICS*.

To KNO'WLEDGE. *v. a.* (not in use.) To acknowledge; to avow (*Bacon*).

KNOX (John), the Scotch reformer, was born at Giffard in the county of Lothian, in 1505, and educated for the church at St. Andrews. Mr. George Wishart brought him off from popery after he had entered into orders. He now openly preached the doctrines of the reformation without reserve, for which he was greatly persecuted by the Romish clergy. When the castle of St. Andrews was taken by the French, he was carried with the garrison to France, from whence he came to England in 1549. In 1552 he was appointed chaplain to king Edward VI. and he might have had considerable preferment if he would have conformed to the liturgy. When queen Mary came to the throne he went to Geneva, from whence he removed to Frankfort, to be preacher to the English refugees. He left Frankfort in 1556, and returned to his own country, and finding the protestant party increased, he redoubled his efforts through all the kingdom, and that with great success. This brought his life into imminent danger, and, therefore, he once more visited Geneva; and when he was gone the bishops caused sentence of death to be passed upon him for heresy, and his effigy was publicly burnt at Edinburgh. While at Geneva he published some severe pieces against the bishops, and also, against female government. In 1559 he returned home, and found his party so strong, that there was little danger to be any longer apprehended from his enemies; he therefore recommenced his labours with new zeal. He died in November, 1572, and was buried at Edinburgh; several lords attending the funeral. He had two sons, both fellows of St.

KNU

John's college, Cambridge. Knox wrote a *History of the Reformation of Religion in Scotland*, folio, and several small tracts and sermons.

The following character of Knox was drawn by Dr. Robertson.—"Zeal, intrepidity, disinterestedness, were virtues that he possessed in an eminent degree. He was acquainted too with the learning cultivated in that age; and excelled in that species of eloquence which is calculated to rouse and to inflame. His maxims, however, were often too severe, and the impetuosity of his temper excessive. Rigid and uncompromising, he shewed no indulgence to the infirmities of others. Regardless of the distinctions of rank and character, he uttered his admonitions with an acrimony and vehemence more apt to irritate than to reclaim; and this often betrayed him into indecent expressions, with respect to queen Mary's person and conduct. Those very qualities, however, which now render his character less amiable, fitted him to be the instrument of Providence for advancing the reformation among a fierce people, and enabled him to face dangers, and to surmount opposition, from which a person of a more gentle spirit would have been apt to shrink back. By an unwearied application to study and to business, as well as by the frequency and fervour of his public discourses, he had worn out a constitution naturally strong. During a lingering illness, he discovered the utmost fortitude; and met the approach of death with a magnanimity inseparable from his character. He was constantly employed in acts of devotion, and comforted himself with those prospects of immortality, which not only preserve good men from desponding, but fill them with exultation in their last moments. The earl of Morton, who was present at his funeral, pronounced his eulogium in a few words, the more honourable for Knox, as they came from one whom he had often censured with peculiar severity. 'Here lies he who never feared the face of man.'"

KNOXIA. In botany, a genus of the class tetrandria, order monogynia. Corol one-petalled, funnel-form; calyx four-leaved, one of the leaflets larger than the rest; seeds two-grooved. Two species; one a native of Ceylon, one of India.

To KNUBBLE. *v. a.* (*knippler*, Danish.) To beat (*Skinner*).

KNUCKLE. *s.* (*cnucle*, Saxon.) 1. The joints of the fingers protuberant when the fingers close (*Garth*). 2. The knee joint of a calf (*Bacon*). 3. The articulation or joint of a plant (*Bacon*).

To KNUCKLE. *v. n.* (from the noun.) To submit.

KNUCKLED. *a.* (from *knuckle*.) Jointed (*Bacon*).

KNUFF. *s.* A lout. An old word (*Hayward*).

KNUR. *s.* (*knor*, German.) A knot; a hard substance (*Woodward*).

K O E

KOEI-tchen, a province of China, and one of the smallest in the kingdom. On the south it has Quang-si, on the east Hou-quang, on the north Se-tchuen, and Yun-nan on the west. The whole country is almost a desert, and covered with inaccessible mountains: it may justly be called the Siberia of China. The people who inhabit it are mountaineers, accustomed to independence, and who seem to form a separate nation: they are no less ferocious than the savage animals among which they live.

KOEI-tchen-sou-sou, a commercial city of China, in the province of Se-tchuen. Its district contains one city of the second class, and nine of the third.

KOEI-yang, the capital of the province of Koei-tcheou, in China. The remains of temples and palaces still announce its former magnificence. It is 420 miles north-west of Canton.

KOEBRENTERIA. In botany a genus of the class octandria, order monogynia. Calyx five-leaved; corol four-petalled, irregular; nectary four bifid scales; capsule three-celled; the cells two-seeded. One species; a native of China.

KOEMPFER (Engelbert), a German physician and naturalist, was born in Westphalia in 1651, and studied at various places. He became secretary of the embassy sent from Sweden to Persia in 1683: in this journey he had ample opportunities of gratifying his curiosity; and when the ambassador returned, he chose rather to stay in the east, as chief surgeon to the Dutch East India fleet. In this capacity he visited different islands, particularly Japan, of which he published afterwards an excellent account. He returned to Europe in 1693, and settled in his own country, where he died in 1716.

KOENIG (Samuel), a learned philosopher and mathematician, was a Swiss by birth, and came early into eminence by his mathematical abilities. He was professor of philosophy and natural law at Franeker, and afterwards at the Hague, where he became also librarian to the Stadtholder, and to the Princess of Orange; and where he died in 1757.

The Academy of Berlin enrolled him among her members; but afterwards expelled him on the following occasion. Maupertuis, the president, had inserted in the volume of the Memoirs for 1748, a discourse upon the Laws of Motion; which Koenig not only attacked, but also attributed the memoir to Leibnitz. Maupertuis, stung with the imputation of plagiarism, engaged the Academy of Berlin to call upon him for his proof; which Koenig failing to produce, he was struck out of the academy. All Europe was interested in the quarrel which this occasioned between Koenig and Maupertuis. The former appealed to the public, and his appeal, written with the animation of resentment, procured him

K O N

many friends. He was author of some other works, and had the character of being one of the best mathematicians of the age.

KOENIGIA. In botany a genus of the class triandria, order trigynia. Calyx three-leaved; corolless; seed one, ovate, naked. One species: a native of Iceland, with numerous terminal flowers divided by membranous bracthes.

KOLA, a town of the Russian government of Archangel, capital of Russian Lapland. It has a good harbour on the river Kola, near a bay of the same name in the Frozen Ocean. Lon. 39. 26. E. Lat. 68. 34. N.

KOLYVAN, a government of the Russian empire, comprehending a part of Western Siberia, and formerly included in the government of Tobolsk.

KONED, for *knew* (Spenser).

KONGSBERG, a town of Norway, belonging to Denmark, and celebrated for its silver mines, whose produce has been considerably exaggerated by most of the travellers that have published on this subject. The town which stretches on both sides the river Lowe, contains about 1600 houses, and, including the miners, 6000 inhabitants. The mines, which lie about two miles from the town, were first discovered and worked during the reign of Christian IV.

KONIG (George Matthias), a learned German, was born at Altdorf in Franconia, where he was professor of poetry and Greek, and library keeper of the university. He died in 1699, aged 88. His principal work is a Biographical Dictionary in Latin, printed at Altdorf in 1678, 4to.

KONIG (Emanuel), a physician of Basil in Switzerland, who was so greatly esteemed in that country as to be reckoned another Hippocrates. He wrote many medical works, and died in 1731, aged 73.

KONINGSBERG, a town of Poland, and capital of Regal Prussia, with a magnificent palace, in which is a hall 274 feet long and 50 broad without pillars to support it, and a handsome library. It is about five miles in circumference; and including the garrison of 7000 men contains 60,000 inhabitants. The town-house, the exchange, and the cathedral church, are all very fine structures. The tower of the castle is exceeding high, and has 284 steps to go to the top, from whence there is a very distant prospect. There are 18 churches in all; of which 14 belong to the Lutherans, three to the Calvinists, and one to the Papists. It stands on the Pregel, a navigable river which flows from the north-western provinces of Poland, and here falls into the eastern extremity of the Frische Haf, an inlet of the Baltic. No ships drawing more than seven feet water can pass the bar and come up to the town; so that the large vessels anchor at Pillau, a small town on the Baltic, which is the port of Koningberg; and the merchandise is sent in smaller vessels to this place. Its trade is very considerable.—Koningberg

K O U

contains an university, founded by Albert of Brandenburg. According to the original endowment there were 40 professors; but their number is now reduced to 16. Each professor receives a salary of about 50l. per annum, which may be increased by private lectures. In 1775, the university contained 800 students, of whom 200 are lodged and boarded at the expence of the crown. There are three public libraries in the town, the royal or university library, the town library, and the Wallenrodt library, so called because it was given by Martien von Wallendorf, in 1650. E. lon. 20. 48. N. lat. 51. 43.

KONIGSTEIN, a town of Upper Saxony, in the territory of Misnia, with an impregnable fort. It is a place of confinement for state prisoners, and is situated on the Elbe, 10 miles south-east of Pyrna, and 10 south-west of Dresden. Lon. 13. 43. E. Lat. 51. 2. N.

KONIGSTEIN, a town of Germany, in the archbishopric of Mentz, with a strong fort, 12 miles north-east of Mentz. It surrendered to the French in 1796. Lon. 8. 25. W. Lat. 53. 5. N.

KONIGSTUTER, a town of Germany in the territory of Brunswick Wolfenbüttele, with a celebrated abbey. Lon. 11. 7. E. Lat. 52. 25. N.

KORAN. See ALCORAN.

KOREKI, the country of the Koriacs.

KORIACS, a nation of Asia, tributary to the Russians. There are two sorts of Koriacs. Those who are properly called by that name have a fixed residence: the others are wanderers, and are known by the appellation of Reindeer Koriacs. Their flocks are numerous, and they maintain them by conducting them to those cantons that abound with moss. When these pastures are exhausted, they seek for others. In this manner they wander about, encamping under tents of skin, and supporting themselves with the produce of their deer, which are as serviceable for draught to the Koriacs as the dogs are to the Kamtschadales. There is, in many respects, a great resemblance between the fixed and the wandering Koriacs: yet the misunderstanding which subsists among them, causes them to be considered as two different people. Their country, however, is the same, and takes in a vast extent, terminated to the south by Kamtschatka and the gulf of Pongina, to the east by the country of the Olutians, to the north by that of the Tehonkchie, and to the west by the Tongouses, the Lamouts, and the Yakouts.

KOS, in the Jewish Antiquities, a measure which held the quantity of four cubic inches, and something over. This was the cup of blessing, out of which they drank when they gave thanks after solemn meals, as on the day of the passover.

KOUANIN, in the Chinese language, the name of a tutelary deity of women. The

K O U

Chinese make great numbers of the figures of this deity in white porcelain, and send them to all parts of the world, as well as keep them in their own houses. The figure represents a woman with a child in her arms. The women, who have no children, pay a sort of adoration to these images, and suppose the deity they represent to be of power to make them fruitful. It has been supposed, by many Europeans, that these images were meant to represent the Virgin Mary, with our Saviour in her arms; but this is an idle opinion; the Chinese having been fond of this figure in all times that we have an account of. The statue always represents a handsome woman, very modestly attired.

KOUCH (Peter), a Dutch painter, was born in 1500. He visited Constantinople, and drew some fine views in the neighbourhood of that city, some of which were afterwards engraved. He afterwards settled at Antwerp, and became principal painter to the emperor Charles V. He died in 1553.

KOULI-KHAN (THAMAS), or Schah Nadir, was not the son of a shepherd, as the authors of the English Biographical Dictionary assert; his father being chief of a branch of the tribe of Afichars, and governor of a fortress erected by that people against the Turks. Upon his father's death, his uncle usurped his government, under the pretext of taking care of it during the minority of Kouli-Khan; or, more properly, young Nadir. Disgust at this affront made him commence adventurer. He entered into the service of Beglerberg, governor of Muschada, in the Khorasan; who, discovering in him strong marks of a military genius, promoted him to the command of a regiment of cavalry. In 1720, the Ubec Tartars having made an irruption into the Khorasan with 10,000 men, Beglerberg, whose whole force consisted only of 4000 horse and 2000 infantry called a council of war, in which it was declared imprudent to face the enemy with such an inferior force: but Kouli-Khan, proposed to march against the enemy, and engaged to conduct the expedition, and to be answerable for the success of it. He was accordingly made general; defeated the Tartars, and took their commander prisoner. Howein Beglerberg received him at his return with marks of distinction; but growing jealous of his rising fame, instead of obtaining him the rank of lieutenant-general of the Khorasan, as he had promised, obtained it for another; which so exasperated Kouli-Khan, that he publicly complained of the governor's ingratitude and perfidy; who thereupon broke him, and ordered him to be punished with the bastinado so severely, that the nails of his great toes fell off. This affront occasioned his flight, and his joining a banditti of robbers (not his stealing his father's or his neighbour's sheep). The rest of his adventures are too numerous to be inserted in this

K R U

wo k. In 1729 he was made general of Persia by Schah Thamas, and permitted to take his name Thamas, and that of Khuli, which signifies slave: his title therefore was, The slave of Thamas; but he was ennobled by the addition of Khan. In 1736, he fomented a revolt against his master, for having made an ignominious peace with the Turks; and having the army at his command, he procured his deposition, and his own advancement to the throne. In 1739 he conquered the Mogul empire; and from this time growing as cruel as he was ambitious, he at length met with the usual fate of tyrants, being assassinated by one of his generals, in league with his nephew and successor, in 1747, aged sixty.

KOUMISS, a sort of wine made in Tartary, where it is used by the natives as their common beverage during the season of it, and often serves them instead of all other food. It is said to be so nourishing and salutary, that the Baschkir Tartars, who towards the end of winter are much emaciated, no sooner return in summer to the use of koumiss, than they become strong and fat.

Dr. Grieve has given in the Edinburgh Transactions, vol. I. p. 181, the recipe for making koumiss, as it was communicated to him by a Russian nobleman.

KRAKEN, the name of a monstrous animal, said to have been seen in the northern seas. A long account of it is given by Bishop Pontoppidan in his Natural History of Norway: but we cannot persuade ourselves to occupy our pages with so incredible a story.

KRAMERIA. In botany a genus of the class tetrandria, order monogynia. Calyx less; corol four-petalled; upper nectary three-parted, lower two-leaved, berry dry, echinate, one-seeded, one species: a South American shrub with alternate-lanceolate leaves, and alternate flowers in terminal racemes.

KRANTZIUS (Albertus,) a native of Hamburg, and famous historian, who travelled over several parts of Europe, and was made rector of the university of Rostoch in 1489. He went from thence to Hamburg in 1508, where he was elected dean of the chapter in the cathedral. He did many good services to that church and city; and was so famed for his abilities and prudence, that John king of Denmark and Frederic duke of Holstein did not scruple to make him umpire in a dispute they had with the Ditmars. He wrote several good historical works; the most considerable of which is an ecclesiastical history of Saxony, intitled *Metropolis*, in folio; the best edition is that of Frankfurt. He died in 1517.

KRAUT, or **CAUL**. See **Caul**.

KRUMHORN, or **KARNHORN**, the name of a portable wind-instrument formerly much in use, the formation and tone of which resembled that of a small cornet. Many organ builders corrupt this word into

K U R

Cremona, and apply it to one of their cornet stops, erroneously supposing that stop to have originally derived that name from its imitation of the tone of the *Cremona* violin. See **Stop CREMONA**.

KRIGIA. In botany a genus of the class syngenesia, order polygamia æqualis. Receptacle naked; calyx many-leaved, simple; seeds crowned with a five-leaved membrane alternating with as many bristles. One species; a Virginian plant.

KUHNTIA. In botany a genus of the class syngenesia, order polygamia æqualis. Receptacle naked; down feathery, sessile; calyx imbricate, cylindrical. Two species: natives of Pennsylvania, with terminal corymbs.

KUHNIIUS (Joachim), professor of Greek and Hebrew at Strasburg, was a native of Pomerania, and distinguished himself by some learned works, as editions of *Ælian's Various History*, *Pausanias's Description of Greece*, and some original pieces of his own. He died in 1697, aged 50.

KUICK (John van), an historical and portrait painter of Dort, was born in 1530. Having given some offence to the jesuits, they accused him of heresy, and had him burnt to death in 1572.

KUNCKEL (John), a celebrated Saxon chemist, born in the duchy of Sleswick, in 1630. He became chemist to the elector of Saxony, the elector of Brandenburg, and Charles II. king of Sweden, who gave him the title of counsellor in metals, and letters of nobility, with the surname of *Leopoldsteing*. He employed 50 years in chemistry; in which, by the help of the furnace of a glass house which he had under his care, he made several excellent discoveries, particularly of the phosphorus of urine. He died in Sweden in 1702; and left several works, some in German, and others in Latin: among which, that intitled *Observationes Chemicae*, and the "Art of making Glass," printed at Paris in 1752, are the most esteemed.

KUNCKEL'S Pyrophorus. See **Pyrophorus**.

KUPFER-NICKEL. In mineralogy. See **Nickelium**.

KURIL or **KURILSKI ISLES**, extending from N. lat. 51. to 45. which probably once lengthened the peninsula of Kamtschatka before they were convulsed from it, are a series of islands running south from the low promontory Lopatka, between which and Shoomska, the most northerly is only the distance of one league. On the lofty Paramonsker, the second in the chain, is a high peaked mountain, probably volcanic; and on the fourth, called *Araumakutan*, is another volcano. On Uruss there is another; on Storgu there are two; and on Kupatir, or Kurnachir, there is one. These three make part of the group which pass under the name of the land of Jesso.

KURTUS. In zoology a genus of the

K U S

class pisces, order jugularia. Body carinate on each side; back elevated; gill-membrane with two rays. One species only. Inhabits the Indian Sea; feeds on crabs and testaceous animals; body short, slender, golden, and appearing as if covered with silvery plates. Head large, compressed, obtuse; eyes very large, pupil black, iris, above blue, beneath white; mouth large; jaws with numerous small teeth, the upper something larger, and a little curved; tongue short, cartilaginous; palate smooth; aperture of the gills large, the cover membranaceous; back spotted with orange, with four black spots before the fin; lateral line straight, commencing above the pectoral fin, bent near the head; fins with forked rays; pectoral and ventral, golden, edged with reddish, the rest blueish at the base and yellow towards the edge, the first ray of the dorsal and ventral fins hard; the two first of the anal, spinous.

KUSTER (*LUDOLF*), a very learned writer in the 18th century, was born at Blomberg in Westphalia. When very young, he was upon the recommendation of baron Spanheim appointed tutor to the two sons of the count de Schwerin, prime minister of the king of Prussia, who, upon our author's quitting that station, procured him a pension of 400 livres. He was promised a professorship in the university of Joachim; and till this should be vacant, being then but 25, he resolved to travel. He read lectures at Utrecht; went to England; and from thence to France, where he collated *Suidas* with three MSS. in the king's library, which furnished him with a great many fragments that had never been published. He was honoured with the degree of doctor by the university of Cambridge, which made him several advantageous offers to continue there: but he was called to Berlin, where he was installed in the professorship promised him. Afterwards he went to Antwerp; and being brought over to the Catholic religion, he abjured that of the Protestants. The king of France rewarded him with a pension, and ordered him to be ad-

K Y R

mitted supernumerary associate of the academy of inscriptions. "But he did not enjoy this new settlement long; for he died in 1716, aged 46. He was a great master of the Latin tongue, and wrote well in it; but his chief excellence was his skill in the Greek language, to which he almost entirely devoted himself. He wrote many works; the principal of which are, 1. *Historia critica Homeri*. 2. *Jamblicus de vita Pythagoræ*. 3. An excellent edition of *Suidas*, in Greek and Latin, three volumes, folio. 4. An edition of *Aristophanes* in Greek and Latin, folio. 5. A new Greek edition of the New Testament, with Dr. Mills's Variations, in folio.

To KYD. v. n. (corrupted probably from cub Saxon.) To know (*Spenser*).

KYLLINGIA. In botany a genus of the class triandria, order monogynia. Ament ovate or oblong, imbricate; calyx two-valved; corol two-valved. Eight species, natives of the East or West Indies.

KYPHONISM, *KYPHONISIMUS*, or *ΚΥΡΟΝΙΣΜΟΣ*, an ancient punishment, which was frequently undergone by the martyrs in the primitive times; wherein the body of the person to suffer was anointed with honey, and so exposed to the sun, that the flies and wasps might be tempted to torment him. This was performed in three manners; sometimes they only tied the patient to a stake; sometimes they hoisted him up into the air, and suspended him in a basket; and sometimes they stretched him out on the ground, with his hands tied behind him. The word is originally Greek, and comes from *κρυπνυ*, which signifies either the stake to which the patient was tied, the collar fitted to his neck, or an instrument wherewith they tormented him.

KYRIE. The vocative of a Greek word signifying lord, and which the Italians generally write *Chrie*. Masses and services frequently begin with this word. It is sometimes used as the designation of a sacred composition: as when we call a mass or service, opening with it, a fine *Kyrie*.

L

L

L, EL, a semi-vowel, or liquid consonant, making the eleventh letter of the English alphabet, and always preserving the same sound.

The *l* is pronounced by applying the tongue to the palate.

Passerat observes, that *l* was frequently used among the ancients for *b*, as in *cillibæ* for *cibillæ*; for *d*, as *alipe* for *adipe*; for *c*, as *mutila* for *multa*; for *n*, as *arvilla* for *arvina*, *belle* for *bene*, *colligo* for *conligo*; for *r*, as *fratellus* of *frater*, *balatrones* for *baratrones*; for *s*, as *ancille* of *am* and *casum*, *equillo* for *equiso*; for *t*, as *equisetis*, for *equisetis*, *Thetis* for *Thetis*. See B, T, &c.

The *ll* is a modern contrivance, and was never used among ancient Roman authors: they wrote *alium*, not *allium*; *macelum*, not *mallum*; *poluccere*, not *pollucere*.

The *ll* of the Greeks was sometimes changed by the Romans into *ll*, as in *ολλοει*, *ollio*; *αλλος*, *allus*; *φολλος*, *folium*; *r* has also been turned in *ll*; as *hira*, *illa*; *sarare*, *sattulare*, &c. and *l* in *x* or *xill*; as *alu*, *axilla*; *mala*, *maxilla*; *velum*, *voxillum*; *d* was also used for *l*, *n* for *ll*, and *r* for *l*. See R, &c.

l is also frequently used instead of *d*, as in *Ulysses*, from the Greek *Ὀδυσσεύς*, in the Æolic dialect *Ὀδυσσεύς*. Thus also for *dantia*, we say *lantia*; for *dacrumæ*, *lacrymæ*, &c. See D.

Among the Saxons the *l* was aspirated, and the Spaniards and Welsh usually double it at the beginning of a word, which sounds nearly the same with our *hl* or *fl*. At the end of a monosyllable it is always doubled, except after a diphthong. In a word of more syllables it is written single. It is sometimes inserted before *c*, and sounded feebly after it.

The figure of our *L* we borrowed from the Latins, they from the Greeks, and they again from the Hebrews, whose *lamed* is much like our *L*, excepting that the angle is somewhat more acute.

L was also a numeral letter among the ancients, and is still so in the Roman cyphering, signifying *fifty*; according to the verac,

Quinquies *L* denos numero designat habendos.

When a dash was added to the top, thus, *L̄*, it stood for *fifty thousand*.

L was used for *fifty*, being half a C, which stood for a hundred, and was formerly written *l̄*, which according to Pasquier, makes the one upright, and the other in-

French Louis d'or have a cross on the obverse, consisting of eight *L*'s interwoven, and disposed in form of a cross. The letter

L A B

L is marked on the money coined at Bayonne. The epochas on Greek medals are usually written with the ancient *lambda*, *L*; which, according to the tradition of the antiquaries, stands for *Λυκοβαντος*, a poetical word, unknown in common speech, signifying *anno*, and which it is probable was more used in Egypt than Greece.

L as an abbreviature stands for *Lucius*; and *L.L.S.* for a setorce. In English it denotes a pound sterling.

LA, In the Italian music, a syllable by which Guido denominated the last sound in each hexachord; if it begins in C it answers to our A, if in G to E, if in F to D.

La. interfect. See; look; behold (*Shaksp.*)

LABADIE (John), a famous enthusiast, was born in 1610, and educated in the Jesuits' college at Bourdeaux. He afterwards entered of the order, but quitted it in 1639, and became a zealous preacher. His affected piety procured him many admirers, and he became canon of the cathedral at Amiens, which place he was obliged to leave on account of some amours. In 1666 he began to publish his peculiar doctrines with great boldness, in which he set aside the Scriptures, and all outward worship, resolving the whole of religion into spiritual feeling and mental prayer. One of his principal followers was Anna Schurman, who attended him in all his peregrinations to his death. He caused great disturbances in the United Provinces by his notions, which spread like wild-fire, and those who held them were called Labadists. After having been expelled from various places he went to settle at Altona in Holstein, where he died in 1674. His works are numerous, but not worth mentioning.

LABADISTS, the followers of Labadie.

LABARUM, the banner or standard borne before the Roman emperors in the wars. The labarum consisted of a long lance, with a staff a-top, crossing it at right angles; from which hung a rich streamer, of a purple colour, adorned with precious stones. Till the time of Constantine it had an eagle painted on it; but that emperor in lieu thereof, added a cross with a cipher expressing the name of Jesus. This standard the Romans took from the Germans, Dacæ, Sarmatæ, Pannonians, &c. whom they had overcome. The same labarum was not known before the time of Constantine.

LABAT (John Baptist), a celebrated traveller, of the order of St Dominic, was born at Paris, taught philosophy at Nancy, and in 1693 went to America in quality of a missionary. At his return to France in 1708,

he was sent to the chapter of his order at Bologna to give an account of his mission, and staid several years in Italy. He died at Paris in 1738. His principal works are, 1. A New Voyage to the American Islands, 8 vols. 12mo. 2. Travels in Spain and Italy, 8 vols. 12mo. 3. A New Account of the Western Parts of Africa, 5 vols. 12mo.: father Labat was not in Africa, and therefore was not a witness of what he relates in that work. He also published the Chevalier des Marchais's Voyage to Guinea, in 4 vols. 12mo.; and an Historical Account of the Western Parts of Ethiopia, translated from the Italian of father Cavazzi, 5 vols. 12mo.

LABA'TIA. In botany a genus of the class tetrandria, order monogynia. Calyx, four-leaved, inferior; corol subcampanulate, four-cleft, with two minute segments in the divisions of the corol; capsule four-celled; seeds solitary. Two species—one a native of Hispaniola; the other of Guiana. The last a tree forty feet high, with axillary flowers triate or timate; the corol greenish.

LABDANUM. See **LADANUM**.

To LABEFY. *v. a.* (*labefacio*, Latin.) To weaken; to impair.

LABELL. *s.* (*labellum*, Latin.) 1. A small slip or scrip of writing (*Shaks.*) 2. Any thing appendant to a larger writing (*Ayliffe*). 3. (In law.) A narrow slip of paper or parchment affixed to a deed or writing, in order to hold the appending seal (*Harris*).

LABENT. *a.* (*labens*, Lat.) Sliding; gliding; slipping.

LABEO (Quintius Fabius), a Roman consul, B.C. 183. He was a soldier and a man of liberality and talents, and assisted Terence in writing some of his plays.

LABEO (Antistius), a Roman lawyer, who greatly opposed the ambitious views of Augustus. His father was one of the conspirators who slew Cæsar, and this Labeo was killed at the battle of Philippi.

LABERIUS, a Roman knight, who wrote Mimes, or trifling satirical productions for the stage. Julius Cæsar obliged Laberius to perform one of his own Mimes contrary to his will. Laberius on this occasion spoke a prologue, in which he threw out several fine strokes of satire against Cæsar. This piece is preserved in Aulus Gellius; fragments of his other works are also extant.

LABIA, in anatomy. See **LIPS**.

LABIAL. *a.* (*labialis*, Lat.) Uttered by the lips (*Holder*).

LABIATE FLOWERS. In botany, a term of Tournefort's. Linnæus uses the term *Roseæ*, *gens*, including under it, both Labiate and Personate flowers. In *Dalén. Pl. Rogens* (corolla) is made synonymous with *Lobate*. This term is applied likewise to the calyx. See **RINOSANT** and **PERSONATE**.

The confusion would be cleared up, if we were allowed to put *Labiate*, for an irregular petalous corol with two lips; I to appropriate the term *Ringent* to such

as have the lips gaping or open—*Personate*, to such as have them closed.

LABIUM, the lip, is usually applied by Linnæus to both lips of a labiate corol, with the distinction of superior and inferior. But it is sometimes used for the lower lip in opposition to the upper lip, which is then called *Galea*, the helmet.

LABIATED. *a.* (*labium*, Latin.) Formed with lips.

LABIODENTAL. *a.* (*labium* and *dentula*, Latin.) Formed or pronounced by the co-operation of the lips and teeth (*Holder*).

LABORANT. *s.* (*laborans*, Lat.) A chemist; not in use (*Boyle*).

LABORATORY (from *labor*, Lat.) In chemistry the room or office in which the experimenter operates. It may be some satisfaction to those of small means to be informed that most of the admirable researches of Scheele, Priestley, Crawford and Berthollet were conducted by means of a very simple and cheap apparatus. Yet a well furnished and convenient laboratory possesses so many important advantages, that no chemist will be without such a building who has it in his power to command one: and hence it may not be unacceptable to those who are entering upon chemical studies to give a short list of such articles of furniture as may be considered as almost indispensable to carry on a general contrée of experiments, omitting however, several nice and complicated instruments which have been devised for many experiments of research, such for example as the composition of water. If the chemist have opportunity of building a laboratory, or of converting a considerable part of a small house to the purpose, it will be more convenient both to have a ground floor, and an upper story; on the ground floor he may build his brick furnaces, keep charcoal and other fuel, grind and sift different materials, evaporate large quantities, and do all those things which make much dust or fumes, and reserve the upper room for the nicer and cleaner experiments. But if he can only devote a single room to chemical uses, it is on the whole preferable to have it above the level of the ground, on account of its being much drier, for a damp air rusts every thing of iron and steel, spoils the scale beams, loosens the gummed labels to the bottles, renders many salts damp and deliquescent, and produces many other inconveniences. The only advantage of a ground floor, is the greater convenience of bringing water (which is abundantly required), but this is not at all counterbalanced by the trouble of dampness. The first object to be considered is, the mode of applying heat, or the selection of furnaces. If the chemist has only a single room with a common fire-place, the latter should be made as wide as possible; and the grate removed to give room for one or two portable furnaces. There may be a Black's furnace with sand bath, earthen tube, muffle, and other appurtenances, and a small blast, which will suffice for most operations: besides which it is extremely convenient to have one or two large black-lead pots with a grate near the bottom, an ash-hole cut below it, and the top deeply indented in the form of battlements, over which a large evaporating pan or other vessel may be set, and heated by charcoal. It is a great saving of room to have an iron flue hanging a few feet from the ground, and running up in front of the chimney piece, and penetrating into the chimney near the

LAB

top of the room, under which a small chamber furnace, or a charcoal pot may be set without encumbering the fire-place. The chimney of the Black's furnace should be lengthened by an iron pipe of at least six or eight feet long and fixed up in the chimney of the room by iron cramps, which increases its draught prodigiously. The room should be amply furnished with shelves for bottles and glass apparatus, and with as many or as large deal tables as can conveniently stand in it, one of which should be substantial and heavy, or else a kitchen dresser may be put up with drawers below. A small set of drawers, such as apothecaries use, will be highly convenient. If possible a stone sink should be placed at one corner of the room, with a supply of clean water, and conveniences for draining bottles, &c. A solid block of wood is also useful for supporting a mortar when pounding hard substances, and in which an iron anvil may be stuck when required. These being arranged, the chemist must furnish himself with the most useful apparatus, of which the following are the principal articles. The description of each individual article, with the kind to be preferred, will be found under their respective heads.

A gazometer with the connecting tubes, blow-pipe, &c.

A bladder or silk bag with stop cock fitting the above.

A Pneumatic water trough.

A copper still with worm tub, the still fitting into the top of the Black's furnace.

A blow pipe with spoon, &c.

Lamps.—An Argand and others of a common construction for oil and alcohol.

An apparatus for drying precipitates by steam.

Scales and weights.

Large and small iron stands for retorts, &c.

Mortars, one of hard steel, one of bell mettle, and one or two of Wedgewood ware.

A silver crucible and spatula.

A platina crucible and spatula.

A jointed iron tube for conveying gasses.

The following Articles in Glass.

Retorts of different sizes plain and stoppered, and long necked for gasses.

Receivers to fit the above, plain and stoppered, with or without an adopter.

Plain jars for gasses, different sizes.

Lipped jars for mixtures, precipitate, &c.

A graduated eudiometer jar.

Bell receivers two or three sizes.

Proof bottles.

Capsules or small evaporating cups.

Water glasses (such as are used at table) which are very convenient for gentle evaporations.

Florence flasks.

Matrasses two or three very small, and others of common size, round and flat-bottomed.

Funnels ribbed, and one plain with a very long neck for charging retorts.

Wine-glasses common or lipped.

Watch-glasses for evaporating minute quantities at a very gentle heat.

Common decanters.

A bottle for specific gravity of fluids.

Phials of all sizes, plain and with ground stoppers.

Plain glass tubes of various thickness, and one for the purpose of syphons, heat tubes for capillary tubes for dropping liquids, &c.

LAB

A gass-saturating apparatus.

A Woulfe's apparatus.

A tube of safety, separate.

A barometer.

Thermometers common and with the bulb naked.

The following in Earthen-ware.

Crucibles. Hessian, common and black lead, with stands and covers.

Retorts.

Cupels.

Wedgewood evaporating dishes, a set.

White basons with lips, different sizes.

Common white cups and saucers.

Tubes straight and bent.

Porcelain spoons.

Do. rods for stirring corrosive fluids.

Stone jars with tin covers for holding salts, &c.

Also the following Sundries.

A mercurial pneumatic trough.

Wire—different sizes and kinds, viz. iron, copper, brass, silver, and platina, gold, silver and leaf; tinfoil.

Fire-tongs, various shapes.

Steel spatula and pallet-knives,

Iron ladles.

Diamond for scratching glass.

Files, flat, three-cornered and rat-tailed.

Hammers.

A vice and anvil.

Pincers.

Shears and scissors.

A magnet.

Sieves.

Corks.

Bladder, spirit varnish, sponge, tow, linen; flannel.

Windsor and common bricks, tiles, sand.

Lutes of various kinds.

And for more Delicate and Extensive Researches

A mercurial and pneumatic trough.

A mercurial gazometer.

A burning lens.

An electrical apparatus.

A galvanic apparatus.

A detonating jar.—A glass or silver alembic.

LABORIOUS. *a.* (*laborieux*, French; *laboriosus*, Latin.) 1. Diligent in work; assiduous (*South*). 2. Requiring labour; tiresome; not easy (*Addison*).

LABORIOUSLY. *ad.* With labour; with toil (*Decay of Piety*).

LABORIOUSNESS. *s.* (from *laborious*.)

1. Toilsomeness; difficulty (*Decay of Piety*). 2. Diligence; assiduity.

LABOUR. *s.* (*labour*, French; *labor*, Lat.)

1. The act of doing what requires a painful exertion of strength; pains; toil (*Shaks*). 2. Work to be done (*Hooker*). 3. Motion done; performance. 4. Exercise; motion with some degree of violence (*Harvey*). 5. Childbirth; travail (*South*).

TO LABOUR. *v. n.* (*labore*, Latin.) 1. To toil; to act with painful effort (*Shaks*). 2. To do work; to take pains (*Ecclesi*). 3. To move with difficulty (*Granville*). 4. To be diseased with; not used (*B. Jonson*). 5. To be in distress; to be pressed (*Macle*). 6. To be in childbirth; to be in travail (*Dryden*).

TO LABOUR. *v. a.* 1. To work at; to

move with difficulty (*Pope*). 2. To beat; to belabour (*Dryden*).

LA'BOURER. *s.* (*laboureur*, French.) 1. One who is employed in coarse and toilsome work (*Swift*). 2. One who takes pains in any employment (*Granville*).

LABOUREUR (Johnle); a French writer and ecclesiastic, was born at Montmorency in 1623. He was for some time in an office about the court, but afterwards entered into orders, and became prior of Juvigné. In 1664 the king appointed him commander of the order of St. Michael, in testimony of his esteem for his talents and virtues. He died in 1675. He wrote the History of the Marshal of Guebriant, with the Genealogy of Budos, and some other houses in Brittany; and published an edition of the Memoirs of Michael de Castelnau, and other curious works. His uncle, Claude le Laboureur, published also several books of considerable merit.

LA'BOURSOME. *a.* Made with great labour and diligence: not in use (*Shakspeare*).

LA'BRA. *s.* (Spanish.) A lip: not used (*Shakspeare*).

LABRADOR, a country on the east side of Hudson's Bay, in North America. The climate, in only lat. 57. N. is excessively cold during winter. Wine freezes in a solid mass; brandy coagulates; and the very breath falls on the blankets of a bed, in the form of a hoar-frost. The ice begins to disappear in May; and about the middle of June commences hot weather, which, at times, is so violent as to scorch the faces of the hunters. Mock suns and halos are not unfrequent: they are very bright, and richly tinged with all the colours of the rainbow. The sun rises and sets with a large cone of yellowish light; and the night is enlivened by the aurora borealis, which spreads many different lights and colours over the whole sky. The animals are moosedecers, stags, reindeers, bears, tigers, buffaloes, wolves, foxes, beavers, otters, lynxes, martens, squirrels, ermines, wild cats, and hares. The feathered kinds are geese, bustards, ducks, partridges, and all kinds of wild fowls. The fish are whales, morses, seals, codfish, and a white fish preferable to herrings; and in their rivers and fresh waters are pike, perch, carp, and trout. In summer there is here, as in other places, a variety in the colour of the several animals: when that season is over, which holds only for three months, they all assume the livery of winter, and every sort of beasts, and most of their fowls, are of the colour of the snow; every thing animate and inanimate is white. But one of the most striking things, that draws the most inattentive to an admiration of the wisdom and goodness of Providence, is, that the dogs and cats from Great Britain, which have been carried to Hudson's Bay, have changed their appearance on the approach of winter, and acquired a much longer, softer, and thicker coat of hair than they

originally had. See NEW BRITAIN, HESPERIAUX, and HUDSON'S BAY.

LABRADOR Stone. In mineralogy. See FELDSPATUM.

LABRADOR Tea. In botany. See LEDUM. LA'BRUM, in antiquity, a bathing tub.

LA'BRUS. Wrasse. In zoology, a genus of the class pisces; order thoracica. Teeth sharp; lips simple; gill-membrane, with about six rays; the covers scaly; dorsal fin, with a slender skin beyond the end of each ray; lateral line straight. Seventy-two species; inhabiting the different parts of the globe: of which nine are common to the coasts of our own country. They may be thus subdivided:

A. Tail forked.

B. Tail entire, comprehending by far the greater number. The chief species are the following:

1. L. Tinca. Old wife. Upper jaw turned up; tail rounded; mouth able to be drawn in or protruded. Inhabits deep waters on the British coasts; grows to five pounds weight; feeds on shell-fishes and testaceous animals; varies much in its colours, sometimes dirty red, and sometimes beautifully striped.

2. L. Ballan. Ballan wrasse. Body yellow, spotted with orange; above the nose a deep furrow; farthest gill-cover with a depression radiated from the centre. Found during summer in great shoals at Scarborough: size of the last, and perhaps only a variety of it.

3. L. Cornubiensis. Goldfinny. Near the tail a large black spot; first rays of the dorsal fins tinged with black. Inhabits the Cornish coast: about a palm long.

4. L. Comber. Comber. Back, fins, and tail red; belly yellow; tail rounded. Inhabits the coasts of Cornwall: body slender; small.

5. L. Coquus. Cook. Body purple and dark blue, beak yellow; tail rounded. Inhabits the Cornish coasts: small in size.

LA'BURNUM, in botany. See CORYSUS.

LA'BYRINTH, *Λαβυρινθος*, among the ancients, was a large and intricate edifice cut out into various isles and meanders, running into each other, so as to render it difficult to get out of it.

There is mention made of four celebrated labyrinths among the ancients, ranked by Pliny in the number of the wonders of the world, viz. the Cretan, Egyptian, Lemnian, and Italian.

That of Crete is the most famed; it was built by Daedalus, for king Minos, on the model of that of Egypt: and it was hence that Theseus made his escape by means of Ariadne's clue.

That of Egypt, according to Pliny, was the oldest of all; and was subsisting in his time, after having stood 3600 years. He says it was built by king Petosiris, or Tithoes; but Herodotus makes it the work of several kings: it stood on the banks of

the lake *Mooria*, and consisted of twelve palaces, in which the twelve kings of Egypt assembled to transact affairs of state and religion, containing three thousand apartments. See a plan and description of this labyrinth, in the present state of it, in *Pocock's Hist. of the East*, vol. i. p. 61, &c. See also *Perry's View of the Levant*, p. 881, &c.

That of Lemnos was supported by columns of wonderful beauty; there were some remains of it at the time when Pliny wrote. That of Italy was built by Porsenna, king of Etruria, for his tomb.

LABYRINTH. In anatomy that part of the internal ear behind the cavity of the tympanum, which is constituted by the cochlea, vestibulum, and semicircular canals.

LAC. See **MILK.**

LAC. (Gum). *Lacque*, French. From the Hebrew *לש* which last is generally understood to imply the may-bug, or chafer (*Scarabæus*). Neither the insect that affords this substance, denominated lac from the name of the insect itself, nor the substance secreted, have been hitherto distinctly explained. We shall offer the latest, and apparently the most accurate account of this subject, from Dr. Buchanan's "Journey from Madras through Mysore, Canara, and Malabar."

"I took an opportunity, in company with this *amildan*, of examining into the management of the lac insect; and for this purpose we collected all the people who follow that employment. The people who manage the lac insect in the hills near Mandidurga are of the cast called Woddaru; and for the exclusive use of the tree, they pay a rent to government. The tree on which the insect feeds is the *jata*, which is nearly related to *saul*, of Bengal, or the storea of Gartner, and perhaps the *batia* (hiness of Linnæus). All the trees that I saw here were small, not exceeding eight or ten feet in height; and their growth was kept down by the insect and its managers, for this size answers best. The tree, left to itself, grows to a large size, and is good timber. For feeding the insect, it thrives very well in a dry barren soil; and is not planted, but allowed to spring up spontaneously as nature directs. It is often choked by other trees, and destroyed by bamboos, which by rubbing one against another, in this arid region, frequently takes fire, and lays waste the neighbouring woods. By removing all other trees from the places where the *jata* naturally grows, and perhaps by planting a few trees on some other hills, and protecting them from being choked as they gradually propagate themselves, the lac insect might be raised to any extent on lands now totally useless, and never capable of being rendered arable. In *Kartika*, or from about the middle of October to the middle of November, the lac is ripe. At that time it sur-

rounds every small branch of the tree, and destroys almost every leaf. The branches intended for sale are then cut off, spread out on mats, and dried in the shade. A tree or two, that are fullest of the insect, are preserved to propagate the breed; and of those a small branch is tied to every tree in the month Chaitra, or from about the middle of March to the middle of April; at which time the trees again shoot out young branches and leaves. The lac dried on the sticks is sold to the merchants of Balakari, Gutli, Bangalore, &c.; and, according to the quantity raised, and the demand, varies in price from 5 to 20 fanams a *maund*. This is what is called *stick-lac*." Vol. i. p. 343 344.

The lac thus collected is purified or accumulated by additional processes: and have, independently of

1. *Stick-lac*, we have
2. *Seed-lac*, which consists of stick-lac broken into small lumps, granulated and picked.
3. *Lump-lac*; which is seed-lac liquified by fire.
4. *Shell-lac*; which is the shells of the stick-lac, liquified by gentle heat, strained, and formed into thin transparent lamine in the following manner: it is broken into small pieces, and picked from the branches and sticks, and put into a canvas bag. This is placed over the fire, and frequently turned till the lac is liquid enough to pass through its pores, when it is taken off and squeezed by two men in different directions, dragging it along the convex part of a plantain tree, prepared for the purpose. The degree of pressure on the plantain tree regulates the thickness of the shell.

"To give the red dye with lac, take 1½ *maund* 38 ½ lb. of lack cleared from the sticks, 1½ *seer* (0 ½ lb.) of Soda bark, 1½ *seer* of Caja Cara, or Soda, and two *Dudus* weight (12 ½ lb.) of hermetic; put them into a narrow-mouthed pot, capable of holding 80 *seers* (5492 cubical inches), with 40 *seers* of water, and boil them four hours; then decant the liquor which is impregnated with the dye; and having to the same material added 20 *seers* more of water, boil them again for three hours; decant this liquor into the former, and then for three hours boil the materials a third time with 10 *seers* of water. Decant this also into the two former, and preserve, in a covered pot, the whole liquor for eight days. At the end of this period the workman judges how much silk his materials will dye. If the lac have been good, it will dye 5 *seers* (3 ½ lb.); but if poor, it will not dye more than 4 *seers*. For 5 *seers* of silk, take 20 *seers* of materials, and for two days infuse them in 18 *seers* of water; then strain the infusion through a thick cloth till about 5 *seers* of clear infusion are procured. Put this into a large open pot with the silk, and warm them

until they be rather too hot for the hand. Take out the silk and pour into the warm infusion of tamarinds three-quarters of the decoction of lac strained through a cloth: then return the silk, and boil it for three hours. After this examine the silk. If it have received a proper colour, nothing more is added; but if the colour be not deep enough, the remaining decoction is strained and added by degrees, till the colour is completed. When cool, the silk must be washed in cold tank-water, and dried in the shade. This is the finest red dye in use here (Bangalore): in some places cochineal is used; but it is much more expensive. The lac dye is not discharged by washing." *Ibid.*

The substance constituting lac is a secretion from the parent female insect, for the purpose of glueing its eggs now just deposited, to the branches upon which they are placed; and also for the purpose of providing the young larvae with food as soon as the rays of the sun have given them animation. It consists, upon a minute examination, of a multitude of minute bags, each bag having a variety of distinct cells like a honey-comb, but of a different shape.

The three common species of lac have been analysed by Mr. Hatchett, and the leading results are as follow:

When water is poured on the stick-lac coarsely powdered, it soon begins to turn red, and by heating a crimson-coloured solution is obtained. Shell-lac loses by this about 10 per cent. of its weight, and the undissolved residue becomes yellowish brown. The watery solution contains the colouring extract, one of the ingredients of lac, but does not extract the whole at once, on account of its intimate union with the other constituent parts. Alcohol dissolves a large portion of all the kinds of lac. The portion soluble in cold alcohol, and which is entirely resin, except a little extract, amounts to about 68 per cent. from stick-lac, 88 from fine seed-lac, and 81 from shell-lac; but in the latter case, about ten more of the resin remain mixed with the other ingredients. Hot alcohol dissolves also other parts of the lac, which are not easily separable again. Sulphuric ether dissolves less of the lac than alcohol. Of the acids, nitre acts most powerfully, and converts it into a brittle opaque, yellow substance. Potash and soda dissolve all kinds of lac.

Lac is used among ourselves as the basis of sealing-wax; and in Portugal and Barbary, in shining goat-skins, so as to form what is called *red Morocco leather*.

Lac ammoniac. A very nauseous attenuant, expectorant, and antispasmodic preparation of ammoniacum.

Lac amygdal. A very pleasant, cooling, emollient drink, calculated to alleviate urticaria, and relieve strangury. It forms a pleasant pisan in coughs, hoarsenesses, and catarrhs, and is denominated in the last

edition of the London Pharmacopoeia *Matura amygdalæ*.

Lac sulphuris. See SULPHUR precipitatum.

Lac tree. See CROTON.

LACARRY (Giles), a French Jesuit, born in 1605, and died in 1684. He wrote, 1. *Historia Galliarum sub prefectis Prætorii Galliarum* 4to.; 2. *Historia Coloniarum à Gallis in exteras nationes missarum*, 4to.; 3. *De Regibus Franciæ et Lege Salicæ*; 4. *Historia Romana*, 4to.; 5. *Notitia Provinciarum Imperii utriusque cum Notis*, 4to.

LACCIC ACID, is yielded by the *Lac* (white), which is also an animal secretion, though we are less acquainted with the insect that produces it, than with that which gives the gum-lac. White lac is a waxy substance, and by various experiments, appears to have a very close chemical analogy with bees' wax, though in a few particulars it differs from it. It has also a very near resemblance to the *Pe-la* of the Chinese, or the white wax used in varnishes for candles. It is exported from India in grey, opaque, rough, roundish pieces, of about the size of a pea. It has a saltish and bitterish taste but when fresh gathered, it appears from Dr. Anderson's account to have a sweetish and delicious flavour. It has no smell unless when used; after melting and straining, it sinks in water.

When heated in water it melts at 145, and then a reddish liquid separates from the lac and mixes with the water. This liquid has various properties of an acid and is hence denominated *Laccic Acid*.

After the separation of this acid the remaining substance is of the colour of bees' wax, and hard and brittle as resin. On digesting it with a solution of pot-ash, Dr. Pearson found that it became brown, gave a smell like palm-oil, and united with the alkali to a coagulated mass, but could not be brought to the state of a true soluble soap. The solution was decomposed by acids. Ammonia had nearly the same effect as pot-ash. Candles were made of this substance with cotton wicks, which burned rapidly and gave much smoke and a resinous smell. In this respect it differs from the Chinese *pe-la*, which burns as well as the finest wax and with as little smoke.

Heated with nitrous acid it gives out much nitrous gas. It is totally dissolved in five parts of oil of turpentine, but the solution grows turbid as it cools. Ether dissolves a tenth part of its weight but imperfectly. Alcohol by repeated affusion dissolves all but 15 per cent. of this lac.

LACTIC ACID. A peculiar acid upon which depends the facility with which milk or whey undergo the acetous fermentation, and which was first ascertained by the experiments of Scheele. See the article MILK.

LACE, *s.* (*laccet*, French.) 1. A string, a cord (*Spencer*). 2. A snare; a gin (*Fairy*). 3. A platted string, with which women

L A C

fasten their clothes (*Swift*). 4. Ornaments of fine thread curiously woven (*Bacon*). 5. Texture of thread, with gold or silver. (*Henbert*). 6. Sugar. A poet word; now out of use (*Prior*).

To LACE. *v. a.* (from the noun.) 1. To fasten with a string run through eilet holes (*Congreve*). 2. To adorn with gold or silver textures sewed on (*Shakespeare*). 3. To embellish with variegations (*Shakespeare*). 4. To beat; to lash (*L'Estrange*).

LACE, in commerce, a work composed of many threads of gold, silver, or silk, interwoven one with the other, and worked upon a pillow with spindles, according to the pattern designed; the open work being formed with pins, which are placed and displaced as the spindles are moved.

Lace, bone, a lace made of fine linen thread or silk, much in the same manner as that of gold and silver. The pattern of the lace is fixed upon a large round pillow, and pins being stuck into the holes or openings in the pattern, the threads are interwoven by means of a number of bobbins, made of bone or ivory, each of which contains a small quantity of fine thread, in such a manner as to make the lace exactly resemble the pattern. There are several towns in England, and particularly in Buckinghamshire, that carry on this manufacture; but vast quantities of the finest laces have been imported from Flanders.

LACE BARK. In botany, see DAPHNE.

LACEDÆMON (*fab. hist.*), a son of Jupiter and Taygeta the daughter of Atlas, who married Sparta the daughter of Europa, by whom he had Amyclas and Eurydice the wife of Acrisius. He was the first who introduced the worship of the graces in Laconia, and who first built them a temple. From Lacedæmon and his wife, the capital of Laconia was called Lacedæmon and Sparta.

LACEDAMON, a noble city of Peloponnesus, called also Sparta; these names differing in this, that the latter is the proper and ancient name of the city, the former of the country, which afterwards came to be applied to the city (*Strabo, Stephanus*). See SPARTA. The present city is called Misitra, situated in E. lon. 23. O. N. Lat. 36. 55.

LA'CEMAN. *s.* (*lace and man*.) One who deals in lace (*Addison*).

LA'CEABLE. *a.* (from *lacerate*.) Such as may be torn (*Harvey*).

To LA'CEATE. *v. a.* (*lacero*, Latin.) To tear; to rend (*Derham*).

LACERATION. *s.* (from *lacerate*.) The act of tearing or rending; the breach made by tearing (*Arætanus*).

LA'CEATING. *a.* (from *lacerate*.) Tearing; having the power to tear (*Harvey*).

LACERNA, a thick coarse sort of military garment worn by the ancients. The lacerna was a kind of cloak of woollen, only used by the men, who wore it over the toga, and, when that was not on, over the

L A C

tunica. It was at first very short, but growing popular in the Roman army, it was soon lengthened.

LACERTA, Lizard, in astronomy, one of the new constellations of the northern hemisphere, added by Hevelius to the 48 old ones, near Copheus and Cassiopeia.

This constellation contains, in Hevelius's catalogue 10 stars, and in Flamsteed's 16, viz. 0. 0. 0. 3. 6. 7, classed according to their magnitudes.

LA'CERTA. Lizard. In zoology, a genus of the class amphibia, order reptilia. A very numerous, active nimble tribe; all of which, except the aquatic ones, feed on insects. The *crocodiles* have both jaws moveable, and the largest mouth of all animals; their body is covered with callosities. The *chameleons* have a prehensile tail; sit on trees; walk slowly and irregularly, have no teeth; eyes large, fixt in a wrinkled socket; tongue very long, worm shaped, with which they draw in flies: head angular, covered with very thin lucid tubercles or scales.

It is a difficult matter to arrange this tribe into distinct sets or sections; being so numerous and running so imperceptibly into the specific characters of each other. The following is the division of Dr. Shaw.

A *Crocodiles*, furnished with very strong scales.

B *Guanes* and such other lizards as have either serrated or carinated backs and tails.

C *Coryles*, with denticulated, and sometimes spiny scales or plates on the abdomen.

D *Lizards proper*, smooth, and the greater number furnished with broad square, scales, or plates on the abdomen.

E *Chameleons*, with granulated skin, large head, long missile tongue, and cylindric tail.

F *Geckos*, with granulated or tuberculated skin, and lobatic feet, with the toes lamellated beneath.

G *Skinks*, with smooth fish-like scales.

H *Salamanders*, and *newts* or *efts*, with soft skins; of which some are water-lizards.

I *Snake-lizards*, with extremely long bodies, very short legs and minute feet.

We shall select a few examples, and with as much variety as we can allow.

1. L. *Crocodilus*. Common or nilotic Crocodile. Head armed; nape carinate; tail above with two lateral crests.

There is another variety with its snout much shorter than the head; nape naked. Inhabits the Nile; from eighteen to twenty-five feet long; possesses amazing swiftness, voracity and strength; smells of musk; swims hideously; devours men and other large animals, both aquatic and terrestrial; swallows stones to prevent the painful wounds of anger; overturns boats when taken in nets, and is not to be killed

L A C E R T A.

by a musket-ball, unless struck on the belly; is destroyed by tobacco; seldom moves but in a straight line, whence it is easily avoided. Eggs hardly larger than those of a goose, and deposited by the female in the sand.

Eyes wrinkled; ears linear, closed with a flap above; teeth in the upper jaw forty, lower thirty-eight and sharp; fore-feet five toed; hind-feet four-toed, palmate.

Tremendous as this animal is when full grown, in a young state it is by no means to be dreaded; it is not only diminutive from the smallness of its egg, but appears also to be extremely feeble and torpid; at least when brought young into Europe, and may be handled with impunity. But in the glowing climates of Africa, and especially when arrived at its maturity, it is justly regarded as the most formidable monster of the rivers. It is by many biblical critics supposed to be the *לִיָּאן* (Leviathan) of the Old Testament; chiefly, perhaps, because the fearful and sublime description of this monster (be he what he may) in the book of Job, ch. xi. and xli. does not sufficiently correspond with the general structure and habits of the whale or great mysticete. Yet the *לִיָּאן* of Job, when minutely examined, will as little correspond with the common crocodile as with the whale: and it is probable that like the mammoth the Leviathan of the scriptures has now ceased to exist: an idea which, we believe, has never been hazarded before, but which the great variety of extinct monsters of enormous magnitude, the skeletons of some of which have been obtained by M. Cuvier and other celebrated zootomists, will justify us in propounding.

The crocodile lies in wait near the banks of the Nile, and snatches dogs and other animals, swallowing them instantly, and then plunging into the flood and seeking some retired part where it may lie concealed till hunger again invites it to its prey. The water-newt imitates its manner of attack, which though not more than about four or five inches long will, with the greatest ease, swallow an insect of more than an inch in length; and that at a single effort and with a motion so quick that the eye can scarcely follow it. It poises itself in the water, and having gained a convenient distance, springs with the utmost celerity on the insect and swallows it. If, therefore, a small lizard of only four or five inches in length can thus instantaneously swallow an animal of a fourth part of its own length, we need not wonder that a crocodile of eighteen, twenty or twenty-five feet long should suddenly gorge a dog or other quadruped. The shell of the crocodile, which we have already observed, is not much larger than that of a goose, has a great resemblance to it in other respects also, consisting of a calcareous incrustation, with

an interior membrane that lines it. The eggs as well as the flesh of the crocodile are esteemed delicacies by some of the African nations, and constitute a part of their richest meals.

In the large rivers of Africa crocodiles are said to be sometimes seen swimming together in large shoals, resembling the trunks of so many huge trees floating on the water. The negroes will sometimes attack and kill a single crocodile by stabbing it under its belly. It is also the custom in some countries to hunt the crocodile by means of strong dogs properly trained to the sport, and armed with spiked collars. Yet we have much reason for doubting the truths of this assertion, as the spiked collar would be but a poor defence against the inorgement of the dog, and certainly none against his digestion in the stomach. It is likewise pretended that in some parts of Africa crocodiles are occasionally tamed, and form an article of royal magnificence with the monarchs of those regions, being kept in large ponds or lakes for this purpose. Among the Romans, Scaurus, during his edileship, treated the people with a sight of five crocodiles, exhibited in a temporary lake; and Augustus introduced one into his triumph over Cleopatra, as well as several others afterwards for the entertainment of the people.

It is denied by Grew and some other naturalists that the crocodile moves its upper jaw: but later zootomists appear to have established the fact in a manner the most convincing.

2. *L. Gangetic.* Gangetic, or Indian crocodile. Jaws long, round, subcylindric; tail a bow with two crests running into one. Snout nearly three times as long as the head; nape with six mamillary scales: teeth, upper jaw sixty; lower fifty-eight, sharp. It is chiefly distinguished from the crocodile of the Nile, by the peculiarity of its mouth, and the great number of its teeth, which are nearly double those of the preceding species.

3. *L. Alligator.* Alligator. Head flat, imbricate; nape naked; tail above with two rough lateral lines. The general manners and habits of the alligator so nearly resemble those of the crocodile that M. de la Cèpede and several other Zoologists have regarded it as a mere variety, ascribing the slight differences that occur to an American instead of an Asiatic or African climate. Yet Blumenbach has pointed out difference enough to render them really distinct species. It differs most essentially from the crocodile in having the upper part of its head much smoother; and in possessing a snout much flatter and wider. The general size is not much inferior to that of the crocodile, and the number of teeth are alike in both.

The largest and greatest number of alligators are found in the hottest regions of America, yet Catesby affirms that they

LACERTA.

are found as low as in latitude 39, which nearly corresponds to the northernmost parts of Africa, where, indeed, they also exist. They live equally in fresh or salt waters: are very numerous in South Carolina; and from October to March lie torpid in caverns and hollows in the banks of rivers; and at their coming forth in the spring make a hideous bellowing. They are also found occasionally on the Jamaica coast, measuring in that situation about twenty feet in length.

4. *L. Monitor*. Monitor-lizard, of which there are seven varieties.

a. Tail serrate; body unarmed; with ocellate spots.

6 Green with red spots.

7 Tesselate grey and white.

8 Cinereous spotted with black; tail very thick.

9 Blue spotted with white.

10 With six longitudinal rows of spots on the back.

11 Sea-green with blackish ocellate spots.

Inhabits America and Southern Asia; about three feet long; frequently accompanies the crocodile and alligator; of whose approach it is said to give notice to other animals by its hissing: whence its specific name.

5. *L. bimaculata*. Pennsylvanian lizard. Tail carinate, toothed, twice as long as the body; all the toes lobate: body greenish blue, mostly spotted with black; the shoulders with two larger spots; feet all five-toed. Inhabits the woods of St. Eustace and Pennsylvania, and lives in holes, gutters, and hollow trees; makes a hissing noise, and deposits its eggs in the earth.

6. *L. Basiliscus*. Basilisk. Tail rounded, long; dorsal fin radiate: hind-head crested, covered by a hollow, scaly, conic, compressed membrane; dorsal fin scaly, and which it can fold up or expand at pleasure when sitting on a tree. Inhabits South America, and appears to occupy a place between the lizard and the dragon.

Notwithstanding the tremendous accounts given by Lucan and other ancient poets of the poisonous and rapacious nature of this animal (if indeed their basilisk prove the same as ours) it is a perfectly harmless animal, residing principally among trees, and feeding on insects. Colour pale cinereous brown, darker towards the upper part of the body: length one and a half foot; possessing great agility both in swimming and leaping from tree to tree.

7. *L. Iguana*. American Guana. Tail round, long; dorsal lance toothed; gular crest denticulate. Inhabits India, the warmer parts of America, and its adjacent islands; from three to five feet long; lives in rocky and woody places; feeds on insects and reptiles; is easily tamed, and follows mankind like a dog; is caught by a noose thrown over its head; the flesh is reckoned delicious, but does not agree with persons of delicate habits: general colour green, but

variously tinged in various animals: has power of inflating the gular pouch to a large size.

8. *L. Palustris*. Warty newt. Body blackish; sides speckled with white; belly orange, with irregular black spots; tail on each side, with a broad silvery streak of a bluish cast; back of the snout with a flattened crest irregularly serrate. Inhabits the stagnant waters of our own country, and other parts of Europe: less than the water newt.

9. *L. Aquatica*. Water newt.

a. Tail roundish, middle sized.

6. Brown or yellowish.

7. Dorsal line dotted with white and black. Inhabits England and other parts of Europe; 6. inhabits France; 7. Germany; lives in pools, ditches, and stagnant waters; and dies in three minutes if salt be sprinkled upon it.

10. *L. Lacustris*. Penny newt. Black; tail lanceolate, middle-sized. Seven other varieties from difference of size, colour, or occasional marks and dots. Inhabits the lakes of Europe; some of them of Martinico, some of Ceylon: very destructive to fishes.

11. *L. Salamandra*. Salamander. Tail short, round; body porous, variegated with black and yellow. Four other varieties, black, brown, white, and small in size; brown, with compressed tail. Inhabits Germany and many other parts of Europe; exudes from its pores a milky liquor, by which it is for a small time defended from the action of fire, which has caused the belief of former times that it is inconsumable by fire. This property, however, it possesses in a greater degree than frogs, snails, or many others of its own tribe. It is perfectly innocuous, though in ancient times also supposed to be highly poisonous. Yet it is said that the slimy fluid issuing from its pores to a variety of the small grey lizard, if the latter by any means is attempting to bite it. The broods viviparously, or rather lays its own eggs internally, as the viper and some other amphibious. It delights in moist and shady places; and is often torpid in the winter, and lies concealed in the hollows about the roots of old trees, in cavernous recesses, or the cavities of old walls.

12. *L. Gekko*. Gekko. Tail round, middle-sized; toes little clawed; ears opaque. It is surrounded with walls, those of a larger preceding provided with smaller parts. Inhabits Egypt, and the warmer parts of Asia; in winter, makes or like the animal of heretofore, it will run into houses, and as moisture from the floor, which is sometimes very filthy of food &c. runs down, and produces a deadly callosities upon

erect on its hind feet, and is capable of adhering to the most polished surfaces.

13. *L. Geige*. Tail lanceolate, middle-sized, fore-feet fore-toed, body variegated, beneath whitish, tail like that of the salamander. Inhabits the Cape of Good Hope; hardly three inches long; the moisture exuding from its pores apt to produce dangerous gangrenes.

14. *L. Chameleon*. Chameleon. Body cinereous; head flat. Two other varieties; one with body white, the other with very large head. Inhabits India and New Spain; lives chiefly in trees; the lungs enormous, which the animal can inflate to a vast size: eyes so moveable that it can look at the same time in different directions, pupil shining golden; frequently changes its colour, varying it from its natural greenish or blueish grey into a pale yellow, produced apparently by a change in the temperature of the surrounding atmosphere, or some internal morbid affection: but by no means able to exhibit the great variety and contrast of colours at will, which has been commonly asserted of this animal. It is said, however, that much of the variety it does actually discover, proceeds from a power of reflecting the hues of other objects that are opposed or contiguous to it. Body about ten inches, tail nearly as long. It is perfectly harmless to man; feeds chiefly on insects; and is capable of bearing very long abstinences.

15. *L. Agilis*. Scaly-Lizard: Green-Lizard. Tail verticillate, longish, with sharp scales; collar scaly beneath. Nine other varieties; greenish, brownish, blueish, or speckled in various ways. Scales of the belly usually disposed in six rows; hind thighs marked beneath with a line of callous dots. Inhabits England, and Europe at large, as far as the Lake Baikal; one species found in America: is innocent, active, elegant; lives in dry meadows, walls and rocks: easily tamed, and rendered familiar.

16. *L. Velox*. Swift Lizard. Tail verticillate, longish; collar beneath scaly; body above cinereous, varied with five longitudinal paler streaks, and brown dots; sides spotted with black and dotted with blueish. Inhabits sultry places about the lake *Indershausen*; wanders among rocks, and is exceedingly swift: resembles the scaly lizard, but is less and much stronger.

17. *L. Sepa*. Rat. Tail verticillate, long; lateral suture reflected; scales square.

6. Another variety variegated with chestnut; head intermixed with black and white.

7. A third variety, black-blue, marked with confluent white bands mixed with round spots. Body covered above and beneath with truncate scales in eight rows, forming lateral and longitudinal streaks. Belly flat; legs short, distant, formed for

Sputator. Spitting Lizard. Tail middle-sized, with a longitudinal

row of scales beneath; feet unarmed, scabbled; body cinereous with white bands above, before and behind edged with black colour: the whole animal, except the tip of the jaws and the lower surface of the tail, covered with minute truncate scales; tongue round, a little notched at the tip. Inhabits South America, in houses and among old walls; when irritated, discharges a black acrid matter, producing inflammation on the skin, which is cured by camphor or spirits of wine. Length two inches.

19. *L. Scincus*. Skink. Tail round, middle-sized, compressed at the tip: is unarmed, marginate.

6. Another variety, with tail very long; toes round. The whole body with the head and tail covered with imbricate scales. Inhabits Lybia, Egypt, and the rocky parts of Arabia: was formerly kept in dispensaries as an aphrodisiac.

20. *L. Apes*. Cylindrical Lizard. Head, body, and tail, a continued imbricate pale cylinder; no fore-feet; hardly any hind feet; subdidactylous. Inhabits the grassy meadows of the deserts of Southern Siberia, and near the rivers Tarya, Cuma, and Terck: in general appearance resembles a snake, but in internal structure the lizard.

LACHENALIA. In botany, a genus of the class hexandria, order monogynia, Corol six-parted, inferior, the three inner petals longer; calyx less; stamens erect; capsule subovate, three-winged; seeds globular, affixed to the receptacle. Twenty-four species, all Cape plants, but *L. Serotina*, which is a native of Spain. The corals are mostly campanulate, but a few cylindrical; the leaves of some species with purple streaks, of a few yellowish or violet tips.

LACHES, from the French *lascher*, i.e. *laxare*, or *lasche*, *ignavus*, in the English law signifies blackness or negligence, as it appears in Littleton, where *laches of entry* is a neglect of the heir to enter. And probably it may be an old English word; for where we say there is *laches* of entry, it is all one as if it were said there is a *lack* of entry, and in this signification it is used.

LACHESIS, in mythology, one of the Færce. Her name is derived from *λαχυν*, to measure out by lot. She presided over futurity, and was represented as spinning the thread of life, or, according to others, holding the spindle. She generally appeared covered with a garment variegated with stars, and holding spindles in her hand.

LACHNOEA. In botany, a genus of the class octandria, order monogynia. Calyx less; corol four-cleft, with an unequal border; nut somewhat drupe-like. Two species; Cape plants.

LACHNOSPERNUM. In botany, a genus of the class syngenesia, order of polygamia equalis. Receptacle villous; seeds wrapped in the down; calyx cylindrical, imbricate. One species; a Cape plant.

LACHRYMA *Arizonicæ*. See **TERREBIN-**
THINIS.

LACHRYMA (*Lachryma*, *a. l.*) The
tears. The fluid secreted by the lachry-
mal and flowing on the surface of
the eye.

LACHRYMAL. *a.* Generating tears.

LACHRYMAL DUCTS. The excretory ducts
of the lachrymal gland, which open upon
the internal surface of the upper eyelid.

LACHRYMAL GLAND. *Glandula lachry-*
malis. A glomerate gland, situated above
the external angle of the orbit, in a pecu-
liar depression of the frontal bone. It se-
cretes tears, and conveys them to the
eye by its excretory ducts, which are six
or eight in number. See **LACHRYMAL DUCTS**.

LACHRYMARY. *a.* (*lachryma*, Latin.)
Containing tears (*Addison*).

LACHRYMATION. *s.* (from *lachryma*,
Lat.) The act of weeping, or shedding
tears.

LACHRYMATORY. *a.* (*lachrymatoire*,
Fr.) A vessel in which tears are gathered
to the honour of the dead.

LACINATE COROL. In botany, *quævis*
pars in quam limbus corollæ monopetalæ dis-
sectus est.—Any part into which the border
of a monopetalous corol is cut. It is ap-
plied also to monophyllous calyxes: and
a calyx which has two *laciniæ* is said to be
bifid, &c. *Philos. Bot.* p. 63.

LACINATE Jagged. *Folium laciniatum*.
Parte sectum in partes, partibus itidem in-
determinato subdivisio. This implies an ir-
regularity in the division and subdivision,
whereas *lacinia* is the same, with a part,
segment or cleft; as Linnæus has explain-
ed it.

LACINATE FLOWER is a term of Tourne-
fort's, for which Linnæus puts *multifida*
corolla.

LACINIATED. *a.* (from *lacinia*, Latin.)
Adorned with fringes and borders.

LACINIUM (anc. geog.), a noble pro-
montory of the Bruttii in Italy, the south
boundary of the Sinus Tarentinus and the
Adriatic, all to the south of it being them-
self the Ionian sea: it was famous for a rich
temple of Juno, surnamed *Lacinia*, with a
pillar of solid gold standing in it, which
Hannibal intending to carry off, was, ac-
cording to Cicero, dissuaded by a dream.
Now Capo delle Colonne, from the columns
of Juno's temple, still standing on the north-
east coast of the Calabria ultra.

LACINULATE. In botany. *Divisa* from
Lacinia. A little jag, or subdivision of the
larger one.

LACIS. In botany, a genus of the class pol-
liandria, order digynia. Calyx less; corol-
les; styles two; capsule one; lobes two-
valved, many seeded. One species a Guiana
plant, with rough herbaceous stem, simple,
terminal raceme.

LACOSTEMA. In botany a genus of the
class monandria, digynia. Calyx scale of
the amant corol four-parted; stamens bi-

fid; very pedicelled, one-seeded. A
maica and Surinam shrub.

To LACK. *v. a.* (*lacken*, to lessen, Dutch.)
To want; to need; to be without (*Daniel*).

To LACK. *v. n.* 1 To be in want (*Common*
Prayer). 2 To be wanting (*Genesis*).

LACK. *s.* (from the verb.) Want; need;
failure (*Hooker*).

LACK OR RUPEES, is 100,000 rupees;
which, supposing them standard, or sicca,
at 2s. 6d. amounts to 12,500l. sterling.

LACK, or **BISCHOFF-LACK**, a town of Ger-
many, in Carfiola. Here is a great deal of
iron, steel, quicksilver, and corn; and
a large quantity of linen is sent hence to
Fiume and Triest. It is 26 miles west by
north of Laubach, and 35 north of Triest.
Lon. 14. 7. E. Lat. 46. 31. N.

LACKBRAIN. *s.* (*lack and brain*.) One
that wants wit (*Shakespeare*).

LACKER. *s.* A kind of varnish, which,
spread upon a white substance, exhibits a
gold-colour.

To LACKER. *v. a.* (from the noun.) To
smear over with lacker (*Pope*).

LACKEY. *s.* (*laquais*, French.) An at-
tending servant; a footboy (*Dryden*).

To LACKEY. *v. a.* (from the noun.) To
attend servilely (*Milton*).

To LACKEY. *v. n.* To act as a footboy; to
pay servile attendance (*Saunders*).

LACKLINEN. *a.* (*lack and linen*.) Want-
ing shirts (*Shakespeare*).

LACKLUSTRE. *a.* (*lack and lustre*.)
Wanting brightness (*Shakespeare*).

LACONIA, or **LACONICA**, a country on the
southern parts of Peloponnesus, having Ar-
gos and Arcadia on the north, Messenia on
the west, the Mediterranean on the south,
and the bay of Argos at the east. Its ex-
tent from north to south was about 50 miles.
It was watered by the river Eurotas. The
capital was called Sparta, or Lacedæmon.
The brevity with which the Laconians always
expressed themselves is now become prover-
bial; and by the epithet of *laconic* we un-
derstand whatever is concise, and is not load-
ed with unnecessary words.

LACONIC. *a.* Short; brief (*Pope*).

LACONISM. *s.* (*laconisme*, Fr.) A con-
cise style (*Collier*).

LACONICALLY. *ad.* (from *laconia*.)
Briefly; concisely (*Cantabrigia*).

LACQUERS, are varnishes applied upon
tin, brass, and other metals, to preserve
them from tarnishing, and to improve their
colour. The basis of lacquer is a solution
of the resinous substance called *serice* in
spirit of wine. The spirit ought to be very
sweet and fragrant, in order to dissolve
For this purpose some

authorities
the spirit. This
with which it forms a
distinctly from the spirit
of the vessel. From the heat the spirit is
separated by decantation. By this me-
thod the spirit is more concentrated, and

at the same time, it becomes impregnated with part of the alkali, which depraves its colour, and communicates a property to the lacquer of imbibing moisture from the air. These inconveniences may be prevented by distilling the spirit; or, if the artist has not an opportunity of performing that process, he may cleanse the spirit, in a great measure, from the alkali, by adding to it some calcined alum; the acid of which uniting with the alkali remaining in the spirit, forms with it a vitriolated tartar, which, not being soluble in spirit of wine, falls to the bottom together with the earth of the decomposed alum. To a pint of the purified spirit, about three ounces of powdered shell-lac are to be added; and the mixture to be digested during the same day with a moderate heat. The liquor ought then to be poured off, strained, and cleared by settling. This clear liquor is now fit to receive the required colour from certain resinous colouring substances, the principal of which are gamboge and annatto; the former of which gives a yellow, and the latter an orange colour. In order to give a golden colour, two parts of gamboge are added to one of annatto; but these colouring substances may be separately dissolved in the tincture of lac, and the colour required may be adjusted by mixing the two solutions in different proportions. When silver leaf or tin is to be lacquered, a larger quantity of the colouring materials is requisite than when the lacquer is intended to be laid on brass.

LACTANTIUS, (*Firmean*) an eloquent father of the church, was, according to some, an African, and to others, a native of Ferme in Italy. He studied under Amobius, and became so famous as a rhetorician, that Constantine the emperor made him preceptor to his son Crispus. He formed his style upon the model of Cicero; but though he writes with the greatest purity and force, especially in confuting the heathens, yet he was not a profound divine. He blends too much philosophy with his theology, and does not steer quite free from error. His works were published at Rome in 1468, folio; but the best edition is that of Paris, 8 vols. 4to. 1748.

LACTARY, *a. (lactarius, Lat.)* Milky; milk-like juice like milk (*Brown*).

LACTARY, *a. (lactarius, Latin.)* A dairy house.

LACTATION, *s. (lact, Latin.)* The act or time of giving milk.

LACTATE, (*Lactas, fr. m.*) Salt formed by the union of the acid of sour whey, or lactic acid, with different bases; thus alkaline salts, ammoniacal lactate, &c.

LACTEALS, *Vasa lactea*. The absorbents of the mesentery, which originate in the small intestines, and convey the chyle thence to the thoracic duct. They are very tender and transparent vessels, possessed of an infinite number of valves, which, when distended with chyle, give them a knotty ap-

pearance. They arise from the internal surface of the villous coat of the small intestines, perforate the other coats, and form a kind of net work, whilst the greater number unite one with another between the muscular and external coats. Thence they proceed between the laminae of the mesentery to the conglobate glands. In their course they constitute the greater part of the gland through which they pass, being distributed through them several times, and carried in various directions. The lacteals having passed these glands, go to others, and at length seek those nearest the trunk of the mesentery. From these glands, which are only four or five, or perhaps more, the lacteals pass out and ascend with the mesenteric artery, and unite with the lymphatics of the lower extremities, and those of the abdominal viscera, and then form a common trunk, the *thoracic duct*, which in some subjects is detached at its origin, forming the *receptaculum chyli*.

LACTEAM, *s. (from lac, Lat.)* Milky; conveying chyle of the colour of milk (*Locke*).

LACTEAL, *s.* The vessel that conveys chyle (*Arbuthnot*).

LACTEOUS, *a. (lacteus, Latin.)* 1. Milky (*Brown*). 2. Lacteal; conveying chyle (*Bentley*).

LACTESCENCE, *s. (lactesco, Latin.)* Tendency to milk, or milky colour (*Boyle*).

LACTESCENT, *a. (lactescens, Lat.)* Producing milk, or a white juice (*Arbuthnot*).

LACTIC ACID. See MILK.

LACTIFEROUS, *a. (lac and fero, Latin.)* What conveys or brings milk (*Ray*).

LACTUCA, Lettuce. In botany, a genus of the class syngenesia, order polygamia equalis. Receptacle naked; calyx imbricate, cylindrical, with a membranous margin: down simple, pedicelled; seeds unarmed. Twenty-one species; almost all European plants; but a few indigenous to South America; three common to the wastes, hedges, or old walls of our own country.

The following are those chiefly cultivated in our own gardens as esculents.

1. Common Garden Lettuce.
2. Cabbage Lettuce.
3. Chisel Lettuce.
4. Dutch Brown Lettuce.
5. Aleppo Lettuce.
6. Imperial Lettuce.
7. Green-Cappuchin Lettuce.
8. Versailles, or upright white Cos Lettuce.
9. Black Cos Lettuce.
10. Common White Cos Lettuce.
11. Red-Cappuchin Lettuce.
12. Roman Lettuce.
13. Princes Lettuce.
14. Royal Lettuce.
15. Egyptian Lettuce.

Of these the first is common in all gardens, and is usually sown for eating very young, or mix with other salad herbs in spring. It may be sown in all seasons of the

year, but in shady borders during the hot months the cabbage lettuce should also be sown at different seasons to have a continuation through the summer. The first crop should be sown in February, in an open situation; the others at the interval of three weeks. But the latter crops should be sown under cover, though not under the drippings of trees. The Cilicia, Imperial, Royal, black, white, and upright Cos Lettuces, may be sown first in the latter end of February, or beginning of March, on a warm, light soil, and in an open situation. When the plants are they must be thinned to fifteen inches distance every way; they will then require no farther care than that of keeping them clear of weeds; and the black Cos, as it grows large, should have its leaves tied together to whiten the inner part. Succeeding crops of these should be sown in April, May, or June, and toward the end of August they may be sown for a winter crop, to be preserved under glasses, or in a bed arched over with hoops, and covered with mats. The most valuable of all the English Lettuces are the Egyptian Green Cos, and the Versailles, or White Cos, the Cilicia, and Black Cos. The Brown, Dutch, and the Green Capuchin are very hardy, and may be sown late under walls, where they will stand the winter, and be valuable when no others are to be had. The Red, Capuchin, and Prince Lettuces are very early kinds, and are sown for variety, as are also the Aleppo ones, for the beauty of their spotted leaves. In obtaining the seeds of Lettuces, care should be taken never to let two sorts stand too near each other, because their farina mixing together, they will be apt to vary from their original, and partake of each other; a stake should be fixed down by the side of each plant, to which they should be fastened, in order to prevent their being broken, or blown out of the ground by the wind.

In medicine the *Lactuca graviosa* or opium scented lettuce, has been strongly recommended and often employed as a sedative and narcotic. It was first noticed by Dioscorides; has been since extolled by Halle, and of late so warmly by Dr. Collin of Vienna, as to have been introduced into the *Materia Medica* of the Royal College of Edinburgh, under the name of *Lactuca Graveolens*. The dose is from eighteen to thirty grains a day, and it is said to have been found highly successful in attenuating viscid humours and promoting secretions. Yet other German physicians have not found the benefits from its use attributed to it by Dr. Collin; and hence in England it has hitherto been regarded as of too doubtful a character to be relied on.

It is found on the hedges and old walls of our own country. Leaves horizontal, prickly on the back, obtuse at the top, arrow shaped at the base, oblong, lanceolate; the lower ones sinuate and denticulate.

LACUNE, (*Lacuna*, *æ*, *f.* from *lacus*, a channel). In anatomy. The mouths or openings of the excretory ducts of the muciparous glands of the urethra.

LACUNAR, in architecture, an arched roof, or ceiling. The term is often restricted to denote the planking or flooring above porticos and piazzas.

LACUNOSE LEAF. In botany. *Lacunosum folium*. *Disco depresso inter venas interjectas*. When the disk is depressed between the veins. Contrary to *rugose*, wrinkled, in which it rises.

LACY (John), an English actor and play writer in the reign of Charles II. with whom he was a great favourite. His plays are 1. *The Dumb Lady*; 2. *The Old Troop*, or *Monsieur Ragou*; 3. *Sir Hercules Buffoon*.

LACYDES, a Greek philosopher of Cyrene, and disciple of Arcesilaus, whom he also succeeded as master of the second academy. Attalus gave him a garden in which to read his lectures. He foolishly mourned the loss of a favourite goose, and had the creature buried magnificently. He died of intemperance, B. C. 212.

LAD. *s.* (leode, Saxon.) 1. A boy; a stripling, in familiar language (*Watts*). 2. A boy; a young man, in pastoral language (*Spenser*).

LADANUM, (*Ladanum*, *L. æt.* *Ἰαδανόν*; from *ladon*, Arab.) *Ladbanum*. This resinous juice exudes upon the leaves of the *Cistus creticus*; *aboreucens exatipulatus*, *foliis spatulato ovatis petiolatis nervis scabris, calycinis lanceolatis* of Linnæus. In Canada, the inhabitants collect it by lightly rubbing the leaves with leather, and afterwards scraping it off and forming it into irregular masses for exportation. Three sorts of ladanum have been described by authors, but only two are to be met with in the shops. The best, which is very rare, is in dark-coloured masses, of the consistence of a soft plaster, and growing still softer on being handled; the other is in long rolls, coiled up much harder than the preceding, and not so dark. The first has commonly a small, and the last a large admixture of fine sand, without which they cannot be collected pure, independently of designed abuses; the dust blown on the plant by winds from the loose sands among which it grows, being retained by the tenacious juice. The soft kind has an agreeable smell, and a lightly pungent bitterish taste; the hard is much weaker. Ladanum was formerly much employed internally as a pectoral and astringent in catarrhal affections, dysenteries, and several other diseases; at present, however, it is wholly confined to external use, and is an ingredient in the stomaclic plaster, *emplastrum ladanii* of the London Pharmacopœia. See *Cistus*.

LA'DDER. *s.* (ladder, Saxon.) 1. A frame made with steps placed between two upright pieces (*Prior*). 2. Any thing by which one climbs (*Stacey*). 3. A gradual rise (*Swift*).

L A D

LA'DDER *Jacob*, in Botany. See **POLEMIUM**.

LA'DDER to Heaven. See **CONVALLARIA**.

LADÉ. *s.* The mouth of a river, from the Saxon *lade*, which signifies a purging or discharging (*Gibson*).

To **LADÉ**. *v. n.* *preter. laded*; part. passive, *laded* or *laden*. (*hlaben*, Saxon.) 1. To load; to freight; to burden (*Bacon*.) 2. (*hlaban*, to draw, Saxon.) To leave out; to throw out (*Temple*).

LADENBURGH, a town of Germany, in the palatinate of the Rhine, seated on the Neckar, eight miles north-west of Heidelberg. Lon. 8. 42. E. Lat. 49. 30. N.

LA'DING. *s.* (from *lade*.) Weight; burden (*wife*).

LA'DE. *s.* (*hlable*, Saxon.) 1. A large spoon; a vessel with a long handle, used in throwing out any liquid from the vessel containing it (*Prior*). 2. The receptacle of a mill-wheel, into which the water falling turns it.

LADOGA, a lake in Russia, between the gulf of Finland and the lake of Onega. It is 150 miles long and 90 broad, and esteemed to be the largest lake in Europe. Among the fish with which it abounds, are seals. It is full of quicksands, which, being moved from place to place, by the frequent storms, cause several shelves which often prove fatal to the flat-bottomed vessels of the Russians. This induced Peter the Great to cut a canal 67 miles in length, from the south-west extremity of this lake to the river Neva, by which it has a communication with the gulf of Finland.

LADOGA, New, a town in the Russian government of Petersburg, seated on the Volkhof, between the lake and canal of Ladoga. Old Ladoga, an inconsiderable place, is higher up the Volkhof. New Ladoga is 70 miles east of Petersburg. Lon. 30. 32. East. Lat. 60. 0. N.

LADOGNA, or **LACEDOGNA**, a town of Naples, in Capitanata, with a bishop's see, 60 miles east of Naples. Lon. 15. 46. E. Lat. 41. 1. N.

LADRONE ISLANDS, islands of the north Pacific Ocean. They are 11 in number, exclusive of the small islets and rocks, lying in 140. E. lon. and between 11 and 28. N. lat. They were discovered by Magellan, in 1521. He touched first at the island of Guam, where the natives stole some of his goods, which caused him to name these islands the *Ladrones*, or islands of Thieves. Beside the other fruits natural to the soil and climate, here is the bread-fruit tree in abundance. The names of the principal islands are Laypan, Linian, Guam, and Rora.

LADY, a title derived from two Saxon words, which signify *leaf-day*, which words have in time been contracted into the present appellation. It properly belongs only to the daughters of earls, and all of higher rank; but custom has made it a word of

L Æ T

complaisance for the wives of gentlemen. As to the original app of this expression, it may be observed, that heretofore it was the fashion for those families, whom God had blessed with affluence, to live constantly at their mansion houses in the country, and that once a-week, or oftener, the lady of the manor distributed to her poor neighbours, with her own hands, a certain quantity of bread. But the practice, which gave rise to this title, is now as little known as the meaning of it: however, it may be from that hospitable custom, that to this day the ladies in this kingdom alone serve the meat at their own tables.

LADY day, in Law and Chronology, the 25th of March, being the supposed anniversary of the annunciation to the Virgin Mary.

LADY-bird, or **LADY-cow**, in Entomology. See **COCCINELLA**.

LADY's Bedstraw, in Botany. See **GALIUM**.

LADY's Bower. See **CLEMATIS**.

LADY's Comb. In botany. See **SCANDIX**.

LADY's Cushion. In botany. **SAXIFRAGA**.

LADY's Finger. In botany. See **ANTHYLLIS**.

LADY's Mantle. In botany. See **ALCHEMILLA**.

LADY's Seal. In botany. See **TAMUS**.

LADY's Stpper. In botany. See **CYPRIPEDIUM**.

LADY's Smock. In botany. See **CARDAMINE**.

LADY's Traces, Triple. In botany. **ORHYZS**.

LADY-LIKE. *a.* Soft; delicate; elegant; (*Dryden*).

LADYSHIP. *s.* The title of a lady.

LÆLIUS (Caius), a Roman consul and great orator, surnamed the Wise, distinguished himself in Spain in the war against Viriathus the Spanish general. He is highly praised by Cicero, who gives an admirable description of the intimate friendship which subsisted between Lælius and Scipio Africanus the younger. His eloquence, his modesty, and his abilities, acquired him a great reputation; and he is thought to have assisted Terence in his comedies. He died about 126 B. C.

LÆNA, in antiquity, was a gown worn by the Roman augurs, and peculiar to their office. In this gown they covered their heads when they made their observations on the flight of birds, &c. See **AUGUR**.

LÆSION, (from *lædo* to injure.) In surgery and medicine, a hurt whether external or internal.

LÆSTRYMONES, the most ancient inhabitants of Sicily.

LÆTIA. In botany a genus of the class polyandria, order monogynia. Calyx five leaved; petals five or none; front one-celled, three-sided, seeds with a pulpy coat. Four species, natives of the West Indies or Ame-

rice, of which the most celebrated is, *L. speciosa*, the petals; peduncles much branched, axillary; leaves long, entire, serrulate, shining. It is an American tree with white hawthorn-like flowers; the stem rises to a considerable height and is richly impregnated with a resin, which exudes on exposure to a strong heat of the sun, and in appearance resembles sandarach. The natives powder and convert it into pounce. It appears to possess the common properties of other terebinthines.

LÆVIUS, a Latin poet. It is not well known when he lived, but probably he was more ancient than Cicero. He wrote a poem entitled *Eclogæ*, i. e. love games. Aulus Gellius quotes two lines of it. Apuleius also quotes six lines from the same poet; but he does not tell from what work he borrowed them. Lælius had also composed a poem entitled, *The Centaurs*, which Festus quotes under the title of *Petrarum*.

LAG. *a.* (lagg, Swedish, the end.) 1. Coming behind; falling short (*Curew.*) 2. Sluggish; slow; *Lardy* (*Dryden*). 3. Last; one delayed (*Shakespeare*).

LAG. *s.* 1. The lowest class; the rump; the lag end (*Shakespeare*). 2. He that comes last, or hangs behind (*Pope*).

To LAG. *v. n.* 1. To loiter; to move slowly (*Dryden*). 2. To stay behind; not to come in (*Swift*).

LAGERSTRÆMIA. In botany, a genus of the class polyandria, order monogynia. Calyx six-cleft, campanulate; petals six; stamens numerous, the six outer ones thicker; capsule four or six-celled, many seeded. Five species, all trees of India or China.

LAGGER. *s.* (from lag.) A loiterer; an idler.

LAGNASCO, a town of Piedmont, 24 miles S. of Turin.

LAGNY, a town of France, in the department of Seine and Marne, with a late famous Benedictine abbey; seated on the Marne, 15 miles E. of Paris. Lon. 2. 45. E. Lat. 48. 50. N.

LAGNY (Thomas Fantet de), an eminent French mathematician, was born at Lyons. Pournier's Euclid, and Pelletier's Algebra, by chance falling in his way, developed his genius for the mathematics. It was in vain that his father designed him for the law; he went to Paris to deliver himself wholly up to the study of his favourite science. In 1697, the Abbé Bignon, protector-general of letters, got him appointed professor-royal of Hydrography at Rochfort. Soon after, the duke of Orleans, then regent of France, fixed him at Paris, and made him sub-director of the General Bank, in which he lost the greatest part of his fortune in the failure of the Bank. He had been received into the ancient academy in 1696; upon the renewal of which he was named Associate-geometrician in 1699, and

professor in 1723. After a life spent in close application, he died, April 12, 1734.

In the last moments of his life, and when he had lost all knowledge of the persons who surrounded his bed, one of them, through curiosity, asked him, what is the square of 12? To which he immediately replied, and without seeming to know that he gave any answer, 144.

De Lagny particularly excelled in arithmetic, algebra, and geometry, in which he made many improvements and discoveries. He, as well as Leibnitz, invented a binary arithmetic, in which only two figures are concerned. He rendered much easier the resolution of algebraic equations, especially the irreducible case in cubic equations; and the numeral resolution of the higher powers, by means of short approximating theorems.—He delivered the measures of angles in a new science, called Goniometry; in which he measured angles by a pair of compasses, without scales, or tables, to great exactness; and thus gave a new appearance to trigonometry.—Cyclo-metry, or the measure of the circle, was also an object of his attention; and he calculated, by means of infinite series, the ratio of the circumference of a circle to its diameter, to 150 places of figures. He gave a general theorem for the tangents of multiple arcs. With many other curious or useful improvements, which are found in the great multitude of his papers, that are printed in the different volumes of the Memoirs of the Academy of Sciences, viz. in almost every volume, from the year 1699, to 1729. (*Hutton's Dict.*)

LAGOECIA. Bastard cumin. In botany, a genus of the class pentandria, order monogynia. Involucre universal and partial; petals bifid; seeds solitary, inferior. One species, an annual of the Levant.

LAGOON ISLAND, a small island in the South Sea, discovered by Captain Cook, in April 1769. Lon. 139. 28. W. Lat. 18. 47. S.

LAGOPHTHALMUS, (*Lagophthalmus*, *i. m.* λαγόφθαλμος, from λαγος, a hare, and οφθαλμος, an eye, because it is believed that hares sleep with their eyes open.) In medicine a want of power to close the eyelid. It may arise from spasm, palsy, atony, or fissure of the muscles of the eye-lids, and a variety of other causes.

LAGOPUS, in ornithology. See **TETRAO.**

LAGOS, a seaport of Portugal, in Algarva, with a castle. Here the English fleets bound to the straits usually take in fresh water. Near this town is Cape Lagos, off which, in 1759, admiral Boscawen defeated a French fleet. It is 120 miles S.E. of Lisbon. Lon. 8. 23. W. lat. 36. 54. N.

LAGRIA. In entomology, a Fabrician tribe of the coleopterous genus *Cryptophaeus*, which see.

LAGRISMO, in music, an Italian term, used to signify a plaintive manner of singing or playing.

L A I

LAGUNA, the capital town of Teneriffe, situated in Lon. 16. 18. W. Lat. 28. 29. N.

LAGUNERA. In botany, a genus of the class monadelphia, order polyandria. Calyx single, five-cleft; style five-cleft; capsule five-celled, five-valved, with the partition contrary. Three species; shrubs of the Isle Bourbon, of Senegal and Coromandel; the last with yellow flowers, and red, peltate stigma.

LAGUNES or **VENICE**, the marshes or lakes in Italy, on which Venice is seated. They communicate with the sea, and are the security of the city. There are about 60 islands in these Lagunes, which together make a bishop's see. Burano is the most considerable, next to those on which Venice stands.

LAGURUS. Hair's-tail-grass. In botany, a genus of the class triandria, order digynia. Calyx two-valved, one flowered, with a villous awn; outer glume of the corol with two terminal awns, and a twisted awn on the back. One species, with ovate spike; lanceolate, acutely-nerved leaves. Found in the sandy fields of our own country.

LAHN, a river of Germany, which rises in Hesse Cassel, and flowing by Marburg, Wetzlar, and Nassau, falls into the Rhine, above Coblenz.

LAHOLM, a seaport of Sweden, in the province of Halland, seated near the Baltic, with a castle, 50 miles N. of Copenhagen. Lon. 12. 40. E. Lat. 56. 31. N.

LAHOR, a large town of Asia, in Indus-tan, and capital of a province of the same name, and one of the most considerable in the Mogul's dominions. It is of a vast circumference, and contains a great number of mosques, public baths, caravanseras, and pagods. It was the residence of the Great Mogul; but since the removal of the court, the fine palace is going to decay. There is a magnificent walk of shady trees, which runs from this to Agra, that is upwards of 300 miles. Here they have manufactures of cotton cloths and stuffs of all kinds, and they make very curious carpets. East long. 75. 55. North lat. 31. 40.

LAIC, the term often used by lawyers for a layman.

LAICAL. *a. (laïque, French; laicus, Lat. &c.)* Belonging to the laity, or people, as distinct from the clergy (*Camden*).

LAID. Preterit participle of *lay* (*Swift*).

LAINE. Preterit participle of *lâre* (*Boyle*).

LAIR. *s. (lai, French.)* The couch of a boar, or wild beast (*Milton*).

LAIRD. *s. (hlæpp, Saxon.)* The lord of a manor in the Scottish dialect (*Claveland*).

LAIRESE (Gerard), a celebrated painter, was born at Liege in 1840. He studied under his father, but formed his style after Poussin and Bartolet. He resided a considerable time at Utrecht little known or esteemed, till one of his pictures being bought by a picture merchant at Amster-

L A K

dam, he prevailed with him to sell the city, where he bore a sufficient reputation. The manner of his painting was singular, for when his employer placed an easel before him, expecting to see him begin to design, Lairese sat down before the canvas, and appearing contemplative for a few minutes, he pulled out a violin, which he usually carried about him, and began to play; then, suddenly laying aside the instrument, he sketched a design of the nativity, and immediately resumed the violin; till having unbent his mind for awhile with the music, he pursued his work, painting and playing alternately, and in two hours completed the heads of Mary, Joseph, and the infant Christ, as also the ox, and all so well finished as to astonish the spectators. He had the misfortune to lose his sight before he died. His greatest pictures are the history of Heliodorus, and young Moses trampling on the crown of Pharaoh. He died at Amsterdam in 1711. Lairese wrote an excellent book upon his art, which has been translated into English. He had three sons, of whom two were painters. He had also three brothers in that line, Ernest, James, and John. James excelled in flower painting, and the two others in painting animals.

LAI, a celebrated courtesan, daughter of Timandra, the mistress of Alcibiades, born at Hyccara in Sicily, was carried into Greece, when Nicias the Athenian general invaded Sicily. She first resided at Corinth, where she sold her favours for 10,000 drachmas, and was visited by princes, noblemen, philosophers, orators, &c. The expenses which attended her pleasures, gave rise to the proverb of *Non curvis homini contingit adire Corinthum*. She next went to Thessaly, where the women, jealous of her personal charms, and apprehensive of her corrupting the fidelity of their husbands, assassinated her in the temple of Venus, about 340 years before the Christian era.

The conduct of Demosthenes in regard to Lai is worth recording. He went secretly to Corinth, on purpose to spend a night with her; but, Lai having demanded 10,000 drachmas, he returned back, saying, "he would not buy repentance at so dear a rate."

LAITTY. *s. (λαϊκ.)* 1. The people, as distinguished from the clergy (*Swift*). 2. The state of a layman (*Ayliffe*).

LAKE. *s. (lac, French; lacus, Latin.)* 1. A large diffusion of inland water (*Dryden*). 2. A small splash of water.

LAKE (from *lao*, an insect, which see) a beautiful red or crimson pigment which may be defined to be an intimate combination of colouring extract with an earth or metallic oxyd formed by precipitation from the solution of the colouring matter. It is generally obtained from cochineal or the dried substance of the *coccus cacti*; though it may be also procured from mad-

dark red wood. The process by which it is obtained from cochineal gives also the lake at the same time; but the preparation is endeavoured to be kept a profound secret, at least that nicety of manipulation upon which the perfection of either of these colouring materials depends. Under the article carmine we have given one mode of operation, and we shall in the present place offer a second, as forming the best plan of working both for carmine and lake at the same time.

Into a fourteen gallon boiler of well tinned copper, put ten gallons of distilled or very clear river or rain-water, for few spring waters will answer the purpose. When the water boils sprinkle in by degrees a pound of fine cochineal previously ground in a stone mortar to a moderately subtile powder; keep up a temperate ebullition for about half an hour, and then add three ounces and a half of crystallized carbonat of soda: in a minute or two, afterwards draw the fire, and then add to the liquor an ounce and a half of Roman alum very finely pulverized: stir the mass with a clean stick till the alum is dissolved, then leave it to settle for twenty-five minutes; draw off the clear liquor with a glass syphon, and separate the sediment from the residue by straining it through a close cloth of linen. Replace the clear liquor in the boiler, and stir in the whites of two eggs previously well beaten with a quart of warm water: then light the fire again and heat the liquor till it begins to boil, at which time the albumen of the eggs will coagulate and combine with the earth of the alum and the finest part of the colouring matter. This sediment is the *carmine*, which being separated by filtration and well-washed on the filter with distilled water, is to be spread very thin on an earthen plate, and slowly dried in a stove, after which it is ready for use.

The finest part of the colouring matter being thus separated, the residue may be employed in the preparation of red lake in the following manner: add two pounds of pearl-ash to the red liquor from which the carmine was precipitated and return it into the boiler together with the dregs of the cochineal, and boil the whole gently for about half an hour; then draw the fire, and after the sediment has subsided, drain off all the clear liquor into wooden or earthenware vessels, the latter are best. Then pour upon the sediment a second alkaline lay, prepared by dissolving a pound of pearl-ash in two gallons of water, and boil this also upon the dregs for half an hour, by which process the whole of the colouring matter will be exhausted. Separate by filtration the liquor from the dregs, and return both the alkaline solutions into the copper. When this bath is as hot as the hand can bear, add by degrees three pounds of finely powdered Roman alum, observing

not to add a second portion till the effervescence from the first has entirely subsided. When the whole of the alum has been put in, raise the fire till the liquor simmers, and continue it at this temperature for about five minutes, at which time if a little is taken out and put into a wine-glass it will be found to consist of a coloured sediment diffused through a clear liquor. After standing quiet a while the greater part of the clear supernatant liquor may be poured off, and the residue being placed on the filter, the coloured *lake* will be deposited, which must be washed with clear rain water. A pound of good Mexican cochineal will afford an ounce and a half of carmine, and about a pound and a quarter of red lake.

LAKEWEED. In botany. A term applied to one or two of the species of the polygonum, which see.

LALANDE (Joseph Jerome le Français de) an eminent French astronomer, member of the legion of honour of the Institute, of the board of longitude, professor of astronomy in the college of France, was born at Bourg, in the department of l'Ain, on July 11, 1732, of respectable parents. He was destined to the bar, and came to Paris for the study of jurisprudence, when the view of the observatory developed to him a propensity which deranged his father's plans, and became the ruling passion of his life. He was kindly received by the celebrated astronomer le Monnier, from whose lessons he profited in such a manner as to acquire his affectionate regard and esteem. So rapid was his advance, that at the age of 19 he was nominated, through the recommendation of le Monnier, the commissioner of the Academy of Sciences, to go to Berlin, in order to determine the parallax of the moon, in concert with M. Lacaille, who was to perform the same operation at the Cape of Good Hope. The account of his mission which he gave at his return opened to him the doors of the Academy, from which time to the period of its suppression there was not a single volume of its transactions in which an important memoir of his did not appear. The active part which he took in the labours of the academy was not limited to astronomical observations. He published the French edition of Halley's Tables, and the History of the Comet of 1759; and he furnished Clairault with immense calculations for the theory of that famous comet. Being charged in 1760 with the compilation of the "Connaissance des Temps," he entirely changed the form of the work, and gave it that which it bears at present. Of this collection he published 32 volumes, viz. from 1775 to 1807 inclusive.

In 1764 appeared the first edition of his great "Traité Astronomique," a classical work, which he has since perfected. He composed all the astronomical articles for

L A L

the *Yverdon Encyclopedia*, and new cast the whole for the *Encyclopedie Methodique*.

To his written lessons he joined, during 46 years, oral instructions. In 1761, he succeeded his first master Deille in the astronomical chair at the college of France; and he taught with so much ability that his school became a seminary of disciples who peopled the observatories. In the midst of his labours he drew up his "*Voyage d'Italie*," which is the most complete collection of curious objects that travellers can consult; his "*Traité des Canaux*;" and his "*Bibliographie Astronomique*," a vast catalogue of all the works which have appeared on this science.

Associated to all the distinguished scientific societies, he was their common bond of union by the correspondences which he maintained, and promoted a circulation of intelligence from one to another. He employed the credit arising from the universal reputation he enjoyed, for the general benefit of the sciences and their cultivators.

To the extraordinary ardour and activity of his character he joined a love for truth which approached the borders of fanaticism. Every degree of concealment appeared to him unworthy of an honest man; and he therefore, without any reserve, uttered his sentiments on all occasions. It may easily be conceived, that in his long career, and while he sometimes assumed the tone of superiority, which he thought justified by his long services, he would wound the self-love of more than one individual; but he was sensible of the fault, and endeavoured to repair it. The high consideration which he obtained would probably, with prudence and circumspection, have secured him an enviable lot to the end of his days; but the habit of speaking his mind, which he did not lay aside in the most stormy times, and upon topics where he might, nay ought to have been silent, together with the bluntness with which he sometimes refuted the established systems of others, animated against him a crowd of detractors, who proceeded so far as to call in question his undoubted merits. His long and durable services in matters of science, were thus in a measure forgotten or lost sight of in the contemplation of his dangerous speculations, and of the imprudent zeal with which he promulgated his opinions. Those who knew him well, affirm, that if any of the French infidels of late times was decidedly an atheist, Lalande was doubtless such; and, that atheistical opinions when embraced by a man of excessive garrulity and overweening vanity, would be injurious in their effects both upon himself and upon others, needs no proof. He was, in fact, as much noted for his profaneness as for his talents; a species of distinction which we hope few other astronomers will emulate.

L A M

In 1802, M. Lalande published a new edition of Montuclæ's *History of Mathematics*, in 4 vols. 4to.; the two first volumes being prepared from Montuclæ's papers, with the assistance of Laplace, Lacroix, and others of the French mathematicians. The fourth volume has for a frontispiece the portrait of Lalande, with the following motto:

— "Du Ciel devenu son Empire
Son Génie a pénétré les vastes profondeurs;
Mais il règne encor sur nos cours,
Et nous l'aimons autant que l'univers l'admire."

In the year 1793, M. Lalande published "*Abrégé de Navigation historique, théorique, et pratique*," containing many valuable rules, and tables. The "*Connaissance des Temps*," from the year 7 to 12, 1799 to 1804 contains his new catalogue of more than 12,000 stars. A few years before his death, viz. in 1802, he published a little collection for the pocket of *Tables of Logarithms, Sines and Tangents*, upon the plan of Lacaille, but much inferior to them. We query, however, whether Laplace thinks half so highly of his "*Mecanique Celeste*," as poor Lalande did of this meagre book of tables. During the latter years of his life he published annually a concise history of astronomy for the current year, which exhibited a summary of the most remarkable facts, discoveries, and inventions, connected with the subject, and at the same time exhibited all the characteristic traits of the author's gossiping and vanity. Lalande died at Paris, April 4th, 1807, in the 75th of his age.

He was an excellent astronomer, and an active promoter of astronomical science; but he had very little taste, and a very confined knowledge of mathematics in general. He considered himself however, as the father of the mathematical sciences generally; and at his death he founded the prize of a medal, which the Institute annually awards to the author of the best astronomical memoir, or the maker of the most curious observation.

LAMA, in mastiology. See CAMELUS.

LAMA, the sovereign pontiff, or rather god, of the Asiatic Tartars, inhabiting the country of Barantola. The lama is not only adored by the inhabitants of the country, but also by the kings of Tartary, who send him rich presents, and go in pilgrimage to pay him adoration, calling him *lama congju*, i.e. "god, the everlasting father of heaven." He is never to be seen but in a secret place of his palace, amidst a great number of lamps, sitting crossed-legged upon a cushion, and adorned all over with gold and precious stones; where at a distance they prostrate themselves before him, it not being lawful for any to kiss even his feet. He is called the *great lama*, or *lama of lamas*; that is, "priest of priests." The orthodox opinion is, that when the grand lama seems to die either of old age or infirmity, his soul

LAMANON.

in fact only quits a crazy habitation to look for another younger or better; and it is discovered again in the body of some child, by certain tokens known only to the lamas or priests, in which order he always appears.

LAMANON (Robert Paul), of the academy at Turin, correspondent of the Academy of Sciences at Paris, and member of the Museum in the same city, was born at Salon in Provence, in 1752, of an old and respectable family. Being a younger son, he was destined for the church, and sent to Paris to complete his theological studies; but getting acquainted with the philosophers (as they called themselves), he soon lost all relish for the study of theology, and devoted himself to the physical sciences, especially those of chemistry and mineralogy. Into the church, however, he got, and rose to the dignity of canon; but by the death of his father and elder brother, having acquired the right of directing his own future exertions, he hastened to quit a profession, towards which he felt no partiality.

Thus liberated from the trammels of his former profession, Lamanon applied himself with uncommon ardour to study. Eager to raise the awful veil that conceals from our eyes the secrets of nature; persuaded, that even the greatest genius only amuses itself with false systems in the silence of a cabinet; convinced of the necessity of much and various observation, and of surprising Nature, as it were, in the very fact; in order to penetrate into the sublimity of her operations;—our young philosopher travelled through Provence and Dauphine, and scaled the Alps and Pyrenees. At the sight of these vast natural laboratories the bent of his mind burst forth instantaneously: he climbed to the summit of rocks, and explored the abyss of caverns, weighed the air, analysed specimens, and, in this ardent fancy, having attained the secrets of creation, he formed a new system of the world. On his return home, he applied with additional interest to the study of meteorology, mineralogy, natural philosophy, and the other branches of the history of nature.

Whilst he was meditating a visit to Paris for the purpose, as his eulogist expresses himself, of conversing with the luminaries of science, the inhabitants of the commune of Salon, having lost a cause against their lord, unanimously elected Lamanon, with whose integrity and abilities they were well acquainted, to go and solicit of the council the repeal of an unjust decree that had been obtained by partiality. The reply of the young philosopher on this occasion is an additional proof of his uncommon disinterestedness. "As I intend (said he) to go to Paris on business of my own, I cannot think of accepting your offer of 24 livres daily pay: a twelfth of this sum will cover the extraordinary expenses of the journey

that I shall be obliged to make to Versailles on your account." He had the satisfaction of complete success in the business thus undertaken.

Convinced that the friendship of an eminent man elevates the soul, excites generous emulation, and becomes an additional stimulus to one whose delight is study, and whose most pressing want is an object on which to place his affection, Lamanon anxiously endeavoured to merit the regard of Condorcet, so well known by his talents, his impetuous, his rebellion, and his misfortunes. This academician, justly considering that an apostate priest would be ready to join the conspiracy of the philosophers against the altar and the throne, received Lamanon with distinction, and at length admitted him to his most intimate friendship.

During the three successive years that Lamanon spent at Paris, he followed with care the track of those learned societies, of which he had been elected a member. He became at this period, together with Count de Gebelin, and some other philosophers and artists, one of the founders of the Museum, the greater part of the members of which are now reunited in the open society of sciences, letters, and arts, at Paris. Among the different papers of his that were read at various meetings of these societies, Ponce mentions with particular approbation what he calls a *notice* of Adam de Craponc, an eminent hydraulic engineer; a memoir on the Cretins; a memoir on the theory of the winds; a treatise on the alteration in the course of rivers, particularly the Rhone; and another on an enormous bone belonging to some cetaceous fish, that was dug up at Paris, in laying the foundations of a house in the *rue Dauphine*. We have not seen these memoirs; but as their author was the friend of Condorcet, and fancied that he had attained the secrets of creation, we can easily conceive their tendency.

Having resolved again to revisit Switzerland and Italy, Lamanon first went to Turin, where he allied himself to the learned of that country. During his stay there, the brilliant novelty discovered by Montgolfier was occupying the attention of all the philosophers of Europe. Lamanon, desirous of making some experiments of this kind himself, ascended in a balloon from the city of Turin; but not perceiving in this discovery, which had at first highly interested him, an object of public utility, not foreseeing that one day, on the plains of Fleurus, it would be the cause of raising and establishing victory under the standards of France, he returned to his favourite occupations. Pursuing his route from Piedmont, he visited Italy, and returned by Switzerland, where he explored the Alps and ascended the summit of Mont Blanc, thence returning, laden with the spoils of the countries which he had traversed, to Provence, he

employed himself in the arrangement of the interesting fruits of his journey.

Of the scrupulous exactness of his observations, his eulogist gives the following instance: "Being convinced that the plain of Crau, divided by the channel of the Durance, had formerly been a lake, he wished to be absolutely assured of it. For this purpose he collected a specimen of each of the stones that are to be found in this vast plain; the number of these he found to amount to nineteen; then tracing the course of the river towards its head, near the frontiers of Savoy, he observed, that above each junction of the tributary streams with the Durance, the variety of pebbles diminished. Afterwards ascending the current of each of these smaller streams, he discovered on their banks the original rock of every pebble that overspreads the plain of Crau; thus incontestably proving, that this plain was anciently a lake formed by the waters of the Durance, and the streams that fall into it. If all philosophers (says our author) would conduct their examinations with equal precision, certain hypotheses, more brilliant than solid, would not find so many admirers; the charm of imagination, and the graces of style, would not so often encroach upon the inprescriptible rights of nature and truth."

To citizen Ponce this appears a demonstration of Lamanon's theory; but we cannot say that it does so to us. It may be a kind of proof, though not a demonstration, that in some convulsion of nature, stones had been rolled from the rock, and the plain of Crau, for a time, overflowed by the Durance; but it surely furnishes no evidence of that plain's having ever been a permanent lake. It may have been so; but such investigations as this will not guard philosophers against the delusions of favourite hypotheses.

It was at the time when Lamanon was preparing for the press his great work on the Theory of the Earth, that the French government conceived the vast project of completing the discoveries of Captain Cook; the academy of sciences was entrusted with the care of selecting men capable of rectifying our notions of the southern hemisphere, of improving hydrography, and advancing the progress of natural history. Condorcet, not knowing any one qualified for this last department, Lamanon, wrote to him an invitation to share the danger and glory of this great enterprise. He accepted with eager transport a proposal that fulfilled his highest expectations, hastened to Paris, refused in a conference with the minister the salary that was offered, took a hasty leave of his friends, and departed for Brest.

On the 1st of August 1785, the armament set sail under the orders of La Pérouse, an experienced commander, whose patriotism

and scientific zeal were equal to his courage and good sense, and who had already merited the public confidence. The philosophers of all Europe were in expectation of those useful discoveries, the probable fruit of the zeal and talents employed in the expedition. The beginning of the voyage was prosperous. After various delays, and a multitude of observations, the two vessels arrived at the island of Mooua, one of the southern Archipelago. The impatient Lamanon, eager to assure himself of the truth of the published accounts of that country, debarked with Langle, the second in command. At the moment of their return, the natives, in hopes of booty, which had been excited by the number of presents that they had received, seized upon the boats, and attacked the party. The French were obliged to have recourse to arms for self-defence, and a desperate combat ensued. Lamanon, Langle, and ten of the two boats' crews, fell a sacrifice to the fury of these barbarians.

Thus perished Lamanon, a young man ardent in the pursuits of science, to a high degree disinterested and a zealot in what he thought the cause of liberty. He refused the salary which was allotted to him when he was appointed to this unfortunate expedition; for "if I do not feel satisfied (said he) on board the vessel; if my inclination or curiosity lead me to quit the ship,—I should be unhappy if any power in the world had acquired the right of preventing me."

According to M. Ponce, Lamanon seemed born to bring about a revolution in science; the depth of his ideas, the energy of his character, the sagacity of his mind, united to that lively curiosity that can draw instruction out of any thing, and leaves nothing unexplored, would have led him to the most valuable discoveries.

LAMB. *s.* (*lamb*, Gothic and Saxon.) 1. The young of a sheep (*Pope*). 2. Typically, the Saviour of the world.

LAMB'S LETTUCE, in botany. See VALEARIANA.

LA'MBATIVE. *s.* (from *lambo*, Latin, to lick.) Taken by licking (*Brown*).

LA'MBATIVE. *s.* A medicine taken by licking with the tongue (*Wicman*).

LAMBENT. *a.* (*lambens*, Latin.) Playing about; gliding over without harm (*Dryden*).

LAMBERT (John), major-general in the parliament army during the great rebellion. He distinguished himself at the battles of Naseby and Epsom, and assisted Cromwell in his advancement to the protectorate, but opposed his assumption of the title of king. At the restoration he was tried and condemned, but received a pardon, and died an exile in the island of Guernsey.

LAMBERT (Claude Francis), a French writer, who is the author of several compilations and romances, the chief of which is

L A M

a literary History of Louis XIV. for which he obtained a pension. He died in 1764.

LAMAR (George), an English painter of landscape. He was instructed by Hassel, and imitated Wootton, but afterwards adopted the manner of Gaspar, but with more richness of composition. He painted scenes for the play-house, and some pictures for the East-India house. He died in 1765.

LAMBERT (John Henry), an eminent mathematician, was a native of Mulhausen in Alsace, where he was born, April 28, 1728. His education was very confined, but he exhibited early indications of genius. At a very early period he invented an arithmetical machine, a mercurial pendulum that vibrated for 27 minutes, arithmetical scales, and a machine for drawing in perspective. From 1748 to 1756, he was engaged as tutor to the grandsons of M. le Comte de Salis, at Coire. In 1757, the tutor and his pupils went to Utrecht, and passed the year in Holland: at this time he published his *Treatise on the Passage of Light*, at the Hague. Afterwards they travelled to Paris, where Lambert was introduced to Dalember. In 1759, he published his *Perspective* at Zurich. From 1753 to 1760, he had several pieces published in the *Acta Helvetica*. In 1759, his *Photometry* was printed at Augsburg. In 1760, he collected the different pieces, still in a fugitive state, of his *Novum Organum*; but which was not published till 1764. In 1761, his *Treatise on the Properties of the Orbits of Comets* was printed at Augsburg. He was admitted a pensioner of the Berlin Academy in 1765, from which time, to his death, in September 1777, he furnished many memoirs for the several volumes of that academy.

The scientific knowledge of Lambert was very considerable: and he had great independence of mind, and a very warm and vivid imagination. It may be added, to his honour, that he was not only religious, but highly devotional; and that he was as much celebrated as a Christian as a philosopher.

LAMBERTIA. In botany, a genus of the class tetrandria; order monogynia. Calyx common, many leaved, imbricate, seven-flowered; petals four, bearing the stamens; stigma tubulate, grooved; capsule one-celled, two-seeded; seeds margined. One species: a branchy shrub of New Holland.

LA'MBKIN. *s.* (from *lamb*.) A little lamb (*Spenser*).

LA'MB'S-WOOL. *s.* (*lamb* and *wool*.) Ale mixed with the pulp of roasted apples.

LAMDO'IAL SUTURE. In anatomy (*Sutura Lambdoidalis*, from λ , and *idos*, resemblance, because it is shaped like the letter λ). Occipital suture. The suture that unites the occipital bone to the two parietal bones.

LAMP. *a.* (*laam*, *lama*, Saxon.) 1. Crippled; disabled in the limbs (*Dante*). 2. Hobbling; not smooth: alluding to the feet

L A M

of a verse (*Dryden*). 3. Imperfect; unsatisfactory (*Bacon*).

To **LAME**. *v. a.* (from the adjective.) To cripple (*Shakspeare*).

LAMECH, of the race of Cain, was the son of Methusael, and father of Jabal, Jubal, Tubal-cain, and Naamath. See Genesis, ch. iv. ver. 18, 19, 20.

LAMECH, the son of Methuselah, and father of Noah. Genesis, ch. v. ver. 25, 31.

LAMELLA. In natural history, a thin plate. In botany, applied to the plates of which the under part in some Funguses is composed: hence these are called *lamellated* or *lamellous* Funguses. Gills is the common English name for *lamelle*.

LA'MELLATED. *a.* (*lamella*, Latin.) Covered with films or plates (*Derham*).

LA'MELY. *ad.* (from *lame*.) 1. Like a cripple; without natural force or activity (*Wiseman*). 2. Imperfectly; without a full or complete exhibition of all the parts (*Dryden*).

LA'MELESS. *s.* (from *lame*.) 1. The state of a cripple; loss or inability of limbs (*Dryden*). 2. Imperfection; weakness (*Dry*).

LA'MENESS, in horses or other quadrupeds, any disease in the limbs by which a free progression is impeded.

"The steps of a horse in a sound state," observes Mr. Clark, are equal and uniform; a certain harmony subsisting in the motion of the whole body and limbs, any deviation from this harmony, or defect in moving the legs, constitutes lameness.

"Various are the causes which may occasion this, and frequently a combination of causes may take place at one and the same time in different parts of the same limb; for instance, a prick with a nail in the foot, and a strain in the tendons of the legs, the ligaments of the joints, or in the shoulders, happen frequently together; for, as the pain arising from the nail in the quick causes the horse to trip and stumble in riding, an exertion to save the pained foot may, and indeed frequently does, occasion the straining of the ligaments of the joints or the tendons, &c. of the legs; and thus a complication of the causes of lameness is produced. The same effects are likewise produced from bony excrescences on the legs, which occasion pain; or even an exertion of the horse to save the pained limb, in such case, may occasion his straining some of the muscles in the shoulders," &c.

Here Mr. Clark remarks, very properly, on the very erroneous notions entertained of what is called a shoulder-dip. This phrase is supposed to imply a separation of the shoulder-blade from the ribs, a circumstance which never can happen to this bone, from the nature of its junction with the ribs; for the scapula is not fixed to the body by any joint, but by apposition, that is, laid along the outside of the ribs, and there fastened by the muscles, &c. which lie both on the inside and outside of the shoulder-blade;

L A M E N E S S.

hence, though the muscles and tendons of the shoulder may be overstretched or strained, the bone never can slip out of its place without a force sufficient to destroy the texture of the parts which connect the latter with the ribs. It is true, that the ligament which surrounds the articulation where the humerus joins with the scapula, at the point of the shoulder, is exposed to considerable injury from strains, &c. as is the case with other joints; but Mr. Clark asserts (what will be easily credited by every scientific veterinarian), that he never knew nor heard of a single instance of its being dislocated in a horse, although it must be allowed that the thing is possible. Hence, therefore, he thinks the term "shoulder slip" improper, only tending to mislead young and inexperienced men, and that it should be expunged from veterinary language.

"Lameness," continues the same writer, "frequently proceeds from tumours growing upon the bones of the legs, or on those immediately connected with them: these are commonly termed, in horses, splints, spavins, osslets, ringbones, &c. (see the plates), and are distinguished or named from the particular part on which they grow. But, as these bony excrescences (or exostoses, as they are called in the human body) are not limited to particular parts of the legs, but are liable to grow on every other bone, they sometimes are concealed in such situations that it is impossible they can be discovered, although their effects in causing lameness, when connected with the parts that are conducive to motion, are very apparent; instances of which might be met with almost every day, if horses were more frequently dissected." A horse's shoulder-bone, which Mr. Clark preserved, evinces this fact; since it has an exostosis, about the size of a large nut, on the thinnest and most transparent part of the scapula on its inside. This having lain next to the ribs, the horse was, of course lame for several years, though the cause could not be discovered till after dissection; when it appeared, that this bony excrescence was so situated as to press upon the middle of the sub-scapular muscle.

"Something of the same nature as these exostoses," says Mr. Clark, "likewise takes place on the small bones of the joints, especially in those of the hind-legs; the osseous matter forming a number of small tumours between the joints, and cementing two or more of these bones together, which impedes the action of the joint, and consequently occasions lameness.

"Many persons flatter themselves that they can cure these bony excrescences by blistering, &c. even after they have acquired their utmost solidity; but those who are acquainted with the anatomical structure of the parts, the solidity and broad basis of these bony tumours, together with the firm connection they have with the bone on which they grow, will at once see the insufficiency

of this method. It is true, in some cases where these tumours have a narrow base, they may be taken off with a chisel; but this operation must, in many cases, be attended with consequences much more detrimental to the horse than the excrescence would be in its fullest growth: indeed, a caries in the leg-bone may follow, and the cicatrix that remains will disfigure the horse more than the excrescence would have done in its full extent. Splints of an uncommon size we daily see on horses' legs, that yet do not go lame in the least. Hence, therefore, it is obvious, that it is not the size of a splint that causes lameness, after it has grown to its full extent, but rather its interference with some of the soft parts that are subservient to the motion of the legs.

"It likewise frequently happens, that these excrescences grow up between the two small bones on the back-part of the fore-legs, and immediately under the tendons; the grooves or hollows that are there formed on the surface of the excrescence, whilst it is in its soft state, by the friction of the tendons, evidently show that they have been impeded in their motion. In this situation it becomes impossible to remove the excrescence, especially as it frequently happens that the leg-bone, in such cases, is considerably enlarged, a case for which there is no cure, as will be evident on inspecting the bare leg-bones that may be found almost in every field in which there are any dead horses."

Mr. Clark here adduces the authorities of Van Swieten and M. Petit, to shew the effects which bony excrescences produce on the human body on their first appearance; but these, though not inapplicable to the purpose of illustration, need not be produced in this place.

"That the same effect," he observes, "is produced by these excrescences growing on the leg-bones of horses, called splints, is very evident from their first beginning to rise on the outside of the bone: they distend or overstretch the periosteum which covers the bone; this creates pain, which is followed with lameness in horses: but, when this membrane is either divided, ruptured, or becomes benumbed by the distention it has undergone, the pain arising from it ceases, and unless the excrescence communicates with some other bone, or presses on some of the parts that are conducive to motion, as the tendons, &c. the lameness goes off, although the tumour on the bone remains in its full extent.

"Lameness likewise proceeds from rheumatic pains in different parts of the body, which frequently change from one place to another, and from cramps, spasms, sciatica, &c. all of which produce lameness; the true seat of which, in some cases, cannot be ascertained with any degree of certainty. Other causes of lameness are more easily discovered from their external appearance, or

L A M E N E S S.

the symptoms which attend them, as a swelling of the parts affected, attended with pain to the animal upon touching them: of this kind are sprains, either of the ligaments of the joints, or of the muscles and tendons of the legs and shoulders.

"Lameness likewise proceeds from blows, as these occasion confusion; or from wounds and punctures, from watery sores about the legs or heels, under every denomination whatever; as, in these cases, the parts are more or less swelled and inflamed, and, of course, unfit for action.

"Lameness likewise proceeds from violent and long continued exercise, which occasions too great a waste of the synovia of the joints; hence they become stiff, and, on the horse's moving, make a crackling noise. The same effect is likewise produced from a variety of other causes which are confined to the feet, as pricks from nails in shoeing, wounds in the hoofs from nails picked up in the streets, glass, sharp-pointed bones, &c. which penetrate into the quick, from injudicious shoeing (see SHOENING), and paring the hoofs to excess, or suffering them to grow too large or long at the toes, by which the feet are benumbed, a partial contraction taking place at the coronet and heels, or a contraction of the whole hoof, which is commonly known by the name of hoof-bound. This last disease is a consequence of keeping the legs and hoofs too hot and too dry, by a great quantity of litter and perhaps hot dung at all times under them. The practice of the Arabians ought, in this respect, to be adopted, which is, washing the legs of their horses frequently through the day with cold water. Whilst this is natural to horses' hoofs, it at the same time not only keeps the legs cool, but contributes to brace and strengthen the muscular fibres, and to prevent swellings, &c. in them. How differently treated are our horses in this respect! No such precautions are ever intentionally adopted, but directly the contrary; for it may literally be said, that they are compelled at all times (when in the stable) to stand on a hot-bed, whilst, at the same time, their hoofs are basted with oil, or other things, perfectly of an opposite quality to the intention with which they are applied. It is by this means that the generality of fine horses that are much kept in stables, sooner or later, become lame.

"Lameness likewise proceeds from corns, running thrushes, from gravel insinuating itself between the shoe and the sole of the foot, especially in weak hoofs, or, by forming a lodgment there, it at last penetrates into the quick, which is called graveling.

"There is likewise another kind of lameness peculiar to the hind-quarters, and which occasions a sudden jerking of the legs upwards on moving; by some it is called string-bait, and by others click-spavin. This complaint seems to be a particular affection of the nerves of the leg, which causes this kind of involuntary motion, for which no one

has yet proposed any certain method of cure.

"From all these, and a variety of other causes, lameness is produced, the true seat of which, in many cases, cannot be discovered by any external appearances;" hence, Mr. Clark says, "practitioners ought to be very cautious in speaking of the causes of lameness, before they positively have discovered the particular seat of the disease, or the circumstance which produces it. From a want of this precaution, together with a too superficial inspection of the parts, and too hasty a determination as to the seat or cause of lameness, applications have been made to the sound parts, whilst the real cause has soon afterwards shewn itself to be elsewhere, perhaps in the hoof, to the shame and confusion of the practitioner. Therefore, unless the cause of a horse's lameness is perfectly evident, it will be prudent to examine, at all times, the foot of the lame limb first, with care and attention; and, if it should still appear doubtful, to inspect it on the next day, and even a third time, rather than give too hasty a determination with respect to the seat of a horse's lameness. Indeed, the foot is always to be suspected; and especially after a horse has been newly shod, or had his shoes fastened, or when the shoe lies too flat, so as to press upon the sole, or when the shoe is made too narrow for the hoof, or if there be a corn in the foot. A horse may be lame from a nail, although it be not driven immediately into the quick, by its thickness pressing on the soft parts, or from its being bent inwards upon the quick; or, when driven too near, it will raise a small portion of the hoof, its own breadth, and force it upon the quick; and this last is the reason why horses remain a longer time lame after such accidents, than when a nail has been driven immediately into the quick. A wound by a nail in the fleshy part of the foot, if discovered soon and properly treated, suppurates, and soon heals up; but a thin splinter, when raised from the hoof by a nail, and forced on the quick, has more lasting effects, and the horse will be longer lame."

From what has been said, Mr. Clark insists, that no certain rules can be laid down for discovering the true seat of lameness in a horse from the motion of his body, although much has been pretended on the subject. "For," says he, "when any of the parts which are necessary to the motion of the body are injured, the adjacent parts will be affected more or less; and thus, by a kind of sympathy, the whole limb will be affected; thus, a prick with a nail in the foot will cause an inflammation of the whole leg; the shooting pains, in these cases, may affect the muscles of the shoulders, so as to obstruct their motion, and, upon touching or pinching those parts, the horse will flinch, and shew a series of pain in them, and a stiffness in moving forward or sidewise, that will be very apt to mislead the unwary, and

make them conclude that the cause of lameness is centered entirely in the shoulder, when, in fact, these are only symptoms which proceed from the shooting pains occasioned by the nail in the foot.

"The caution above mentioned will appear still more necessary, when it is considered, that bony excrescences excite the most acute pains whilst they are growing, by their effect in extending the membrane which covers the bone, and which is always attended, more or less, with some degree of inflammation on the part, although, in some cases, the situation of these tumours cannot be perceived. Whilst growing, they may be compared to the pain of teething in children, which continues till the periosteum which covers the jaw-bone is penetrated by the new tooth."

In investigating other possible causes of lameness in the horse, the same judicious writer alludes to what he formerly hinted on the subject of spasms in the muscles, cramps, &c. the real seat of which, he says, cannot easily be ascertained in horses from any external appearances that present themselves. Yet the experience of such complaints in our own persons, he thinks, sufficient to make us sensible how painful they may likewise be supposed to horses, and how likely to occasion lameness.

Another cause of lameness, which Mr. Clark notices in conclusion, is the injury done to the backs of horses by ill-made saddles, or those that are not properly fitted. "This," says he, "is a consideration of importance both to the ease of the horse and to the rider's safety. It frequently happens, however, that both suffer from inattention to this; for, if the saddle-tree be too wide, and the saddle without a crupper, it moves too far forward upon the shoulder-blades, by which means the weight of the rider, together with the points of the saddle-tree, confining the motion of the shoulder-bones, impedes their action, which causes the horse to stumble, and frequently to come down, whilst, at the same time, the cartilaginous ends of the shoulder-bones, muscles, &c. are bruised. Hence large swellings are produced on the shoulders or withers, which terminate in fistulous ulcers, and which, from the situation of the parts, are very difficult to cure. On the other hand, too narrow saddle-trees bruise the skin, and occasion those hard lumps called sitfasts or warbles, and render the horse's back tender for a long time."

"A saddle that is well fitted should press equally on every part of the back, the middle or ridge of the spine excepted, without touching, pressing, or even coming near the shoulder-blades, which ought by no means to be interrupted in their motion; the saddle pannel, opposite to the hollows that are on each side of the spine, should be bolstered and well fitted up on each side, which will prevent it from moving too far

forward on the shoulder-blades, even though no crupper is used."

As the best general means of preventing lameness in the feet, we may recommend the use of Mr. Coleman's artificial frog (see FROG). This, together with shoes properly adapted to the state of the hoof, and an attention to Mr. Clark's injunctions to keep the feet cool, and in that state of moisture which is almost natural, may undoubtedly prevent many troublesome diseases, the horse will be fine and clean limbed, and free from any disposition to grease or swelling of the heels.

The specific diseases which occasion lameness in horses are treated of under their several heads. See BLOOD-SPAVIN: BONE-SPAVIN: SPLINTS: WIND-GALLS: WENS: QUITTERS: FALSE-QUARTERS.

To LAMENT. *v. n.* (*lamentor*, Latin.) To mourn; to wail; to grieve; to express sorrow (*Dryden*).

To LAMENT. *v. a.* To bewail; to mourn; to bemoan; to sorrow for (*Dryden*).

LAME'NT. *s.* (*lamentum*, Latin.) 1. Sorrow audibly expressed; lamentation; grief uttered in complaints or cries (*Dryden*). 2. Expression of sorrow (*Shakspeare*).

LA'MENTABLE. *a.* (*lamentabilis*, Latin.) 1. To be lamented; causing sorrow (*Shaks.*) 2. Mournful; sorrowful; expressing sorrow (*Sidney*). 3. Miserable, in a ludicrous or low sense; pitiful; despicable (*Stillingfleet*).

LA'MENTABLY. *ad.* (from *lamentable*.) 1. With expressions or tokens of sorrow; mournfully (*Sidney*). 2. So as to cause sorrow (*Shakspeare*). 3. Pitifully; despicably.

LAMENTA'TION. *s.* (*lamentatio*, Latin.) Expression of sorrow; audible grief (*Shaks.*)

LAMENTA'TIONS, a canonical book of the Old Testament, written by the prophet Jeremiah, according to archbishop Usher and some other learned men, who follow the opinion of Josephus and St. Jerom, on occasion of Josiah's death. But this opinion does not seem to agree with the subject of the book, the Lamentation composed by Jeremiah on that occasion being probably lost. The fifty-second chapter of the book of Jeremiah was probably added by Ezra, as a preface or introduction to the Lamentations: the two first chapters are employed in describing the calamities of the siege of Jerusalem: in the third the author deploras the persecutions he himself had suffered: the fourth treats of the desolation of the city and temple, and the misfortune of Zedekiah: the fifth chapter is a prayer for the Jews in their dispersion and captivity: and at the close of all he speaks of the cruelty of the Edomites, who had insulted Jerusalem in her misery. All the chapters of this book, except the last, are in metre, and digested in the order of the alphabet; with this difference, that in the first, second, and fourth chapters, the first letter of every verse fol

lows the order of the alphabet; but in the third the same letter is continued for three verses together. This order was probably adopted, that the book might be more easily learnt and retained. The subject of this book is of the most moving kind; and the style throughout lively, pathetic, and affecting. In this kind of writing the prophet Jeremiah was a great master, conformably to the character which Grotius gives of him: *Mirus in affectibus concitandis*.

LAMENTATIONS. The funeral music of the ancient Jews was called by this name. At the death of any one it was not only usual to employ tibicines, or flute-players, to perform over the body of the deceased, but to hire at least one vocal female mourner, or lamentatrix. From the rabbin Maimonides we learn, that the husband was obliged to provide mourners to weep over the corpse of his deceased wife, and at her funeral; or at least that this was the established custom of the country. The poorest persons among the Israelites, he tells us, engaged two flutes and one female mourner; and if the husband were rich, the expence and pomp of the ceremony were proportioned to his wealth and dignity.

LAMENTATRICES. The name given by the ancient Hebrews to certain female vocal performers who were hired to chant over the dead, and to sing dirges at funerals; on which occasions they were accompanied with flutes. See **LAMENTATIONS**.

LA'MENTS. The name given by the Scotch to some of their old serious and melancholy airs: as Earl Douglas's *Lament*, Sir Norman MacLeod's *Lament*, St. Kilda Girl's *Lament*, &c.

LAMENTER. *s.* (from *lament*.) He who mourns or laments (*Spectator*).

LA'MIA. In entomology, a Fabrician-tribe of the coleopterous genus *Cerambyx*, which see.

LAMIÆ, a sort of demons who had their existence in the imaginations of the heathens, and were supposed to devour children. Their form was human, resembling beautiful women. Horace makes mention of them in his *Art of Poetry*. The name, according to some, is derived from *lanio* "to tear;" or, according to others, is a corruption of a Hebrew word signifying to devour. They are also called *Larvæ* or *Lemures*.

LA'MINA. In botany the border. Corollæ polypetalæ pars superior patula. The upper, broad or spreading part of the petal, in a polypetalous corol. Called *limbus*, in a monopetalous corol.

LA'MINA. *s.* (Latin.) Thin plate; one coat laid over another (*Sharp*).

LA'MINATED. *s.* (from *lamina*.) Plated: used of such bodies whose contexture discovers such a disposition as that of plates lying over one another (*Sharp*).

LA'MIUM. Archangel. In botany a genus of the class *didynamia*, order *gymno-*

perma. Calyx five-toothed, the teeth setaceous, and spreading; upper lip of the corol vaulted, lower two-lobed; the throat inflated and toothed on each side at the margin. Thirteen species—mostly indigenous to the south of Europe—three common to our own fields and water. These three are as follow.

1. *L. Album*. White archangel, with cordate, pointed, serrate, petioled leaves; twenty-flowered whorls, formerly celebrated as an astringent, but long disused and forgotten.

2. *L. Purpureum*. Red archangel; with leaves cordate, obtuse, equally and obtusely toothed, and petioled; the young leaves boiled and eaten like spinach.

3. *L. Amplexicaule*. Floral leaves sessile, clasping the stem, obtuse.

To **LAMM.** *v. a.* To beat soundly with a cudgel.

LAMMAS-DAY, the first of August; so called, as some will have it, because lambs then grow out of season, as being too big. Others derive it from a Saxon word, signifying "loaf-mass," because on that day our forefathers made an offering of bread made with new wheat. On this day the tenants who formerly held lands of the cathedral church in York, were bound by their tenure to bring a lamb alive into the church at high-mass.

LAMP, a vessel containing oil, with a lighted wick. Lamps were in general use among the Jews, Greeks, and Romans. The candlestick with seven branches, placed in the sanctuary by Moses, and those which Solomon afterwards prepared for the temple, were crystal lamps filled with oil, and fixed upon the branches. The lamps or candlesticks made use of by the Jews in their own houses, were generally put into a very high stand on the ground. The lamps supposed to be used by the foolish virgins, &c. in the Gospel, were of a different kind.—According to critics and antiquaries, they were a sort of torches, made of iron or potter's earth, wrapped about with old linen, and moistened from time to time with oil. Matth. xxv. 1, 2. The lamps of Gideon's soldiers were of the same kind. The use of wax was not unknown to the Romans, but they generally burnt lamps; hence the proverb *Tempus et oleum perdidit*, "I have lost my labour." Lamps were sometimes burnt in honour of the dead, both by Greeks and Romans.

Dr. St. Clair, in the *Philos. Trans.* No. 245, gives the description of an improvement on the common lamp. He proposes that it should be made two or three inches deep, with a pipe coming from the bottom almost as high as the top of the vessel. Let it be filled so high with water that it may cover the whole of the pipe at the bottom, that the oil may not get in at the pipe, and so be lost. Then let the oil be poured in so as to fill the vessel almost brim-full; and to the

vessel must be adapted, a cover having as many holes as there are to be wicks. When the vessel is filled and the wicks lighted, if water falls in by drops at the pipe, it will always keep the oil at the same height or very near it; the weight of the water being to that of the oil as 20 $\frac{1}{2}$ to 19, which in two or three inches makes no great difference. If the water runs faster than the oil wastes, it will only run over at the top of the pipe, and what does not run over will come under the oil, and keep it at the same height.

LAMPS, Perpetual. The testimonies of Pliny, St. Austin, and others, have led many to believe that the ancients had the invention of perpetual lamps; and some moderns have attempted to find out the secret, but hitherto in vain. Indeed it seems no easy matter to find out either a perpetual wick or a perpetual oil. The curious may read Dr. Plot's conjectures on the subject in the Phil. Trans. No. 166; or in Lowthorp's abridgment, vol. iii. p. 636. But few, we believe, will give themselves the trouble of searching for the secret, when they consider that the credulity of Pliny and of St. Austin were such, that their testimony does not seem a sufficient inducement to us to believe that a lamp was ever formed to burn 1500 or 1000 years; much less is it credible that the ancients had the secret of making one burn for ever.

LAMP, Argand's. This is a very ingenious contrivance, and the greatest improvement in lamps that has yet been made. It is the invention of a citizen of Geneva; and the principle on which the superiority of the lamp depends is the admission of a larger quantity of air to the flame than can be done in the common way. This is accomplished by making the wick of a circular form, by which means a current of air rushes through the cylinder on which it is placed with great force; and, along with that which has access to the outside, excites the flame to such a degree, that the smoke is entirely consumed. Thus both the light and heat are prodigiously increased, at the same time that there is very considerable saving in the expense of oil, the combustion being exceedingly augmented by the quantity of air admitted to the flame; and that what in common lamps is dissipated in smoke is here converted into a brilliant flame. This lamp is now very much in use; and is applied not only to the ordinary purposes of illumination, but also to that of a lamp furnace for chemical operations, in which it is found to exceed every other contrivance yet invented. It consists of two parts, viz. a reservoir for the oil, and the lamp itself. The reservoir is usually in the form of a vase, and has the lamp proceeding from its side. The latter consists of an upright metallic tube, about one inch and six-tenths in diameter, three inches in length and open at both ends. Within this is another tube, about an inch in diameter, and nearly of an equal length; the space be-

twixt the two being left open for the passage of the air. The interior tube is closed at the bottom, and contains another similar tube, about half an inch in diameter, which is soldered to the bottom of the second. It is perforated throughout, so as to admit a current of air to pass through it, and the oil is contained in the space betwixt the tube and that which surrounds it. A particular kind of cotton cloth is used for the wick, the longitudinal threads of which are much thicker than the others, and which nearly fills the space into which the oil flows; and the mechanism of the lamp is such, that the wick may be raised or depressed at pleasure. When the lamp is lighted, the flame is in the form of a hollow cylinder; and by reason of the strong influx of air through the heated metallic tube becomes extremely bright, the smoke being entirely consumed for the reasons already mentioned. The heat and light are still further increased, by putting over the whole a glass cylinder, nearly of the size of the exterior tube. By diminishing the central aperture the heat and light are proportionably diminished, and the lamp begins to smoke. The access of air both to the external and internal surfaces of the flame is indeed so very necessary, that a sensible difference is perceived when the hand is held even at the distance of an inch below the lower aperture of the cylinder; and there is also a certain length of wick at which the effect of the lamp is strongest. If the wick be very short, the flame, though white and brilliant, emits a disagreeable and pale kind of light; and if it be very long, the upper part becomes brown, and smoke is emitted.

We shall now give from Gregory's Cyclopaedia, an improvement of this invention. See PLATE 93.

The upper compartment of the plate represents an improved construction of Argand's lamp. A, fig. 1. is the reservoir for the oil, which unscrews at B; in order to fill it the oil is poured in at a hole a, fig. 4, in the lower end of the reservoir, which is covered, when the lamp is not burning, by a sliding collar, b, drawn up by a handle, d, which comes through a hole in the screw, c, by which the reservoir is screwed in the short tube, E, fig. 1: there being no vent-holes in the upper part of the reservoir, A, to admit the air as the oil runs out; a bubble of air must enter the hole, a, fig. 4, to supply the place of every drop of oil that comes out, when the reservoir, A, is screwed to the tube, E; the collar, b, being down, the oil runs out (the air being admitted from without through a small hole, f), till E is filled above the level of the hole, a, which prevents more air getting in; it remains in this state till by the burning of the lamp the oil is drawn down beneath the hole, a, when it is filled again as before; by this means the lamp is always well supplied, but never overstocked with oil. From the bottom of the tube, E, fig. 4, the oil is conveyed by a pipe, D, to

the lamp, the constitution of which is best explained in fig. 2; EF is the external tube of brass, which is supplied with oil by the pipe D; in the centre of this another tube, GG, is soldered, which is open at both ends: between these tubes is a cylinder of slightly wove cotton, gg, called the wick; this is fastened to a small cylinder of brass, hh (shewn separately in fig. 3), which can be moved down and up as the wick burns. The wick is lowered or raised by turning round the cylinder, HH (shewn separately in fig. 5), by means of its rim, II, fastened to the cylinder, HH, by three small rods, ii; the cylinder, HH, fig. 5, has a spiral groove, kk, cut obliquely round it: the cylinder, hh, figs. 2 and 3, which goes within the cylinder, HH, has a small stub, l, projecting from it, which works into the groove, kk, fig. 5; the leaf, l, is long enough to project a small distance through the groove, kk, and when in its place takes against a small bead, n, fig. 2, fixed within the cylinder, FF, so as to prevent its turning, when HH is turned by its rim, II. By the above arrangement it is evident, that when the cylinder, HH, fig. 5, is turned round, h is prevented from turning, the sides of the groove, k, will act as an inclined plane against the stub, l, and raise the cylinder h down or up, and the cotton wick, gg, with it. The rim, II, figs. 1, 2, and 5, has an ornamented border, L, round it, which serves to secure the glass chimney, o, from being overthrown. To prevent the cylinder, HH, from being lifted out by accident, it has a rim, o, figs. 2 and 5, at the lower end, cut through in one place to allow it to pass down by the bead, n; when it is below the end of the head it cannot be raised, unless the notch in the rim, o, corresponds with the bead. When the wick, gg, figs. 1 and 5, is lighted, it rarefies the air in the glass chimney, O, and causes a draught through the tube GG, to supply the inside of the wick, and also under the edge of the glass chimney: to supply the outside; as the wick burns down it can be raised from time to time by turning the rim, I, as before described. The tube, EE, is always nearly full of oil, brought by the pipe, D. When it is required to put in a new wick, the glass chimney O, is lifted off; the tube hh, is screwed up to the top; by turning the rim, II, the tube fig. 3, is then taken out, the old wick pulled off, and a new one is put round the small part, n, of the tube, which is then put in again, and screwed down to the proper depth for lighting the wick.

LAMP, Rolling. A machine AB, pl. 93. fig. 6, with two moveable circles DE, FG, within it; whose common centre of motion and gravity is at K, where their axes of motion cross another. If the lamp KC, made pretty heavy and moveable about its axis HI, and whose centre of gravity is at C, be fitted within the inner circle, the common centre of gravity of the whole machine will fall between A and L; and by reason of the pivots

A, B, D, E, H, I, will be always at liberty to descend: hence, though the whole machine be rolled along the ground, or moved in any manner, the flame will always be uppermost, and the oil cannot spill. It is in this manner mariners hang the compass at sea; and thus should all the moon-lanterns be made, that are carried before coaches, chaises, and the like.

It is found that a lamp will burn without consuming any considerable portion of its wick, as long as it is amply supplied with oil: hence it becomes desirable that it should be level with the surface of the reservoir; and this may be effected sufficiently well by placing the wick at the edge of a very large vessel, or at the end of a tube projecting from such a vessel, or from a vessel closed above, and opening only by an orifice below, which lets in the air as the oil escapes through it. But all these methods have their attendant inconveniences. Mr. Keir's lamp contains a divided cavity, one part of which is filled with oil, and the other with a saccharine or saline fluid of greater density, so that when the oil contained in the upper part of the tube is exhausted, its place is partly supplied by a fresh portion, which is forced up in consequence of the descent of the denser fluid in a much larger vessel. Still, however, the surface must be lowered by degrees: but, by combining the invention with Dr. Hooke's cemicylindrical counterpoise, a little modified, the height of this fluid may be so regulated, that the surface of the oil may remain almost invariable, until the reservoir is quite exhausted. For this purpose the centre of gravity of the counterpoise must be a little higher than the line which bisects it; and its specific gravity must be about three-fourths as great as that of the liquid; and in this manner it may be made to raise the surface of the heavier liquid, in proportion as a greater quantity of it escapes, to supply the place of the oil; and to keep it always at a sufficient height above the surface which separates it from the oil, so that the wick may be amply and almost uniformly supplied. A more particular description of this ingenious contrivance, is given in vol. I. of Dr. T. Young's Philosophy, and illustrated with a diagram.

The saving of oil which arises from making use of an Argand's lamp, above described, instead of a common lamp, in the production of light, is evident; and it appears, from Count Rumford's experiments, that that saving cannot amount to less than fifteen per cent. Now for the advantage of this saving may, under certain circumstances, be counterbalanced by inconveniences that may attend the making use of this improved lamp, our author does not pretend to determine.

The Count made a considerable number of experiments to determine the relative quantities of light emitted by an Argand's

L A M P.

Lamp and a common wax candle; and the general result of them is, that a common Argand's lamp, burning with its usual brightness, gives about as much light as nine good wax candles; but the sizes and qualities of candles are so various, and the light produced by the same candle so fluctuating, that it is very difficult to ascertain, with any kind of precision, what a common wax candle is, or how much light it ought to give. He once found that his Argand's lamp, when it was burning with its greatest brilliancy, gave twelve times as much light as a good wax candle three-fourths of an inch in diameter, but never more.

From the results of all the count's experiments, it appears that the relative expense of the undermentioned inflammable substances, in the production of light, is as follows:

		Equal Parts in Weight.
Bees' wax.	A good wax candle, kept well snuffed, and burning with a clear, bright flame -	100
Tallow.	A good tallow candle, kept well snuffed, and burning with a bright flame -	101
	The same tallow candle, burning very dim for want of snuffing -	229
Olive oil.	Burnt in an Argand's lamp -	110
	The same burnt in a common lamp, with a clear, bright flame, without smoke -	129
Rape oil.	Burnt in the same manner -	125
Linseed oil.	Likewise burnt in the same manner -	120

With the foregoing table, and the prices current of the therein mentioned articles, the relative prices of light produced by those different materials may very readily be computed.

In the year 1795, Mr. J. H. Hassenfratz was employed by the French government to make a series of experiments to determine the most economical method of procuring light from the different combustible substances usually employed for that purpose. The materials of his experiments were, wax, spermaceti, and tallow candles, fish oil, oil

of cole-seed, and of poppy seeds. In all these oils, both the Argand and common lamps were employed. The wicks of the latter were round, containing thirty-six cotton threads. The tallow and spermaceti candles were mould, six to the pound. The wax candles five to the pound. Mr. Hassenfratz used the same method with Count Rumford for determining the comparative intensity of the lights.

Count Rumford, as we have seen, used the Argand lamp as a standard for comparison; but as the intensity of its light varies according to the height of the wick, Mr. Hassenfratz preferred a wax candle, making use of it soon after it was lighted. When two luminous bodies, of different intensities, are put in comparison with each other, the shadows are of two colours. That from the weakest light is blue, and from the strongest, red. When the lights of two different combustible bodies are compared, they are either red or blue in a compound ratio of the colour and intensity. Thus in comparing the shadows from different luminous bodies, they will be red or blue respectively, in the following order:

- Light of the sun.
- of the moon.
- of Argand lamps.
- of tallow candles.
- of wax ditto.
- of spermaceti ditto.
- of common lamps.

That is to say, when a body is illuminated by the sun and by any other luminous substance, the shadow of the former is red, and of the latter blue. In like manner, the shadow from an Argand lamp is red, when placed by that of a tallow candle, which is blue.

The following table will shew, according to Mr. Hassenfratz, the proportional distance that different luminous bodies should be placed at, to produce an equally intense shadow from the same object. The second column gives the proportional intensity of each light, which is known to be in proportion to the squares of the distances of luminous bodies giving the same depth of shadow. The third column shews the quantity of combustible matter consumed in the hour by each mode of giving light, which Mr. Hassenfratz calculates from the average of many repeated experiments.

		Distance.	Intensity.	Quantity consumed per hour.	Quantity required for equal intensities.
Argand Lamps, with	Oil of poppy seed	10	10.000	23	23
	— of fishes -	10	10.000	23.77	23.77
	— of cole-seed	9.246	8.549	14.18	16.59
Common Lamps, with	Oil of cole-seed	6.774	4.588	8.81	16.2
	— of fishes -	6.524	4.559	9.14	20.06
	— of poppy seed	5.917	3.501	7.05	20.14
Spermaceti candle - - -		5.917	3.501	9.23	26.37
Old tallow candle - - -		5.173	2.995	7.54	25.17
New ditto - - - - -		5.473	2.995	8.23	27.48
Wax candle - - - - -		4.275	1.827	9.54	53

The relative quantity of combustible matter required to produce equal lights at equal distances, may be obtained by a simple rule of proportion from the above data. Thus, if a given intensity of light, expressed by 3.501, has been produced by a consumption of 9.23 of spermaceti in the hour, the same luminous body will produce a light of 10.000, by consuming in the same time a quantity

$$\text{of spermaceti} = \frac{10.000 \times 9.23}{3.501} = 26.37 -$$

Therefore we may add to the table a fourth column, expressing the quantity of combustible which each body must consume to produce a light of 10.000.

From what has been laid down, it will also appear that the number of lights required to produce a given light, will be as follows: To produce a light equal to 100 Argand lamps, burning poppy seed oil, it will require

- 100 Argand lamps with fish oil
- 117 Ditto do. with cole-seed oil
- 218 Common lamps with cole-seed oil
- 219 Ditto do. with fish oil
- 285 Ditto do. with poppy seed oil
- 285 Spermaceti candles
- 333 Tallow ditto
- 546 Wax ditto.

Mr. Hassenfratz next takes notice of the comparative price of these articles; by which he finds, that in Paris the most expensive light is that produced from wax candles; and the most economical, that from oil of cole-seed, burned in Argand lamps.

See further the article CANDLE.

Lamp-Black, a pigment so denominated from its being occasionally obtained from the black soot of lamps. This, however, is not the mode of obtaining it for common use, though it may be procured from the combustion of any oily or resinous substances.

Lamp-black, as sold in the shops, is of two kinds; the one kind, the light soot from burning wood of the pine, or of other resinous woods; and the other a heavy black prepared from bones, by burning them in

close vessels, and not unfrequently denominated *ivory-black*.

The part of the pine usually employed in the former sort, is most frequently the impure resin or turpentine; whence lamp-black, properly so called, is prepared in large quantities by all the turpentine manufacturers, and from the impure resin that remains after the distillation of the oil, as well as from other refuse matters of the same kind. These are burnt in iron pots, or in a furnace appropriated for the purpose, and the dense smoke arising from the combustion is introduced into chambers hung with sack, upon the surface of which the soot or lamp-black is deposited, and whence it is swept off from time to time and sold without any farther preparation. Common lamp-black is not indeed pure charcoal, being mixed with some empyreumatic acid and a portion of resin, in a state of imperfect decomposition; but after it has been heated to redness in a close vessel, all these impurities are driven off, and there remains behind a carbon, or charcoal, in a state of nearly perfect purity, as it will burn away with scarcely any perceptible residue.

The carbon of a similar kind, denominated *ivory-black*, is obtained from bones during the process of distilling them for the purpose of obtaining ammonia. If the distillation be stopped when the oil first arises, which, from the first discoverer is called *Dippel's oil*, it comes out very black, the bones are found drenched with an oil of the same kind very dark and fetid. If the whole be then urged to redness in a close earthen or iron vessel, till every thing volatile has passed over, the earth of the bones remains so thoroughly impregnated with the fine charcoal of the oil as to be uniformly black, glossy, and brittle. When ground to a fine powder, mixed with size and made up into cakes, the substances sold in the shops by the name of *ivory-black* is completed; and this, from its greasy nature, readily mixes with oil, and is the material ingredient of the ordinary black paints and

L A M

A fine black of the same kind is obtainable by charring ivory shavings in close vessels: and as this, though the more expensive, is the way in which this material was first obtained, the cause of the name is obvious.

LAMPADARIUS. (Greek.) The name given to that of the two principal singers, in the patriarchal church of Constantinople, who holds the first place on the left side of the choir. The appellation of lampadarius is supposed to be derived from the musical writer and composer of that name, who flourished about the year 1300, and is conjectured to have been the first who filled the office.

LAMPAS, (called also *Lampers*, and *Lampards*.) a spongy elastic enlargement of the roof of a young horse's mouth, just behind the nippers of his upper jaw, by which the bars of the mouth often project below the surface of the upper teeth. The actual cautery has been often recommended in this complaint, but cruelly and absurdly. If the protuberance be so considerable as to produce pain in mastication, it will generally be found sufficient to pass the point or edge of a sharp penknife or lancet, transversely, and longitudinally, over the puffy and prominent part, so as to let it bleed for a few minutes; it should afterwards be washed with a solution of alum in water, and no farther inconvenience need be feared.

LAMPERN, in zoology. See **PETROMYZON.**

LAMPING. *a.* (λαμπισμ.) Shining; sparkling: not used (*Spenser*).

LAMPOON. *s.* A personal satire; abuse; censure written not to reform but to vex (*Dryden*).

To LAMPOON. *v. a.* (from the noun.) To abuse with personal satire.

LAMPOONER. *s.* (from *lampoon*.) A scribbler of personal satire (*Tatler*).

LAMPREY. See **PETROMYZON.**

LAMPSONA. See **LAPSANA.**

LAMPYRIS. Fire-fly. In zoology, a genus of the class insecta, order coleoptera. Antennas filiform; feelers four; shells flexible; thorax flat, semiorbicular, surrounding and concealing the head; segments of the abdomen terminating in folded papillæ; female (usually) apterous. Fifty-two species—scattered over the four quarters of the globe; of which two only are found in our own country. They may be thus subdivided:

A. Feelers subclavate,

With hoary, entire lip: the *Lampyrus* of Fabricius.

C. With membranaceous, emarginate lip; forming the *Fabriciana* tribe *Omalyssus*.

B. Four feelers hatchet-shaped. The tribe *Cossypus* of Fabricius, constituting, however, but a single species in *depressa*. An inhabitant of India.

D. Feelers subuliform. The *Pyrochroa* of Fabricius.

E. First joint of the feelers truncate and truncate; the tribe *Lycus* of Fabricius.

L A N

The following are the chief species:

1. L. Noctiluca. Glow-worm. Oblong, brown, shield cinereous. Inhabits woods and meadows of our own country, and other parts of Europe. The female is larger than the male, and emits a beautiful light, (supposed to be phosphorescent but not really so) for the purpose of attracting the male; this issues from the four last rings of the abdomen. The male has a power of emitting a feeble light, but very disproportioned to that of the female.

Two or three of these insects enclosed in a glass vase, will give a light sufficient to enable a person to read in the darkest night.

This singular phenomenon is observed most frequently in the month of June, when the insect is in motion. The female can withdraw or display this light at pleasure, by contracting or unfolding her body. When crushed with the hand, this luminous substance of the glow-worm adheres to it, and continues to shine till it is dried up.

2. L. Japonica. Yellow; last segment but two of the abdomen black: antennæ, eyes, and wings black. Inhabits Japan; flies about in the evenings during the months of May and June, and scatters a luminous vapour from two vesicles at the end of the tail.

3. L. Depressa. Brown; margin of the shield and shells dilated, flat. Inhabits India.

4. L. Coccinea. Head, thorax and shells sanguineous; body black: antennæ pectinate. Inhabits England and other parts of Europe: very rarely in any degree phosphorescent.

5. L. Pennsylvanica. Oblong; shells grey—testaceous; thorax black within the margin, with two rufous spots. Inhabits America; and emits a phosphoric light in the evening like the glow-worm. The eggs of all these are minute, of a yellowish hue, and deposited on grass-leaves.

LANA. Wool. In botany, *Pili curvi densi*. Delin. Pl.—*servans plantas ab æstu nimio*. Philos. Bot. Crooked or curling, close, thick hairs: the principal use of which is to defend plants against too great a degree of heat. As in *Salvia canariensis*, and *Æthiopsis*. *Sideritis canariensis*. *Marubium*. *Verbascum*. *Stachys*. *Carduus eriocephalus*. *Onopordum*. See **WOOL**.

LANARIA. In botany, a genus of the class hexandria, order monogynia. Corol superior, woolly, longer than the filaments, with a six-parted, spreading border; calyx-leaf; pericarp three-celled. One species; a woolly herb of the Cape.

LANATE. Woolly. In botany applied to the stem; as in *Stachys germanica*, &c.—*Lanatum folium*. A woolly leaf. *Quasi tela aranea indutum*—to which is added in Delin. Pl. *pilis spinis curvatis*. With a covering resembling a spider's web, composed of hairs curling spontaneously: as in *Salvia* and *Sideritis*.

LANCASHIRE, a county of England, bounded on the north by Cumberland, West-

LAN

moreland, and Yorkshire; on the east by Yorkshire, on the south by Cheshire, and on the west by the Irish Sea; seventy-four miles long, and from fifteen to forty-four wide. The form is irregular, not very unlike to England, Wales, and part of Scotland united, the indentations on the borders being imilar. A ridge of mountains separates it from Yorkshire, and continuing its course through some other counties, has been called the Back-bone of England: this mountain screens the county from the easterly winds and the attendant evils, and is thought to cause a greater quantity of rain than in the more interior parts of the kingdom; but does not seem to make the climate the less wholesome. In the north-east part of this division the hills are very lofty: the highest is called Pendle Hill, on the side of which is a very extensive factory for printing cottons, &c. Lancashire has some local advantages, which have been the cause of rendering the country so famous for its manufactures. These, in a great measure, depend upon the two most material articles of coal and water; the former of which lies in immense beds towards the southern and middle part, and the many rivers, &c. which in so many places intersect the country, together with the springs, have had no small effect upon the agriculture of this district. The northern and north-east districts produce lime-stone in abundance; mail is found towards the south. Besides water and coal, this county also produces stone of various denominations. Near Lancaster (upon the common) is an extensive quarry of excellent free-stone, which admits of a fine polish. The county town (Lancaster) is built wholly of this stone. Flags and grey slates are dug up at Holland, near Wigan. Blue slates are got in large quantities in the mountains, called Conistone and Telberthwaite, fells near Hawkshead. Great quantities are exported. They are chiefly distinguished into three classes, viz. London, country, and tom slate, which are valued in proportion, London best, &c. Copper mines in the north have been worked, but without much success. The best scythe-stones are obtained at Rainford, well wrought on the spot. Iron ore, in large quantities, is obtained at Hindle, between Ulverstone and Dalton. The features of this county are in many places strongly marked; towards the north they are bold and picturesque, diversified with lofty mountains and fertile vales. The north-east part of the county is rugged, interspersed with many rivulets, with a thin stratum of upper soil: the southern part more softened, and the plains more fertilized: along the sea coast, the land is chiefly flat, and has the appearance, in many places, as if formerly covered by the ocean. Few countries produce greater varieties of soil, which yet does not change so rapidly as in some others. A considerable tract, which lies between the Ribble and the Mersey, is

LAN

a sandy loam, well adapted to the production of almost every vegetable that has yet been brought under cultivation; beneath which is a clay or marl. There is also a black sandy loam, something distinct from the above description, which has no red rock, but the substratum white sand, under which is clay, and then marl. There are also tracks of white sand lands, and some little pebbly-gravel lands. There are many large tracts, which come under the denomination of mosses, and some stiff, but not obdurate clay lands. Lancaster is divided into six hundreds, which contain sixty-three parishes, and twenty-seven market towns. It contains about 1,150,000 acres of land, and in 1800 it had 672,730 inhabitants, of whom more than 160,000 were men capable of bearing arms. The towns are Lancaster, Liverpool, Preston, Wigan, Newton, Clithero, all which are boroughs, and send two members each to the British parliament, making, with two for the country, fourteen in the whole; other towns are Manchester, Blackburn, Bolton, Burnley, Bury, Cartmel, Chorley, Colne, Dalton, Garstang, Haslingden, Hawkshead, Kirkham, Leigh, Ormskirk, Poulton, Prescott, Rochdale, Ulverstone, and Warrington. The principal rivers are the Lon or Lune, Ribble, Mersey, Weaver, and Irwell.

LANCASHIRE *Asphodel*, in botany. See NARTHRECIUM.

LANCASTER, the county town of Lancashire, with a market on Saturday. It is governed by a mayor; sends two members to parliament; and is seated on the Lon, which here forms a port for vessels of moderate burden, and over which is a stone bridge of five arches. It has but one church, on the side of a hill, on the summit of which is the castle, serving both as the shire-house and the county-gaol. On the top of this castle is a square tower, called John of Gaunt's Chair, whence there is a fine prospect of the mountains of Cumberland, and the view toward the sea, extending to the Isle of Man. Five miles from this place is Dunald-Mill-Hole, a cave at the foot of a mountain, into which a large brook runs, after it has driven a mill near its entrance. Some of its vaults are so high that they resemble the roof of a church, and in other parts so low, that they can be passed only by creeping on the hands and feet. Lancaster has about 1600 inhabited houses, and rather more than 9,000 inhabitants, about one-fifth of whom are entitled to vote for the Borough representatives. This town carries on a considerable trade, especially to the West Indies; and is noted for the making of mahogany cabinet ware. It is 68 miles S. of Carlisle, and 235 NNW. of London. Lon. 2. 56. W. Lat. 54. 4. N.

LANCASTER, a county of Pennsylvania, 41 miles long and 40 broad. In 1790, it contained 36,147 inhabitants.

LAN

LANCASTER, the capital of a county of the same name, in Pennsylvania. Beside its churches, and other public buildings, it contains a college founded in 1787, and named Franklin college, after the late Dr. Franklin. It is a place of considerable trade, seated on the Conestogo Creek, near the river Susquehannah, 66 miles W. by N. of Philadelphia. Lon. 76. 17. W. Lat. 40. 2. N.

LANCE. *s.* (*lance*, French; *lancea*, Latin.) A long spear (*Sidney*).

To LANCE. *v. a.* (from the noun.) 1. To pierce; to cut (*Shakspeare*). 2. To open chirurgically; to cut in order to cure (*Dryden*).

LANCE, in Ichthyology. See **LAUNCE**.

LANCE-WOOD, in botany. See **CABBAGE-TREE**.

LA'NCELY. *a.* (from *lance*.) Suitable to a lance; not in use (*Sidney*).

LANCEOLATE LEAF. In botany. Oblongum utrinque sensim versus extremitatem attenuatum. Oblong, and gradually tapering towards each extremity: like the head of a lance.—Exemplified in *Plantago lanceolata*.—Some call it spear-shaped, others lance-shaped or lanced; but lanceolate appears in all respects preferable.—It is applied also to the *Stipule*, *Bracte*, and *Perianth*.

Lanceolate-ovate leaf; partaking of both forms, or between both; but inclining more to the latter. An ovate lanceolate leaf, on the contrary, would incline more to the lanceolate. This is a general rule with respect to these compound words.

LANCEPE'SADÉ. *s.* (*lance spezzate*, Fr.) The officer under the corporal (*Cleveland*).

LANCEROTA, one of the Canary Isles, about 15 miles long and 10 broad. It is very high, and may be discovered at a great distance. Long. 13. 26. W. Lat. 29. 14. N.

LA'NCET. *s.* (*lancette*, French.) A small pointed surgical instrument. See **SURGERY**.

To LAUNCH. *v. n.* (*lancer*, French. This word is too often written *launch*.) To dart; to cast as a lance; to throw; to let fly (*Pope*).

LANCH, or **LAUNCH**, a peculiar sort of long-boat, used by the French, Spanish, and Italian shipping, and in general by those of other European nations when employed in voyaging in the Mediterranean sea. A launch is proportionably longer, lower, and more flat-bottomed than the long-boat; it is by consequence less fit for sailing, but better calculated for rowing and approaching a flat shore. Its principal superiority to the long-boat, however, consists in being by its construction much fitter to under-run the cable, which is a very necessary employment in the harbours of the Levant sea, where the cables of different ships are fastened across each other, and frequently render this exercise extremely necessary.

LANCH, is also the movement by which a

LAN

ship or boat descends from the shore, either when she is at first built, or at any time afterwards.

LANCIANO, a town of Naples, in Abruzzo Citeriore, with an archbishop's see. It is famous for its fairs in July and August; and is seated on the Feltrino, 87 miles N. E. of Naples. Long. 14. 50. E. Lat. 42. 18. N.

LANCINATION. *s.* (from *lancino*, Latin.) Tearing; laceration.

To LANCINATE. *v. a.* (*lancino*, Latin.) To tear; to rend; to lacerate.

LAND. *s.* (*land*, Saxon.) 1. A country; a region, distinct from other countries (*Spenser*). 2. Earth, distinct from water (*Abbot*). 3. Ground; surface of the place (*Locke*). 4. An estate real and immoveable (*Knolles*). 5. Nation; people (*Dryden*). 6. Urine. An old word (*Shakspeare*).

To LAND. *v. a.* (from the noun.) To set on shore (*Dryden*).

To LAND. *v. n.* To come to shore (*Bac.*)

LAND, *Flooding*. See **IRRIGATION** and **HUSBANDRY**.

LAND, in the sea-language, makes part of several compound terms; thus, *land-laid*, or, to lay the land, is just to lose sight of it. *Land-locked*, is when land lies all round the ship, so that no point of the compass is open to the sea. If she is at anchor in such a place, she is said to ride *land-locked*, and is therefore concluded to ride safe from the violence of the winds and tides. *Land-mark*, any mountain, rock, steeple, tree, &c. that may serve to make the land known at sea. *Land is shut in*, a term used to signify that another point of land hinders the sight of that from which the ship came. *Land-to*, or the ship lies *land-to*; that is, she is so far from shore, that it can only just be discerned. *Land-turn* is a wind that in almost all hot countries blows at certain times from the shore in the night. To set the land; that is, to see by the compass how it bears.

LAND-TAX, one of the annual taxes raised upon the subject. See **TAX**. The land-tax, in its modern shape, has superseded all the former methods of rating either property, or persons in respect of their property, whether by tenths or fifteenths, subsidies on land, hydages, scutages, or talliages. Many of the ancient levies were in the nature of a modern land-tax; for we may trace the original of that charge as high as to the introduction of our military tenures; when every tenant of a knight's fee was bound, if called upon, to attend the king in his army for forty days in every year. In lieu of this personal attendance, a pecuniary satisfaction came to be levied by assessments, at so much for every knight's fee, under the name of scutages. See **ES. DAGE**. Of the same nature with these were the assessments of hydag or hidag upon all other lands, and of talliage upon cities and boroughs. But they induse, upon the introduction of subsidies, about the time of king Richard II. and

L A N D.

king Henry IV. See *SUESBOR.* In lieu of subsidies, which were usually raised by commissioners appointed by the crown, or the great officers of state, the parliament, in the beginning of the civil wars, introduced the practice of laying weekly and monthly assessments of a specific sum upon the several counties of the kingdom, to be levied by a pound rate on lands and personal estates, which were occasionally continued during the whole usurpation, sometimes at the rate of 120,000*l.* a month, sometimes at inferior rates. After the Restoration, the ancient method of granting subsidies, instead of these monthly assessments, was twice, and twice only renewed, viz. in 1663, when four subsidies were granted by the laity, and four by the clergy; and in 1670, when 800,000*l.* was raised by way of subsidy, which was the last time of raising supplies in this manner. The monthly assessments being established by custom, raised by commissioners named by parliament, and producing a more certain revenue, subsidies were discontinued, and occasional assessments granted, as emergencies required. These periodical assessments, the subsidies which preceded them, and the more ancient scutage, hydragage, and talliage, says Judge Blackstone, were to all intents and purposes a land-tax; and the assessments were sometimes expressly called so. However, in the year 1692, a new assessment or valuation of estates was made throughout the kingdom, which, though by no means a perfect one, had this effect, that a supply of 500,000*l.* was equal to 1*l.* in the pound of the value of the estates given in. And, according to this enhanced valuation, from the year 1693 to the present, the land-tax has continued an annual charge upon the subject; above half the time at 4*s.* in the pound, sometimes at 3*s.*: sometimes at 2*s.*: twice, viz. in 1732 and 1733, at 1*s.* but without any total intermission. The medium has been 3*s.* 3*d.* in the pound, being equivalent to 23 ancient subsidies, and amounting annually to more than a million and a half of money. The different rates, at various periods, are stated below.

In 1698 and 1699,	at 3 <i>s.</i>
1700,	at 2 <i>s.</i>
1701,	at 3 <i>s.</i>
1702 to 1712,	at 4 <i>s.</i>
1713 to 1715,	at 2 <i>s.</i>
1716,	at 4 <i>s.</i>
1717 to 1721,	at 3 <i>s.</i>
1722 to 1726,	at 2 <i>s.</i>
1727,	at 4 <i>s.</i>
1728 and 1729,	at 3 <i>s.</i>
1730 and 1731,	at 2 <i>s.</i>
1732 and 1733,	at 1 <i>s.</i>
1734 to 1739,	at 2 <i>s.</i>
1740 to 1749,	at 4 <i>s.</i>
1750 to 1752,	at 3 <i>s.</i>
1753 to 1755,	at 2 <i>s.</i>
1756 to 1766,	at 4 <i>s.</i>

In 1767 to 1770,	at 3 <i>s.</i>
1771,	at 4 <i>s.</i>
1772 to 1775,	at 3 <i>s.</i>
1776 to 1798,	at 4 <i>s.</i>

The sums to be raised at 4*s.* in the pound were stated, in the annual act, at 1,989,673*l.* 7*s.* 10*d.* for England, and 47,954*l.* 1*s.* 2*d.* for Scotland, making together 2,037,627*l.* 9*s.* 0*d.*; and upon credit of this assessment 2,000,000*l.* was annually borrowed of the Bank in anticipation of the tax, for which sum exchequer-bills were given them, which were to be discharged out of the produce of the tax as it came in; but the full amount of the assessment was seldom, if ever, collected, so that the nett payments into the exchequer always fell short of the sum borrowed on the credit thereof, exclusive of interest on the bills; and the deficiency was made good out of the supplies for the next year.

In 1798, the current value of the public funds having been unusually depressed for some time past, and apprehensions being entertained that the further increase of the funded debt would be attended with peculiar inconvenience, unless some mode was discovered of counteracting its effects, a project was adopted of offering the land-tax for redemption or sale. With this view an act was passed, making the land-tax a perpetual tax, from 25th of March, 1799; and being thus converted into a permanent annuity, it was offered for sale to the proprietors of the lands upon which it was charged; or if they declined it, to any other person who chose to become a purchaser. In the first case it was considered as a redemption of the tax, the estate becoming in future wholly freed from it; in the latter case the purchaser became entitled to receive the land-tax regularly from the receiver-general, half-yearly, on the 16th of March and 20th of September, in every year. The consideration to be given in either case was not to be in money, but stock, either in the three per cent. consols, or three per cent. reduced, to be transferred to the commissioners for the reduction of the national debt. The quantity of stock to be transferred for redemption of the tax by persons interested in the land on which it was charged, was so much capital as yielded an annuity or dividend exceeding the amount of the tax to be redeemed by one-tenth part thereof; and the stock to be transferred for purchase of the tax by persons not interested in the land, was so much capital as yielded an annuity or dividend exceeding the tax to be purchased by one-fifth part thereof. Thus the amount of three per cent. stock to be transferred for 10*l.* per annum tax was 366*l.* 13*s.* 4*d.* for redemption, or 400*l.* for purchase.

This scheme was adopted with the view of facilitating the raising of money on loan, by absorbing a large quantity of floating

stock, and thus raising the current price; while at the same time it would be attended with an increase of revenue. This at least was the avowed object of the measure, which it was estimated would be the means of redeeming or taking out of the market about 80,000,000*l.* of stock; the advantages offered by it were, however, by no means such as to induce a general approval of it, many persons subject to the tax declined redeeming it, and but few were inclined to become purchasers. The period first limited was several times extended, but the plan succeeded very imperfectly, and on the first of February, 1803, the total amount of three per cent. stock, which had been transferred for the redemption of land-tax, was only 21,794,307*l.* 17*s.* 3*d.*

LANDAFF, a small place in Glamorganshire, but honoured with the appellation of a city, on account of its being an episcopal see. It is seated on an ascent, on the river Taafé, near Cardiff; but the cathedral, a large stately building, stands on low ground. It is 30 miles N.W. of Bristol, and 166 W. of London. Lon. 8. 10. W. Lat. 51. 24. N.

LANDAU, a strong town of Germany, in the palatinate of the Rhine. It was formerly imperial, but was ceded to the French in 1648. It sustained a severe bombardment by the allies, in 1793; but they were compelled to raise the siege. It is seated on the Queich, nine miles S. by E. of Neustadt, and 270 E. of Paris. Lon. 8. 10. E. Lat. 49. 12. N.

LANDAU, a town of Germany, in the circle of Upper Rhine, 12 miles N. of Waldeck, and 34 S.S.E. of Paderborn.

LANDED. a. (from *land*.) Having a fortune in land (*Shakspeare*).

LANDEN, a town of Austrian Brabant, famous for a battle gained by the French, over the allies, July 29, 1693, and for a battle fought March 18, 1793, between the Austrians and French, by which the latter were compelled to evacuate the Austrian Netherlands. Landen is seated on the Becke, 17 miles N.W. of Huy, and 18 N.E. of Namur. Lon. 5. 5. E. Lat. 52. 41. N. See **NEERWINDEN**.

LANDEN (John), an eminent mathematician, was born at Peakirk, near Peterborough in Northamptonshire, in January 1719. He became very early a proficient in the mathematics, for we find him a very respectable contributor to the *Ladies Diary* in 1741; and he was soon among the foremost of those who then contributed to the support of that small but valuable publication, in which almost every English mathematician who has arrived at any degree of eminence for the best part of this century, has contended for fame at one time or other of his life. Mr. Landen continued his contributions to it at times, under various signatures, till within a few years of his death.

It has been frequently observed, that the histories of literary men consist chiefly of the history of their writings; and the observation was never more fully verified, than in the present

article concerning Mr. Landen. All that we have to relate in the way of event, is that Mr. Landen lived in the earlier part of his life, as a farmer, at the village of Walton, near Peterborough; where also, he gave instructions in mathematics, to young men in the neighbourhood: among those whom he thus assisted with his instruction and advice, were Mr. Thomas Bosworth, afterwards master of the Charity School at Peterborough, and Mr. Richard Weston, afterwards for many years master of a large boarding-school at Yaxley; both of them respectable mathematicians. From Walton, Mr. Landen removed about 1762 to Milton, the seat of earl Fitzwilliam, to undertake the business of land steward to that amiable nobleman, in this situation he remained till within a year or two of his death.

In the 48th volume of the *Philosophical Transactions*, for the year 1754, Mr. Landen gave "An Investigation of some theorems which suggest several very remarkable properties of the Circle, and are at the same time of considerable use in resolving Fractions, the denominators of which are certain Multinomials, into more simple ones, and by that means facilitate the computation of Fluents." This ingenious paper was delivered to the Society by that eminent mathematician Mr. Thomas Simpson of Woolwich, a circumstance which will convey to those who are not themselves judges of it, some idea of its merit.

In the year 1755, he published a volume of about 160 pages, intitled *Mathematical Lucubrations*. The title to this publication was made choice of, as a means of informing the world, that the study of the mathematics was at that time rather the pursuit of his leisure hours than his principal employment: and indeed it continued to be so, during the greatest part of his life. These *Lucubrations* contain a variety of tracts relative to the rectification of curve lines, the summation of series, the seeing of fluents, and many other points in the higher parts of the mathematics. About the latter end of the year 1757, or the beginning of 1758, he published proposals for printing by subscription "The Residual Analysis, a new branch of the Algebraic art:" and in 1758 he published a small tract in quarto, entitled "A Discourse on the Residual Analysis," in which he resolved a variety of problems, to which the method of fluxions had been usually applied, by a mode of reasoning entirely new; compared those solutions with solutions of the same problems, investigated by the fluxionary method; and showed that the solutions by his new method were, in general, more natural and elegant than the fluxionary ones.

In the 51st volume of the *Philosophical Transactions*, for the year 1760, he gave "A new method of computing the sums of a great number of infinite series." This paper was also presented to the society by his ingenious friend the late Mr. Thomas Simpson. In 1761, he published the first book of "The Residual Analysis," in a 4to. volume of 218 pages, with several copper-plates. In this treatise, besides explaining the principles which his new analysis was founded on, he applied it to drawing tangents and finding the properties of curve-lines; to describing their involutes and evolutes, finding the radius of curvature, their greatest and least ordinates, and points of contrary flexure; to the determin-

L A N D E N.

nation of the curves, and the drawing of asymptotes; and he proposed in a second book to extend the application of this new analysis to a great variety of mechanical and physical subjects. The papers which were to have formed this book lay long by him; but he never found leisure to put them in order for the press.

On the 16th of January 1766, Mr. Landen was elected a fellow of the Royal Society, and admitted on the 24th of April following. In the 58th volume of the Philosophical Transactions, for the year 1768, he gave a "Specimen of a new method of comparing curvilinear areas: by means of which many areas did not appear to be comparable by any other method;" a circumstance of no small importance in that part of natural philosophy which relates to the doctrine of motion. In the 60th volume of the same work, for the year 1770, he gave "Some new theorems for computing the whole areas of curve-lines, where the ordinates are expressed by fractions of a certain form," in a more concise and elegant manner than had been done by Cotes, De Moivre, and others who had considered the subject before him. In the 61st volume, for 1771, he has investigated several new and useful theorems for computing certain fluents, which are assignable by arcs of the conic sections. This subject had been considered before both by Mr. Maclaurin and Mr. D'Alembert; but some of the theorems which were given by these celebrated mathematicians, being in part expressed by the difference between an arc of an hyperbola and its tangent, and that difference being not directly attainable when the arc and its tangent both become infinite, as they will do when the whole fluent is wanted, although such fluent be finite, these theorems therefore fail in those cases, and the computation becomes impracticable without farther help. This defect Mr. Landen has removed by assigning the limit of the difference between the hyperbolic arc and its tangent, while the point of contact is supposed to be removed to an infinite distance from the vertex of the curve. And he concludes the paper with a curious and remarkable property relating to pendulous bodies, which is deducible from those theorems. In the same year he published "Animadversions on Dr Stewart's computation of the sun's distance from the earth;" a clever pamphlet, but couched in far more acrimonious and scornful language than any man ought to employ when writing against so excellent a geometer as Dr. Stewart.

In the 60th volume of the Philosophical Transactions, for 1771, he gave the investigation of a general theorem, which he had promised in 1771, for finding the length of any arc of a conic hyperbola by means of two elliptic arcs; and observes, that by the theorems there investigated, both the elastic curve and the curve of equal recess from a given point, may be constructed on those cases where Mr. Maclaurin's elegant method fails. In the 67th volume, for 1777, he gave "A new theory of the motion of bodies revolving about an axis in free space, when that motion is disturbed by some extraneous force, either percussive or accelerative." At this time he did not know that the subject had been handled by any person before him; and he considered only the motion of a sphere's spheroid and cylinder. The publication of this paper, however, was the cause of his being told, that the doctrine of rotatory motion had been considered by M.

D'Alembert; and purchasing that author's *Opusculæ Mathematicæ*, he there learned that M. D'Alembert was not the only one who had considered the matter before him; for M. D'Alembert there speaks of some mathematician, though he does not mention his name, who, after reading what had been written on the subject, doubted whether there be any solid whatever, outside the sphere, in which any line, passing through its centre of gravity, will be a permanent axis of rotation. In consequence of this, Mr. Landen took up the subject again; and though he did not then give a solution to the general problem, viz "To determine the motions of a body of any form whatever, revolving without restraint about any axis passing through its centre of gravity," he fully removed every doubt of the kind which had been started by the person alluded to by M. D'Alembert, and pointed out several bodies, which, under certain dimensions, have that remarkable property. This paper is given, among many others equally curious, in a volume of *Memoirs* which he published in the year 1780. But what renders that volume yet more valuable, is a very extensive appendix, containing "Theorems for the calculation of fluents." The tables which contain these theorems are more complete and extensive than any which are to be found in any other author, and are chiefly of his own investigating; being such as had occurred to him in the course of a long and close application to mathematical studies in almost every branch of those sciences. In 1781, 1782, and 1783, he published three little tracts on the summation of converging series, in which he explained and showed the extent of some theorems which had been given for that purpose by M. de Moivre, Mr. Sterling, and his old friend Thomas Simpson, in answer to some things which he thought had been written to the disparagement of those excellent mathematicians. It was the opinion of some, that Mr. Landen did not show less mathematical skill in explaining and illustrating these theorems, than he has done in his writings on original subjects; and that the authors of them were as little aware of the extent of their own theorems as the rest of the world were, before Mr. Landen's ingenuity made it obvious to all. At this period, too, he was engaged in a controversy with Dr. Henry Clarke, in consequence of that gentleman's publishing a translation of Longna's Treatise on the Summation of Series. This controversy was conducted with much talent, but far too much warmth and anger on both sides. The pamphlets, however, are nearly forgotten; and the world has yet to learn that the terms of mathematics and those of Billingsgate, are convertible, and admit of mutual substitution.

About the beginning of the year 1782, Mr. Landen had made such improvements of his theory of rotatory motion, as enabled him, he thought, to give a solution of the general problem specified above; but finding the result of it to differ very materially from the result of the solution which had been given of it by M. D'Alembert, and being not able to see clearly where that gentleman had erred, he did not venture to make his own solution public. In the course of that year, having procured the *Memoirs* of the Berlin Academy for 1757, which contain M. Euler's solution of the problem, he found that this gentleman's solution gave the same result as had been deduced by M. D'Alembert; but the perspicuity of M. Euler's manner

of writing enabled him to discover where he had erred, which the obscurity of the other did not permit. The agreement, however, of two writers of such established reputation as M. Euler and M. D'Alembert, made him long dubious of the truth of his own solution, and induced him to revise the process again and again with the utmost circumspection; and being every time more convinced that his own solution was right and theirs wrong, he at length gave it to the public in the 75th volume of the *Philosophical Transactions*, for 1785.

The extreme difficulty of the subject, joined to the concise manner in which Mr. Landen had been obliged to give his solution, in order to confine it within proper limits for the *Transactions*, rendered it too difficult, or at least too laborious a piece of business for most mathematicians to read it; and this circumstance, joined to the established reputation of Euler, induced many to think that his solution was right and Mr. Landen's wrong; and there did not want attempts to prove it. But notwithstanding these attempts were manifestly wrong, and that every one who perused them saw it, they convinced Mr. Landen that there was a necessity for giving his solution at greater length, in order to render it more generally understood. About this time also he met by chance with the late P. Frisi's *Cosmographie Physico-mathematicæ*; in the second part of which there is a solution of this problem, agreeing in the result with those of M. Euler and D'Alembert, which is not surprising, as P. Frisi employs the same principle that they did. Here Mr. Landen learned that M. Euler had revised the solution which he had given formerly in the *Berlin Memoirs*, and given it another form and at greater length in a volume published at Gryphiswell in 1765, entitled, *Theoria Motus corporum solidorum seu rigidorum*. Having therefore procured this book, Mr. Landen found the same principles employed in it, and of course the same conclusion resulting from them that he had found in M. Euler's former solution of the problems: but as the reasoning was given at greater length, he was enabled to see more distinctly how M. Euler had been led into the mistake, and to set that mistake in a stronger point of view. As he had been convinced of the necessity of explaining his ideas on the subject more fully, so he now found it necessary to lose no time in setting about it. He had for several years been severely afflicted with the stone in the bladder, and toward the latter part of his life to such a degree as to be confined to his bed for more than a month at a time; yet even this dreadful disorder did not very materially abate his ardour for mathematical studies; for the second volume of his *Memoirs* was written and revised during the intervals of his disorder. This volume, beside a solution of the general problem concerning rotatory motion, contains the resolution of the problem concerning the motion of a top; an investigation of the motion of the equinoxes, in which Mr. Landen was first of any one pointed out the cause of Sir Isaac Newton's mistake in his solution of this celebrated problem; and some other papers of considerable importance. He just lived to see this work finished, and received a copy of it the day before his death, which happened on the 15th of January 1790, at Milton, near Peterborough, in the 71st year of his age.

As a mathematician Mr. Landen stands far

above all praise: his talents were of the first order, and his application almost unequalled. Yet, he was far from an elegant writer: he often failed in perspicuity, and always in regard for those who had to learn. His contempt for those who knew less than himself was excessive, disgusting, and surely unreasonable: for had the talents or genius of all mathematicians been equal to his, he could have attained no relative eminence, no distinction; and without that distinction his contempt would have had no sustentacle on which to erect itself. He had too an awkward knack at stabbing the reputation of others with notes of admiration, in this manner:

"Emerson blundered here!"

"What a goose was Heath to fall into such a mistake!"

"Mr. Emerson has touched upon this subject; but his reasoning thereon is false!"

"This proposition and Leonhard Euler's 11th problem, &c. are to the same purport, but our conclusions are very different!"

"Mr. Euler, without any explanatory reasoning! without any regard to the inclinations of the two planes with respect to the centre of gravity of the body!" &c.

"The errors here noticed Mr. Euler has repeated in his 13th and 15th problems!"

"His general theory is most egregiously erroneous!"

"That" he "should err so greatly, and so repeatedly, I must say, seems very extraordinary!"

Such are the rhetorical beauties which Mr. Landen scatters in almost every page. Notwithstanding all this, however, we are inclined to believe that Euler will be remembered as long as Mr. Landen.—His manners in private life were very consistent with these specimens: insomuch that the strange contrast of his haughty and assuming airs, with the urbanity, mildness, and benevolence of his noble employer, would cause the villagers to exclaim as they passed together, "There goes Lord Landen and Mr. Fitzwilliam."

Mr. Landen left one daughter, who is now, we believe, living in the neighbourhood of Peterborough. His manuscripts, we are sorry to say, for many of them doubtless were valuable, were sold to the cheesemongers and tallow-chandlers of that city, and thence distributed among the inhabitants, in a very different manner from any which the author had in contemplation.

LA'NDFALL. *s.* (land and fall.) A sudden translation of property in land by the death of a rich man.

LA'NDFLOOD. *s.* (land and flood.) Inundation (Clarendon).

LA'ND-FORCES. *s.* (land and forces.) Warlike powers not naval; soldiers that serve on land (Temple).

LANDGRAVE (formed of the German land, "earth," and graff or grave, "judge" or "count"), a name formerly given to those who executed justice in behalf of the emperors, with regard to the internal policy of the country. The title does not seem to have been used before the 11th century. These judges were first appointed within a certain district of Germany: in process of time the title became hereditary, and these judges assumed the sovereignty of the so-

veral districts or countries over which they presided. Landgrave is now applied by way of eminence to those sovereign princes of the empire who possess, by inheritance, certain estates called *landgraves*, and of which they receive the investiture of the emperor. There are four princes who have this title, viz. those of Thuringia, Hessa, Alsace, and Leuchtenberg. There are also other landgraves who are not princes, but counts of the empire. See *COUNT*.

LANDGUARD FORT, a fort of England, situated on a point of land, at the south-east extremity of the county of Suffolk, at the mouth of the rivers Orwell and Stour, opposite Harwich, and furnished with a garrison, under the command of a governor, and a platform of guns, to defend the coast.

LANDHOLDER. *s.* (*land and hold.*) One who holds land (*Locke*).

LANDJOBBER. *s.* (*land and job.*) One who buys and sells lands for other men (*Swift*).

LANDING. } *s.* (*from land.*) The

LANDING-PLACE. } top of stairs (*Add.*)

LANDLADY. *s.* (*land and lady.*) 1. A woman who has tenants holding from her. 2. The mistress of an inn (*Swift*).

LANDLESS. *a.* (*from land.*) Without property; without fortune (*Shakspeare*).

LANDLOCKED. *a.* (*land and lock.*) Shut in, or enclosed with land (*Addison*).

LANDLOPER. *s.* (*land and loopen*, Dutch.) A landman; a term of reproach used by seamen of those who pass their lives on shore.

LANDLORD. *s.* (*land and lord.*) 1. One who owns lands or houses, and has tenants under him (*Spenser*). 2. The master of an inn (*Addison*).

LANDMARK. *s.* (*land and mark.*) Any thing set up to preserve boundaries (*Dry.*)

LANDRECY, a town of France, in the department of the North, and late province of Hainault. It was besieged in vain by prince Eugene, in 1712. It was taken by the allies in April 1794; but retaken in July following. It is seated on the Sambre, 18 miles S.W. of Maubeuge, and 100 N. by E. of Paris. E. long. 3. 47. N. lat. 50. 7.

LANDSCAPE, in painting, the view or prospect of a country extended as far as the eye will reach. See *PAINTING* and *DRAWING*.

LANDSCROON, a sea-port town of Sweden, in South-Gothland, and territory of Schonen, seated on the Baltic Sea, within the Sound, 23 miles north of Copenhagen. E. lon. 12. 46. N. lat. 55. 52.

LANDSDOWN, a place in Somersetshire, near Bath, with a fair on October 10th for cattle and cheese.

LAND'S-END, a promontory of Cornwall, the most westerly point of Great Britain. According to the *Requisite Tables*, the Lon. is 5. 15. W. Lat. 49. 57. 30. N.

LANDSHUT, a strong town of Germany, in Lower Bavaria, with a strong castle on an adjacent hill. It is seated on the river

Iser, in E. lon. 1. 15. N. lat. 48. 23. There is another small town of the same name in Silesia, and in the duchy of Schweidnitz, seated on the river Zieder, which falls into the Banber: and there is also another in Moravia, seated on the river Morave, on the confines of Hungary and Austria.

LAND-WAITER. *s.* (*land and waiter.*) An officer of the customs, who is to watch what goods are landed (*Swift*).

LANDWARD. *ad.* (*from land.*) Toward the land (*Sandys*).

LANE. *s.* (*laen*, Dutch.) 1. A narrow way between hedges (*Locke*). 2. A narrow street; an alley (*Sprat*). 3. A passage between men standing on each side (*Bacon*).

LANERK, a town of Scotland, which gives name to the county, situated on the north-east side of the Clyde; near it are some celebrated falls, or cataracts, in that river, which, especially in rainy seasons, form a tremendous appearance. Here the brave Wallace first meditated to revenge the wrongs of his country, and slew the governor, who was a wan of rank. In the neighbourhood are some of the greatest cotton manufactures of Scotland: 19 miles S.E. Glasgow. Long. 3. 49. W. Lat. 55. 43. N.

LANERKSHIRE, a county of Scotland, bounded on the north by Dumbartonshire, on the north-east by Selkirkshire, Linlithgowshire, and Edinburghshire; on the east by Peebleshire, on the south by Dumfriesshire, on the south-west by Ayrshire, and on the west, toward the north, by the Clyde; 40 miles long, and about 22 in its mean breadth. Its form has been fancifully compared to that of a vine-leaf; the mouth of the Clyde supposed to represent the stem, the course of that river the middle vein, and the lesser streams its collateral branches. The river Clyde, descending from the southern part of this county, divides it into two equal parts, the one called the Shire of Lanerk, and the other the Barony of Glasgow; the one hilly, heathy, and fit for pasture; and the other level, and proper for corn. The principal rivers, all of which rise on the same hill, are the Clyde and the Annan, both of which run into the Irish Sea; also, the Tweed, which falls into the German Ocean: besides which, the Frith of Clyde is joined to the Frith of Forth by a canal, for the benefit of navigation and trade. It abounds with coal and limestone; has some lead mines, and abundance of lapis lazuli is dug up here. The chief towns are Glasgow, Hamilton, Lanerk, and Rutherglen. The population, in 1801, amounted to 147,796.

LANFRANC, archbishop of Canterbury, was born at Pavia, and studied at Bologna, after which he went to France, where he retired to the abbey of Bec, of which he was elected prior in 1044. William, duke of Normandy, made him abbot of St. Stephen, at Caen; and when he conquered

LAN

England, preferred him to the see of Canterbury. In 1011, he went to Rome, to receive the pallium from the pope; but it must be observed, to his honour, that he stoutly resisted the authority of Gregory VII. who repeatedly cited him to Rome, to answer the charge of heresy brought against him. He rebuilt the cathedral of Canterbury, and founded several other churches and hospitals. He died in 1089. He wrote a book against Berenger, and other works, which were collected into a volume, in 1647.

LANGANICO, or **SUNRI**, anciently **OLYMPIA**, a town of European Turkey, in the Morea, situated on a small river called Carbon, the ancient Alpheus. This was once a city of great note, near which, on the Olympian plain, were celebrated the games so called, which were first instituted by Pelops, in honour of Jupiter, and afterwards revived by Atreus and Hercules. They were held every fifth year, with great solemnity, amidst an infinite number of spectators, and lasted for five whole days together. From these spectacles, the computation of time in Greece, by Olympiads, took its rise. In this city, also, was a very fine temple of Jupiter Olympus, with a celebrated image of that god, fifty ells high, which was reckoned one of the seven wonders of the world. It is 32 miles S. E. of Chiarenza, and 60 S. W. of Corinth.

LANGBAINE (Gerrard), a learned English divine, was born in Westmoreland, about 1608, and educated at Queen's college, Oxford, where he obtained a fellowship, and proceeded to the degree of D. D. He printed an edition of Longinus at Oxford, in 1636, and several other learned works afterwards. In 1645, he was chosen provost of his college, which, with the office of keeper of the archives, he held to his death in 1657. He was held in great esteem by Selden, Usher, and other eminent scholars of that period.

LANGELAND, an island of Denmark, in the strait called the Great Belt. It is 33 miles long, but scarcely five in breadth, and produces plenty of corn. The principal town is Rutcoping. Lon. 11. 0. E. Lat. 55. 4. N.

LANGELAND (Robert), a very old English poet, and one of the first disciples of Wicliffe. He distinguished himself by a curious poem, entitled, *The Visions of Pierce Plowman*, written about 1369, intended as a satire on almost every description of men, but especially the clergy. It is written in blank verse, with considerable force and humour, and in an alliterative measure.

LANGENTHAL, a town of Switzerland, in the canton of Berne. Here are three great annual fairs, at which great quantities of linen, as also cattle, cheese, and grain, are sold. Near the town are some medicinal springs. It is 10 miles E. of Soleure, and 12 N. E. of Berne.

LAN

LANGHORNE (Dr. John), an ingenious English divine and poet, was born at Kirby Steven, in Westmoreland, and on entering into orders became tutor to the sons of a Lincolnshire gentleman, whose daughter he married. He held the living of Blagden, in Somersetshire, and was besides a justice of the peace at the time of his death, which happened in 1779. He published, 1. *Rogus*, in 2 vols. 12mo.; 2. *Theodosius and Constantia*, 2 vols. 12mo.; 3. *Solyman and Almenna*, a tale; 4. *Frederic and Pharamond*, 12mo.; 5. *Sermons*, 2 vols.; 6. *Effusions of Fancy*, 2 vols.; 7. *Fables of Flora*, in verse; 8. A translation of Plutarch's *Lives*, of which a new edition has been lately published, by the Rev. F. Wrangham.

LANGIONE, a city, deemed by some the capital, of the kingdom of Laos, with a magnificent royal palace, seated on a small river, 140 miles S. E. of Ava. Lon. 101. 15. E. Lat. 21. 12. N.

LANGIUS (John), a physician of Silesia, was born in 1485, and took his degree at Pisa, after which he practised at Heidelberg, and became physician to four electors palatine. He died in 1565. He published at Basil, in 4to. 1554, *Medical Epistles*, which abound with curious matter, and are worth perusal.

LANGLEY (Batty), an English architect, who died in 1751. He published many useful practical books, as the *Builder's Jewel*; the *Builder's Price-Book*; and other works for masons, bricklayers, and carpenters.

LANGOGNE, a town of France, in the department of Lozere, 21 miles N. E. of Mende, and 33 W. of Privas. Lon. 3. 45. E. Lat. 44. 44. N.

LANGON, a town of France, in the department of Gironde. It is noted for excellent wine, and seated on the Garonne, 15 miles N. or Bazas. Lon. 0. 10. W. Lat. 44. 33. N.

LANGPORT, a town in Somersetshire, with a market on Saturday. It is seated on a hill, by the river Parret, which is navigable for barges to Bridgewater. It is 10 miles S. E. of Bridgewater, and 128 W. by S. of London. Lon. 3. 0. W. Lat. 51. 0. N.

LANGRES, an ancient town of France, in the department of Upper Marne, with a bishop's see. It is seated on a mountain, near the sources of the Marne, and its cutlery wares are in high esteem. This town is thought to stand the highest of any in France; and the prospect from the towers of the principal church is beyond conception. It is 35 miles N. E. of Dijon, and 100 S. by E. of Rheims. Lon. 5. 24. E. Lat. 47. 52. N.

LANGTON (Stephen), archbishop of Canterbury, was born in England, but educated at Paris. He was chancellor of Paris, cardinal of Rome, and made bishop of Canterbury by the pope, in opposition to king John and the clergy. John forbade Langton from entering his dominions, and banished the monks of Canterbury, for which the

L A N G U A G E.

kingdom was laid under the papal interdict. The king was afterwards particularly excommunicated, and his subjects absolved from their allegiance. He then found it necessary to make his submission, to receive the archbishop, and to restore the monks. Langton was a haughty prelate, wholly devoted to the papal chair; however, he was a man of great learning, and wrote several books, which we have not room to enumerate. He died in 1228.

LANGUAGE, in the proper sense of the word, signifies the expression of our ideas and their various relations by certain articulate sounds, which are used as the signs of those ideas and relations. By articulate sounds are meant those modulations of simple voice, or of sound emitted from the thorax, which are formed by means of the mouth and its several organs; the teeth, the tongue, the lips, and the palate. In a more general sense the word language is sometimes used to denote all sounds by which animals of any kind express their particular feelings and impulses in a manner that is intelligible to their own species.

Nature has endowed every animal with powers sufficient to make known all those of its sensations and desires, with which it is necessary, for the preservation of the individual or the continuance of the kind, that others of the same species should be acquainted. For this purpose, the organs of all vocal animals are so formed, as, upon any particular impulse, to utter sounds, of which those of the same species instinctively know the meaning. The summons of the hen is instantly obeyed by the whole brood of chickens; and in many others of the irrational tribes a similar mode of communication may be observed between the parents and the offspring, and between one animal and its customary associate. But it is not among animals of the same species only that these instinctive sounds are mutually understood. It is as necessary for animals to know the voices of their enemies as the voices of their friends; and the roaring of the lion is a sound of which, previous to all experience, every beast of the forest is naturally afraid. Between these animal voices and the language of men there is however very little analogy. Human language is capable of expressing ideas and notions, which there is every reason to believe that the brutal mind cannot conceive. "Speech," says Aristotle, "is made to indicate what is expedient and what is inexpedient, and in consequence of this what is just and unjust. It is therefore given to men; because it is peculiar to them that of good and evil, just and unjust, they only (with respect to other animals) possess a sense or feeling." The voices of brutes seem intended by nature to express, not distinct ideas or moral modes, but only such feelings as it is for the good of the species that they should have the power of making known; and in this, as in all other respects, these voices are analogous; not to our speaking, but to our weeping, laughing, sighing, groaning, screaming, and other natural and useful expressions of appetite and passion. Another difference between the language of men and the voices of brute animals consists in articulation, by which the former may be resolved into distinct elementary sounds or syllables, whereas the latter, being for the

most part unarticulated, is not capable of such a resolution. Hence Homer and Hesiod characterize man by the epithet *λογησάμενος*, or, "voice dividing;" as denoting a power peculiar to the human species: for though there are a few birds which utter sounds that may be divided into syllables, yet each of these birds utters but one such sound, which seems to be employed rather as notes of natural music than for the purpose of giving information to others; for when the bird is agitated, it utters cries which are very different, and have no articulation. A third difference between the language of men and the significant cries of brute animals, is, that the former is from art and the latter from nature. Every human language is learned by imitation, and is intelligible only to those who either inhabit the country where it is vernacular, or have been taught it by a master or by books: but the voices in question are not learned by imitation; and being wholly instinctive, they are intelligible to all the animals of that species by which they are uttered, though brought together from the most distant countries on earth. That a dog, which had never heard another bark, would notwithstanding bark himself, and that the barkings or yelps of a Lapland dog would be instinctively understood by the dogs of Spain, Calabria, or any other country, are facts which admit not of doubt: but there is no reason to imagine that a man who had never heard any language spoken would himself speak; and it is well known that the language spoken in one country is unintelligible to the natives of another country where a different language is spoken. Herodotus indeed records a fact which, could it be depended upon, would tend to overturn this reasoning, as it infers a natural relation between ideas and certain articulate sounds. He tells us, that Psammethichus, king of Egypt, in order to discover which was the oldest language, caused two children, newly born of poor parents, to be brought up by a shepherd among his cattle, with a strict injunction that they should never hear a human voice; and that at the end of two years the children pronounced at the same time the word *bread*, which in the Phrygian language signified bread. Either this is one of the many fables which that credulous historian collected among the Egyptians, or the conduct and reasoning of Psammethichus were very absurd; for it is added, that from this circumstance he inferred that the Phrygians were the most ancient people, and that they spoke the primitive language. The only rational purpose for which such an experiment could be instituted, would be to discover, not which is the oldest or the latest language, but whether there be such a thing as a language of nature or instinct: but in such a language it is obvious that there could be no word to denote bread, because in what is called the state of nature bread is unknown. The experiment of Psammethichus was probably never made; but in the woods of different countries solitary savages have at different times been caught, who, though they apparently possessed all the sagacity which is natural to man, and though their organs both of hearing and of speech were perfect, never used articulate sounds as signs of sensations or ideas. They uttered indeed the inarticulate cries which are instinctively expressive of pleasure and pain, of joy and sorrow, more distinctly and forcibly than men civilized; but with respect to the very rudiments of language, they were what Horace

LANGUAGE.

represents all mankind to have been originally, *mutin et turpe pecus*. Indeed it seems to be obvious that were there any instinctive language, the first word uttered by children would be the same; and that every child, whether born in the desert or in society, would understand the language of every other child, however educated or however neglected. Nay more, we may venture to affirm, that such a language, though its general use might, in society, be superseded by the prevailing dialect of art, could never be wholly lost; and that no man of one country would find it difficult, far less impossible, to communicate the knowledge of his natural and most pressing wants to the men of any other country, whether barbarous or civilized. The exercise of cultivated reason, and the arts of civil life, have indeed eradicated many of our original instincts, but they have not eradicated them all (See INSTINCT). There are external indications of the internal feelings and desires, which appear in the most polished society, and which are confessedly instinctive. The passions, emotions, sensations, and appetites, are naturally expressed in the countenance by characters which the savage and the courtier can read with equal readiness. The look serene, the smoothed brow, the dimpled smile, and the glistening eye, denote equanimity and good will in terms which no man mistakes. The contracted brow, the glaring eye, the sullen gloom, and the threatening air, denote rage, indignation, and defiance, as plainly and forcibly as revilings or imprecations. To teach men to disguise these instinctive indications of their temper, and

“ To carry smiles and sunshine in their face,
“ When discontent sits heavy at their heart,”

constitutes a great part of modern and refined education. Yet in spite of every effort of the utmost skill, and of every motive resulting from interest, the most consummate hypocrite, or the most hackneyed politician, is not always able to prevent his real disposition from becoming apparent in his countenance. He may indeed, by long practice, have acquired a very great command both over his temper and over the instinctive signs of it, but at times nature will predominate over art, and a sudden and violent passion will flash in his face, so as to be visible to the eye of every beholder. If these observations be just, and we flatter ourselves with the belief that no man will call them in question, it seems to follow, that, if mankind were prompted by instinct to use articulate sounds as indications of their passions, affections, sensations, and ideas, the language of nature could never be wholly forgotten, and that it would sometimes predominate over the language of art. Groans, sighs, and some inarticulate lively sounds, are naturally expressive of pain and pleasure, and equally intelligible to all mankind. The occasional use of these no art can wholly banish; and if there were articulate sounds naturally expressive of the same feelings, it is not conceivable that art or education could banish the use of them, merely because by the organs of the mouth they are broken into parts and resolvable into syllables.

It being thus evident that there is no instinctive articulated language, it has become an inquiry of some importance, how mankind were first induced to fabricate articulate sounds, and to employ them for the purpose of communicating their thoughts. Children learn to speak

by insensible imitation; and when advanced some years in life, they study foreign languages under proper instructors: but the first men had no speakers to imitate, and no formed language to study; by what means then did they learn to speak? On this question only two opinions can possibly be formed. Either language must have been originally revealed from heaven, or it must be the fruit of human industry. The greater part of Jews and Christians, and even some of the wisest pagans, have embraced the former opinion; which seems to be supported by the authority of Moses, who represents the Supreme Being as teaching our first parents the names of animals. The latter opinion is held by Diodorus Siculus, Lucretius, Horace, and many other Greek and Roman writers, who consider language as one of the arts invented by man. The first men, say they, lived for some time in woods and caves, after the manner of beasts, uttering only confused and indistinct noises; till, associating for mutual assistance, they came by degrees to use articulate sounds, mutually agreed upon for the arbitrary signs or marks of those ideas in the mind of the speaker which he wanted to communicate to the hearer. This opinion sprung from the atomic cosmogony which was framed by Mochus the Phenician, and afterwards improved by Democritus and Epicurus; and though it is part of a system in which the first men are represented as having grown out of the earth like trees and other vegetables, it has been adopted by several modern writers of high rank in the republic of letters, and is certainly in itself worthy of examination.

The most learned, and on every account the most respectable author who now supports this opinion, candidly acknowledges, that if language were invented, it was of very difficult invention, and far beyond the reach of the grossest savages. Accordingly he holds, that though men were originally solitary animals, and had no natural propensity to the social life; yet before language could be invented, they must have been associated for ages, and have carried on of concert some common work. Nay, he is decidedly of opinion, that before the invention of an art so difficult as language, men must not only have herded together, but have also formed some kind of civil polity, have existed in that political state a very long time, and have acquired such powers of abstraction as to be able to form general ideas. But it is obvious, that men could not have instituted civil polity, or have carried on of concert any common work, without communicating their designs to each other: and there are four ways by which the author thinks that this could have been done before the invention of speech, viz. 1. inarticulate cries, expressive of sentiments and passions: 2. gestures, and the expression of countenance: 3. imitative sounds expressive of audible things; and, 4. painting, by which visible objects may be represented. Of these four ways of communication, it is plain that only two have any connection with language, viz. inarticulate cries and imitative sounds; and of these the author abandons the latter, as having contributed nothing to the invention of articulation, though he thinks it may have helped to advance its progress. “ I am disposed,” says he, “ to believe that the framing of words with an analogy to the sound of the things expressed by them, belonged rather to languages of art than to the first languages spoken by rude and barbarous

LANGUAGE.

nations." It is therefore inarticulate cries only that must have given rise to the formation of language. Such cries are used by all animals who have any use of voice to express their wants; and the fact is, that all barbarous nations have cries expressing different things, such as joy, grief, terror, surprise, and the like. These, together with gestures and expression of the countenance, were undoubtedly the methods of communication first used by men: and we have but to suppose," says our author, "a great number of our species carrying on some common business, and conversing together by signs and cries, and we have men just in a state proper for the invention of language. For if we suppose their numbers to increase, their wants would increase also; and then these two methods of communication would become too confined for that larger sphere of life which their wants would make necessary. The only thing then that remained to be done, was to give a greater variety to the instinctive cries; and as the natural progress is from what is easy to what is more difficult, the first variation would be merely by tones from low to high, and from grave to acute. But this variety could not answer all the purposes of speech in society; and being advanced so far, it was natural that an animal so sagacious as man should go on farther, and come at last to the only other variation remaining, namely, articulation. The first articulation would be very simple, the voice being broken and distinguished only by a few vowels and consonants. And as all natural cries are from the throat and larynx, with little or no operation of the organs of the mouth, it is natural to suppose, that the first languages were for the greater part spoken from the throat; that what consonants were used to vary the cries, were mostly guttural, and that the organs of the mouth would at first be very little employed. From this account of the origin of language it appears, that the first sounds articulated were the natural cries by which men signified their wants and desires to one another, such as calling one another for certain purposes, and other such things as were most necessary for carrying on any joint work: then in process of time other cries would be articulated, to signify, that such and such actions had been performed or were performing, or that such and such events had happened relative to the common business. Then names would be invented of such objects as they were conversant with; but as we cannot suppose savages to be deep in abstraction, or skilful in the art of arranging things according to their genera and species, all things, however similar, except perhaps the individuals of the lowest species, would be expressed by different words not related to each other either by derivation or composition. Thus would language grow by degrees; and, as it grew, it would be more and more broken and articulated by consonants: but still the words would retain a great deal of their original nature of animal cries. And thus things would go on, words unrelated still multiplying, till at last the language would become too cumbersome for use; and then art would be obliged to interfere, and form a language upon a few radical words, according to the rules and method of etymology.

Warburton, De Saury, Johnson, Beattie, Blair, Dr. Stanhope Smith of New Jersey, and others, who think that language was originally revealed from heaven, consider this account of its human

invention as a series of mere suppositions hanging loosely together, and the whole suspended from no fixed principle. The opinions of Diódo-rus, Vitruvius, Horace, Lucretius, and Cicero, which are frequently quoted in its support, are in their estimation of no greater authority than the opinions of other men; for as language was formed and brought to a great degree of perfection long before the era of any historian with whom we are acquainted, the antiquity of the Greek and Roman writers, who are comparatively of yesterday, gives them no advantage in this inquiry over the philosophers of France and England. Aristotle has defined man to be ζῷον μίμνησκον: and the definition is certainly so far just, that man is much more remarkable for imitation than invention; and therefore, say the reasoners on this side of the question, had the human race been originally *mutum et turpe pecus*, they would have continued so to the end of time, unless they had been taught to speak by some superior intelligence. That the first men sprung from the earth, like vegetables, no modern philosopher has ventured to assert; nor does there any where appear sufficient evidence that men were originally in the state of savages. The oldest book extant contains the only rational cosmogony known to the ancient nations; and that book represents the first human inhabitants of this earth, not only as reasoning and speaking animal, but also as in a state of high perfection and happiness, of which they were deprived for disobedience to their Creator. Moses, setting aside his claim to inspiration, deserves, from the consistence of his narrative, at least as much credit as Mochus, or Democritus, or Epicurus: and from his prior antiquity, if antiquity could on this subject have any weight, he would deserve more, as having lived nearer to the period of which they all write. But the question respecting the origin of language may be decided without resting in authority of any kind, merely by considering the nature of speech, and the mental and corporeal powers of man. Those who maintain it to be of human invention, suppose men at first to have been solitary animals, afterwards to have herded together without government or subordination, then to have formed political societies, and by their own exertions to have advanced from the grossest ignorance to the refinements of science. But, say the reasoners whose cause we are now pleading, this is a supposition contrary to all history and all experience. There is not upon record a single instance, well authenticated, of a people emerging by their own efforts from barbarism to civilization. There have, indeed, been many nations raised from the state of savages; but it is known that they were polished, not by their own repeated exertions, but by the influence of individuals or colonies from nations more enlightened than themselves. The original savages of Greece were tamed by the Pelasgi, a foreign tribe; and were afterwards further polished by Orpheus, Cecrops, Cadmus, &c. who derived their knowledge from Egypt and the East. The ancient Romans, a ferocious and motley crew, received the blessings of law and religion from a succession of foreign kings; and the conquests of Rome at a later period contributed to civilize the rest of Europe. In America, the only two nations which at the invasion of the Spaniards could be said to have advanced a single step from barbarism, were indebted for their superiority over

LANGUAGE.

other tribes, not to the gradual and unassisted progress of the human mind, but to the wise institutions of foreign legislators.

This is not the proper place for tracing the progress of man from the savage state to that of civil society; but experience teaches us, that every art is much easier to improve than invent. The human mind, when put into the proper track, is indeed capable of making great advances in arts and sciences; but if any credit be due to the records of history, it has not, in a people sunk in ignorance and barbarity, sufficient vigour to dis. over that track, or to conceive a state different from the present. If the rudest inhabitants of America and other countries have continued, as there is every reason to believe they have continued, for ages in the same unvaried state of barbarism; how is it imaginable that people so much ruder than they, as to be ignorant of all language, should think of inventing an art so difficult as that of speech, or even to frame a conception of the thing? In building, fishing, hunting, navigating, &c. they might imitate the instinctive arts of other animals; but there is no other animal that expresses its sensations and affections by arbitrary articulate sounds. It is said, that before language could be invented, mankind must have existed for ages in large political societies, and have carried on of concert some common work: but if inarticulate cries, and the natural visible signs of the passions and affections, were modes of communication sufficiently accurate to keep a large society together for ages, and to direct its members in the execution of some common work, what could be their inducement to the invention of an art so useless and difficult as that of language? Let us however suppose, say the advocates for the cause which we are now supporting, that different nations of savages set about inventing an art of communicating their thoughts, which experience had taught them was not absolutely necessary: how came they all, without exception, to think of the one art of articulating the voice for this purpose? Inarticulate cries, out of which language is fabricated, have indeed an instinctive connection with our passions and affections; but there are gestures and expressions of countenance with which our passions and affections are in the same manner connected. If the natural cries of passion could be so modified and enlarged as to be capable of communicating to the hearer every idea in the mind of the speaker, it is certain that the natural gestures could be so modified as to answer the very same purpose (see Pantomime); and it is strange that among the several nations who invented languages, not one should have stumbled upon fabricating visible signs of their ideas, but that all should have agreed to denote them by articulated sounds. Every nation whose language is narrow and rude, supplies its defects by violent gesticulation; and therefore, as much less genius is exerted in the improvement of any art than was requisite for its first invention, it is natural to suppose, that, had men been left to devise for themselves a method of communicating their thoughts, they would not have attempted any other than that by which they now improve the language transmitted by their fathers. It is vain to urge that articulate sounds are fitter for the purpose of communicating thought than visible gesticulation: for though this may be true, it is a truth which could hardly occur to savages, who

had never experienced the fitness of either; and if, to counterbalance the superior fitness of articulation, its extreme difficulty be taken into view, it must appear little less than miraculous that every savage tribe should think of it rather than the easier method of artificial gesticulation. Savages, it is well known, are remarkable for their indolence, and for always preferring ease to utility; but their modes of life give such a pliancy to their bodies, that they could, with very little trouble, bend their limbs and members into any positions agreed upon as the signs of ideas. This is so far from being the case with respect to the organs of articulation, that it is with extreme difficulty, if at all, that a man advanced in life can be taught to articulate any sound which he has not been accustomed to hear. No foreigner who comes to England after the age of thirty, ever pronounces the language tolerably well; an Englishman of that age can hardly be taught to utter the guttural sound which a Scotchman gives to the Greek χ , or even the French sound of the vowel u : and of the solitary savages who have been caught in different forests, we know not that there has been one who, after the age of manhood, learned to articulate any language so as to make himself readily understood. The present age has indeed furnished many instances of deaf persons being taught to speak intelligibly by skilful masters moulding the organs of the mouth into the positions proper for articulating the voice: but who was to perform this task among the inventors of language, when all mankind were equally ignorant of the means by which articulation is effected? In a word, daily experience informs us, that men who have not learned to articulate in their childhood, never afterwards acquire the faculty of speech but by such helps as savages cannot obtain; and therefore, if speech was invented at all, it must have been either by children who were incapable of invention, or by men who were incapable of speech. A thousand, nay a million of children could not think of inventing a language. While the organs are pliable, there is not understanding enough to frame the conception of a language; and by the time that there is understanding, the organs are become too stiff for the task. And therefore, say the advocates for the divine origin of language, reason as well as history intimates, that mankind in all ages must have been speaking animals; the young having constantly acquired this art by imitating those who were elder; and we may warrantably conclude, that our first parents received it by immediate inspiration.

To this account of the origin of language an objection readily offers itself. If the first language were communicated by inspiration, it must have been perfect, and held in reverence by those who spake it, i. e. by all mankind. But a vast variety of languages have prevailed in the world; and some of these which remain are known to be very imperfect, whilst there is reason to believe that many others are lost. If different languages were originally invented by different nations, all this would naturally follow from the mixture of these nations; but what could induce men possessed of one perfect language of divine original, to forsake it for barbarous jargons of their own invention, and in every respect inferior to that with which their forefathers or themselves had been inspired?

In answer to this objection, it is said, that no

LANGUAGE.

thing was given by inspiration but the faculty of speech and the elements of language; for when once men had language, it is easy to conceive how they might have modified it by their natural powers, as thousands can improve what they could not invent. The first language, if given by inspiration, must in its principles have had all the perfection of which language is susceptible; but from the nature of things it could not possibly be very copious. The words of language are either proper names or the signs of ideas and relations; but it cannot be supposed that the All-wise Instructor would load the memories of men with words to denote things then unknown, or with the signs of ideas which they had not then acquired. It was sufficient that a foundation was laid of such a nature as would support the largest superstructure which they might ever after have occasion to raise upon it, and that they were taught the method of building by composition and derivation. This would long preserve the language radically the same, though it could not prevent the introduction of different dialects in the different countries over which men spread themselves. In whatever region we suppose the human race to have been originally placed, the increase of their numbers would in process of time either disperse them into different nations, or extend the one nation to a vast distance on all sides from what we may call the seat of government. In either case they would every where meet with new objects, which would occasion the invention of new names; and as the difference of climate, and other natural causes, would compel those who removed eastward or northward to adopt modes of life in many respects different from the modes of those who travelled towards the west or the south, a vast number of words would in one country be fabricated to denote complex conceptions, which must necessarily be unintelligible to the body of the people inhabiting countries where those conceptions had never been formed. Thus would various dialects be unavoidably introduced into the original language, even whilst all mankind remained in one society and under one government. But after separate and independent societies were formed, these variations would become more numerous, and the several dialects would deviate farther and farther from each other, as well as from the idiom and genius of the parent tongue, in proportion to the distance of the tribes by whom they were spoken. If we suppose a few people either to have been banished together from the society of their brethren, or to have wandered of their own accord to a distance, from which through trackless forests they could not return (and such emigrations have often taken place), it is easy to see how the most copious language must in their mouths have soon become narrow, and how the offspring of inspiration must have in time become so deformed as hardly to retain a feature of the ancestor whence it originally sprung. Men do not long retain a practical skill in those arts which they never exercise; and there are abundance of facts to prove, that a single man cast upon a desert island, and having to provide the necessities of life by his own ingenuity, would soon lose the art of speaking with fluency his mother-tongue. A small number of men cast away together, would indeed retain that art somewhat longer; but in a space of time not very long, it would in a great measure be lost by them or their posterity. In this state of banish-

ment, as their time would be almost wholly occupied in hunting, fishing, and other means within their reach to support a wretched existence, they would have very little leisure, and perhaps less desire, to preserve by conversation the remembrance of that ease and those comforts of which they now found themselves for ever deprived; and they would, of course, soon forget all the words which in their native language had been used to denote the accommodations and elegancies of polished life. Thus at least seems to be certain, that they would not attempt to teach their children a part of language which in their circumstances could be of no use to them, and of which it would be impossible to make them comprehend the meaning; for where there are no ideas, the signs of ideas cannot be made intelligible. From such colonies as this dispersed over the earth, it is probable that all those nations of savages have arisen, which have induced so many philosophers to imagine, that the state of the savage was the original state of man; and if so, we see that from the language of inspiration must have unavoidably sprung a number of different dialects, all extremely rude and narrow, and retaining nothing of the parent tongue, except perhaps the names of the most conspicuous objects of nature, and of those wants and enjoyments which are inseparable from humanity. The savage state has no artificial wants, and furnishes few ideas that require terms to express them. The habits of solitude and silence incline a savage rarely to speak; and when he speaks, he uses the same terms to denote different ideas. Speech, therefore, in this rude condition of men, must be extremely narrow and extremely various. Every new region, and every new climate, suggests different ideas, and creates different wants, which must be expressed either by terms entirely new, or by old terms used with a new signification. Hence must originate great diversity, even in the first elements of speech, among all savage nations, the words retained of the original language being used in various senses, and pronounced, as we may believe, with various accents. When any of those savage tribes emerged from their barbarism, whether by their own efforts or by the aid of people more enlightened than themselves, it is obvious that the improvement and copiousness of their language would keep pace with their own progress in knowledge and in the arts of civil life; but in the infinite multitude of words which civilization and refinement add to language, it would be little less than miraculous were any two nations to agree upon the same sounds to represent the same ideas. Superior refinement, indeed, may induce imitation, conquests may impose a language, and extension of empires may melt down different nations and different dialects into one mass; but independent tribes naturally give rise to diversity of tongues, nor does it seem possible that they should retain more of the original language than the words expressive of those objects with which all men are at all times equally concerned.

The variety of tongues, therefore, the copiousness of some, and the narrowness of others, furnish no good objection to the divine origin of language in general; for whether language was at first revealed from heaven, or in a course of ages invented by men, a multitude of dialects would inevitably arise as soon as the human race was separated into a number of distinct and independent nations. We pretend not to decide

LANGUAGE.

for our readers in a question of this nature : we have given the best arguments on both sides which we could either devise or find in the writings of others : and if it be seen, as we doubt not it will, that our own judgment leans to the side of revelation, let it not be hastily condemned by those whose knowledge of languages extends no farther than to Greece and Rome, and France and England ; for if they will carry their philological inquiries to the east, they may perhaps be able to trace the remains of one original language through a great part of the globe at this day.

The late learned Gilbert Wakefield, in his *Essay on the Origin of Alphabetical Characters*, first published in the Memoirs of the Manchester Philosophical Society, argues very ingeniously in favour of the opinion that alphabetical characters were not of human invention, but communicated to man from God himself. We have not room to republish the whole of his ingenious essay, but cannot forbear making a few quotations :

I. "The five first books of the Old Testament are, I believe, acknowledged by all to be, not only the most ancient compositions, but also the most early specimens of alphabetical writing at present existing in the world. Now, taking for granted the authenticity of the Mosaic records, if alphabetical writing be indeed the result of human ingenuity, one great peculiarity distinguishes it from all other human inventions whatsoever : the very first effort brought it to perfection."

Mr. Wakefield controverts the objection that there may have been alphabetical characters prior to the time of Moses, although no traces of them have reached us. There is, however, one obvious reply which Mr. Wakefield does not make. Had there been alphabetical characters prior to the time of Moses, there would have been writings, most probably epistolary ones : now Moses often speaks of messages and presents, and tokens of affection, and other things equally minute, but never of sending letters.

II. Says Mr. W. "If alphabetical writing were a human invention, the natural result of ingenuity and experience, might we not expect that different nations would have fallen upon the same expedient, independently of each other?" This he shews was not the case, by a fair induction of particulars, and by tracing the progress and mutation of the characters from the Hebrew, through the Chaldee, Syriac, Arabic, Æthiopic, Persian, &c. to the Greek, and thence to the Latin language. We cannot follow him at length, but shall extract a quotation from Herodotus, by which he strengthens his reasoning :

"Those Phœnicians that came with Cadmus introduced many improvements among the Greeks, and alphabetical writing too, not known, in my opinion, to the Greeks before that period. At first they used the Phœnician character ; but in process of time, as the pronunciation altered, the standard of the letters was also changed. The Ionian Greeks inhabited at that time the parts adjacent to the Phœnicians ; who, having received the art of alphabetical writing from these Phœnicians, used it with an alteration of some few characters : and confessed ingenuously, that it was called Phœnician from the introducers of it. And I have seen myself the characters of Cadmus in the temple of Iambelian Apollo, at Thebes in

Boeotia, engraven upon tripods, and very much resembling the Ionian characters."

III. Says Mr. W. "What we know of those nations, who have continued for many centuries unconnected with the rest of the world, strangely militates against the hypothesis of the human invention of alphabetical writing." This is instanced in the case of the Chinese, the Mexicans, and the Egyptians. "Now, what will our adversaries reply to this? They will pertinaciously maintain, that alphabetical writing is a human invention : and yet all those nations who have been conversant with this expedient, are discovered to have derived it from the same original, from some one people in the east, whose time and means of attaining it we cannot now certainly find out ; but are compelled to conclude from analogy, and the experience of other nations, that their imagination, as it was not more fertile, was not more successful than that of their neighbours.

"Again : where large communities have flourished for ages, but unconnected with those countries which enjoyed this advantage, their own solitary exertions were never capable of effecting this capital discovery. Is it possible for presumptive evidence to be more satisfactory than this?"

Mr. Wakefield's essay is concluded with the following remarks.

"1. Pliny asserts the use of letters to have been eternal. This shews the antiquity of the practice to extend beyond the era of authentic history.

"2. The rabalistical doctors of the Jews maintain, that alphabetical writing was one of the ten things which God created in the evening of the sabbath.

"3. Most of the profane authors of antiquity ascribe the first use of alphabetical characters to the Egyptians, who, according to some, received the expedient from Mercury, and, according to others, from the god Teuth. This ascription of alphabetic characters to a divine communication, shews the sense entertained by the ancients of the difficulty of the invention. The Indian letters are in a similar manner ascribed by the Hindus to a divine origin.

"4. It is remarkable that history commonly attributes the introduction of letters to some great traveller ; a concurring proof of their derivation among different nations from a common source.

"5. No mention is made of the alphabet in Homer, though it appears to have been in use among the Jews long before his time.

"6. Is there any reason to suppose from the history of the human mind, that oral language, which has long been perfect, beyond any memorials of our species in heathen writings, and is co-eval with man, according to the testimony of Scripture ; is there any reason, I say, to suppose that even language itself is the effect of human ingenuity and experience.

"7. To suppose that the art of alphabetical writing is the invention of man is almost a philosophical impossibility, when we consider that it must, in this case, have been devised in the rudest state of human intellect, while *typography*, a discovery less curious and sagacious, eluded the detection of the most refined ages of literary perfection."—*Life of G. Wakefield*, in. 362.

"6. Is there any reason to suppose from the history of the human mind, that oral language, which has long been perfect, beyond any memorials of our species in heathen writings, and is co-eval with man, according to the testimony of Scripture ; is there any reason, I say, to suppose that even languages itself is the effect of human ingenuity and experience."

"7. To suppose that the art of alphabetical writing is the invention of man, is almost a philosophical impossibility, when we consider that it must, in this case, have been derived in the rudest state of human intellect, while *typography*, a discovery less curious and sagacious, eluded the detection of the most refined ages of literary perfection."—*Life of G. Wakefield*, ii. 362.

Language, whatever was its origin, must be

L A N G U A G E.

subject to perpetual changes from its very nature, as well as from that variety of incidents which affect all sublunary things; and those changes must always correspond with the change of circumstances in the people by whom the language is spoken. When any particular set of ideas becomes prevalent among any society of men, words must be adopted to express them; and from these the language must assume its character. Hence the language of a brave and martial people is bold and nervous, although perhaps rude and uncultivated; while the languages of those nations in which luxury and effeminacy prevail, are flowing and harmonious, but devoid of force and energy of expression.

But although it may be considered as a general rule, that the language of any people is a very exact index of the state of their minds, yet it admits of some particular exceptions. For as man is naturally an imitative animal, and in matters of this kind never has recourse to invention but through necessity, colonies planted by any nation, at whatever distance from the mother-country, always retain the same general sounds and idiom of language with those from whom they are separated. In process of time, however, the colonists and the people of the mother country, by living under different climates, by being engaged in different occupations, and by adopting, of course, different modes of life, may lose all knowledge of one another, assume different national characters, and form each a distinct language to themselves, totally different in genius and style, though agreeing with one another in the fundamental sounds and general idiom. If, therefore, this particular idiom, formed before their separation, happen to be more peculiarly adapted to the genius of the mother country than of the colonies, these will labour under an inconvenience on this account, which they may never be wholly able to overcome; and this inconvenience must prevent their language from ever attaining to that degree of perfection to which, by the genius of the people, it might otherwise have been carried. Thus various languages may have been formed out of one parent tongue; and thus that happy concurrence of circumstances which has raised some languages to a high degree of perfection, may be easily accounted for, while many ineffectual efforts have been made to raise other languages to the same degree of excellence.

As the knowledge of languages constitutes a great part of erudition, as their beauty and deformities furnish employment to taste, and as these depend much upon the idioms of the different tongues, we shall proceed to make a few remarks upon the advantages and defects of some of those idioms of language with which we are best acquainted:—As the words *idiom* and *genius* of a language are often confounded, it will be necessary to inform the reader, that by *idiom* we would here be understood to mean, that general mode of arranging words into sentences which prevails in any particular language; and by the *genius* of a language, we mean to express, the particular set of ideas which the words of any language, either from their formation or multiplicity, are most naturally apt to excite in the mind of any one who hears it properly uttered. Thus, although the English, French, Italian, and Spanish languages nearly agree in the same general idiom, yet the particular *genius* of each is remarkably different: the English is naturally

bold, nervous, and strongly articulated; the French is weaker, and more flowing; the Italian more soothing and harmonious; and the Spanish more grave, sonorous, and stately. Now, when we examine the several languages which have been most esteemed in Europe, we find that there are only two *idioms* among them which are essentially distinguished from one another, and all those languages are divided between these two idioms, following sometimes the one and sometimes the other, either wholly or in part. The languages which may be said to adhere to the first *idiom*, are those which in their construction follow the order of nature; that is, express their ideas in the natural order in which they occur to the mind; the subject which occasions the action appearing first; then the action, accompanied with its several modifications; and, last of all, the object to which it has reference.—These may properly be called *analogous* languages; and of this kind are the English, French, and most of the modern languages in Europe. The languages which may be referred to the other *idiom*, are those which follow no other order in their construction than what the taste or fancy of the composer may suggest; sometimes making the object, sometimes the action, and sometimes the modification of the action, to precede or follow the other parts. The confusion which thus might occasion is avoided by the particular manner of inflecting their words, by which they are made to refer to the others with which they ought to be connected, in whatever part of the sentence they occur, the mind being left at liberty to connect the several parts with one another after the whole sentence is concluded. And as the words may be here transposed at pleasure, those languages may be called *transpositive* languages. To this class we must, in an especial manner, refer the Latin and Greek languages. As each of these *idioms* has several advantages and defects peculiar to itself, we shall endeavour to point out the most considerable of them, in order to ascertain with greater precision the particular character and excellence of some of those languages now principally spoken or studied in Europe.

The partiality which our forefathers, at the revival of letters in Europe, naturally entertained for the Greek and Roman languages, made them look upon every distinguishing peculiarity belonging to them as one of the many causes of the amazing superiority which those languages evidently enjoyed above every other at that time spoken in Europe. This blind deference still continues to be paid to them, as our minds are early prepossessed with these ideas, and as we are taught in our earliest infancy to believe, that to entertain the least idea of our own language being equal to the Greek or Latin in any particular whatever, would be a certain mark of ignorance or want of taste. Their rights, therefore, like those of the church in former ages, remain still to be examined; and we, without exerting our reason to discover truth from falsehood, tamely sit down satisfied with the idea of their undoubted pre-eminence in every respect. But if we look around us for a moment, and observe the many excellent productions which are to be met with in almost every language of Europe, we must be satisfied, that even these are now possessed of some powers which might afford at least a presumption, that, if they were cultivated with a proper degree of attention, they

LANGUAGE

might, in some respects, be made to rival, if not to excel, those beautiful and justly admired remains of antiquity. Without endeavouring to derogate from their merit, let us, with the cool eye of philosophic reasoning, endeavour to bring before the sacred tribunal of Truth some of those opinions which have been most generally received upon this subject, and rest the determination of the cause on her impartial decision.

The learned reader well knows, that the several changes which take place in the arrangement of the words in every *transpositive* language, could not be admitted without occasioning great confusion, unless certain classes of words were endowed with particular variations, by means of which they might be made to refer to the other words with which they ought naturally to be connected. From this cause proceeds the necessity of several variations of verbs, nouns, and adjectives; which are not in the least essential or necessary in the *analogous* languages, as we have pretty fully explained under the article *GRAMMAR*, to which we refer for satisfaction on this head.

Having thus considered language in general, we shall close these remarks with a few observations upon the particular nature and genius of those languages which are now chiefly spoken or studied in Europe.

Of all the nations whose memory history has transmitted to us, none have been so eminently distinguished for their literary accomplishments, as well as a acquaintance with the polite arts, as the Greeks: nor are we as yet acquainted with a language possessed of so many advantages, with so few defects, as that which they used, and which continues still to be known by their name.—The necessary connection between the progress of knowledge and the improvement of language has been already explained; so that it will not be surprising to find their progress in the one keep pace with that of the other: but it will be of utility to point out some advantages which that distinguished people possessed, which other nations, perhaps not less distinguished for talents or taste, have not enjoyed, which have contributed to render their language the most universally admired in ancient as well as in modern times.

It has been observed, that the original inhabitants of Greece, who were gross savages, and whose language of course would be very rude and narrow, were first tamed by the Pelasgi, an eastern or an Egyptian tribe. From the east it is well known that arts and sciences were spread over the rest of the world, and that Egypt was one of the countries first civilized. The language therefore imported into Greece by the Pelasgi would be pure from the fountain head, and much more perfect in its structure than if it had been transmitted through many nations. But this was not the only circumstance highly fortunate for the Greek language. Before it had time to be fully established among the people, its aptitudes, which it had in common with the other dialects of the east, were polished away by such a succession of poets, musicians, philosophers, and legislators, from different countries, as never appeared in any other nation at a period so early as to give their genius and taste its full influence. In this respect, no people were ever so eminently distinguished as the ancient Greeks, who had their Orpheus, their Linus, their Cecrops, and their Cadmus, who introduced their different improve-

ments at a time when the nation had no standard of taste formed by itself. Hence the original sounds of the Greek language are the most harmonious, and the most agreeable to the ear, of any that have hitherto been invented. They are indeed agreeable to every person who hears them, even when the meaning of the words is not understood; whereas almost all other languages, till they are understood, appear, to an ear which has not been accustomed to them, jarring and discordant. This is the fundamental excellence of that justly admired language; nor have the people failed to improve this to the utmost of their power, by many aids of their own invention. The Greek language is of the transpositive kind; but a people so lively, so acute, and so loquacious, could ill bear the ceremonious restraint to which that mode of language naturally subjected them; and have therefore, by various methods, freed it in a great measure from the stiffness which that produced. In inflecting their nouns and verbs, they sometimes prefix a syllable, and sometimes add one; which, besides the variety that it gives to the sounds of the language, adds greatly to the distinctness, and admits of a more natural arrangement of the words than in the Latin, and of consequence renders it much fitter for the easiness of private conversation. and indeed the genius of the people so far prevailed over the idiom of the language, as to render it, in the age of its greatest perfection, capable of almost as much ease, and requiring almost as little transposition of words, as those languages which have been called analogous. But as those nations who spoke this language were all governed by popular assemblies, and as no authority could be obtained among them but by a skill in rhetoric and the powers of persuasion, it became necessary for every one, who wished to acquire power or consideration in the state, to improve himself in the knowledge of that language, in the use of which alone he could expect honours or reputation. Hence it happened, that while the vivacity of the people rendered it easy, the great men studiously improved every excellence that it could reap from its powers as a transpositive language; so that, when brought to its utmost perfection by the amazing genius of the great Demosthenes, it attained a power altogether unknown to any other language.—Thus happily circumstanced, the Greek language arrived at that envied pre-eminence which it still justly retains. From the progress of arts and sciences; from the gaiety and inventive genius of the people; from the number of free states into which Greece was divided, each of which invented words of its own, all of which contributed to the general stock; and from the natural communication which took place between these states, which excited in the strongest degree the talents of the people; it acquired a copiousness unknown to any ancient language, and excelled by few of the moderns.—In point of harmony of numbers, it is altogether unrivalled; and on account of the ease as well as dignity which, from the causes above mentioned, it acquired, it admits of perfection in a greater number of particular kinds of composition than any other language known.—The irresistible force and overwhelming impetuosity of Demosthenes seems not more natural to the genius of the language, than the more flowery charms of Plato's calm and harmonious cadences, or the unadorned simplicity of Xenophon; nor does the majestic pomp of Homer seem to be more agreeable to the genius

L A N G U A G E.

of the language in which he wrote, than the more humble strains of Theocritus, or the laughing festivity of Anacreon. Equally adapted to all purposes, when we peruse any of these authors, we would name the language was most happily adapted for his particular style alone. The same powers it likewise, in a great measure, possessed for conversation; and the dialogue seems not more natural for the dignity of Sophocles or Euripides, than for the more easy tenderness of Menander, or buffoonery of Aristophanes.—With all the advantages, however, it must be acknowledged, that it did not possess that unexceptionable clearness of meaning which some analogous languages enjoy, or that characteristic force which the emphasis properly varied has power to give, were not these defects counterbalanced by other causes which we shall afterwards point out.

The Romans, a people of fierce and warlike dispositions, for many ages during the infancy of their republic, more intent on pursuing conquests and military glory than in making improvements in literature or the fine arts, bestowed little attention to their language. Of a disposition less social or more phlegmatic than the Greeks, they gave themselves no trouble about rendering their language fit for conversation, and it remained strong and nervous, but, like their ideas, was limited and confined. More disposed to command respect by the power of their arms than by the force of persuasion, they despised the more clamorous powers of speech: so that, before the Punic wars, their language was perhaps more reserved and unsmooth than any other at that time known.—But after their rival Carthage was destroyed, and they had no longer that powerful curb upon their ambition; when riches flowed in upon them by the multiplicity of their conquests, luxury began to prevail, the severe austerity of their manners to relax, and selfish ambition to take place of that disinterested love for their country so eminently conspicuous among all orders of men before that period.—Popularity began then to be coveted: ambitious men, finding themselves not possessed of that merit which insured them success with the virtuous senate, amused the mob with artful and seditious harangues; and by making them believe that they were possessed of all power, and had their sacred rights encroached upon by the senate, led them about at their pleasure, and got themselves exalted to honours and riches by these insidious arts. It was then the Romans first began to perceive the use to which a command of language could be put. Ambitious men then studied it with care, to be able to accomplish their ends; while the more virtuous were obliged to acquire a skill in this, that they might be able to repel the attacks of their adversaries.—Thus it happened, that in a short time that people, from having entirely neglected, began to study their language with the greatest assiduity; and as Greece happened to be subjected to the Roman yoke about that time, and a friendly intercourse was established between these two countries, this greatly conspired to nourish in the minds of the Romans a taste for that art of which they had lately become so much enamoured. Greece had long before this period been corrupted by luxury; their taste for the fine arts had degenerated into unnecessary refinement; and all their patriotism consisted in popular harangues and unmeaning declamation. Oratory was then studied as a re-

finer art; and all the subtleties of it were taught by rule, with as great care as the gladiators were afterwards trained up in Rome. But while they were thus idly trying who should be the lord of their own people, the nerves of government were relaxed, and they became an easy prey to every invading power. In this situation they became the subjects, under the title of the allies, of Rome, and introduced among them the same taste for haranguing which prevailed among themselves. Well acquainted as they were with the powers of their own language, they set themselves with unwearied assiduity to polish and improve that of their new masters: but with all their assiduity and pains, they never were able to make it arrive at that perfection which their own language had acquired; and in the Augustan age, when it had arrived at the summit of its glory, Cicero bitterly complains of its want of copiousness in many particulars.

But as it was the desire of all who studied this language with care, to make it capable of that stately dignity and pomp necessary for public harangues, they followed the genius of the language in this particular, and in a great measure neglected those lesser delicacies which form the pleasure of domestic enjoyment, so that, while it acquired more copiousness, more harmony, and precision, it remained stiff and inflexible for conversation, nor could the minute distinction of nice grammatical rules be ever brought down to the apprehension of the vulgar: whence the language spoken among the lower class of people remained rude and unpolished even to the end of the monarchy. The Etrus who overran Italy, incapable of acquiring any knowledge of such a difficult and abstruse language, never adopted it; and the native inhabitants being made acquainted with a language more easily acquired, quickly adopted that idiom of speech introduced by their conquerors, although they still retained many of those words which the confined nature of the barbarian language made necessary to allow them to express their ideas. And thus it was that the language of Rome, that proud mistress of the world, from an original defect in its formation, although it had been carried to a perfection in other respects far superior to any northern language at that time, easily gave way to them, and in a few ages the knowledge of it was lost among mankind: while, on the contrary, the more easy nature of the Greek language has still been able to keep some slight footing in the world, although the nations in which it has been spoken have been subjected to the yoke of foreign dominion for upwards of two thousand years, and their country has been twice ravaged by barbarous nations, and more cruelly depressed than ever the Romans were.

From the view which we have already given of the Latin language, it appears evident, that its idiom was more strictly transpositive than that of any other language yet known, and was attended with all the defects to which that idiom is naturally subjected: nor could it boast of such favourable alleviating circumstances as the Greek, the prevailing sounds of the Latin being far less harmonious to the ear; and although the formation of the words is such as to admit of full and distinct sounds, and so modulated as to lay no restraint upon the voice of the speaker; yet, to a person unacquainted with the language, they do not convey that enchanting harmony so remarkable in the Greek language. The Latin is stately and

LANGUAGE

Solemn; it does not excite disgust; but at the same time it does not charm the ear, so as to make it listen with delightful attention. To one acquainted with the language, indeed, the nervous boldness of the thoughts, the harmonious rounding of the periods, the full solemn swelling of the sounds, so distinguishable in the most eminent writers of that language which have been preserved to us, all conspire to make it pleasing and agreeable. In these admired works we meet with all its beauties, without perceiving any of its defects; and we naturally admire, as perfect, a language which is capable of producing such excellent works. Yet with all these seeming excellencies, this language is less copious, and more limited in its style of composition, than many modern languages, far less capable of precision and accuracy than almost any of these; and infinitely behind them all in point of easiness in conversation. But these points have been so fully proved already, as to require no further illustration. Of the compositions in that language which have been preserved to us, the Orations of Cicero are best adapted to the genius of the language, and we there see it in its utmost perfection. In the philosophical works of that great author we perceive some of its defects: and it requires all the powers of that great man to render his epistles agreeable, as these have the genius of the language to struggle with. Next to oratory, history agrees with the genius of this language; and Caesar, in his Commentaries, has exhibited the language in its purest elegance, without the aid of pomp or foreign ornament. Among the poets, Virgil has best adapted his works to his language. The flowing harmony and pomp of it are well adapted for the epic strain, and the correct delicacy of his taste rendered him perfectly equal to the task. But Horace is the only poet whose force of genius was able to overcome the bars which the language threw in his way, and succeeded in lyric poetry. Were it not for the brilliancy of the thoughts, and acuteness of the remarks, which so eminently distinguish this author's compositions, his odes would long ere now have sunk into utter oblivion. But so conscious have all the Roman poets been of the unfitness of their language for easy dialogue, that almost none of them, after Plautus and Terence, have attempted any dramatic compositions in that language. Nor have we any reason to regret that they neglected this branch of poetry, as it is probable, if they had ever become fond of these, they would have been obliged to have adopted so many unnatural contrivances to render them agreeable, as would have prevented us (who of course would have considered ourselves as bound to follow them) from making that progress in the drama which so particularly distinguishes the productions of modern times.

The modern Italian, from inattention too common in literary subjects, has been usually called a child of the Latin language, and is commonly believed to be the ancient Italian a little debased by the mixture of the barbarous language of those people who conquered Italy. The truth is, the case is directly the reverse: for this language, in its general idiom and fundamental principles, is evidently of the analogous kind, first introduced by those fierce invaders, although it has borrowed many of its words, and some of its modes of phraseology, from the Latin, with which they were so intimately blended that this could scarcely be avoided; and it has been from remarking this slight connection, so obvious at first sight, that

superficial observers have been led to draw this general conclusion, so contrary to fact.

When Italy was overrun with the Lombards, and the empire destroyed by the northern invaders, they, as conquerors, continued to speak their own native language. Fierce and illiterate, they would not stoop to the servility of studying a language so clogged with rules, and difficult of attainment, as the Latin would naturally be to a people altogether unacquainted with nice grammatical distinctions: while the Romans of necessity were obliged to study the language of their conquerors, as well as to obtain some relief of their grievances by prayers and supplications, as to destroy that odious distinction which subsisted between the conquerors and conquered while they continued a distinct people. As the language of their new masters, although rude and confined, was natural in its origin, and easy to be acquired, the Latins would soon attain a competent skill in it: and as they bore such a proportion to the whole number of people, the whole language would partake somewhat of the general sound of the former; for, in spite of all their efforts to the contrary, the organs of speech could not at once be made to acquire a perfect power of uttering any unaccustomed sounds; and as it behoved the language of the barbarians to be much less copious than the Latin, whenever they found themselves at a loss for a word, they would naturally adopt those which most readily presented themselves from their new subjects. Thus a language in time was formed, somewhat resembling the Latin both in the general tenor of the sounds and in the meaning of many words: and as the barbarians gave themselves little trouble about language, and in some cases perhaps hardly new the general analogy of their own language, it is not surprising if their new subjects should find themselves sometimes at a loss on that account; or if, in these situations, they followed on some occasions the analogy suggested to them by their own: which accounts for the strange degree of mixture of heterogeneous grammatical analogy we meet with in the Italian as well as Spanish and French languages. The idiom of all the Gothic languages is purely analogous; and in all probability, before their mixture with the Latins and other people in their provinces, the several grammatical parts of speech followed the plain simple idea which that supposes; the verbs and nouns were all probably varied by auxiliaries, and their adjectives retained their simple unalterable state—but by their mixture with the Latins, this simple form has been in many cases altered; then verbs became in some cases inflected; but then nouns in all these languages still retained their original form; although they have varied their adjectives, and foolishly clogged their nouns with gender, according to the Latin idioms. From this heterogeneous and fortitious (as we may say, because injudicious) mixture of parts, results a language possessing almost all the defects of each of the languages of which it is composed, with few of the excellencies of either: for it has neither the ease and precision of the analogous, nor the pomp and boldness of the transpositive languages; at the same time that it is clogged with almost as many rules, and liable to as great abuses.

These observations are equally applicable to the French and Spanish as to the Italian language. With regard to this last in particular, we may observe, that as the natural inhabitants

LANGUAGE.

of Italy before the last invasion of the barbarians, were sunk and enervated by luxury, and that by depression of mind and genius which anarchy always produces, they had become fond of feasting and entertainments, and the enjoyment of sensual pleasures constituted their highest delight; their language partook of the same debility as their body.—The barbarians, too, unaccustomed to the seductions of pleasure, soon fell from their original boldness and intrepidity, and, like Hannibal's troops of old, were enervated by the sensual gratifications in which a nation of conquerors unaccustomed to the restraint of government freely indulged. The softness of the air, the fertility of the climate, the unaccustomed flow of riches which they at once acquired, together with the voluptuous manner of their conquered subjects, all conspired to enervate their minds, and render them soft and effeminate. No wonder, then, if a language new moulded at this juncture, should partake of the genius of the people who formed it; and, instead of participating of the martial boldness and ferocity of either of their ancestors, should be softened and enfeebled by every device which an effeminate people could invent.—The strong consonants which terminated the words, and gave them life and boldness, being thought too harsh for the delicate ears of these sons of sloth, were banished their language; while sonorous vowels, which could be protracted to any length in music, were substituted in their stead.—Thus the Italian language is formed flowing and harmonious, but destitute of those nerves which constitute the strength and vigour of a language: at the same time, the sounds are neither enough diversified, nor in themselves of such an agreeable tone, as to afford great pleasure without the aid of musical notes, and the small pleasure which this affords is still lessened by the little variety of measure which the great similarity of the terminations of the words occasions. Hence it happens, that this language is fitted for excelling in fewer branches of literature than almost any other: and although we have excellent historians, and more than ordinary poets, in Italian, yet they labour under great inconveniences, from the language wanting nerves and stateliness for the former, and sufficient variety of modulation for the latter. It is, more particularly on this account, altogether unfit for an epic poem: and though attempts have been made in this way by two men whose genius, if not fettered by the language, might have been crowned with success; yet these, notwithstanding the fame that with some they may have acquired, must, in point of poetic harmony, be deemed defective by every impartial person. Nor is it possible that a language which hardly admits of poetry without rhyme, can ever be capable of producing a perfect poem of great length, and the stanza to which their poets have ever confined themselves, must always produce the most disagreeable effect in a poem where unrestrained pomp or pathos are necessary qualifications. The only species of poetry in which the Italian language can claim a superior excellence, is the tender tone of elegy: and here it remains unrivalled and alone; the plaintive melody of the sounds, and smooth flow of the language, being perfectly adapted to express that soothing melancholy which this species of poetry requires. On this account the plaintive scenes of the Pastor Fido of Guarini have justly gained to that poem an universal applause; although, unless on this account alone, it is perhaps

inferior to almost every other poem of the kind which ever appeared. We must observe with surprise, that the Italians, who have fettered every other species of poetry with the severest shackles of rhyme, have in this species shewed an example of the most unrestrained freedom; the happy effects of which ought to have taught all Europe the powerful charms attending it: yet with amazement we perceive, that scarce an attempt to imitate them has been made by any poet in Europe except by Milton in his *Lycides*; no dramatic poet, even in Britain, having ever adopted the unrestrained harmony of numbers to be met with in this and many other of their best dramatic compositions.

Of all the languages which sprang up from the mixture of the Latins with the northern people on the destruction of the Roman empire, none of them approach so near to the genius of the Latin as the Spanish does. For as the Spaniards have always been remarkable for their military prowess and dignity of mind, their language is naturally adapted to express ideas of that kind. Sonorous and solemn, it admits nearly of as much dignity as the Latin. For conversation, it is the most elegant and courteous language in Europe.

The humane and generous order of chivalry was first invented, and kept its footing longest, in this nation; and although it ran at last into such a ridiculous excess as deservedly made it fall into universal disrepute, yet it left such a strong tincture of romantic heroism upon the minds of all ranks of people, as made them jealous of their glory, and strongly emulous of cultivating that heroic politeness, which they considered as the highest perfection they could attain. Every man disdained to flatter, or to yield up any point of honour which he possessed, at the same time, he rigorously exacted from others all that was his due. These circumstances have given rise to a great many terms of respect and courteous condescension, without meanness of flattery, which give their dialogue a respectful politeness and elegance unknown to any other European language. This is the reason why the characters so finely drawn by Cervantes in *Don Quixote* are still unknown to all but those who understand the language in which he wrote. Nothing can be more unlike the gentle meekness and humane heroism of the knight, or the native simplicity, warmth of affection, and respectful loquacity of the squire, than the inconsistent follies of the one, or the impertinent forwardness and disrespectful petulance of the other, as they are exhibited in every English translation. Nor is it, as we imagine, possible to represent so much familiarity, united with such becoming condescension in the one, and unforged deference in the other, in any other European language, as is necessary to paint these two admirable characters.

Although this language from the solemn dignity and majestic elegance of its structure, is perhaps better qualified than any other modern one for the sublime strains of epic poetry; yet as the poets of this nation have all along imitated the Italians by a most servile subjection to rhyme; they never have produced one poem of this sort, which in point of poetry of style deserves to be transmitted to posterity. And in any other species of poetry but this, or the higher tragedy, it is not naturally fitted to excel. But although the drama and other polite branches of literature were early cultivated in this country, and made considerable progress in it, before the thirst of gain

LANGUAGE

debased their souls, or the desire of universal dominion made them forfeit that liberty which they once so much prized; since they became enervated by an overbearing pride, and their minds enslaved by superstition, all the polite arts have been neglected: so that, while other European nations have been advancing in knowledge, and improving their language, they have remained in a state of torpid inactivity: and their language has not arrived at that perfection which its nature would admit, or the acute genius of the people might have made us naturally expect.

It will perhaps by some be thought an unpardonable insult, if we do not allow the French the preference of all modern languages in many respects. But so far must we pay a deference to truth as to be obliged to rank it among the poorest languages in Europe. Every other language has some sounds which can be uttered clearly by the voice: even the Italian, although it wants energy, still possesses distinctness of articulation. But the French is almost incapable of either of these beauties; for in that language the vowels are so much curtailed in the pronunciation, and the words run into one another in such a manner, as necessarily to produce an indistinctness which renders it incapable of measure or harmony. From this cause, it is in a great measure incapable of poetic modulation, and rhyme has been obliged to be substituted in its stead, so that this poorest of all contrivances which has ever yet been invented to distinguish poetry from prose, admitted into all the modern languages when ignorance prevailed over Europe, has still kept some footing in the greatest part of these, rather through a deference for established customs than from any necessity. Yet as the French language admits of so little poetic modulation, rhyme is in some measure necessary to it; and therefore this poor deviation from prose has been adopted by it, and dignified with the name of Poetry. But by their blind attachment to this artifice, the French have neglected to improve so much as they might have done the small powers for harmony of which their language is possessed, and by being long accustomed to this false taste, they have become fond of it to such a ridiculous excess, as to have all their tragedies, nay even their comedies, in rhyme. While the poet is obliged to enervate his language, and check the flow of composition, for the sake of linking his lines together, the judicious actor finds more difficulty in destroying the appearance of that measure, and preventing the clinking of the rhymes, than in all the rest of his task.—After this, we need not be surprised to find Voltaire attempt an epic poem in this species of poetry; although the more judicious Fenelon in his *Telemaque* had shown to his countrymen the only species of poetry that their language could admit of for any poem that aspired to the dignity of the epic strain.—Madam Deshoulières, in her *Idyllic*, has shown the utmost extent of harmony to which their language can attain in smaller poems: indeed in the tenderness of an elegy, or the gaiety of a song, it may succeed; but it is so destitute of force and energy, that it can never be able to reach the pindaric, or even perhaps the lyric strain—as the ineffectual efforts even of the harmonious Rousseau, in his translation of the *Psalms* of David of this stamp, may fully convince us.

With regard to its powers in other species of composition, the sententious rapidity of Voltaire, and the more nervous dignity of Rousseau, af-

fords us no small presumption, that, in a skilful hand, it might acquire so much force, as to transmit to futurity historical facts in a style not altogether unworthy of the subject. In attempts at pathetic declamation, the superior abilities of the composer may perhaps on some occasions excite a great idea; but this is ever cramped by the genius of the language: and although no nation in Europe can boast of so many orations where this grandeur is attempted, yet perhaps there are few who cannot produce more perfect, although not more laboured compositions of this kind.

But notwithstanding, the French language labours under all these inconveniences; although it can neither equal the dignity or genuine politeness of the Spanish, the nervous boldness of the English, nor the melting softness of the Italian; although it is destitute of poetic harmony, and so much cramped in sound as to be absolutely unfit for almost every species of musical composition, yet the sprightly genius of that volatile people has been able to surmount all these difficulties, and render it the language most generally esteemed, and most universally spoken, of any in Europe, for this people, naturally gay and loquacious, and fond to excess of those superficial accomplishments which engage the attention of the fair sex, have invented such an infinity of words capable of expressing vague and unmeaning compliment, now dignified by the name of politeness, that, in this strain, one who uses the French can never be at a loss; and as it is easy to converse more, and really say less, in this than in any other language, a man of very moderate talents may distinguish himself much more by using this than any other that has ever yet been invented. On this account, it is peculiarly well adapted to that species of conversation which must ever take place in those general and promiscuous companies, where many persons of both sexes are met together for the purposes of relaxation or amusement; and must of course be naturally admitted into the courts of princes, and assemblies of great personages; who, having fewer equals with whom they can associate, are more under a necessity of conversing with strangers, in whose company the tender stimulus of friendship does not so naturally expand the heart to mutual trust or unrestrained confidence. In these circumstances, as the heart remaineth disengaged, conversation must necessarily flag; and mankind in this situation will gladly adopt that language in which they can converse most easily without being deeply interested. On these accounts the French now is, and probably will continue to be, reckoned the most polite language in Europe, and therefore the most generally studied and known: nor should we envy them this distinction, if our countrymen would not weaken and enervate their own manly language, by adopting too many of their unmeaning phrases.

The English is perhaps possessed of a greater degree of excellence, blended with a greater number of defects, than any of the languages we have hitherto mentioned. As the people of Great Britain are a bold, daring, and impetuous race of men, subject to strong passions, and, from the absolute freedom and independence which reigns amongst all ranks of people throughout this happy isle, little solicitous about controlling these passions;—our language takes its strongest characteristic distinction from the

LANGUAGE.

Genius of the people; and, being bold, daring, and abrupt, is admirably well adapted to express those great emotions which spring up in an intrepid mind at the prospect of interesting events. Peculiarly happy too in the full and open sound of the vowels, which forms the characteristic tone of the language, and in the strong use of the aspirate *h* in almost all those words which are used as exclamations, or marks of strong emotions upon interesting occasions, that particular class of words called interjections have, in our language, more of that fulness and unrestrained freedom of tones, in which their chief power consists, and are pushed forth from the inmost recesses of the soul in a more forcible and unrestrained manner, than any other language whatever. Hence it is more peculiarly adapted for the great and interesting scenes of the drama than any language that has yet appeared on the globe. Nor has any other nation ever arrived at that perfection which the English may justly claim in that respect, for however faulty our dramatic compositions may be in some of the critical niceties which relate to this art—in nervous force of diction, and in the natural expression of those great emotions which constitute its soul and energy, we claim, without dispute, an unvalued superiority. Our language too, from the great intercourse that we have had with almost all the nations of the globe by means of our extensive commerce, and from the eminent degree of perfection which we have attained in all the arts and sciences, has acquired a copiousness beyond what any other modern language can lay claim too; and even the most partial favourers of the Greek language are forced to acknowledge, that in this respect it must give place to the English. Nor is it less happy in that facility of construction which renders it more peculiarly adapted to the genius of a free people, than any other form of language. Of an idiom purely analogous, it has deviated less from the genius of that idiom, and possesses more of the characteristic advantages attending it, than any other language that now exists. For, while others, perhaps by their more intimate connection with the Romans, have adopted some of their transpositions, and clogged their language with unnecessary fetters, we have preserved ourselves free from the contagion, and still retain the primitive simplicity of our language. Our verbs are all varied by auxiliaries (except in the instance we have already given, which is so much in our favour): our nouns remain free from the perplexing embarrassment of genders, and our pronouns mark this distinction where necessary with the most perfect accuracy; our articles also are of course freed from this unnatural encumbrance, and our adjectives preserve their natural freedom and independence. From these causes our language follows an order of construction so natural and easy, and the rules of syntax are so few and obvious, as to be within the reach of the most ordinary capacity. So that from this, and the great clearness and distinctness of meaning with which this mode of construction is necessarily accompanied, it is much better adapted for the familiar intercourse of private society, and liable to fewer errors in using it, than any other language yet known; and on this account we may boast, that in no nation of Europe do the lower class of people speak their language with so much accuracy, or have their minds so much enlightened by knowledge, as in Great Britain.

say of the discernment of those grammarians, who are every day echoing back to one another complaints of the poverty of our language, on account of the few and simple rules which it requires in syntax? As justly might we complain of an invention in mechanics, which, by means of one or two simple movements, obvious to an ordinary capacity, little liable to accidents, and easily put in order by the rudest hand, should possess the whole powers of a complex machine, which had required an infinite apparatus of wheels and contrary movements, the knowledge of which could only be acquired, or the various accidents to which it was exposed by using it be repaired, by the powers of an ingenious artist, as complain of this characteristic excellence of our language as a defect.

But if we thus enjoy in an eminent degree the advantages attending an analogous language, we likewise feel in a considerable measure the defects to which it is exposed; as the number of monosyllables with which it must always be embarrassed, notwithstanding the great improvements which have been made in our language since the revival of letters in Europe, prevents in some degree that swelling fulness of sound which so powerfully contributes to harmonious dignity and graceful cadences in literary compositions. And as the genius of the people of Britain has always been more disposed to the rougher arts of command than to the softer insinuations of persuasion, no pains have been taken to correct these natural defects of our language: but, on the contrary, by an inattention of which we have hardly a parallel in the history of any civilized nation, we meet with many instances, even within this last century, of the harmony of sound being sacrificed to that never so desirable in conversation, as many elegant words have been curtailed, and harmonious syllables suppressed, to substitute in their stead others, shorter, indeed, but more barbarous and enigmatical.—Nay, so little attention have our fathers bestowed upon the harmony of sound in our language, that one would be tempted to think, on looking back to its primitive state, that they had on some occasions studiously debased it. Our language, at its first formation, seems to have laboured under a capital defect in point of sound, as such a number of *s*'s enter into the formation of our words, and such a number of letters and combinations of other letters assume a similar sound, as to give a general liss through the whole tenor of our language, which must be exceedingly disagreeable to every unprejudiced ear.—We would therefore have naturally expected, that at the revival of letters, when our forefathers became acquainted with the harmonious languages of Greece and Rome, they would have acquired a more correct taste, and endeavoured, if possible, to diminish the prevalence of this disgusting sound. But so far have they been from thinking of this, that they have multiplied this letter exceedingly. The plurals of almost all our nouns were originally formed by adding the harmonious syllable *en* to the singular, which has given place to the letter *s*; and instead of houses formerly, we now say houses. In like manner, many of the variations of our verbs were formed by the syllable *eth*, which we have likewise changed into the same disagreeable letter; so that instead of loveth, moveth, writeth, walketh, &c. we have changed them into the more modish form of loves, moves, writes, walks, &c. Our very auxiliary verbs

L A N G U A G E .

have suffered the same change; and instead of hath and doth, we now make use of has and does. From these causes, notwithstanding the great improvements which have been made in our language, within these few centuries, in other respects, yet, with regard to the pleasingness of sound alone, it was perhaps much more perfect in the days of Chaucer than at present: and although custom may have rendered these sounds so familiar to our ear, as not to affect us much; yet to an unprejudiced person, unacquainted with our language, we have not the smallest doubt but the language of Bacon or Sidney would appear more harmonious than that of Robertson or Hume. This is indeed the fundamental defect of our language, and loudly calls for reformation.

But notwithstanding this great and radical defect with regard to pleasingness of sounds, which must be sensibly perceived by every one who is unacquainted with the meaning of our words; yet to those who understand the language, the exceeding copiousness which it allows in the choice of words proper for the occasion, and the nervous force which the perspicuity and graceful elegance the emphasis bestows upon it, make the defect to be totally overlooked; and we could produce such numerous works of prose, which excel in almost every different style of composition, as would be tedious to enumerate: every reader of taste and discernment will be able to recollect a sufficient number of writings which excel in point of style, between the graceful and becoming gravity so conspicuous in all the works of the author of the *Whole Duty of Man*, and the animated and nervous diction of Robertson in his history of Charles the Fifth,—the more flowery style of Shaftesbury, or the attic simplicity and elegance of Addison. But although we can equal, if not surpass, every modern language in works of prose, it is in its poetical powers that our language shines forth with the greatest lustre. The brevity to which we must here necessarily confine ourselves, prevents us from entering into a minute examination of the poetical powers of our own, compared with other languages, otherwise it would be easy to show, that every other modern language labours under great restraints in this respect which ours is freed from,—that our language admits of a greater variety of poetic movements, and diversity of cadence, than any of the admired languages of antiquity; that it distinguishes with the greatest accuracy between accent and quantity, and is possessed of every other poetic excellence which their languages were capable of; so that we are possessed of all the sources of harmony which they could boast; and, besides all these, have one superadded, which is the cause of greater variety and more forcible expression in numbers than all the rest; that is, the unlimited power given by the emphasis of quantity and cadence; by means whereof, a necessary union between sound and sense, numbers and meaning, in versification, unknown to the ancients, has been brought about, which gives our language in this respect a superiority over all those justly admired languages. But as we cannot here further pursue this subject, we shall only observe, that these great and distinguishing excellencies far more than counterbalance the inconveniences that we have already mentioned; and although, in mere pleasantness of sounds, or harmonious flow of syllables, our language may be inferior to the Greek, the Latin, Italian, and Spanish;

yet in point of manly dignity, graceful variety, intuitive distinctness, nervous energy of expression, unconstrained freedom and harmony of poetic numbers, it will yield the palm to none. Our immortal Milton, slowly rising, in graceful majesty stands up as equal, if not superior in these respects, to any poet in any other language that ever yet existed;—while Thomson, with more humble aim, in melody more smooth and flowing, softens the soul to harmony and peace: the plaintive moan of Hammond calls forth the tender and sympathetic sigh; while Gray's more soothing melancholy fixes the sober mind to silent contemplation:—more tender still than these, the amiable Shenstone comes; and from his Doric reed, still free from courtly affectation, flows a strain so pure, so simple, and of such tender harmony, as even Arcadian shepherds would be proud to own. But far before the rest, the daring Shakespeare steps forth conspicuous, clothed in native dignity; and, pressing forward with unremitting ardour, boldly lays claim to both dramatic crowns held out to him by Thalia and Melpomene:—his rivals, far behind, look up, and envy him for these unfading glories; and the astonished nations round, with distant awe, behold and tremble at his daring flight. Thus the language, equally obedient to all, bends with ease under their hands, whatever form they would have it assume, and, like the yielding wax, readily receives, and faithfully transmits to posterity, those impressions which they have stamped upon it.

Such are the principal outlines of the language of Great Britain; such are its beauties, and such its most capital defects, a language more peculiarly circumstanced than any that has ever yet appeared.—It is the language of a great and powerful nation, whose fleets surround the globe, and whose merchants are in every port; a people admired or revered by all the world:—and yet it is less known in every foreign country than many of the other languages in Europe. In it are written more perfect treatises on every art and science than are to be found in any other language, yet it is less sought after or esteemed by the literati in any part of the globe than almost any of these. Its superior powers for every purpose of language are sufficiently obvious from the models of perfection in almost every particular which can be produced in it:—yet it is neglected, despised, and vilified by the people who use it; and many of those authors who owe almost the whole of their fame to the excellence of the language in which they wrote, look upon that very language with the highest contempt. Neglected and despised, it has been trodden under foot as a thing altogether unworthy of cultivation or attention. Yet in spite of all these inconveniences, in spite of the many wounds it has thus received, it still holds up its head, and preserves evident marks of that comeliness and vigour which are its characteristic distinction. Like a healthy oak planted in a rich and fertile soil, it has sprung up with vigour: and although neglected, and suffered to be over-run with weeds; although exposed to every blast, and unprotected from every violence; it still beareth up under all these inconveniences, and shoots up with a robust healthiness and wild luxuriance of growth. Should this plant, so sound and vigorous, be now cleared from those weeds with which it has been so much encumbered;—should every obstacle which now buries it under thick shades, and hides it from the view of every eye,

senger, be cleared away; should the soil be cultivated with care, and a strong fence be placed around it, to prevent the idle or the wicked from breaking or distorting its branches;—who can tell with what additional vigour it would flourish, or what amazing magnitude and perfection it might at last attain! How would the astonished world behold, with reverential awe, the majestic gracefulness of that object which they so lately despised!

LANGUAGE. *s.* (*language*, Fr.) 1. Human speech (*Holder*). 2. The tongue of one nation is distinct from others (*Shaksp.*) 3. Style; manner of expression (*Roscommon*).

LANGUAGED. *a.* (from the noun.) Having various languages (*Pope*).

LANGUAGE-MASTER. *s.* One whose profession is to teach languages (*Spectator*).

LANGUEDOC, a late province of France, bounded on the N. by Querci, Rouergue, Auvergne, and Lyons; on the E. by Dauphiny and Provence; on the W. by Gascony; and on the S. by the Mediterranean and Roussillon. It is 225 miles in length, and 100 where broadest. It now forms the departments of Aude, Gard, Upper Garonne, and Herault.

LANGUEMENTE. (*Ital.*) In music, a word implying that the movement before which it is placed is to be sung or played in a soft and dolorous style.

LANGUET (Hubert), minister of state to Augustus elector of Saxony, was a native of France, and through his intimacy with Melancthon embraced the protestant religion. He was at Paris at the time of the bloody massacre of St. Bartholomew, an ambassador from the elector, and narrowly escaped with his own life, after saving that of Wichelius the printer, in whose house he lodged, and the famous Philip de Mornay. He was employed in several other embassies: but when the dispute broke out between the lutherans and zuinglians concerning the eucharist, he was suspected of favouring the latter, which occasioned him to quit the elector and go to Prague. He afterwards entered into the service of William prince of Orange. He died at Antwerp in 1581.

LANGUET (John Baptist Joseph), the celebrated vicar of St. Sulpice at Paris, and a doctor of the Sorbonne, was born at Dijon in 1675. He was received into the Sorbonne, in 1698; and attached himself to the community of St. Sulpice, to which parish he was of great service. M. de la Chetardie the vicar, conscious of his talents, chose him for his curate, in which capacity he officiated near 10 years: and in 1714 succeeded to the vicarage. His parish-church being small and out of repair, he conceived the design of building a church suitable to the size of this parish, which he began with the sum of 100 crowns, but soon obtained considerable donations; and the duke of Orleans, regent of the kingdom, granted him a lottery, and laid the first stone of the porch in 1718. It was consecrated in 1745, after M. Languet had spared neither labour nor

expence to render it one of the finest churches in the world both for architecture and ornament. Another work which did him no less honour was the *Maison de l'enfant Jesus*. This establishment consisted of two parts; the first composed of about 35 poor ladies of good families, and the second of more than 400 poor women and children of town and country. The order and economy in this house, for the education and employment of so many persons, gave cardinal Fleury so high an idea of the vicar of St. Sulpice, that he proposed to make him superintendent-general of all the hospitals in the kingdom; which, however, was declined. Never man took more pains than he did to procure charitable donations and legacies, which he distributed with admirable discretion: he is said from good authority to have disbursed near million of livres to the poor annually. When there was a general dearth in 1725, he sold, in order to relieve the poor, his household goods, pictures, and some curious pieces of furniture that he had procured with difficulty; and when the plague raged at Marseilles, he sent large sums into Provence for the relief of the distressed. M. Languet was not only singular in this warm, disinterested, benevolent conduct, but also in another circumstance equally rare; and this was in the refusal of several bishoprics that were offered him: he resigned even his vicarage in 1748; but continued to preach every Sunday at his own parish-church, and to support the *Maison de l'enfant Jesus*, to his death, which happened in 1750. It is observed, that his piety and charity did not proceed from poverty of talents; for he was sensible and lively in conversation, and his genius often discovered itself in his agreeable repartees.

LANGUET. *s.* (*languette*, Fr.) Anything cut in the form of a tongue.

LANGUID. *a.* (*languidus*, Latin.) 1. Faint; weak; feeble (*Bentley*). 2. Dull; heartless (*Addison*).

LANGUID. *s.* (from *languid*.) Weakness; feebleness; want of strength.

LANGUIDLY. *ad.* Weakly; feebly (*Boyle*).

TO LANGUISH. *v. n.* (*languir*, French; *languere*, Latin.) 1. To grow feeble; to pine away; to lose strength (*Dryden*). 2. To be no longer vigorous in motion (*Dryden*). 3. To sink or pine under sorrow (*Shaksp.*) 4. To look with softness or tenderness (*Dryden*).

LANGUISH. *s.* (from the verb.) Soft appearance (*Pope*).

LANGUISHINGLY. *ad.* (from *languishing*.) 1. Weakly; feebly; with feeble softness (*Pope*). 2. Dully; tediously (*Sidney*).

LANGUISHMENT. *s.* (*languishment*, Fr.) 1. State of pining (*Spenser*). 2. Softness of mien (*Dryden*).

LANGUOR. *s.* (*languor*, Latin.) 1. Faintness; wearisomeness (*Shakespeare*). 2. Listlessness; inattention (*Watts*). 3. Softness; laxity (*Dunoiad*).

LANGUOROUS. *a.* (*languoreus*, French.) Tedious; melancholy: not in use (*Spenser*).

LANHAM. See **LAVENHAM**.

LANIARD (from *lanier*, Fr.) a short piece of cord or line fastened to several machines in a ship, and serving to secure them in a particular place, or to manage them more conveniently. Such are the laniards of the gun-ports, the laniards of the gun-ports, the laniard of the buoy, the laniard of the cat-hook, &c.

LA'NIFICE. *s.* (*lanificium*, Latin.) Wool-len manufacture (*Bacon*).

LAN'IGEROUS. *a.* (*laniger*, Latin.) Bearing wool.

To LA'NITE. *v. a.* (*lanto*, Latin.) To tear in pieces; to rend; to lacerate.

LANIUS. Shrike. In zoology a genus of the class aves, order accipies. Bill straightish, with a tooth on each mandible near the end, naked at the base; tongue jagged at the end. The birds of this genus are generally noisy and quarrelsome; prey on smaller birds which they tear to pieces, sticking the fragments on thorns; nostrils generally round, covered with stiff bristles; toes divided to the origin, except the middle toe, which is slightly connected to the outer; tail mostly wedge-shaped, the middle rising higher than the rest, and the sides doubled down. Fifty-six species scattered over the globe, of which two only are common to our own country. We shall commence the following examples with a description of them.

1. **L. Excubitor.** Great Shrike. Three varieties:

a. Tail wedged; white at the sides; back hoary; wings black with a white spot.

b. Body white; legs yellowish; bill and claws blackish.

c. Smaller wing-coverts and shoulders reddish. In all the bill and legs are black; crown and neck hoary; body beneath white with pale brown arched lines; tail white at the tip, except the two middle feathers; cheeks white with a black transverse line from the base of the bill. Inhabits woods of Europe and North America; preys on small birds which it fixes on a thorn and tears to pieces; makes it nest of dry grass and feathers; lays seven blueish eggs spotted with brown.

2. **L. Collurio.** Five varieties:

a. Tail somewhat wedged; back grey; four middle feathers uniform; bill lead-colour. Common to England and called *Butcher Bird*.

b. Body above variegated with reddish white and black, beneath reddish-white. Common to England, and called *Wood-chat*.

c. Body grey, beneath reddish with brown streaks; scapulars half white, half black: three outer quill feathers white at the base and tips, the outermost reddish-white above; inhabits Europe.

d. Base of the quill-feathers spotted with white.

e. Head black; tail long. The two last

inhabitants of Senegal. These birds are seven and a half inches long: build in bushes and hedges; lay six eggs with a circle of brown near the broad end; kill small birds by piercing the skull with its bill, and insects by transfixing them on the thorn of the sloe-tree; imitates the notes of other birds, that it may decoy them into its clutches.

3. **L. Tyrannus.** Tyrant Shrike. Body cinereous, beneath white; crown black, with a longitudinal tawny streak. Three other varieties from differences of colour or streaks. Inhabits America: eight inches long; builds in hollow trees; fierce audacious; fixes on the backs of eagles and hawks; and makes a continual chattering noise till they are hereby compelled to retire.

4. **L. Faustus.** Wreathed Shrike. Grey; beneath rusty; a white line behind the eyes; tail rounded; bill and legs pale; wings rounded; quill-feathers brownish, grey at the edges, and marked with light-brown lines, crossing each other; inhabits China, of the size of the field-fare; and is often painted on paper-hangings brought from China.

5. **L. Nengota.** Grey Shrike. Tail wedged, white at the tip; body cinereous, beneath whitish: irides light green; wings and tail blackish; wing-coverts black with dirty white tips; primary quill-feathers black; outer tail-feathers white at the ends. Inhabits Brasil, Surinam, Russia and Siberia, in marshy places; nine inches long, gregarious. See Nat. Hist. Pl. CXLVII.

LANK. *a.* (*lancke*, Dutch.) 1. Loose; not filled up; not stiffened out; not fat; not plump; slender (*Boyle*). 2. Faint; languid (*Milton*).

LAN'KNES. *s.* (from *lank*.) Want of plumpness.

LANNER, in Ornithology. See **FALCO**.

LANSQUINET, the name of a game at cards, of French origin. It may be played at by any indiscriminate number of people, though a single pack of cards is used during the deal. The dealer, who possesses an advantage, shuffles the cards, and, after they have been cut by another of the party, deals out two cards on his left hand, turning them up then one for himself, and a fourth that he places on the table for the company, which is called the *rejouissance*. On this card any, or all the company, the dealer excepted, may put their money, which the dealer is compelled to answer. The dealer continues turning the cards upwards, one by one, till two of a sort come up, that is to say, two aces, two deuces, &c. which, to prevent mistakes, or their being considered as single cards, he places on each side of his own card; and as often as two, three, or the fourth sort of a card come up, he invariably places them, as before mentioned, on each side of his own card. The company has a right to take and put money upon any single card, unless

The dealer's card should happen to be double, which is often the case, by his card being the same as one of the two hand-cards, which he first dealt out on his left hand: thus he continues dealing till he brings either their cards or his own. Whilst the dealer's own card remains undrawn, he wins; and whichever card is turned up first, loses. If he deals out the two cards on his left hand, which are styled the *hand-cards*, before his own, he is entitled to deal again. This advantage amounts to no more than his being exempted from losing, when he turns up a similar card to his own, immediately after he has turned up one for himself.

Lansquinet is often played without the *rejouissance*, the dealer giving every one of the party a card to put their money upon. It is also often played by dealing only two cards, one for the company and the other for the dealer.

It should likewise be observed, that a limitation is generally fixed for the sum to be placed upon any card or number of cards, either in gold or silver, beyond which the dealer is not obliged to answer.

LANSQUINET, is also the name sometimes given to a common foot soldier.

LANTANA. Indian-sage. In botany a genus of the class didynamia, order angiospermia. Calyx absolutely four-toothed; corol with the border four-cleft, and the orifice pervious; stigma bent down like a hook; drupe with a two-celled, smooth nut. Fifteen species: chiefly natives of America, a few of India and the Cape. The following are those chiefly cultivated in our own gardens

1. L. Camara. Wild sage. Leaves opposite, decussate, ovate, pointed, serrate, hairy; stem unarmed, branched; flowers in umbelled heads; heap leafless; colour of the flowers yellow-tinged with red, very beautiful.

2. L. Involucrata. Sea-side sage. Leaves, opposite and ternate, rhombosate, obtuse, wrinkled, downy; stem unarmed; heads bractes ovate. The leaves have an agreeable fragrance and are used as a demulcent, in catarrhs, and coryzas.

3. L. Aculeata. Prickly sage. Leaves opposite, ovate, some of them cordate, rather soft underneath; stem prickly; heads hemispheric; bractes linear, wedge-form: flowers yellow, imbecent. All American plants; and capable of propagation by seeds or cuttings: the last requires a stone heap in our own country.

LANTERLOO, or Loo, a game at cards, played several ways: the two following are the most common.

The first way is this: lift for dealing, and the best put carries it: as many may play as the cards will permit; five being dealt to each, and then turning up trump. Now, if three, four, five, or six play, they may lay out the threes, fours, fives, sixes, and sevens, to the intent they may not be quickly loosed; or if they would have the loos

come fast about, then they are to play with the whole pack.

Having dealt, set up five scores, or chalks. Then ask every one, beginning with the eldest in hand, whether they will play, or pass from the benefit of the game; and here it is to be observed that the cards have the same values as in honours. You may play upon every card what sum you please, from a penny to a pound; and if loosed, that is, win never a trick, you must lay down to the stock so much for your five cards, as you played upon every one of them. Every deal rub off a score, and for every trick you win set up a score, till the first scores are out; then counting your scores, or the numbers of the tricks you have won, you are to take from the stock in proportion to the value. A flush, or five cards of a suit, looses all the other hands, and sweeps the board; and if there be two flushes, the eldest in hand hath the advantage: the knave of clubs, called paam, has this privilege, that he makes a suit with any other cards, and saves the person who has him from being loosed.

The other way is this: the dealer lays down so much for every card as the company please to play for; and the cards being dealt, all must play; if any be loosed, they must each lay down so much as the cards are valued at, for their loo; and if the person next dealing be loosed, he must lay down double the said sum, viz. one for dealing, and the other for his loo. In case of a loo, the gamesters are asked whether they will play or not, beginning at the eldest hand; but if there is no loo they must all play as at first; and this necessity they justly call force.

If there be never a loo the money may be divided by the gamesters, according to the number of their tricks, or left till one be loosed, as they shall judge proper.

LANTERN, or LANTHORN, a contrivance to carry a candle in; being a kind of cover usually made of tin, with sashes of some transparent matter, as glass, horn, &c. to transmit the light.

LANTERN, Dark, one with only one opening, which may also be closed up when the light is to be entirely hid, or opened when there is occasion for the assistance of the light to discover some object.

LANTERN, magic, an optic machine, whereby little painted images are represented so much magnified as to be accounted the effect of magic by the ignorant. See OPTICS.

The contrivance is briefly this: A B C D (Plate 93. Miscel. fig. 9.) is a tin lantern, from whose side there proceeds a square tube *b n k l m c*, consisting of two parts; the outermost of which, *n k l m*, slides over the other so as that the whole tube may be lengthened or shortened by that means. In the end of the arm, *n k l m*, is fixed a convex glass, *k l*; about *d e* there is a contrivance for admitting and placing an object, &c. painted in dilute and transparent co-

LAN

lours, on a plane thin glass; which object is there to be placed inverted. This is usually some ludicrous or frightful representation, the more to divert the spectators; *b h c* is a deep convex glass placed in the other end of the prominent tube, the only use of which is to cast the light of the flame, *a*, strongly on the picture, *d e*, painted on the plain thin glass. Hence, if the object, *d e*, be placed further from the glass, *k l*, than its focus, it is manifest that the distinct image of the object will be projected by the glass, *k l*, on the opposite white wall, *F H*, at *f g*; and that in an erect posture: so that, in effect, this appearance of the magic lantern is the same with that of the camera obscura, or darkened room; since here the chamber, *E F G H*, is supposed quite dark, excepting the light in the lantern *A B C D*. And here we may observe, that if the tube *b n k l m c*, be contracted, and thereby the glass, *k l*, brought nearer the object, *d e*, the representation, *f g*, will be projected so much the larger, and so much the more distant from the glass *k l*; so that the smallest picture at *d e* may be projected at *f g* in any greater proportion required, within due limits: whence it is, that this lantern got the name *lanterna megalographica*. On the other hand, protracting the tube will diminish the object.

Instead of the convex glass to heighten the light, some prefer a concave speculum, its focus being nearer than that of a lens; and in this focus they place the candle.

The invention of the magic lantern is due to Father Kircher. At the epoch of the invention the manufacturers of magic lanterns employed exclusively figures painted on small pieces of glass, the images of which appeared without motion and without life. Afterwards, figures were traced partly on glass, which was to be fixed and partly on other pieces of glass, which admitted of a motion either rectilinear or rotary, and thus to give the appearance of motion to part of a figure, while the other was at rest, as in the vanes and body of a windmill. But the most important application of the principle is to the PHANTASMATOPHORIA: which see.

LANTEARN, in architecture, a little dome raised over the roof of a building to give light, and serve as a crowning to the fabric. The term *lantern* is also used for a square cage of carpentry, placed over the ridge of a corridor or gallery, between two rows of shops, to illumine them, like that of the Royal-exchange, London.

LANTEARN, on ship-board, a well-known machine, of which there are many in a ship, particularly for the purpose of directing the course of other ship in a fleet or convoy: such are the poop and top lanterns, &c.

LANTERNS, Feast of, in China, is a celebrated feast held on the 15th day of the first month; so called from the infinite number of lanterns hung out of the houses and

LAO

streets; which, it is said, is no less than two hundred millions.

LA'NTERN Fly, in Entomology. See FULGORA; LA'NTERN jaws. A thin visage (Addition); LANUGINOUS. *a.* (*lanuginous*, Latin.) Downy; covered with soft hair.

LANUGO. Down. In botany. *Pili molles plantarum partes vestientes*. Soft hairs clothing the parts of plants.

LAOCOON, in fabulous history, a son of Priam and Hecuba, or according to others, of Antenor or of Capys, was priest of Apollo. When sacrificing a bullock to Neptune, two enormous serpents issued from the sea, and attacked Laocoon's two sons who stood next to the altar. The father immediately attempted to defend his sons, but the serpents seizing him, squeezed him in their complicated wreathes, and he died in the greatest agonies. This punishment was inflicted for his temerity in dissuading the Trojans to bring into the city the fatal wooden horse consecrated to Minerva, as also for his impiety in hurling a javelin against the sides of the horse as it entered within the walls.

LAOCOON, in the History of the Arts, is a celebrated monument of Greek sculpture, executed in marble by Polydorus, Athenodorus and Agesander, the three famous artists of Rhodes. This remain of antiquity was found at Rome in the ruins of the palace of Titus, in the beginning of the sixteenth century, under the pontificate of Julius II. and since deposited in the Farnese palace. Laocoon, the priest of Apollo and Neptune, is here represented with his two sons, with two hideous serpents clinging round his body, gnawing it, and injecting their poison: Virgil has given us the following description of the fact;

*Serpens amplexus uterque
Implicat & miseris morsu depascitur artus:
Corripuit, spirisque ligant ingentibus, & jam
Bis medium amplexit, bis collo squamea circum
Terga dati, superant capite, & cervicibus
altis*

This statue exhibits the most astonishing dignity and tranquillity of mind in the midst of the most excruciating torments: Pliny says of it, that it is, *opus omnibus, pictura & statuariae artis, preferendum*. Lib. xxxvi. c. 5.

The Laocoon, Dr. Gillies observes in his History of Greece, vol. ii. p. 177, may be regarded as the triumph of Grecian sculpture; since bodily pain, the grossest and most ungovernable of all our passions, and that pain united with anguish and torture of mind, are yet expressed with such propriety and dignity, as afford lessons of fortitude superior to any taught in the schools of philosophy. The horrible shriek which Virgil's Laocoon emits is a proper circumstance for poetry, which speaks to the fancy by images and ideas borrowed from all the senses, and has a thousand ways of embellishing its object; but the expression of this

shriek would have totally degraded the statue. It is softened, therefore, into a patient sigh, with eyes turned to heaven in search of relief. The intolerable agony of suffering nature is represented in the lower part, and particularly in the extremities of the body; but the manly breast struggles against calamity. The contention is still more plainly perceived in his furrowed forehead; and his languishing paternal eye demands assistance, less for himself than for his miserable children, who look up to him for help.

Again, Thomson, in Part IV. of his poem on "Liberty," has the following lines, describing what he calls Sculpture's "utmost master-piece:"

— The miserable sire,
Wrapt with his sons in fate's severest grasp.
The serpents, twisting round, their stringent folds

Inextricable tie. Such passion here!
Such agonies! such bitterness of pain!
Seems so to tremble thro' the tortur'd stone,
That the touch'd heart engrosses all the view.

Almost unmark'd the best proportions pass
That ever Greece beheld; and, seen alone,
On the rapt eye th' imperious passions seize;
The father's double pangs, both for himself
And sons convuls'd; to heav'n his rueful look,

Imploring aid, and half-accusing, cast;
His fell despair with indignation mixt,
As the strong-curling monsters from his side
His full-extended fury cannot tear.
More tender touch'd, with varied art, his sons

All the soft rage of younger passions show;
In a boy's helpless fate one sinks oppress'd,
While, yet unpierc'd, the frightened other tries

His foot to steal out of the horrid twine.

When Italy was over-run by the French, during the late Revolution, this admirable specimen of ancient genius was removed, along with the celebrated Apollo Belvidere, &c. from the Vatican, where they had been for 300 years, and placed in the Museum of Arts at Paris. The group is tolerably well preserved, the deficiencies being supplied by plaster of Paris.

LAODAMIA, in fabulous history, a daughter of Acastus and Astydamia, married Protesilaus, the son of Iphiclus, king of a part of Thessaly. The departure of her husband for the Trojan war, and his death from the hand of Hector, was the source of great grief to her. To keep alive the memory of her husband, she ordered a wooden statue to be made, and regularly placed in her bed. This was seen by one of her servants, who informed Iphiclus, that his daughter's bed was daily defiled by an unknown stranger. Iphiclus watched his daughter, and when he found that the intelligence was false, he ordered the wooden image to be burned, in hopes of dissipating

his daughter's grief. He did not succeed. Laodamia threw herself into the flames with the image, and perished. This circumstance has given occasion to the fabulous tradition that Protesilaus was restored to life, and to Laodamia for three hours, and that when he was obliged to return to the internal regions, he persuaded his wife to accompany him. (*Virg.*)—2. A daughter of Bellerophon, by Achemone, the daughter of king Iobates. She had a son by Jupiter, called Sarpedon. She dedicated herself to the service of Diana, and hunted with her, but her haughtiness proved fatal to her, and she perished by the arrows of Diana. (*Homer.*)—3. A daughter of Alexander, king of Epirus, by Olympia, the daughter of Pyrrhus.

LAODICE. There are many illustrious women of this name recorded in ancient history, the most remarkable of whom are the following.—A daughter of Priam and Hecuba, who became enamoured of Acamas, son of Theseus, when he came with Diomedes from the Greeks to Troy, with an embassy to demand the restoration of Helen. She had a son by Acamas, whom she called Munitus. She afterwards married Helicaon, son of Antenor, and Telephus, king of Mysia. Some call her Astyoche. Laodice threw herself down from the top of a tower, and was killed when Troy was sacked by the Greeks. *Dictys Cret. Paus. (Homer.)*—A sister of Mithridates, who married Ariarathes, king of Cappadocia, and afterwards her own brother Mithridates. During the secret absence of Mithridates, she prostituted herself to her servants, in hopes that her husband was dead, but when she saw her expectations frustrated, she attempted to poison Mithridates, for which she was put to death.—3. The mother of Seleucus. Nine months before she brought forth, she dreamt that Apollo had introduced himself into her bed, and had presented her with a precious stone, on which was engraved the figure of an anchor, commanding her to deliver it to her son as soon as born. This dream appeared the more wonderful, when in the morning she discovered in her bed a ring answering the same description. Not only the son that she brought forth called Seleucus, but also all his successors of the house of the Seleucida, had the mark of an anchor upon their thigh. (*Justin.—Appian in Syr.*) mentions this anchor, though in a different manner.

LAODICEA, a name common to four cities in Asia, the most remarkable of which is that situate on the borders of Caria, Phrygia, and Lydia, so called from Laodice, the wife of Antiochus. It was celebrated for its commerce and fine wool of its sheep. It was originally called Diospolis, and afterwards Rhoss.

LAODICENE, a province of Syria, which receives its name from Laodicea, its capital.

LAODICHUS, a son of Antenor, whose form Minerva borrowed to advise Pandarus

L A P

to break the treaty between the Greeks and Trojans.

LAOMEDON, son of Ilus, king of Troy, was father to Podarces, afterwards known by the name of Priam, and Hesione. He built the walls of Troy, assisted by Apollo and Neptune. When the walls were finished Laomedon refused to reward the labours of the gods, and soon after his territories were laid waste by the sea, and his subjects were visited by a pestilence. Sacrifices were offered to the offended divinities, but nothing could appease the gods, according to the oracle, but annually to expose to a sea monster a Trojan virgin. This victim was decided by lot and when the calamity had continued for five or six years, the lot fell upon Hesione, Laomedon's daughter. In the midst of Laomedon's fears for the fall of his daughter, Hercules came and offered to deliver the Trojans from this calamity, if Laomedon promised to reward him with a number of fine horses. The king consented, but when the monster was destroyed, he refused them. Hercules was obliged to besiege Troy, and take it by force of arms. Laomedon was put to death, after a reign of 29 years.

LAON, a town of France, in the department of Aisne, with a castle, and lately a bishop's see. Its principal trade consists in corn and wine; and it is noted for excellent artichokes. It is seated on a mountain, 77 miles N. E. of Paris. Lon. 3. 43. E. Lat. 49. 34. N.

LAOS, a kingdom of Asia, bounded on the N. by China, on the E. by Tonquin and Cochinchina; on the S. by Cambodia, and on the W. by Burmah. It is full of forests, and abounds in rice and fruits. The inhabitants are well made robust, of an olive complexion, and mild; but very superstitious, and much addicted to women. Their principal occupation is tilling the ground and fishing. The king is absolute, and has no other law than his own will: he shows himself but twice a year, and has a large revenue from elephants' teeth found in his dominions. Their religion is much the same as in China. Lanjan is the capital.

LAP. *s.* (lappē, Saxon.) 1. The loose part of a garment, which may be doubled at pleasure (*Swift*). 2. The part of the clothes that is spread horizontally over the knees as one sits down, so as any thing may lie on it (*Shakspeare*).

To **LAP.** *v. a.* (from the noun.) 1. To wrap or twist round any thing (*Newt.*) 2. To involve in any thing (*Swift*).

To **LAP.** *v. n.* To be spread or turned over any thing (*Grew*).

To **LAP.** *v. n.* (lappian, Saxon.) To feed by quick reciprocations of the tongue (*Digby*).

To **LAP.** *v. a.* To lick up (*Chapman*).

LAPATHICIS (from λαπαζω, to evacuate.) Purgative medicines.

LA'PATHUM, (*Lapatham*, *f.* *α. λαπάθον*;

L A P

from λαπαζω, to evacuate; so named because it purges gently.) The dock.

LA'PATHUM ACETOSUM. Common sorrel. See **ACETOSA**.

LA'PATHUM ACUTUM. See **OXYLAPATHUM**.

LA'PATHUM AQUATICUM. See **HYDROLAPATHUM**.

LA'PDOG. *s.* (*lap* and *dog*.) A little dog, fondled by ladies in the lap (*Dryden*).

LAPEIROUSIA. In botany, a genus of the class syngenesia, order polygamia frutranæa. Receptacle naked, rough, with small protuberances; downless, or a thin margin; flowers without ray. One species, a shrubby plant of the Cape, erect with terminal, solitary, sessile flowers.

LA'PFUL. *s.* (*lap* and *full*.) As much as can be contained in the lap (*Locke*).

LA'PICIDE. *s.* (*lapicida*, Latin.) A stone-cutter.

LA'PIDARY, *Lapidarius*, an artificer, who cuts precious stones.

The art of cutting precious stones is very ancient; but, like other arts, its original was very imperfect. The French have succeeded in it the best; and the lapidaries of Paris, who have been a corporation since the year 1290, have carried it, especially the cutting of diamonds called brilliants, to a very great perfection, but not superior to that of the English.

There are various machines used in the cutting of precious stones, according to the quality of the matter to be cut: the diamond, which is extremely hard, is cut and formed on a wheel of soft steel, turned by a kind of mill, with diamond dust tempered in oil of olives; and this serves to polish them as well as to cut them.

Oriental rubies, sapphires, and topazes, are cut and formed on a copper wheel, with oil of olives, and diamond dust: they are afterwards polished on another copper wheel with tripoli and water.

Emeralds, hyacinths, amethysts, garnets, agats, and other stones less hard, are cut on a leaden wheel, with smalt and water, and polished on a tin wheel with tripoli.

Turquois, of the old and new rock, lapis girasol, and opal, are cut and polished on a wooden wheel with tripoli.

LA'PIDARY is also used for a virtuoso skilled in the nature, kinds, &c. of precious stones; or a merchant who deals in them.

LA'PIDARY style, denotes the style proper for monumental or other inscriptions.

This is a kind of medium between prose and verse; the jejune and the brilliant are here equally to be avoided. Cicero has prescribed the rules of it: *Accedat oportet oratio varia, vehemens, plena spiritus. Omnium sententiarum gravitate, omnium verborum ponderibus, est utendum.*

The lapidary style, which was lost with the ancient monuments, was retrieved, at the beginning of this age, by count Emanuel Tesoro: it is now used various ways at the beginning of books; and even

epistles dedicatory are composed in it, which we have no example among the ancients.

To LA'PIDATE. *v. a.* (*lapido*, Lat.) To stone; to kill by stoning.

LAPIDATION. *s.* (*lapidatio*, Latin; *lapidation*, French.) A stoning.

LAPIDES CANCROSUM. See CANCER.

LAPIDEOUS. *a.* (*lapideus*, Lat.) Stony; of the nature of stone (*Ray*).

LAPIDESCENT. *s.* (*lapidesco*, Latin.) Stony concretion (*Brown*).

LAPIDESCENT. *a.* (*lapidescens*, Latin.) Growing or turning to stone.

LAPIDIFIC. *a.* (*lapidifique*, Fr.) Forming stones (*Grew*).

LAPIDIFICATION. *s.* (*lapidification*, Fr.) The act of forming stones (*Saon*).

LA'PIDIST. *s.* (from *lapidis*, Latin.) A dealer in stones or gems (*Ray*).

LAPIS, in general, is used to denote a stone of any kind.

LAPIS, in Roman antiquity, a geographical measure denoting a mile; because miles were distinguished by erecting a stone at the end of each; from the number marked on which, the length of way from Rome might be known. The device is by Plutarch ascribed to Caius Gracchus. This was more accurately executed by Augustus, who erected a gilt pillar in the Forum, at which all the public ways of Italy, distinguished by stones, were terminated. The same thing was done in the Roman provinces. Hence the phrases *tertius lapis*, *centesimus lapis*, &c. for three, a hundred, &c. miles; and sometimes the ordinal number without *lapis*, as *ad duodecimum*, &c. at 12 miles distance.

LAPIS ASSIUS, in the natural history of the ancients, the name of a stone called also *sarcophagus*, from its power of consuming flesh. See *SARCOPHAGUS*.

LAPIS BONONIENSIS. BONONIAN or BOLOGNA-Stone, in mineralogy a species of BARYTES, which is also BONONIAN-STONE.

LAPIS BEZOAR. See BEZOAR.

LAPIS CERULEUS. See LAPIS LAZULI.

LAPIS CALAMINARIUS. See CALAMIN-STONE.

LAPIS CYANUS. See LAPIS LAZULI.

LAPIS HEMATITES. See HEMATITES.

LAPIS HYBERNICUS. *Tegula hybernica*. *Arctia hibernica*. *Hardata*. Irish slate. Kind of slate or very hard stone found in great parts of Ireland, in a mass of a deep black colour, which stains the hands, when dried and powdered it is pale, or of a whitish blue, and by keeping grows black. In the fire it yields a sulphureous gas, and acquires a pale red colour, with additional hardness. It is occasionally powdered by the common people, and taken in spruce beer, against inward bruises.

LAPIS STYACIUS. See BEZOAR PORCINUS.

LAPIS INTERMEDIUS. See LALIFERUS.

LAPIS LAZULI. *Lapis cyanus*. Azure stone. A combination of silice, the blue flint of lime and sulphat of lime, and iron. This singular mixture forms a stone of a beautiful opaque blue, which it preserves in a strong heat, and does not suffer any alteration by the contact of air. It was formerly exhibited as a purgative and vomit, and given in epilepsy. See LAZULUS.

LAPIS MALACENSIS. See BEZOAR PORCINUS.

LAPIS PORCINUS. See BEZOAR PORCINUS.

LAPIS SIMILE. See BEZOAR SIMILE.

LAPITHÆ, a people of Thessaly.

LAPITHUS, in fabulous history, a son of Apollo, by Stilbia. He was brother to Centaurus and married Orsinome, daughter of Euronymus, by whom he had Phorbas and Periphas. The name of Lapithæ was given to the numerous children of Phorbas and Periphas. The chief of the Lapithæ assembled to celebrate the nuptials of Pirithous, one of their number. The Centaurs were invited to partake of the festivity, one of whom being intoxicated, offered violence to Hippodamia, the bride of Pirithous. A general quarrel ensued, in which many of the Centaurs were slain, and they at last were obliged to retire. Theseus among the Lapithæ, shewed himself brave and intrepid in supporting the cause of his friends, and Nestor also was not less active in the protection of chastity and innocence. The invention of bits and bridles for horses is attributed to the Lapithæ.

LAPLAND, a country of Europe, bounded on the N. by the North Sea and the Frozen Ocean, on the E. by the White Sea, on the S. by Sweden and the gulf of Bothnia, and on the W. by Norway. It is situate between 62 and 75. of N. lat. comprehending, on the most northern side of it, the frozen Alps, or Alps of Snow. These Alps compose the summit of that chain of mountains called Severnoi, whose declivity toward the E. and S. consists of lower mountains, deserts, forests, seas, and lakes. Swedish Lapland occupies the S. division of this country, which is the largest; Russian Lapland is situate in the E. part; and Danish Lapland, which is the smallest, extends the whole length of the Severnoi, on their northern side. The Laplanders are of a middling stature; stout, straight, and of a yellowish complexion, occasioned by the weather, the smoke of their habitations, and their habitual filthiness. They have generally a flat face, fallen cheeks, dark gray eyes, thin beard, and brown hair. Their manner of life renders them hardy, agile, and supple, but, at the same time, much inclined to laziness. They are docile, obedient to their superiors, cheerful in company, but mistrustful, cheats in commerce, and so proud of their country and constitution, that, when removed from the place of their activity, they usually die of the scurvy.

L A P L A N D.

or longing to return. Their women are short, often well made, complaisant, chaste, and of weak nerves; which is also observable sometimes among the men. The language of the Laplanders comprehends so many dialects, that it is with difficulty they understand each other. The men are divided into Fishers and Mountaineers. The former make their habitations in the neighbourhood of some lake, whence they draw their subsistence. The others seek their support upon the mountains, possessing herds of reindeer, which they use according to the season; but they go generally on foot. They are very industrious herdsmen, and are rich in comparison of the fishers. Some of them possess six hundred or a thousand reindeer; and they castrate the superfluous males by crushing the testicles with their teeth. The Lapland fishers, who are also called Laplanders of the woods (because in summer they dwell upon the borders of the lakes, and in winter in the forests) live by fishing and hunting, and choose their situation from its convenience for either. Beside looking after their reindeer, the fishery, and the chase, the men employ themselves in the construction of their canoes, which are little, light, and compact. They also make sledges, to which they give the form of a canoe; harness for the reindeer; all sorts of utensils in wood, such as cups, bowls, &c. which are sometimes prettily carved, sometimes ornamented with bones, brass, or horn: it is the man's business, likewise, to look after the kitchen. The employment of the women consists in making nets for the fishery, drying fish and meat, milking the reindeer, making cheese, and tanning hides. They prepare the nerves of the reindeer in such a manner as to make them serve for thread; and draw brass wire by the help of the horns of the reindeer pierced, instead of a drawing iron. They embroider their clothes with brass wire, silver, sham gold, or wool, which they have the art of dying in all sorts of colours. These people live in huts in the form of tents, covered with briars, bark, linen, turf, coarse cloth, felt, or reindeer-skin; and the door is of felt, made like two curtains, which open asunder. They are not able to stand upright in these huts, but constantly sit upon their heels round the fire. At night they lie down quite naked, and to separate the apartments, place upright sticks at small distances. They cover themselves with their clothes, and in winter put their feet into a fur bag. Their household furniture consists of iron or copper kettles, wooden cups, bowls, spoons, and sometimes tin, or even silver basins; to these may be added their implements of fishing and hunting. That they may not be obliged to carry such a number of things with them in their excursions, they build, at certain distances, in the forests, little huts made like pigeon-houses,

and placed upon the trunk of a tree cut off at about the height of six feet from the root. In these elevated huts they keep their goods and provisions; and though they are never shut, yet are they never plundered. In their dress they use no linen. The men wear close breeches, reaching down to their shoes, which are made of untanned skin, pointed, and turned up before; and, in winter, they put a little hay in them. Their doublet is made to fit their shape, and open at the breast; over this they wear a close coat, the skirts of which reach down to the knees, and it is fastened round them by a leathern girdle, ornamented with plates of tin or brass. To this girdle they tie their knives, their instruments for getting fire, and their smoking apparatus. Their clothes are made of fur, leather, or cloth; always bordered with fur, or cloth of different colours. Their caps are edged with fur, pointed at top, and the four seams adorned with lists of a different colour. The Russian Laplanders generally border their caps with ratskins. The women wear breeches, shoes, doublets, and close coats, like the men; but their girdle is commonly embroidered with brass wire. Beside these, they wear kerchiefs, and little aprons, made of Russian painted cloth, rings on their fingers, and ear-rings, to which they sometimes hang chains of silver, which pass two or three times round the neck. They sometimes wear caps folded after the manner of turbans; and sometimes caps to the shape of the head; but all are ornamented with the embroidery of brass wire, or with list of different colours. The reindeer supply the Laplanders with the greatest part of their provisions; the chase and the fishery furnish the rest; but the flesh of the bear is their most delicate meat. Their common drink is water, sometimes mixed with milk: brandy is scarce with them; but they are very fond of it. Their considerable traffic is with the Norwegians, and the balance is always in favour of the Laplanders; because they can furnish more skins and furs than they buy flour, cloth, and hardware goods. All the money, which they have not immediate occasion for, they bury in the earth, as well as their plate, and whatever they think of value. Nor even at the point of death do they declare the spot where it is hidden, imagining that they shall want it in the other world. Sterility is a reproach among the women. They are generally delivered without difficulty; the husband assists at the labour, and affords his wife the necessary help. Their cradle is small, light, and made in the shape of a canoe; and, in their journeys, the women carry it at their backs. Their weddings are kept at the bride's house, who appears with her head quite uncovered, which, at other times, is never the custom with either women or maidens: the feast is a kind of

club-mess, to which each of the ^{guests} brings meat and drink. Their diversion, at weddings and other merry-makings, is the game of fox and geese: they wrestle and jump over a stick; and are fond of giving grotesque accounts of different adventures. They likewise dance and sing, or rather howl in disagreeable measures. All the Swedish and Norwegians, as well as the greatest number of the Russian Laplanders, bear the name of Christians; but their religion is a compound of Christian and pagan ceremonies.

LAPLI-LA. Sea-hare. In helminthology, a genus of the order mollusca. Body creeping, covered with reflected membranes, with a membranaceous shield on the back covering the lungs; aperture placed on the right side; vent above the extremity of the back; feelers four, resembling ears. Two species.

1. *L. Depilans*. Body pale lead colour, immaculate, apparently a mass, enveloped in a loose skin which folds over and nearly meets on the back; shield nearly in the middle of the back and circular; the two fore-feelers thick and placed forwards, the hind ones at a little distance backwards, behind which are the eyes. Inhabits European seas; from two to five inches long; is extremely nauseous and fetid; and is said to occasion the hair to fall off the hands of those who touch it; whence its specific name.

2. *L. Fasciata*. Black: the edges of the membranaceous covering and of the feelers scarlet. Inhabits the shores of Barbary among rocks; when touched discharges a black and red sames, but not fetid or dipylatory like the last.

LAPPA MAJOR. See **BARBADA**.

LAPPAGO, in botany, a genus of the class triandria, order digynia. Calyx about three-valved; corol two valved, reversed. One species; a three or four-flowered grass of the south of Europe.

LAPPER. *s.* (from *lap*.) 1. One who wraps up (*swift*). 2. One who laps or licks.

LAPPET. (diminutive of *lap*.) The part of a headdress that hangs loose (*swift*).

LAPSAVA. Nipplewort: dog-cress. In botany, a genus of the class syngenesia, order polygamia equals. Receptacle naked; calyx invested with scales; the inner leaflets equal and channelled; downless. Five species, four European plants, one a native of Barbary: of the former the two following are common to our own country.

1. *L. minima*. Stemless; three or four flowered; peduncles hollow, thickened at the top; leaves obovate; oblong, toothed. Found in our dry fields.

2. *L. communis*. Caulicent; branched; leaves ovate, petioled, with angular teeth. Found in our wastes; and formerly employed in medicine as a lactescent bitter, and as

possessing the same virtues as cichory, endive, dandelion.

LAPSE. *s.* (*lapsus*, Latin.) 1. Flow; fall; glide; smooth course (*Hale*). 2. Petty error; small mistake (*Rogers*). 3. Transition of right from one to another.

to LAPSE. *v. n.* (from the noun.) 1. To glide slowly: to fall by degrees (*swift*). 2. To fail in any thing; to slip (*Shakespeare*). 3. To slip, as by inadvertency or mistake (*Addison*). 4. To lose the proper time (*Lyfife*). 5. To fall by the negligence of one proprietor or another (*Ayliffe*). 6. To fall from perfection, truth, or faith (*stirling fleet*).

LAPSE, in law, the omission of a patron to present to a church, within six months after voidable; by which neglect title is given to the ordinary to collate to such church: and in such case, the patronage devolves from the patron to the bishop, from the bishop to the archbishop, and from the archbishop to the king. A donative does not go in lapse; but the ordinary may compel the patron by ecclesiastical censures to fill up the vacancy. But if the donative has been augmented by the governors of queen Anne's bounty, it will lapse in like manner as presentative livings.

LAPSED LEGACY, is where the legatee dies before the testator; or where a legacy is given upon a future contingency, and the legatee dies before the contingency happens. As if a legacy is given to a person when he attains the age of 21 years, and the legatee dies before that age, in this case the legacy is a lost or lapsed legacy, and shall sink into the residuum of the personal estate. 2 Black. 61

LAPWING, in Ornithology. See **TRINGA**.

LAPWORK. *s.* (*lap* and *work*.) Work in which one part is interchangeably wrapped over the other (*Trew*).

LAQUEARIUS, a kind of athleta among the ancients, who on one hand held the laqueus, i. e. a sort of snare, wherewith to embarrass and entangle his antagonist, and in the other a poignard to stab him.

LARA or **LARANDA**, one of the Naiades, daughter of the river Almon in Latium, famous for her beauty and her loquacity. She revealed to Juno the amours of her husband Jupiter with Juturna, for which the god cut out her tongue, and ordered Mercury to conduct her to the infernal regions. The messenger fell in love with her by the way, and gratified his passion. Lara became mother of two children, to whom the Romans have paid divine honours, according to the opinion of some, under the name of Lares. *Ovid*.

LAR, a town of Persia, in the province of Fars, with a castle. It carries on a great trade in silk; and its territory abounds in oranges, lemons, and very large tamarinds. E. lon. 54. 15. N. lat. 27. 30.

LARACHA, an ancient and strong town

of Africa, in the kingdom of Fez. It is seated at the mouth of a river of the same name, with a good harbour. It was once in possession of the Spaniards; but the Moors took it from them. W. lon. 5. 55. N. lat. 35. 0.

LARARIUM, was a chapel which the Romans frequently had in their houses for the household gods, called lares.—Spartian says, that Alexander the son of Mammeus kept in his lararium the figure of our Saviour, together with his other idols.

LARK-BOARD, among seamen, the left-hand side of the ship when you stand with your face towards the head.

LARCENY, or **THEFT**, by contraction for larceny, latrocinium, is distinguished by the law into two sorts: the one called simple larceny or plain-theft, unaccompanied with any other atrocious circumstance; and mixed or compound larceny, which also includes in it the aggravation of a taking from one's house or person.

I. Simple larceny, when it is the stealing of goods above the value of twelvepence, is called grand larceny; when of goods to that value, or under, is petit larceny: offences, which are considerably distinguished in their punishment, but not otherwise. See **THEFT**.

II. Mixed, or compound larceny, is such as has all the properties of the former (see **THEFT**); but is accompanied with either one or both of the aggravations of a taking from one's house or person. First therefore of larceny from the house, and then of larceny from the person.

I. Larceny from the house, though it might seem to have a higher degree of guilt than simple larceny, yet is not at all distinguished from the other at common law; unless where it is accompanied with the circumstance of breaking the house by night; and then it falls under another description, viz. that of burglary (see **BURGLARY**.) But now by several acts of parliament (the history of which is very ingeniously deduced by a learned modern writer, who hath shewn them to have gradually arisen from our improvements in trade and opulence) the benefit of clergy is taken from larcenies committed in a house in almost every instance; except that larceny of the stock or utensils of the plate glass company from any of their houses, &c. is made only single felony, and liable to transportation for seven years. The multiplicity of the general acts is apt to create some confusion; but upon comparing them diligently, we may collect, that the benefit of clergy is denied upon the following domestic aggravations of larceny; viz. first, in larcenies above the value of twelvepence committed, 1. In a church or chapel, with or without violence, or breaking the same: 2. In a booth or tent in a market or fair, in the day-time or in the night, by violence or breaking the same, the owner or some of

his family being therein: 3. By robbing a dwelling-house in the day-time (which robbing implies a breaking), any person being therein: 4. In a dwelling-house by day or by night, without breaking the same, any person being therein and put in fear; which amounts in law to a robbery: and in both these last cases the accessory before the fact is also excluded from his clergy. Secondly, in larcenies to the value of five shillings, committed, 1. By breaking any dwelling-house, or any out-house, shop, or warehouse thereunto belonging, in the day-time, although no person be therein; which also now extends to aiders, abettors, and accessories before the fact: 2. By privately stealing goods, wares, or merchandise, in any shop, warehouse, coach-house, or stable, by day or by night; though the same be not broken open, and though no person be therein: which likewise extends to such as assist, hire, or command the offence to be committed. Lastly, in larcenies to the value of forty shillings in a dwelling-house, or its out-houses, although the same be not broken, and whether any person be therein or not; unless committed against their masters by apprentices under the age of 15. This also extends to those who aid or assist in the commission of any such offence.

2. Larceny from the person is either by privately stealing, or by open and violent assault, which is usually called robbery. See **ROBBERY**.

The offence of privately stealing from a man's person, as by picking his pocket or the like, privily, without his knowledge, was debarred of the benefit of clergy so early as by the statute 8 Eliz. c. 4. But then it must be such a larceny as stands in need of the benefit of clergy, viz. of above the value of 12d.; else the offender shall not have judgment of death.—For the statute creates no new offence; but only takes away the benefit of clergy, which was a matter of grace, and leaves the thief to the regular judgment of the ancient law. This severity (for a most severe law it most certainly is) seems to be owing to the ease with which such offences are committed, the difficulty of guarding against them, and the boldness with which they were practised (even in the queen's court and presence) at the time when this statute was made: besides that this is an infringement of property in the manual occupation or corporal possession of the owner, which was an offence even in a state of nature. And therefore the saccularii, or cutpurses, were more severely punished than common thieves by the Roman and Athenian laws.

LARCH TREE, in botany. See **PINUS**.

LARD. The English name of hog's fat when melted down. Hog's lard, adeps suellæ, forms the base of many unguents, and is often eaten by the poor instead of butter.

To LARD, *v. a.* (*larder*, French.) 1. To stuff with bacon (*King*). 2. To fatten (*Shakespeare*). 3. To mix with something else by way of improvement (*Dryden*).

L'ARDIER, *s.* (*lardier*, old French.) The room where meat is kept or salted (*Ascham*).

L'ARDERER, *s.* (from *larder*.) One who has the charge of the larder.

LARDNER (Nathaniel), an eminent English dissenting divine, was born at Hawkhurst in Kent, June 6, 1684. After a grammatical education, he was sent first to a dissenting academy in London, which was under the care of the Rev. Dr. Joshua Oldfield; and thence, in his 16th year, to prosecute his studies at Utrecht, under the celebrated professors D'Uries, Grævius, and Burman. Here he remained somewhat more than three years, and then removed for a short space to Leyden. In 1703 he returned to England, continuing at his father's house to employ himself by close and diligent preparation for the sacred profession which he had in view. Qualified as he was, it was not till 1709 that he preached his first sermon.

A few years after this, Lardner was received into Lady Treby's family as domestic chaplain and tutor to her son, and continued in this comfortable situation till her ladyship's death in 1721. This event threw him into circumstances of some perplexity, having preached to several congregations during his residence with Lady Treby, without the approbation or choice of any one congregation. Here we are told, "that it reflects no honour on the Dissenters, that a man of such merit should have been so long neglected. But it has been observed upon this, that the pulpit was not the place in which Lardner was calculated either to convey improvement or acquire reputation." Dr. Kippis afterwards informs us, "that his mode of elocution was very unpleasant; that from his early and extreme deafness he could have no such command of his voice as to give it a due modulation; and that he greatly dropped his words." It cannot then, as his biographer adds, be matter of surprise that he was not popular; nor, it may be added, can it be any reflection on the congregations to which he occasionally preached, that they did not choose for their minister a man, who, notwithstanding his great learning and amiable virtues, was so very deficient as a public speaker, that it was impossible to hear him with any pleasure, and scarcely without pain.

Though Lardner had no church at which he officiated as minister, he was engaged with some of his dissenting brethren in preaching a Tuesday evening lecture at the Old Jewry.—Acquainted probably with the direction of his studies, they appointed him to preach on the proof of the Credibility of the Gospel History. This he discussed, we are told, in two sermons; and prosecuting

the subject which he had taken up in these discourses, in Feb. 1727, he published, in two volumes octavo, the first part of "The Credibility of the Gospel History, or, the Facts occasionally mentioned in the New Testament, confirmed by passages of ancient authors, who were contemporary with our Saviour or his Apostles, or lived near their time." An Appendix was subjoined, relating to the time of Herod's death.

Thus Lardner commenced author, and began his literary career with singular reputation. "It is scarcely necessary to say (observes Dr. Kippis), how well this work was received by the learned world. Not only was it highly approved by the Protestant dissenters, with whom the author was more immediately connected, but by the clergy in general of the established church; and its reputation gradually extended into foreign countries. It is indeed an invaluable performance, and hath rendered the most essential service to the cause of Christianity. Whoever peruses this work (and to him that does not peruse it, it will be to his own loss), will find it replete with admirable instruction, sound learning, and just and candid criticism." These two, with the subsequent fifteen volumes octavo, and the fourth and fourth quarters entitled "Jewish and Heathen Testimonies," occupied him, with the interruption arising from some smaller productions, during the long space of forty-three years.

Applauded as Dr. Lardner's works were, he received little recompense for them. Some of the latter volumes of the Credibility were published at a loss; and at last he sold the copy-right and all the remaining printed copies to the book-sellers, for the trifling sum of 150*l.* His object, however, was not private emolument, but to serve the interests of truth and virtue; and it pleased divine providence to spare his life, both to complete his extensive plan, and to see the last volume, the fourth of the Testimonies, published. This was in 1767. He was seized with a decline in the summer following; and was carried off in a few days at Hawkhurst, the place of his nativity, where he had a paternal estate, in the 85th year of his age.

LARES, among the ancients, derived by Apuleius, *De deo Socratis*, p. 689, from *lar*, familiaris; a kind of domestic genii, or divinities, worshipped in houses, and esteemed the guardians and protectors of families; supposed to reside more immediately in the chimney corner.

The Lares were distinguished from the Penates, as the former were supposed to preside over house-keeping, the servants in families, and domestic affairs, and the latter were the protectors of the masters of families, their wives and children: accordingly the Lares were dressed in short succinct habits, to shew their readiness to serve, and they held a sort of cornucopia in their

hands, as a signal of hospitality and good house-keeping. According to Ovid there were generally two of them, who were sometimes represented with a dog at their feet. *Fast.* 5. v. 146.

Plutarch distinguishes good and evil Lares, as he had before done good and evil Genii.

There were also some public, others private Lares.

Apuleius tells us the domestic Lares were no more than the souls of departed persons, who had lived well, and discharged the duties of their station; whereas those who had done otherwise, were vagabonds, wandering about, and frightening people, called *Lavæ* and *Lemures*.

The Lares were, however, sometimes called *Penates*, and were worshipped under the figures of little marionettes, or images of wax, silver, or earthen ware.

The public Lares were also called *Compitales*, from *compitum*, a cross-way; and *Viales*, from *via*, a way, or public road; as being placed at the meetings of roads, and in the highways, and esteemed the patrons and protectors of travellers.

Their private Lares took care of particular houses and families: these they also called *Præstites*, from *præsto*:

Quod præstant oculis omnia tuta suis.

Ovid. *Fast.*

They gave the name *Urbani*, i. e. Lares of cities, to those who had cities under their care; and *Hostili*, to those who were to keep their enemies off. There were also Lares of the country, called *Rurales*, as appears by several antique inscriptions.

The Lares were also genial gods, and were supposed to take care of children from their birth. It is for this reason that when Macrobius tells us the Egyptians had four gods who presided over the birth of children, viz. the Genius, Fortune, Love, and Necessity, called *Præstites*, some interpret him as if he had said, the Egyptians had Lares; but they have mentioned that there was a great difference between the Lares of the Romans, and the *Præstites* of the Egyptians. However, the learned Mr. Bryant affirms that they were the same.

The ancients differ extremely about the origin of the Lares. Varro and Macrobius say, that they were the children of Mania; Ovid makes them the issue of Mercury, and the named Lara, whom Lactantius and Ausonius call *Larunda*; Apuleius assures us they were the posterity of the *Lemures*; Nigidius, according to Arnobius, made them sometimes the guardians and protectors of houses, and sometimes the same with the *Curætes* of Samothracia, which the Greeks call *Idæi dactylæ*. Nor was Varro more consistent in his opinion of these gods; sometimes making them the names of heroes, and sometimes gods of the air.

T. Tatius king of the Sabines, was the first who built a temple to the Lares. The

chimney and fire-place in the house were particularly consecrated to them.

Tertullian tells us the custom of worshipping the Lares arose from this, that they anciently interred their dead in their houses; whence the credulous people took occasion to imagine their souls continued there also, and proceeded to pay them divine honours. To this it may be added, that the custom being afterwards introduced of burying in the highways, they might hence take occasion to regard them as gods of the highways.

LARGE. In music. A character, or note, formerly in use, of the greatest value or duration. Equal in length to two longs, four breves, eight semibreves, sixteen minims, thirty-two crotchets, sixty-four quavers, and so on in duple proportion.

LARGE. *a.* (*large*, French.) 1. Big; bulky (*Temple*). 2. Wide; extensive (*Carew*). 3. Liberal; abundant; plentiful (*Thompson*). 4. Copious; diffuse (*Clarendon*). 5. At large. Without restraint (*Baron*). 6. At large. Diffusively (*Watts*).

LARGELY. *ad.* (from *large*.) 1. Widely; extensively. 2. Copiously; diffusely; amply (*Watts*). 3. Liberally; bounteously (*Swift*). 4. Abundantly; without sparing (*Milton*).

LARGENESS. *s.* (from *large*.) 1. Bigness; bulk (*Sprai*). 2. Greatness; comprehension (*Collier*). 3. Extensive; amplitude (*Hooker*). 4. Wideness (*Bentley*).

LARGESS. *s.* (*largesse*, French.) A present; a gift; a bounty (*Denham*).

LARGHETTO. (*Ital.*) In music, a word specifying a time not quite so slow as that denoted by *Largo*, of which word it is the diminutive. See *LARGO*.

LARGITION. *s.* (*largitio*, Lat.) The act of giving.

LARGO. (*Ital.*) A word by which is to be understood a movement one degree quicker than *Grave*, and two degrees quicker than *Adagio*.

LARK. in Ornithology. See *ALAUDA*.

LARK'S-HEEL. In botany. See *DEL.*

LARK'S-NEUR. } *PHINIUM*.

LARMIER, in architecture, a flat, square, massive member, of the cornice, between the cymatium and the ovolo; so called from its use, which is to disperse the water, and cause it to fall at a distance from the wall, drop by drop, or, as it were, by tears; *larme*, in French, signifying a tear. The *larmier* is also called *corona*; and in English, the drip.

LARRA. In entomology, a Fabrician tribe of the hymenopterous genus *Tiphia*, which see.

LARVA or **LARVÆ**, in natural history, a name given by Linnæus to insects in that state, called by other writers *eruca* or caterpillar. See *ENTOMOLOGY* and *PAPILIO*.

LARVÆ, in antiquity, derived from the Etruscan word *lar* or *lars*, signifying "prince or lord," denoted the ghosts of the deceased, considered as wicked and mischievous. Hence is formed the term *lar-*

malus, i. e. *serpens indutus*, or *demoniac*. The ingenious Mr. Farmer urges the etymology and use of this term to prove, that the heathen demons were human ghosts. The larvae were also called *lemures*.

LARVÆ, in mineralogy, the same with petrifications.

LA'RVATED. *a.* (*larvatus*, Lat.) Masked.

LA'RUM. *s.* (from *alarum* or *alarm*.) 1. Alarm; noise denoting danger (*Shakspeare*). 2. An instrument that makes a noise at a certain hour (*Wilkins*).

LARUS. Gull. In zoology, a genus of the class aves, order anseres. Bill straight, sharp edged, a little hooked at the tip, and without teeth; lower mandible gibbous below the point; nostrils linear, broader on the fore-part, and placed in the middle of the bill.

This genus is well known every where, being almost universally spread over the globe. It is distinguished from the other sea-fowl, by its strong, straight bill, bending down towards the point, and marked, below the under mandible, with a triangular prominence; by a light body, supported by large wings; and by slender legs, palmed feet, and a small back toe.

Though the gulls seem to prefer those lofty precipices that hang over the sea, yet there is no bird more frequent on every part of the shore. They have been found east, as far as Japan; and, in the north sea, considerably within the arctic circle. Those in the isles of Faro, are so strong and so voracious, that they sometimes tear lambs to pieces, and carry them to their nests; while those of the frozen ocean, with the greediness of vultures, unite in great flocks, and gorge themselves with the dead carcasses of whales, and carry off large pieces to appease the hereditary gluttony of their young. They are found at sea, an hundred leagues distant from the land. One species leaves the shore, at certain seasons, to follow the plough, for the sake of the worms which it digs up; while others follow the course of the fishermen, in order to pick up any garbage they may throw away. These birds can accommodate themselves equally to the rigorous winters of the arctic regions, and to the excessive heat of the torrid zone, without suffering any apparent inconvenience from either. The nostrils of some are cereless; of others covered with a cere. The following are a few of the chief species:

1. *L. Tridactylus*. Tarrock. Kittiwake. Back whitish-hoary; quill-feathers white; hind-toe unarmed. The colours differ in the younger bird of this and of most of the species; they are also most of them spotted, till the third year, when the spots disappear gradually, which makes the discrimination of the species of this genus difficult. The bill is yellowish; mouth saffron within; head, neck, belly, and tail, snowy; wings hoary; the outer edge of the first, and tips

of the fourth and fifth feathers white; legs dusky; hind-toe a mere wart. Inhabits our own country, and Europe, Asia, and America, generally.

2. *L. Canus*. Common Gull. White; back hoary; primary quill-feathers black at the ends, the fourth and fifth with a black spot at the tip, the outer one black without. The younger bird, head spotted with brown; neck brown above; tail-feathers white, with a black band; bill yellow, irids hazel; legs greenish-white. Inhabits Europe and America: 17 inches long.

3. *L. Marinus*. Black-backed Gull. White; back black. The aged bird, white; back and wings hoary; primary quill-feathers black towards the tip. The young bird, white; back cinereous; tail tipped with black; bill blackish; quill-feathers black; bill yellow; irids yellow. Inhabits Europe and America: 29 inches long; feeds on fishes and young birds; eggs blackish-grey, with dark purple spots.

4. *L. Fuscus*. Herring Gull. White; back brown; legs yellow; bill yellow; irids straw-colour. Inhabits Europe, North America, and Asia, migrates in winter to Iceland: 23 inches long; feeds on fishes, particularly herrings; to the shoats of which fishermen are directed by these birds hovering over and following them: whence the specific English name: eggs three, whitish, spotted with black.

5. *L. Risibundus*. Laughing Gull. Whitish; head blackish; bill and legs pale red. Two other varieties from variance of colour: eye-lids red; irids hazel; neck and chin dusky brown, in the full-grown bird black; first ten quill-feathers white, edged and tipped with black; the rest cinereous, tipped with white; claws black. Inhabits Europe and America: 15 inches long; makes a laughing kind of noise: eggs three, greenish-brown, spotted with tawny.

6. *L. Parasiticus*. Arctic Gull. Two middle tail feathers very long; bill and legs dusky; body above black; beneath, temples and front white; breast with a dusky band. Female, brown breast. Inhabits Europe, Asia, and America: 21 inches long; is very rapacious, and pursues the smaller gulls till they have discharged what they have lately eaten, which it dexterously catches and devours, before it reaches the water. Eggs cinereous, spotted with black.

The whole of the species here described, are found at times on the coasts of our own country.

LARYNGOTOMY, (*Laryngotomia*, *æ*, *f.* λαρυγγιτομία; from λαρυγξ, the larynx, and τομή, to cut). See BRONCHOTOMY.

LARYNX, (*Larynx*, *ngis*, *f.* λαρυγξ.) A cartilaginous cavity, situated behind the tongue, in the anterior part of the fauces, and lined with an exquisitely sensible membrane. It is composed of the annular or cricoid cartilage, the scutiform or thyroid, the epiglottis, and two arytenoid cartilages.

The superior opening of the larynx is called the glottis. The laryngeal arteries are branches of the external carotids. The laryngeal veins evacuate their blood into the external jugulars. The nerves of the larynx are from the eighth pair. The use of the larynx is to constitute the organ of voice, and to serve also for respiration.

LASCIVIENT. *a.* (*lascivens*, Lat.) Frolicsome; wantoning.

LASCIVIOUS. *a.* (*lascivus*, Latin.) 1. Lewd; lustful (*South*). 2. Wanton; soft, luxurious (*Shakspeare*).

LASCIVIOUSLY. *ad.* Lewdly; wantonly; loosely.

LASCIVIOUSNESS. *s.* (from *lascivious*.) Wantonness; looseness (*Dryden*).

LASERPITIUM. Laserwort. In botany, a genus of the class pentandria, order digynia. Fruit oblong, with membranaceous angles, petals inflected, emarginate, spreading. Twenty-three species: almost entirely natives of Europe; but one or two of the Cape and Palestine.

LASERPITIUM LATIFOLIUM. See **GEN-TIANA ALBA**.

LASERPITIUM SILER. See **SFSELI**.

LASERWORT. In botany. See **LASERPITIUM**.

LASH. *s.* (*schlagen*, Dutch) 1. A stroke with any thing plant and tough (*Dryden*). 2. The thong or point of the whip (*Shak*). 3. A lash, or string in which an animal is held: out of use (*Tusser*). 4. A stroke of satire, a sarcasm (*L'Estrange*).

To LASH. *v. a.* (from the noun) 1. To strike with any thing plant, to scourge (*Garth*). 2. To move with a sudden spring or jerk (*Dryden*). 3. To beat; to strike with a sharp sound (*Prior*). 4. To scourge with satire (*Pope*). 5. To tie any thing down to the side or mast of a ship: properly to *lace*.

To LASH. *v. n.* To ply the whip (*Gay*).

LASHIER. *s.* (from *lash*) One that whips or lashes.

LASIOPETALUM. In botany, a genus of the class pentandria, order monogynia. Corol wheel-shaped, busily, five-cleft; stamens defended by a scale at the base: anthers with two lobes behind, and two pores at the tip; capsule superior, three-celled, three-valved, the divisions from the middle of the valves. One species: a downy plant of Australasia, with brown racemed flowers.

LASIOSIOMA. In botany, a genus of the class tetrandria, order monogynia. Calyx five-cleft, corol funnel-form, with a villous throat; capsules one-celled, two-seeded. One species: a Guiana shrub, with opposite branches furnished at the end with a simple tendril.

LASS. *s.* A girl, a maid, a young woman (*Philips*).

LASSA, a city of Asia, and capital of Great Thibet, in d'Anville's chart of Thibet, called Tonker; major Rennel says, much confusion arises from the application of so many different names to this capital of Thibet. Giorgi tells us, that the proper name of it, in the language of Thibet, is Baronthala; but that the Tartars call it Lassa, or Lahassa. Other ac-

counts call it Tonker, and apply the name Lassa, or Baronthala to the district which contains Tonker and Putala. And again, others give the name of Putala instead of Lassa to the capital of Thibet. But we ought to apply the name Lassa, or Lahassa, to the capital; and to consider Putala as the castle and palace of the lama, and his ordinary place of residence: 220 miles N.E. Patna. Lon. 91. 30 E. Lat. 30. 35 N.

LASSITUDE. *s.* (*lassitudo* Lat.) Weariness; fatigue (*Moré*).

LASSLORN. *a.* (*lass and lorn*.) Forsaken by his mistress: not used (*Shakspeare*).

LASSUS or **LASUS**, a dithyrambic poet, born at Hermione, in Peloponnesus, about 500 years before Christ, and reckoned by some among the wise men of Greece.—Some fragments of his poetry may be found in Athenæus.

LAST. *a.* (*læst*, Saxon.) 1. Latest; that follows all the rest in time (*Samuel*). 2. Hindermost; which follows in order of place (*Pope*). 3. Beyond which there is no more (*Cowley*). 4. Lowest, meanest (*Pope*). 5. Next before the present: as, *last week*. 6. Utmost (*Dryden*). 7. *At LAST*. In conclusion; at the end (*Gen*). 8. *The LAST*; the end (*Pope*).

LAST. *ad.* 1. The last time, the time next before the present (*Shak*). 2. In conclusion (*Dryden*).

To LAST. *v. n.* (*lætan*, Saxon) To endure, to continue; to persevere (*Locke*).

LAST. *s.* (*læst*, Saxon) 1. The mould on which shoes are formed (*Addison*). 2. (*last*, German) A load; a certain weight or measure.

LAST, in general signifies, the burden or load of a ship. It signifies also a certain measure of h h, corn, wool, leather, &c. A last of codfish, white herrings, meal, and ashes for soap, is twelve barrel; of corn or rapeseed, ten quarters, of gunpowder, twenty-four barrel; of red herrings, twenty cades; of hides, twelve dozen; of leather twenty dickers; of pitch and tar, fourteen barrel; of wool, twelve sacks; of stock-fish, one thousand; of flax or feathers, 1700lb.

LASTAGE. *s.* (*lestage*, Fr. *lastage*, Dut) 1. Custom paid for freightage. 2. The ballast of a ship.

LASTERY. *s.* A red colour (*Spenser*).

LASTING. *particip. a.* (from *last*.) 1. Continuing; durable (*Ray*). 2. Of long continuance; perpetual (*Boyle*).

LASTINGLY. *ad.* Perpetually; durably.

LASTINGNESS. *s.* (from *lasting*.) Durableness; continuance (*Newton*).

LASTLY. *ad.* (from *last*.) 1. In the last place (*Bacon*). 2. In the conclusion, at last; finally.

LATCH. *s.* (*letse*, Dutch) A catch of a door moved by a string, or a handle (*Smart*).

To LATCH. *v. a.* (from the noun.) 1. To fasten with a latch (*Locke*). 2. (*lecher*, Fr.) To smear (*Shakspeare*).

LATCHES. *s.* *Latches* or laskets, in a ship, are small lines like loops, fastened by sewing into the bonnets and dlablers, in order

L A T

to lace the bonnets to the courses, or the drablers to the bonnets (*Harris*).

LATCHET. *s.* (*lacet*, Fr.) The string that fastens the shoe (*Mark*).

LATE. *a.* (*læt*, Saxon) 1. Contrary to early; slow; tardy; long delayed (*Milton*). 2. Last in any place, office, or character (*Addison*). 3. The deceased: as, *the works of the late Mr. Pope*. 4. Far in the day or night.

LATE. *ad.* 1. After long delays; after a long time (*Philips*). 2. In a later season (*Bacon*). 3. Lately; not long ago (*Spenser*). 4. Far in the day or night (*Dryden*). 5. *Of late*; lately; in times past (*Milton*).

LATED. *a.* (from *late*) Belated, surprised by the night (*Shakspeare*).

LATELY. *a.* (from *late*) Not long ago (*Acts*).

LATENESS. *s.* (from *late*.) Time far advanced (*Swift*).

LATENT. *a.* (*latens*, Lat) Hidden; concealed; secret (*Woodward*).

LATERAL. *a.* (*lateral*, Fr) 1. Growing out on the side, belonging to the side (*Di Luth.*). 2. Placed, or acting on the side (*Milton*).

LATERAL EQUATION, the same, simple equation.

LATERAL COMMUNICATION OF MOTION, in liquids, a principle in consequence of which a liquid or fluid in motion urges on to accompany it, the particles which are contiguous or at the side of the particles already moving. M. Venturi has made use of this principle in some of his disquisitions. See **HYDRODYNAMICS**.

LATERAL SINUSES In anatomy. The bifurcation and continuation of the longitudinal sinuses of the dura mater. They commence about the middle of the tentorium, one passing along each horizontal crucial spine within the tentorium, and round to the former lacerum in basi crani, where the internal jugular vein begins. Their use is to carry the blood from the brain into the internal jugulars, which return it to the heart.

LATERALITY. *s.* (from *lateral*) The quality of having distinct sides (*Brown*).

LATERALLY. *ad.* (from *lateral*) By the side; sidewise (*Holder*).

LATERAN (Plautus), a Roman consul elect A. D. 65. A conspiracy with Piso against the emperor Nero proved fatal to him. Being ordered to execution, he refused to confess his associates, and did not even frown at the executioner, who was as guilty as himself, and when a first blow could not sever his head from his body, he looked at the executioner, and shaking his head he returned it to the hatchet with the greatest composure, and it was cut off.

LATERAN was originally the proper name of a man, (see above:) whence it descended to an ancient palace in Rome, and to the buildings since erected in its place; particularly a church called St. John of Lateran, which is the principal see of the popedom.

LATERAN (Councils of the), are those held in the basilica of the Lateran of those there have been five, held in 1123, 1139, 1179, 1215, and 1513.

L A T

LATERAN (Canons regular of the congregation of the), is a congregation of regular canons, whereof that church is the principal place or seat. It is pretended there has been an uninterrupted succession of clerks, living in community from the time of the apostles; and that a number of these were established in the Lateran in the time of Constantine. But the canons were not introduced till the time of Leo I. and these held the church 800 years, till the reign of Boniface, who took it from them, and placed secular canons in their room: 150 years after, the regulars were reinstated.

A **LATERE**, a term used to denote the qualifications of the cardinals whom the pope sends as legates into foreign countries. They are called legates a latere, as being his holiness's assistants and counsellors in ordinary. These are the most considerable of the other three kinds of legates, being such as the pope commissions to take his place in councils; and so called, in regard that he never gives this office to any but his favourites and confidants, who are always *a latere*, at his side. A legate a latere has the power of conferring benefices without a mandate, of legitimating bastards to hold offices, and has a cross carried before him as the ensign of his authority.

DE LATRE, legates who are not cardinals, but yet are entrusted with an apostolical legation. See the article **LIGATE**.

LATE-WAKE, a ceremony used at funerals in the highlands of Scotland. The evening after the death of any person, the relations and friends of the deceased meet at the house, attended by bagpipe or fiddle; the nearest of kin, be it wife, son, or daughter, opens a melaucholy ball, dancing, and greeting (i. e. crying violently) at the same time, and this continues till day-light; but with such gambols and frolics among the younger part of the company, that the loss which occasioned them is often more than supplied by the consequences of that night. If the corpse remains unburied for two nights, the same rites are renewed. Thus, Scythian-like, they rejoice at the deliverance of their friends out of this life of misery.

LATERIFOLIACEOUS **FLOWER** or **PE-
DUNCLE**. In botany. Ad latus basis folii. By the side of the base of the leaf. As in Claytonia, Solanum, Asperifoliæ.

LATEWARD. *ad.* (*late*, and *þearf*, Sax) Somewhat late.

LATEX. (*later*, quod in venis terræ lateat). All manner of water or juice. A term sometimes applied to the blood as being the spring or source of all the humours.

LATH, in building, a long, thin, and narrow slip of wood, nailed to the rafters of a roof or ceiling, in order to sustain the covering. These are distinguished into three kinds, according to the different kinds of wood of which they are made, viz. heart of oak, sap-laths, and deal laths; of which the two last are used for ceilings and partitions, and the first for tilin only. Laths are also distinguished according to their length, into five feet, four feet, and three feet laths, though the statute allows but of two,

L A T

lengths, those of five and those of three feet, each of which ought to be an inch and a half in breadth, and half an inch in thickness; but they are commonly less.

LATHS (Cleaving of). The lath-cleavers having cut their timbers into lengths, they cleave each piece with wedges, into eight, twelve, or sixteen, according to the size of their timber; these pieces are called bolts: this is done by the felt-grain, which is that grain which is seen to run round in rings at the end of a piece of a tree. Thus they are cut out for the breadth of the laths, and this work is called felling. Afterwards they cleave the laths into their proper thicknesses with their chit, by the quarter-grain, which is that which runs in a straight line towards the pith. See **GRAIN**.

TO LATH. *v. a.* (*latter*, French; from the noun.) To fit up with laths (*Mortimer*).

LATH. *s.* (*læð*, Saxon.) A part of a county (*Bacon*).

LATHE. *s.* The tool of a turner, by which he turns about his matter so as to shape it by the chisel. See **TURNING**.

TO LATHER. *v. n.* (*leppan*, Saxon.) To form a foam (*Baynard*).

TO LA'THER. *v. a.* To cover with a foam of water and soap.

LA'THER. *s.* (from the verb.) A foam or froth made commonly by beating soap with water.

LATHRÆA. Toothwort. In botany, a genus of the class didynamia, order angiosperma. Calyx four-cleft; germ with a depressed gland at the base of its suture, capsule one or two-celled, mucronate; seeds few, angular, mucronate. Three species: one a plant of Palestine, one of the south of Europe, and one *L. squarrosa*, common to our own groves.

LATHREVE, LEIDGREVE, or TRIGHENGRIVE, was an officer under the Saxon government, who had authority over a third part of the county, and whose territory was therefore called tithing, otherwise a leid or leithin, in which manner the county of Kent is still divided, and the rapes in Sussex seem to answer to the same.

LATHYRUS. Chickling pea. In botany, a genus of the class diadelphus, order decandria. Style flat, villous above, broader upwards, two upper segments of the calyx shorter. Thirty-six species chiefly leguminous plants of Europe, a few of Asia, Africa, and America: seven indigenous to the fields, pastures, and hedges of our own country. Of the whole, some have their peduncles one-flowered, some two-flowered, some many-flowered. The following are the chief:

1. *L. latifolius*. Everlasting pea. Peduncles many-flowered; tendrils with two elliptic leaves, stem winged. A native of our woods, and cultivated with ease in our gardens.

2. *L. odoratus*. Sweet-scented pea, or sweet-pea. Peduncles two flowered; tendrils two-leaved; leaflets ovate-oblong; legumes hairy. A native of Sicily; and so frequently cultivated and so well known in our gardens as to render

L A T

all description of its mode of increase unnecessary.

LATIAR, in Roman antiquity, a feast or ceremony instituted by Tarquinius Superbus, in honour of Jupiter Latiaris or Latialis.

LATICLAVE (*laticlavium*), in Roman antiquity, was an honourable distinction, peculiar, in the times of the republic, to the senators; but whether it was a particular kind of garment, or only an ornament upon it, the critics are not agreed: but the more general opinion is, that it was a broad stripe of purple sewed upon the fore part of their tunic, and round the middle of the breast.

LATIMER (Hugh), an English reformer, was the son of a farmer at Thurstaston in Leicestershire. Being designed for the church, he was sent to Cambridge, where he took his degrees in arts, and entered into orders. On the breaking out of the reformation he shewed himself a zealous papist, but his friend Thomas Bilney, who died a martyr to the truth, brought him off from his errors, and he became as zealous a protestant. This change was soon observed, and gave great offence to the heads of the university, especially as it was perceived that the new opinions gained ground daily. Mr. Latimer continued to preach in spite of academical censure, and was followed by great crowds of people. Henry VIII. had the curiosity to hear him, and expressed himself much pleased with his piety and talents. Latimer, however, had no ambition, and when that monarch issued a proclamation prohibiting the reading the scriptures, he wrote him a free expostulatory letter full of honesty and truth. The king received it in good part, and took Latimer into especial favour. Various attempts were made against his life, but he was preserved through the whole of that reign, and preferred to the bishopric of Worcester, in which diocese he laboured with great prudence and success in promoting the reformation. On the fall of his old friend lord Cromwell, Latimer, through the influence of Gardner, was sent to the Tower, where he remained till the accession of king Edward VI. He might then have returned to his diocese, but he chose rather to reside with archbishop Cranmer at Lambeth. He, however, made occasional journeys through various parts of the kingdom as an itinerant preacher, having the king's licence for that purpose. When Mary came to the throne he was apprehended and sent to the Tower, from whence he was sent with Ridley to Oxford, to have a public disputation with some of the popish divines. At this conference Latimer refused to abide by the authority of the fathers, but only by the scriptures. After it was ended, sentence of death was passed upon him, and he and Ridley were burnt at Oxford in 1554. Two volumes of his sermons are in print, and well known. (*Watkins*).

LATIN, a dead language, first spoken in Latium, and afterwards at Rome, and still used in the Romish church, and among men of letters.

L A T

Some authors rank the Latin among the number of original languages, but by mistake : it is formed principally from the Greek, and particularly from the Æolic dialect of that tongue ; though it has a great number of words which it borrowed from the languages of the Etrusci, Osci, and other ancient people of Italy ; and foreign commerce and wars, in course of time, added a great many more.

The Latin is a strong, nervous language, perfectly suitable to the character of the people who spoke it. The Romans were engaged in wars and commotions, foreign and domestic, which for seven hundred years engrossed all their thoughts. Hence, therefore, says the ingenious Mr. Harris, their language became like their ideas, copious in all terms, expressive of things political, and well adapted to the purposes both of history and popular eloquence. But the Romans were no philosophers ; and hence the untiness of their language to this subject ; a defect, which even Cicero is compelled to confess, and more fully makes appear, when he writes philosophy himself, from the number of terms he is obliged to invent. Harris's *Hermes*, p. 411, &c.

The Latin is more figurative than the English, less pliant than the French, less copious than the Greek, less pompous than the Spanish, less delicate than the Italian, but closer and more nervous than any of them. See LANGUAGE.

For a while the Latin tongue was confined almost wholly within the walls of Rome, nor would the Romans allow the common use of it to their neighbours, or to the nations they subdued. Cicero observed, that even in his time, Greek was used almost among every people, but the Latin only confined to a very narrow compass. By degrees they were brought to grant the use of it as a favour, and in time became sensible of the necessity there was of its being generally understood, for the convenience of commerce : and, accordingly, used their utmost endeavours that all the nations subject to their empire should be united by one common language : so that at length they imposed that as a law, which they had before granted as a favour.

After the translation of the seat of the empire from Rome to Constantinople, the emperors of the East, being always desirous of retaining the title of Roman emperors, appointed the Latin to be still retained in use, both in their rescripts and edicts, as appears by the constitutions of the eastern emperors, collected in the Theodosian code ; but at length the emperors, neglecting the empire of the West, abandoned all care of the Latin tongue, and allowed their judges to pass sentence in Greek, and, accordingly, we find the emperor Justinian's Novels are composed in Greek.

Charlemagne, coming to the empire of the West, appointed the law-proceedings in sovereign courts to be made in Latin ; and the notaries were to draw their acts and instruments in the same language : this practice continued a long time through great part of Europe ; but

L A T

at length it gave way, and the French took place of the Latin, not only in France, but in some measure in England also.

LATIN BIBLE. See **BIBLE**.

LATINI, the inhabitants of Latium. (Vid. **LATIUM**.)

LATINISM. *s.* (*latinisme*, Fr. *latinismus*, low Lat.) A Latin idiom ; a mode of speech peculiar to the Latin (*Addison*).

LATINIST. *s.* One skilled in Latin (*Oldham*).

LATINITY. *s.* (*latinite*, Fr. *latinitas*, Latin.) The Latin tongue (*Dennis*).

To **LATINIZE**. *v. a.* (*latiniser*, Fr.) To use words or phrases borrowed from the Latin (*Dryden*.)

To **LATINIZE**. *v. n.* To give names a Latin termination, to make them Latin (*Watts*).

LATINUS, a son of Fannus by Marica, king of the Aborigines in Italy, who from him were called Latin, married Amata, by whom he had a daughter, called Lavinia, who was secretly promised in marriage by her mother to Turnus, king of the Rutuli. The gods opposed this union, and the oracles declared that Lavinia must become the wife of a foreign prince. The arrival of Æneas seemed favourable to this prediction, and Latinus, by offering his daughter to him, seemed to have fulfilled the commands of the oracle. Turnus, however, claimed Lavinia as his lawful wife, and prepared to support his cause by arms. Æneas then took up arms in his own defence, and after mutual losses it was agreed, that the quarrel should be decided by the two rivals. Æneas obtained the victory, and married Lavinia. Latinus soon after died, and was succeeded by his son-in-law.

LATISH. *a.* (from *late*.) Somewhat late.

LATIOSTROUS. *a.* (*latus* and *rostrum*, Latin.) Broad-beaked (*Brown*).

LATRITIOUSSEDIMENT (*latritius*, from *later*, a brick.) A term applied to the brick-like sediment deposited in the urine of people afflicted with fever, twelve or fourteen hours after the urine is passed.

LATISSIMUS COLLI, in anatomy. See **PLATYSMA MYOIDES**.

LATISSIMUS DORSI. (*latissimus*, *musculus*.) A muscle of the humerus, situated on the posterior part of the trunk. It is a very broad, thin, and for the most part fleshy muscle, placed immediately under the skin, except where it is covered by the lower extremity of the trapezius. It arises tendinous from the posterior half of the upper edge of the spine of the os ilium, from the spinous processes of the os sacrum and lumbar vertebræ, and from five or six, and sometimes from seven, and even eight, of the lowermost ones of the back ; also tendinous and fleshy from the upper edges and external surface of the four false ribs, near their cartilages, by as many distinct slips. From these different origins the fibres of the muscles run in different directions : those from the ilium and false ribs run almost perpendicularly upwards ; those from the sacrum and lumbar vertebræ, obliquely upwards and forwards ; and

those from the vertebrae of the back, transversely outwards and forwards, over the inferior angle of the scapula, where they receive a small thin bundle of fleshy fibres, which arise tendinous from that angle, and are inserted with the rest of the muscle, by a strong, flat, and thin tendon, of about two inches in length, into the fore part of the posterior edge of the groove produced between the two tuberosities of the os humeri, for lodging the tendon of the long head of the biceps. In dissection, therefore, this muscle ought not to be followed to its insertion, till some of the other muscles of the os humeri have been first raised. Its use is to pull the os humeri downwards and backwards, and to turn it upon its axis. Riolaus, from its use on certain occasions, gave it the name of *antitensor*. When we raise ourselves upon our hands, as in rising from off an arm-chair, we may easily perceive the contraction of this muscle. A bursa mucosa is found between the tendon of this muscle and the os humeri, into which it is inserted.

LATITANCY. *s* (from *latitans*, Latin) Delitescence; the state of lying hid. (*Brown*).

LATITANT *a.* (*latitans*, Latin) Delitescens; concealed; lying hid (*Boyle*).

LATTAT, a writ whereby all men in personal actions are called originally to the king's bench. F. N. B. 78.

A *latus* may be considered either as the commencement of the action, or only as a process to bring the defendant into court, at the election of the plaintiff. Bul. N. P. 151.

If it is stated as the commencement of the action to avoid a tender, the defendant may deny that the plaintiff had any cause of action at the time of suing it out. 1 Wils. 141.

Or if it is replied to a plea of the statute of limitations, the defendant, in order to maintain his plea, may aver the real time of suing it out, in opposition to the test. 2 Burr. 950. See *Impey's B. R.* and *C. B. Practice*.

LATTATION, *s* (from *latus*, Lat.) The state of lying concealed.

LATITUDE *s* (*latitude*, Fr.) 1. Breadth; width, in bodies of unequal dimensions the shorter axis (*Hutton*). 2. Room; space; extent (*Locke*). 3. The extent of the earth or heavens, reckoned from the equator to either pole (*Swift*). 4. A particular degree, reckoned from the equator (*Addison*). 5. Unrestrained acceptance (*King Charles*). 6. Freedom from settled rules, laxity (*Taylor*). 7. Extent; diffusion (*Brown*).

LATITUDE, in geography, or navigation, the distance of a place from the equator; or an arch of the meridian, intercepted between its zenith and the equator. Hence the latitude is either north or south, according as the place is on the north or south side of the equator: thus London is said to be in $51^{\circ} 31'$ of north latitude.

Circles parallel to the equator are called parallels of latitude, because they shew the latitudes of places by their intersections with the meridian.

The latitude of a place is equal to the eleva-

tion of the pole above the horizon of the place; and hence these two terms are used indifferently for each other.

This will be evident from fig. 8. pl. 93, where the circle ZHQP is the meridian, Z the zenith of the place, HO the horizon, EQ the equator, and P the pole; then is ZE the latitude, and PO the elevation of the pole above the horizon. And because PE is = ZO, being each a quadrant, if the common part PZ be taken from both, there will remain the latitude ZE = PO the elevation of the pole. Hence we have a method of measuring the circumference of the earth, or of determining the quantity of a degree on its surface; for by measuring directly northward or southward, till the pole be one degree higher or lower, we shall have the number of miles in a degree of a great circle on the surface of the earth, and consequently multiplying that by 360, will give the number of miles round the whole circumference of the earth.

The knowledge of the latitude of the place is of the utmost consequence, in geography, navigation, and astronomy; it may be proper therefore to lay down some of the best ways of determining it, both by sea and land.

1st. One method is, to find the latitude of the pole, to which it is equal, by means of the pole star, or any other circumpolar star, thus. Either draw a true meridian line, or find the times when the star is on the meridian, both above and below the pole; then at these times, with a quadrant, or other fit instrument, take the altitudes of the star, or take the same when the star comes upon your meridian line; which will be the greatest and least altitude of the star: then shall half the sum of the two be the elevation of the pole, or the latitude sought. For, if *abc* be the path of the star about the pole P, Z the zenith, and HO the horizon: then is *aO* the altitude of the star upon the meridian when above the pole, and *cO* the same when below the pole; hence, because *aP* = *cP*, therefore *aO* + *cO* = 2OP, hence the height of the pole OP, or latitude of Z, is equal to half the sum of *aO* and *cO*.

2d. A second method is by means of the declination of the sun, or a star, and one meridian altitude of the same, thus. Having, with a quadrant, or other instrument, observed the zenith distance Z*d* of the luminary; or else its altitude H*d*, and taken its complement Z*d*; then to this zenith distance, add the declination *dE* when the luminary and place are on the same side of the equator, or subtract it when on different sides, and the sum or difference will be the latitude EZ sought. But note, that all altitudes observed must be corrected for refraction and the dip of the horizon, and for the semidiameter of the sun, when that is the luminary observed.

Circumstances frequently occur which render it impossible to observe the meridian altitude, or the maximum and minimum altitudes of any celestial objects, when, of course, the above methods fail. We shall, therefore, sub-

LATITUDE.

join some of the most approved practical methods of determining the latitude in cases of this kind.

For this purpose take one, two, or more altitudes of the sun in the forenoon, noting by a watch the time of each, and if the meridian altitude, take one, two, or more altitudes of the sun in the afternoon, noting also the times by the watch. if possible, let the morning altitudes, if three, be taken at equal intervals of time; if not, let the afternoon observations be taken at the same altitudes with the morning ones. Then,

1. If one morning and one afternoon observation are taken, when the sun has the same altitude, and the name of the elevated pole is known, to find the elevation or latitude. To 12 hours add the morning and afternoon times shewn by the watch, and half the sun gives the time by the watch, when the sun was on the meridian of that place, supposing no change of declination. Let the interval of time between that noon and the time of either observation be turned into degrees and minutes for the hour-angle, which is supposed to be less than 90° , because the observations are within six hours of noon: to the logarithmic cosine of the hour-angle add the logarithmic tangent of the sun's distance from the elevated pole, their sum is the log. tangent of the first arc, of the same kind with the polar distance: add the arithmetical complement of the log. cosine of the polar distance, the log. sine of the altitude, and the log. cosine of the aforesaid first arc, their sum is the log. cosine of a second arc, always less than 90° the difference of the first and second arcs is the complement of the required latitude, when the first arc exceeds the second, otherwise, the difference is the latitude. See **EQUAL ALTITUDE**.

2. When three zenith distances between the limits of 30° and 70° are taken with in an hour of noon, at equal intervals of time between 15 and 30 minutes. If the first and third zenith distances are equal, the middle one is the meridian zenith distance. If the two first or two last zenith distances are equal, from one of these take one-eighth of the difference between it and the greater zenith distance, and the remainder is that on the meridian. When the three zenith distances are unequal, let the difference between the greatest and middle be called A, the difference between the greatest and the least be called B, the difference between B and 4 A be called C, and the difference between B and C be called D: then $\frac{C^2}{4D}$, will give a number of minutes, which, subtracted from the greatest zenith distance, leaves the meridian zenith distance.

3. When three zenith distances, between the limits of 30° and 70° are taken within an hour and half of noon, at unequal intervals of time: let the difference in minutes between the greatest and middle zenith distances be called A, and the interval of time a ; the difference between the first and last be called B, and

the corresponding interval of time b . From the logarithm of the difference of the products Ab and Ba , take the logarithm of b , and call the remainder N; then add the log. of N, twice the log. of the difference between a and $\frac{1}{2}b$, the arithmetical complement of the difference between a and b , and the arithmetical complement of the log. of a , and the sum will give a log. which call M. Find the numbers corresponding to N, M, and $\frac{1}{2}B$, and call their sum E. From 4 E take B, and call the remainder C, and $B - C$ call D. Then the log. of 4 D, taken from twice the log. of C, gives the logarithm of the correction in minutes; and the greatest zenith distance diminished by the correction, will give the meridian zenith distance.

4. When three altitudes are taken at equal intervals of time, at any distance from noon: find the natural sines of the three given altitudes; call the difference between the first and third, D, and by twice the second and third F. Let $E = D + 2F$, when the degrees of the third altitude fall between those of the first and second, otherwise let $E = D - 2F$. Add the log. cotang. of half one interval of time in degrees, the log. of E, and the ar. co. log. of D, each in numbers; and their sum is the logarithmic tangent of an angle A, or of its supplement, if the first altitude exceeds the third; convert the angle A into time, to A add one interval then the difference between this sum and six hours will shew the time from noon, when the last observation was made. Hence, by the intervals the other times are known relative to the noon of the place of observation. Add together the ar. co. log. cosine of A, the ar. co. log. sine of one interval observed, and the log. of D, and their sum is the log. of a number B, to the log. of which add twice the logarithmic sine of half the least time from noon; seek the number, and add it to the natural sine of the greatest altitude, which will give the natural sine of the meridian altitude. The number B, lessened by the natural sine of the meridian altitude, gives the natural sine of the midnight depression: then the half sum and the half difference, being taken, of the degrees and minutes answering to the sines of the meridian altitude and midnight depression, will give the co-latitude and declination. If the zenith falls between the equator and the sun, the half sum is the co-declination, and the half difference is the latitude.

5. When three altitudes are taken at unequal intervals of time. call the interval between the first and third times M, between the first and second, m , between the second and third, n , and convert M, m , n , into degrees; find the natural sines of the three observed altitudes; call the difference between the first and third D, and between the second and third F; add the log. sines of $\frac{1}{2}m$ and $\frac{1}{2}n$, for the log. of $\frac{1}{2}A$; and the log. cosine of $\frac{1}{2}m$ to the log. sine of $\frac{1}{2}n$ for the log. of $\frac{1}{2}B$: add the ar. co. log. of D, the log. of F, and the log. sine of $\frac{1}{2}M$, for the log. of $\frac{1}{2}C$: take the difference between $\frac{1}{2}B$ and $\frac{1}{2}C$, and call it $\frac{1}{2}E$: or let $\frac{1}{2}E$ be the sum of $\frac{1}{2}B$

LATITUDE.

and $\frac{1}{2}$ C, when the degrees in the third altitude fall between those of the first and second. From the log. of $\frac{1}{2}$ E take the log of $\frac{1}{2}$ A, the remainder, adding 10 to the index, is the logarithmic tangent of an arc G, or of its supplement, when the first altitude exceeds the second. Take the difference between G, and the complement of $\frac{1}{2}$ M, the remainder is an arc H, shewing the time from noon when the last altitude was taken; hence the other times are known. Add the ar. co. log. cosine of G, the ar. co. log. sine of $\frac{1}{2}$ M, and the log. of D, their sum is the log. of a number 1^o to log. of 1 add twice the log. sine of $\frac{1}{2}$ H for the log. of K, which, added to the natural sine of the third altitude, will give the natural sine of the meridian altitude, and the number 1, diminished by the natural sine of the meridian altitude, gives the natural sine of the midnight depression; the half sum and half difference of the degrees shewing the meridian altitude and midnight depression, will give the co. latitude and declination or co-declination and latitude, when the zenith falls between the sun and the equator.

6. When two altitudes of the sun, the interval of time between the two observations, the sun's declination, and the latitude by dead reckoning, are given, to find the true latitude. 1. Convert the interval of time into degrees, and take its half, take also the half sum and half difference of the two altitudes. 2. Add the five following logarithms; viz. log. cosine of the half sum of the two altitudes; log. sine of the half difference of the two altitudes; ar. co. log. sine of the half interval, ar. co. log. cosine of the declination, and ar. co. log. cosine of the latitude by account, their sum is the log. sine of an arc. 3. Half the difference between this arc and the half interval, is half a time from noon. 4. Then add the log. cosine of the declination, log. cosine of the latitude by account, and twice the log. sine of half a time from noon, in degrees: the number answering to the log. of this sum, doubled, is the correction, which being added to the natural sine of the greatest observed altitude, gives the natural sine of the meridian altitude, whence the latitude is known. In order to know whether the latitude thus found be accurate, make a second operation thus, to the sum of the first four logs. used in the second article of the preceding operation, add the ar. co. log. cosine of the latitude found by art. 4. the sum is the log. sine of an arc. Proceed by the third and fourth articles for a corrected latitude; and if it comes out the same, within a minute or two, as that found above, it may be esteemed the true latitude; or, if the difference between the results of the two operations do not exceed about $\frac{1}{4}$ th of the difference between the latitude assumed, and that first found, the last result may be accounted sufficiently correct. But if the difference is much greater than the said $\frac{1}{4}$ th part, then a third operation with the last found latitude will generally give the latitude exact enough. When the latitudes, found by the first and second operations, have one greater and one less than the latitude by account, or if they differ by a

degree or more, make a third operation with the half sum or mean of these two latitudes; and if the latitude found differs from the said mean, then half their sum will generally give the latitude very near the truth. When both observations are made in the forenoon, or both in the afternoon, the half interval is half the difference of the times from noon, and the first found arc is half the sum of the times from noon; but when the observations occur, one before and the other after noon, the $\frac{1}{2}$ interval is the $\frac{1}{2}$ sum, and the first found arc is the half difference of the times from noon, the $\frac{1}{2}$ difference added to the $\frac{1}{2}$ sum, gives the time of the observation farthest from noon, and the $\frac{1}{2}$ difference taken from the $\frac{1}{2}$ sum, gives the time of the observation nearest to noon. The times of observation are best when taken to seconds, or at least to quarters or thirds of a minute of time: they are also best when taken between the times of 9 h. A. M. and 3 h. P. M. and the interval between them should not exceed five hours, nor be much less than the time from noon at the taking of the greatest altitude, or, in general, the interval should not be much less than about $\frac{1}{4}$ of an hour.

Mr. John Douwes of Amsterdam contrived, in 1740, solar tables for the solution of this problem, which were published in 1759. Dr. Pemberton communicated to the Royal Society the whole construction of these tables, &c. in a paper published in the Phil. Trans. vol. li. art. 81.; and afterwards the tables were published in a folio volume. But the preceding solution requires no other tables than are found in the common books of navigation, though the solar tables, such as may be found in the Nautical Almanac for 1771, may save some time in the computation. See the principles on which the preceding problems are founded, mathematically demonstrated, and their use illustrated by examples, in Robertson's Elem. of Navigation, book v. and book ix. See also Nautical Almanac for 1771 and the requisite tables for various other rules. For professor Lax's method of solving the problem, see the Phil. Trans. for 1798, part i. See also Mackay's Treatise on finding the latitude and longitude at sea, and O. Gregory's Astronomy, ch. 23.

The preceding methods ascertain the apparent latitude, that is, the angle formed between a plumb-line at the given place, and a diameter of the equator: the true latitude, or the angle at the centre of the spheroid, subtended between the given place and the equator, may be correctly found thus. Divide the square of the polar axis of the spheroid by the square of the equatorial axis, and multiply the tangent by the apparent latitude of the place by the quotient, the product is the tangent of the latitude at the centre. This rule is demonstrated in O. Gregory's Astronomy, p. 445, also in Simpson's Fluxions, vol. ii. p. 306. Since the earth's axes are nearly as 21' to 215, we may

assume $\frac{214}{215} = .9907193$ for a common mul-

tiplier, by which, if the nat. tangent of the apparent latitude be multiplied, the product will

L A T

be the nat. tangent of the latitude at the centre. Mr. Richard Graham contrived an instrument for taking the latitude of a place at any time of the day. For this purpose, to the meridian of a globe properly divided, he adapts a piece of a like meridian, called the beam-compass, divided in the same manner, and sliding under the meridian to those circles, and to five minutes of their degrees, are fitted two sliding Vernier's scales, in such a manner, that a wire fixed at 0 degree at the centre or end of the beam-compass, shall pass through a hole at the beginning of the divisions of one Vernier, which is to slide on the meridian, that wire serving as the center of motion of the beam-compass when the Vernier is screwed to the meridian. the other Vernier is to slide on the beam-compass, and carry with it a pointer, or index, at the beginning of its divisions.

With this instrument the problem is thus solved. At the time of the first observation, let the sun's bearing be also observed, and take the difference between the rhumb on which the sun was observed, and the rhumb on which the ship steered between the observations: then say,

As radius is to the cosine of that difference of rhumbs, so is the distance run between the observations, to the minutes of correction to be applied to the first zenith distance, and is to be added when the ship sails from the sun, otherwise it is to be subtracted.

Then slide the Vernier's scale on the meridian to the given declination, and the Vernier on the beam-compass to the first zenith distance as corrected, and let these scales be fixed by their screws: rectify the globe for noon, turn it till the hour-index points at the time of the first observation, there hold the globe fast, and move the beam-compass on its center, nearly into the azimuth of the sun at that observation, and describe an arc on the globe with the pointer of the Vernier, slide the Vernier on the beam-compass to the second observed zenith distance; turn the globe (the proper way) till the hour-index points at the time of the second observation, there hold the globe fast, and with the beam compass cut the former arc, their intersection will shew the place of the ship at the time of the second observation. bring the meridian over that point, and the latitude is found; also the hour-index will point at the true time of the day when the last observation was made. *Phil. Trans. No. 435.*

LATITUDE, in astronomy, is the distance of a star or planet from the ecliptic.

Or, it is an arch of a great circle, intercepted between the center of the star, and the ecliptic and perpendicular thereto.

Through the poles of the ecliptic are supposed to pass an indefinite number of great circles, cutting the ecliptic at right angles, called circles of latitude, or secondaries of the ecliptic; by means of which every star, and point of the heavens, is reduced to the ecliptic, and his its place in regard thereto determined; the latitude of a star being an arch of one of these secondaries, intercepted between that star, and the point where it intersects the ecliptic.

L A T

In which the latitude differs from the declination, which is the distance of a star from the equator towards one of the poles of the world. So that the geographical latitude is the same thing with the astronomical declination; and the astronomical latitude a quite different thing.

The latitude of a planet is an angle, under which a planet's distance from the ecliptic is seen on the earth.

The sun never has any latitude, but the planets have, for which reason, in the common sphere, the zodiac has some breadth. The ancients only allowed six degrees on each side the ecliptic, but the moderns have extended it to nine.

When they have no latitude, they are said to be in the nodes of the ecliptic, or in the intersection of their orbit with that of the sun; and in this situation it is that they eclipse, or are eclipsed by, the sun.

LATITUDE (Circle of), is a great circle passing through the poles of the ecliptic.

LATITUDE OF THE MOON (North ascending), is when she proceeds from the ascending node towards her northern limit, or greatest elongation.

LATITUDE (North descending), is when the moon returns from her northern limit to the descending node.

LATITUDE (South descending), is when she proceeds from the descending node to her southern limit.

LATITUDE (South ascending), is when she returns from her southern limit to her ascending node.

And the same holds good of the other planets.

LATITUDE OF A PLANET (Heliocentric), is its distance from the ecliptic, such as it is seen from the sun. This when the planet comes to the same point of its orbit, is always the same, and unchangeable.

LATITUDE OF A PLANET (Geocentric), is the distance of the planet from the ecliptic, as it is seen from the earth.

This, though the planet be in the same point of its orbit, yet is not constantly the same, but alters according to the position of the earth, in respect to the planet.

LATITUDINARIAN. *a.* (*Latitudinarius*, low Lat.): Not restrained; not confined (*Col.*).

LATITUDINARIAN. *s.* One who departs from orthodoxy.

LATIUM (anc. geog.), the country of the Latins, at first contained within very narrow bounds, but afterwards increased by the accession of various people. The appellation, according to Virgil, is a *latendo*, from Saturn's lying hid there from the hostile pursuits of his son Jupiter; and from Latium comes the name Latini, the people, (Virgil): though Dionysius Halicarnasæus derives it from king Latinus, who reigned about the time of the Trojan war. But whatever be in this, it is certain, that Latium, when under Æneas and his descendants, or the Alban kings, contained only the Latins, exclusive of the Æqui, Volsci, Hernici, and other people; only that Æneas reckoned the Rutuli,

L A T

after their conquest, among the Latins. And this constituted the ancient Latium, confined to the Latins but afterwards, under the kings, and after their time, it reached from the Tiber to Circeii. Under the consuls, the country of the Æqui, Volsci, Hernici, &c. after long and bloody wars, was added to Latium, under the appellation adjectitious or superadded Latium, as far as the river Liris, the eastern boundary, and to the north as far as the Marsi, and Sabinæ. The various people, which in succession occupied Latium, were the Aborigines, the Pelasgi, the Arcades, the Siculi, the Arunci, the Rutuli, and beyond Circeii, the Volsci, the Osci, the Ausones: but who first, who next, occupied the country, it is difficult to say.

LATMUS, a mountain of Caria near Miletus, famous for the residence of Endymion, whom the moon regularly visited in the night, whence he is often called Latmus Heros.

LATOMIA, properly signifies a stone quarry: but places whence stones had been dug having been made use of sometimes as dungeons, jails, or prisons for criminals, it is oftentimes applied as a name for a prison. There was a place of confinement of this sort at Rome, near the Tullianum; another at Syracuse, in which Cicero says Verres had shut up Roman citizens.

LATONA, a daughter of Cœus, the Titan, or, according to Homer, of Saturn. She is celebrated for the favour which she granted to Jupiter. Juno, always jealous of her husband, sent the serpent Python to persecute her. Latona wandered from place to place in the time of pregnancy, continually alarmed for fear of Python. She was driven from heaven, and Terra refused to give her a place where she might rest and bring forth. Neptune, moved with compassion, struck with his trident, and made immovable the island of Delos, which before wandered in the Ægean sea. Latona changed into a quail by Jupiter, came to Delos, where she resumed her original shape, and gave birth to Apollo and Diana. Juno obliged her to fly from Delos. After having wandered over the greatest part of the earth, and experienced the violence of Niobe and Tityus, (Vid. **NIÖBE** and **TITYUS**) she at length, though exposed to the resentment of Juno, became a powerful deity, and saw her children receive divine honours. Her worship was generally established where her children received adoration, particularly at Argos, Delos, &c. where she had temples.

LA'TRANT. *a.* (*latrans*. Lat.) Barking.

LATRIA, in theology, a religious worship due only to God. The Romanists say, "they honour God with the worship of latria, and the saints with the worship of dulia." But the terms, however distinct, are usually confounded. The worship of latria, besides its inner characters, has its external marks to distinguish it; the principal whereof is sacrifice, which cannot be offered to any other but God himself, as being a solemn acknowledgement or recognition of the sovereignty of God, and our dependance on him. Mr. Daille seems to own, that some of

L A T

the fathers of the fourth century allowed the distinction between *latria* and *dulia*.

LATRINÆ, were public houses of office, or necessaries, amongst the Romans.

LATRUNCULLI, a game amongst the Romans of much the same nature with our chess. The *latrunculi* were properly the chess-men, called also *latrones* and *calculi*. They were made of glass, and distinguished by black and white colours. Sometimes they were made of wax or other convenient substance. Some give the invention of this game to Palamedes when at the siege of Troy, Seneca attributes it to Chilon, one of the seven Grecian sages; others honour Pyrrhus with the invention; and others again contend that it is of Persian origin. See **CHESS**.

LATTIN, denotes iron plates tinned over, of which tea canisters, &c. are made. Plates of iron being prepared of a proper thickness, are smoothed by rusting them in an acid liquor, as common water made eager with rye: with this liquor they fill certain troughs, and then put in the plates, which they turn once or twice a day, that they may be equally rusted over, after this they are taken out, and well scoured with sand, and, to prevent their rusting again, are immediately plunged into pure water, in which they are to be left till the instant they are to be tinned or blanch'd, the manner of doing which is this. they flux the tin in a large non crucible, which has the figure of an oblong pyramid with four faces, of which two opposite ones are less than the two others. The crucible is heated only from below, its upper part being luted with the furnace all round. The crucible is always deeper than the plates, which are to be tinned, are long; they always put them in downright, and the tin ought to swim over them; to this purpose artificers of different trades prepare plates of different shapes, though M. Reaumur thinks them all exceptionable. But the Germans use no sort of preparation of the iron, to make it receive the tin, more than the keeping it always steeped in water, till the time; only when the tin is melted in the crucible, they cover it with a layer of a sort of suet, which is usually two inches thick, and the plate must pass through this before it can come to the melted tin. The first use of this covering is to keep the tin from burning, for if any part should take fire, the suet would soon moisten it, and reduce it to its primitive state again. The blanchers say, this suet is a compounded matter; it is indeed of a black colour, but M. Reaumur supposed that to be only an artifice, to make it a secret, and that it is only coloured with soot or the smoke of a chimney; but he found it true so far, that the common unprepared suet was not sufficient, for after several attempts, there was always something wanting to render the success of the operation certain. The whole secret of blanching, therefore, was found to lie in the preparation of this suet; and this, at length, he discovered to consist only in the first frying and burning it. This simple

L A T

operation not only gives it the colour, but puts it into a condition to give the iron a disposition to be tinned, which it does surprisingly. The melted tin must also have a certain degree of heat, for if it is not hot enough, it will not stick to the iron; and if it is too hot, it will cover it with too thin a coat, and the plates will have several colours, as red, blue, and purple, and upon the whole will have a cast of yellow. To prevent this, by knowing when the fire has a proper degree of heat, they might try with small pieces of iron, but in general, use teaches them to know the degree, and they put in the iron when the tin is at a different standard of heat, according as they would give it a thicker or thinner coat. Sometimes also they give the plates a double layer, as they could have them very thickly covered. This they do by dipping them into the tin, when very hot, the first time; and when less hot the second. The tin which is to give the second coat must be fresh covered with suet, and that with the common suet, not the prepared.

LATTEN BRASS, plates of milled brass reduced to different thicknesses, according to the uses for which they are intended.

LATTER. *a.* 1 Happening after something else. 2 Modern, lately done or past (*L. che*). 3. Mentioned last of two (*Mells*).

LATTERLY. *ad* (from *latter*) Of late.

LATTICE. *s.* (*latis*, French.) A reticulated window; a window made with sticks or irons, crossing each other at small distances (*Cleveland*).

To **LATTICE**. *v. a* (from the noun) To decussate, or cross; to mark with cross parts like a lattice.

LATTICED. In botany. Cancellatus. Applied to the involucre in *atractylis cancellata*; and to the capsule of lily.

LATTIMO, in the glass trade, a name for a fine milk-white glass. There are several ways of making it, but the best of all is this: take four hundred weight of crystal frit, and sixty pounds of calcined tin and two pounds and an half of prepared manganese; mix these well with the frit, and set them in a pot in a furnace to melt and refine. At the end of eighteen hours this will be purified, then cast it into water, purify it again afterwards in the furnace, and make a proof of it. If it be too clear add fifteen pounds more of calcined tin; mix it well with the metal, and let it stand one day to purify; it will then be of a whiteness surpassing even that of snow, and is fit to work into vessels.

LATUS RECTUM, in conic sections, the same with **PARAMETER**; which see.

LATUS TRANSVERSUM, of the hyperbola, is the right line between the vertices of the two opposite sections; or that part of their common axis lying between the two opposite cones. It is the same as the transverse axis of the hyperbola, or opposite hyperbolas.

LATUS PRIMUM, a right line, drawn through the vertex of the section of a cone, within the same, and parallel to the base.

L A V

LAVA. In mineralogy, a genus of the class earths, order argillaceous. Consisting of a lumine with a larger portion of silex and oxyd of iron, and frequently a little carbonat of lime, and carbonat of magnesia; generally of a dull colour, becoming hoary when scraped, meager, breaking into indeterminate fragments, mouldering into argil in the air produced by the internal fires of volcanic mountains from which it is thrown out, and melting into a black glass. Six species, the following are the chief:

1. **L. compacta**. Compact lava. Nearly opaque, compact, hardish, of a conchoidal texture. Found in volcanic mountains and their neighbourhood, appearing to have been fused by the action of fire, but not vitrified, and becoming when cooled close and solid, and bearing the resemblance of its original mineral; colour generally blackish, sometimes grey, brown, or red, rarely white, very rarely green or blue: its substance so very little porous as to admit being cut into slabs, with an almost entire surface and marble polish; fracture earthy or fine splintery, more rarely foliated; contains often hornblend, white garnet, olivin, calcareous spat, mica, schorl, &c.

2. **L. pumex**. Pumice stone: of which there are several varieties; one, opaque, without lustre, parallel, fibrous, porous, light, rough. A second, fibrous with elongated pores. A third, hardly fibrous, with very minute pores. Found in the ashes of most volcanic mountains, whence it is washed down into the sea; colour grey, greyish-white, brown or reddish, rarely yellowish the fibres are generally parallel, more or less discernible, and have a silky lustre; does not effervesce with acids, melts into a white enamel. See **VOLCANO**.

The quantity of matter thrown out from volcanoes under the name of lava is prodigious. After the great eruption of Etna in 1669, Borelli went from Pisa to Sicily to observe the effects of it. The matter thrown out at that time amounted to 93,830,750 cubical paces; so that, had it been extended in length upon the surface of the earth, it would have reached more than four times round the whole earth. All this matter, however, was not lava, but consisted also of sand, stone, gravel, &c. The lava he computed at 6,300,000 paces, which formed a river, according to our author, sometimes two miles broad; but according to others it was six or seven miles broad, and sometimes 20 or 30 yards in depth. Sir William Hamilton informs us, that the lavas of Etna are very commonly 15 or 20 miles in length, six or seven in breadth, and 50 feet deep. The most considerable is scarce less than 30 miles long and 15 broad. The most considerable lavas of Vesuvius do not exceed seven miles in length. The same author, however, tells us, that the lava which issued from Vesuvius in 1767 was six miles long, two in breadth, and in most places 60 or 70 feet deep. In one place it had run along a hollow-way made by currents of rain, not less than 200 feet deep and 100 wide; and this vast hollow it had in one place filled up.

L A V

He says, he could not have believed that so great a quantity of matter could have been thrown out in such a short time, if he had not examined the whole course of it himself. Even this quantity, however, great as it is, appears very trifling in comparison of that thrown out in Iceland in the year 1783, which covered a space of ground 90 miles in length and 42 in breadth, to the depth of more than 100 fct. Dr Von Troil, in his letters on Iceland, tells us, that he and his companions travelled over a tract of lava upwards of 300 miles in length: and in 1728, we are told that an eruption of lava took place, which continued for two years to run into a great lake, which it almost filled up.

As the lavas are thrown out from the volcanoes in the highest degree of ignition, it may easily be supposed that such vast bodies will retain their heat for a long time. It would indeed be well worth observing, what length of time is required to cool a lava perfectly; as from thence we might in some measure judge how far those philosophers are in the right, who argue concerning the length of time required to cool an ignited globe of the size of our earth or larger. Sir William Hamilton tells us, that in the month of April 1771, he thrust sticks into some of the crevices of the lava which had issued from Vesuvius in October 1767, and they immediately took fire. On Mount Etna, in 1709, he observed the lava that had been disgorged three years before to smoke in many parts. No particular observation, however, hath been made in what proportion the heat of lavas is gradually lost.

Sir William Hamilton informs us of a curious fact relating to a lava in the island called Lacco. Here is a cavern shut up with a door; and this cavern is made use of to cool liquors and fruit, which it does in a short time as effectually as ice. Before the door was opened, he felt the cold on his legs very sensibly, but when it was opened, the cold rushed out so as to give him pain, and within the grotto it was intolerable. He was not sensible of wind attending this cold; though upon Mount Etna and Vesuvius, where there are caverns of this kind, the cold is evidently occasioned by a subterranean wind: the natives call such places *moscetes*. These likewise break out from wells and subterranean places in the neighbourhood of a volcano before an eruption. Our author tells us, that the vapour affects the nostrils, throat, and stomach, just as the spirit of hartshorn or any strong volatile salt, and would soon prove fatal if you did not immediately withdraw from it. These *moscetes*, he says, are at all times to be met with under the ancient lavas of Vesuvius, particularly those of the great eruption of 1631.

LAVAL, a considerable town of France, in the department of Maine, with two castles. Since the revolution it has been erected into a bishopric; and the inhabitants are computed at 24,000. Linen of all kinds and qualities is

L A V

manufactured here; and the neighbouring quarries produce green marble, or black veined with white. It is seated on the Maine, 15 miles S. of the town of that name, and 40 W. of Mans. Lon. 0. 42 W. Lat. 48. 7 N.

LA'VANDULA. Lavender. In botany, a genus of the class *didynamia*, order *gymnospermia*. Calyx ovate, slightly toothed, supported by a bract; corol reversed, stamens within the tube. Eight species chiefly of the south of Europe. The following are the chief:

1. *L. spica*. Spike or common lavender. Leaves sessile, lance-linear, revolute at the edge; spike interrupted, naked, with blue flowers. The taste of the flowers is bitter, warm, and somewhat pungent, the leaves are weaker and less grateful. The essential oil obtained from them by distillation is a bright yellow colour, of a very pungent taste, and possesses if carefully distilled the fragrance of the lavender in perfection. The use of the leaves and flowers of this species has been long recommended in nervous debilities and various affections proceeding from want of energy in the animal functions. The London College directs an essential oil, a simple spirit, and a compound tincture, to be kept in the dispensatories of Europe.

2. *L. stœchas*. French lavender. Leaves sessile, linear, downy, revolute at the edge; spike contracted, comose, bractes about three-lobed. South of Europe.

3. *L. viridis*. Leaves sessile, linear, wrinkled, villous; revolute at the edge; spike comose; bractes undivided. A native of Madeira.

4. *L. dentata*. Leaves sessile, linear, with pectinate divisions; spike contracted, comose. Spain.

The first species is a shrubby plant, and is propagated by cuttings or slips; the best season for which is March, the cuttings should be planted in a shady situation, or may be shaded with mats till they have taken root, after which expose them to the sun, and when they have acquired strength, remove them to the places where they are designed to remain: they succeed best upon the most barren and rocky soil, in which they will endure the severest winters. The second sort is a biennial plant, the seeds of which may be sown every spring on borders or beds of light fresh earth, and when the plants arise, they may be transplanted into other borders of the flower-garden, or into pots, where they will require no other care than to be kept free from weeds. The third and fourth species are shrubby plants; the third is managed like the first sort, but the fourth being tenderer, must be sown on a moderate hot-bed in the spring, and when the plants come up they should be planted each in a separate small pot, filled with light earth, and plunged into another hot-bed, to bring them forward; in the beginning of June they may be inured to the external air, where they should be planted in an open situation toward the end of the month. They may be preserved through the winter in a good green-house, and will produce flowers through most part of the season, as well as fertile seeds.

L A V

LAVARET, in ichthyology. See **SALMO**.

LAVATER (John Gaspard Christian), a celebrated physiognomist, was born at Zurich, in Switzerland, in 1741. He was brought up a protestant minister, entered into holy orders in 1761; in 1778, was appointed deacon and pastor of St. Peter's church, where he was long noted as an eloquent and faithful preacher. He was persuaded by Dr. Zimmerman (who had often been struck with his physiognomical remarks) to reduce into a systematic form his notions on that subject; in consequence of which, he published his first volume on physiognomy in 1776, and two other volumes followed after no very long interval. This work contains a wonderful assemblage of curious observations, delicate feeling, and philanthropic sentiment, with a great number of engravings highly finished and singularly expressive. It was well translated into the English and other modern languages, and was for some time the favourite topic of literary discussion. Lavater also published *Aphorisms on Man*, and the *Journal of a Self-observer*; both of which exhibit much originality of sentiment and expression, with deep and philosophical views of human nature.

Lavater was zealously attached to the christian religion, and translated Bonnet's *Enquiry into the Evidences of Christianity* into the German language. This book he dedicated to the celebrated Jewish philosopher Moses Mendelssohn, with a challenge either to refute it publicly, or profess his conviction of the truth of its arguments. His popularity at Zurich was extremely great; and well he deserved it, as his zeal for doing good was hardly ever surpassed. His genuine love of liberty caused him to be a great admirer of the French revolution, but as he had not a head so stupid as to derive no advantage from experience, nor a heart so hard as to be untouched by the rapine, plunder, and bloodshed, which afterwards disgraced that revolution, he then became one of its most decided antagonists. He was wounded in the breast when Zurich was stormed by Massena in 1799; and never thoroughly recovered from it: he lived, however, till January 1801, and retained his activity and vigour of mind till within a few days of his death.

LAVATERA. Mallow tree. In botany, a genus of the class monadelphia, order polyanthia. Calyx double, the outermost three-cleft; capsules numerous, one-seeded, disposed in a ring. Twelve species; natives of the Levant and south of Europe; one common to the searocks of our own country. Of these some have shrubby and some herbaceous stems. Many of these are cultivated in our own gardens, and may be easily propagated by seeds.

The season for sowing is March, and they should be sown upon a bed of fresh light earth. When the plants are come up let them be cleared from weeds, and in very dry weather be refreshed with water; when about two inches high, they should be transplanted to the places in which they are designed to remain. In transplanting them, care should be taken to

L A U

preserve a ball of earth around their roots, they should be watered and shaded till they have taken new root, after which they will require no other care than to clear them from weeds, and support them by stakes, to prevent their being injured by strong winds. The seeds of these plants may also be sown in autumn, and when the plants are come up, let them be transplanted into small pots, which, toward the end of October, should be placed in a common hot-bed frame, where the plants, being defended from severe frosts will continue through the winter without injury. These in the spring may be transferred to larger pots, or even to the open ground where they are designed to flower; and by this management they will be stronger, larger, and flower earlier, than if not sown till the spring.

LAVATION. *s.* (*lavatio*, Latin.) The act of washing (*Halewell*).

LAVATORY. *s.* (from *lavo*, Lat.) A wash; something in which parts diseased are washed (*Harvey*).

LAUBACH, a handsome and strong town of Germany, in the circle of Austria, and in Carniola, with a bishop's see, a castle, and very handsome houses. It is seated on a river of the same name, wherein are the largest crawfish in Europe. Lon. 14. 25 E. Lat. 40. 24 N.

LAUD. *s.* (*laus*, Lat.) 1. Praise; honour paid; celebration (*Pope*). 2. That part of divine worship which consists in praise (*Bacon*).

To **LAUD**. *v. a.* (*laudo*, Lat.) To praise; to celebrate (*Bentley*).

LAUD (William), archbishop of Canterbury, the son of a clothier of Reading, in Berkshire, was born on the 7th of October, 1573, and educated at Oxford. In 1600 he was ordained deacon, and in 1601 priest. In 1603 he was chosen proctor of the university of Oxford, and the same year made chaplain to Charles Blount, earl of Devonshire. In 1607 he was inducted into the vicarage of Stamford in Northamptonshire, and in the following year had North-Kilworth, in Leicestershire, given him. In 1608 he took the degree of doctor of divinity, and the same year was made chaplain to Dr. Richard Neal, bishop of Rochester. After several other preferments, he was in 1620 made prebendary of Westminster, and the next year bishop of St. David's. In 1620 he was translated to the see of Bath and Wells, and made dean of the royal chapel; and next year privy-counsellor to his majesty. In 1628 he was translated to the see of London; and in 1630 elected chancellor of Oxford. From this time he made it his business to adorn that university, and beginning with St. John's college where he was educated, built all the inner quadrangle, except a part of the south side. He then erected that elegant pile of building at the west end of the divinity school; in which is the convocation-house, and Selden's library. He also gave the university, at several times, one thousand three hundred manuscripts in various languages, which he

L A U

had purchased at a prodigious expence. After the murder of the duke of Buckingham, Dr. Laud became chief favourite to king Charles I. which whilst it augmented his power and interest, increased the envy and hatred he had raised against him. The superstitious ceremonies he used in the consecration of St. Catherine Cree church, London, the 6th of January, 1630-1, gave great disgust, and his zeal in the prosecutions carried on in the high commission and star-chamber courts, against authors, printers, and divines, filled the minds of the people with resentment. But the prosecution of the king's printers, for leaving out the word *not* in the seventh commandment, in an edition of the English bible, gave great offence. In 1633 he attended the king into Scotland, and was sworn a privy counsellor for that kingdom. During his stay in Scotland, he formed the resolution of bringing that church to an exact conformity with the church of England. In the same year he succeeded archbishop Abbot in the see of Canterbury. In 1634, and the following year, the archbishop, by his vicar-general, preformed his metropolitical visitation, in which among other things, the church-wardens in every parish were enjoined to remove the communion table from the middle to the east end of the chancel, altar-wise, the ground being raised for that purpose, and to fence it with proper rails. On the 5th of February, 1634-5, he was put into the great committee of trade, and the king's revenue; on the 4th of March following, appointed one of the commissioners of the treasury; and on the 6th of March, 1635-6, he received the staff of lord high-treasurer of England. A new parliament being summoned, met the 13th of April, 1640, and the convocation the day following: but the commons launching out into complaints against the archbishop, and insisting upon a redress of grievances before they granted any supply, the parliament was dissolved the 7th of May. The convocation, however, continued sitting, and made seventeen canons, which were supposed to be formed under the immediate direction of the archbishop. In the beginning of the long parliament he was attacked on account of those canons, and they being condemned by the house of commons on the 16th of December, 1640, "as containing many things contrary to the king's prerogative, to the fundamental laws and statutes of this realm, to the rights of parliament, to the property and liberty of the subject, and tending to sedition, and of dangerous consequence," he was, on the 18th of December, accused by the commons of high treason, upon which he was committed to the custody of the usher of the black rod, and on the 1st of March sent to the Tower; and being at length tried before the house of lords, for endeavouring to subvert the laws, and to overthrow the protestant religion, was found guilty, and beheaded on Tower-hill, Friday the 10th of January, 1644-5, in the 72d year of his age. This learned prelate was temperate in his diet, and regular in his private life; but his fondness for introducing new ceremonies, in

L A U

which he shewed a hot and indiscreet zeal, his encouraging sports on Sundays, his illegality and severity in the star-chamber and high-commission courts, and the fury with which he persecuted the dissenters, and all who presumed to contradict his sentiments, exposed him to popular hatred. Though he was charged with a design to introduce popery, his answer to Dr. Fisher was one of the best ever printed against that religion.

LAUDABLE. *a.* (*laudabilis*, Latin.) 1. Praiseworthy; commendable (*Locke*). 2. Healthy; salubrious (*Arbutnot*).

LAUDABLENESS. *s.* (from *laudable*.) Praiseworthiness.

LAUDABLY. *ad.* (from *laudable*.) In a manner deserving praise (*Dryden*).

LAUDAMIA, in fabulous history, a daughter of Alexander, king of Epirus, and Olympus, daughter of Pyrrhus, killed in a temple of Diana, by the enraged populace. (*Justin*).

LAUDANUM. (from *lauda*, Lat.) A name commonly given to the tincture of opium, on account of its deserved praise as a specific, or at least, as an extenuant, in a great variety of cases. See **TINCTURA OPII**.

LAUDER, a borough in Berwickshire, with a castle, 22 miles S of Edinburgh. Lon. 3. 5 W. Lat. 55. 30 N.

LAUDI, or **LODI**. The name formerly given to certain sacred or spiritual songs of Italian invention, distinct from the hymn, and composed in the praise of God, the Virgin Mary, and the saints and martyrs.

LAUDICENI, amongst the Romans, applauders, who for reward entered the rehearsal-rooms, attended the repetition of plays, and were in waiting when orations were pronounced, in order to raise or increase the acclamation and applause.

LAUDON (Field-marshal), a celebrated general in the Imperial service, born in 1716, was a native of Livonia, and descended from a Scottish family. He made his first campaigns under marshal Munich, in the war of 1738 between the Russians and Turks; and was at the taking of Oczakow, Choczim, and Stawutzhane, where the Turks were entirely defeated. Frederick the Great refused, in 1741, to take young Laudon into his service, saying he did not like his countenance; though this monarch, who was considered as the greatest general of his age, afterwards said, that he often admired the positions of other generals, but that he had ever dreaded the battles of Laudon. In 1756, when but just entered into the service of the house of Austria, with the rank of lieutenant-colonel, he made such a rapid progress, that within less than a year he was general of artillery, and within three years commander in chief of the whole army. He rescued Olmutz, when besieged by the Prussians; beat the king himself at Frankfurt on the Oder; at Zondorf, took general Fouquet prisoner; carried Glatz and Schweidnitz by assault; and stopped the progress of Frederick in a war which might have proved fatal to the

L A V

house of Austria. In 1778, when elevated to the rank of marshal, at the head of 60,000 men he hindered Henry, brother to the king of Prussia, from joining his army to that of the king. At Dubicza, Novi, Gradisca, and Belgrade, in the late war between the emperor and the Turks, he had but to present himself before the place, and say with Cæsar, *Veni, vidi, vici*. But at his head-quarters in Moravia he was seized with a fever, in consequence of an operation he underwent for an obstruction in the urethra. His impatience under the medical applications, the impetuous ardour of his character, and the knowledge, above all, of his importance in the war, contributed to irritate his mind, and promote the violence of the fever. He resisted the application of cataplasms, before and after the incisions were made, with a fatal obstinacy, which raised the inflammation to such a height, that he expired under the accession of the fever on the 14th of July, 1790, in the 74th year of his age.

LAUDS, LAUDES, the second part of the ordinary office of the breviary, said after matins; though, heretofore, it ended the office of the night. The laudes consist principally of psalms, hymns, &c. whence they took their name, from *laus, laudis*, praise.

To LAVE. v. u. (*lavo*, Lat.) 1. To wash; to bathe (*Dryden*). 2. (*lener*, Fr.) To throw up; to lade; to draw out (*Ben Jonson*).

To LAVE. v. n. To wash himself; to bathe (*Pope*).

To LAVER. v. n. To change the direction often in a course (*Dryden*).

LAVENDER, in botany. See **LAVANDULA**.

LAVENDER (Cotton). See **SANTALINA**.

LAVENDER (Sea) See **STATICE**.

LAVENHAM, or LANHAM, 61 miles from London, is a pleasant and pretty large town of Suffolk, on a branch of the river Bret, from whence it rises gradually to the top of a hill, where are its church, which is a very handsome Gothic structure, and in which are several ancient monuments; and a spacious market-place, encompassed with nine streets or divisions, in a very healthy free air. It had formerly a very considerable trade in blue cloth; and had three guilds or companies, with each their hall. It has still a considerable manufactory of serges, shalloons, says, stuffs, and spinning fine yarn for London: and many hundred loads of wool are delivered in a year from its wool-hall. It is governed by six capital burgesses, who are for life, and choose the inferior officers. The church and its steeple, which is 137 feet high, are reckoned the finest in the county. Its tenor bell, though not much more than a ton, has as deep a note as a bell of twice that weight. Here is a free-school and a bridewell; and here the tenure of land called Borough English exists. Lon. 0. 51 E. Lat. 52. 39 N.

LAVER, in botany. See **ULVA**.

LAVER, in scripture history, a sacred utensil placed in the court of the Jewish tabernacle, consisting of a basin, whence they drew water

L A V

by cocks, for washing the hands and feet of the officiating priests, and also the entrails and legs of the victims.

LAVERNA, in antiquity, the goddess of thieves and cheats among the Romans, who honoured her with public worship.

LAUGERIA. In botany, a genus of the class pentandria, order monogynia. Corol five-cleft; drupe with a five-celled nut. Five species: native shrubs of America or the West Indies. The several species vary much in the number of cells their nuts contain.

To LAUGH. v. n. (*lahan*, Sax. *lachen*, German.) 1. To make that noise which sudden merriment excites (*Bacon*). 2. (In poetry.) To appear gay, favourable, pleasant, or fertile (*Shakspeare*). 3 **To LAUGH at.** To treat with contempt; to ridicule (*Shakspeare*).

To LAUGH. v. a. To deride; to scorn (*Shakspeare*).

LAUGH. s. (from the verb.) The convulsion caused by merriment; an inarticulate expression of sudden merriment (*Pope*).

LAUGHABLE. a. (from *laugh*.) Such as may properly excite laughter (*Dryden*).

LAUGHER. s. (from *laugh*.) A man fond of merriment (*Pope*).

LAUGHINGLY. ad. (from *laughing*.) In a merry way; merrily.

LAUGHINGSTOCK. s. (*laugh* and *stock*.) A butt; an object of ridicule (*Spenser*).

LAUGHTER. s. (from *laugh*.) Convulsive merriment; an inarticulate expression of sudden merriment (*Shakspeare*).

LAUINGEN, a town of Suabia, formerly imperial, but now subject to the duke of Neuberg. It is seated on the Danube, 32 miles N.W. of Augsburg. Lon. 10. 25 E. Lat. 48. 38 N.

LAVINGTON, a town in Wilts, with a market on Wednesday, 20 miles N.W. of Salisbury, and 88 W. by S. of London. Lon. 2. 3 W. Lat. 51. 13 N.

LAVINIA, a daughter of king Latinus and Amata, was betrothed to her relation king Turnus, but because the oracle ordered her father to marry her to a foreign prince, she was given to Æneas after the death of Turnus. (See **LATINUS**.) At her husband's death she was left pregnant, and being fearful of the tyranny of Ascanus, her step-son, she fled into the woods, where she brought forth a son called Æneas Sylvius.

LAVIPEDIUM, in medicine, a pediluvium or feet-bath.

LA'VISH. a. (from *lave*, to throw out.) 1. Prodigal; wasteful; indiscreetly liberal (*Rome*). 2. Scattered in waste; profuse. 3. Wild; unrestrained (*Shakspeare*).

To LA'VISH. v. a. (from the adjective.) To scatter with profusion; to waste (*Add.*).

LA'VISHER. s. (from *lavish*.) A prodigal; a profuse man.

LA'VISHLY. ad. (from *lavish*.) Profusely; prodigally (*Shakspeare*).

LA'VISHMENT. LA'VISHNESS. a.

(from *lavish*.) Prodigality; profusion (*Spenser*).

LAUNCE, or **SEA LAUNCE**. In ichthyology. *Anmodytes*; by mistake, however, misprinted *anmorytes* in the preceding part of this work, and arranged accordingly.

LAUNCESTON, a borough in Cornwall, with a market on Saturday. It is the county-town, governed by a mayor, and sends two members to parliament. It had a strong castle, which is now in ruins; and a little without the town stands the old priory. It is seated on a hill, near the river Tamar, 28 miles N. of Plymouth, and 214 W. by S. of London. Lon. 4. 35 W. Lat. 50. 40 N.

To LAUNCH. *v. n.* 1. To force a vessel into the sea (*Locke*). 2. To rove at large; to expatiate; to make excursions (*Davies*).

To LAUNCH. *v. a.* 1. To push to sea (*Pope*). 2. To dart from the hand, to lanch (*Dryden*).

LAUNCH, among sailors; a sort of boat used by the French, Italian, and Spanish ships; and is peculiar to those which are employed in the Mediterranean trade, being better fitted for the ports of that sea than a long-boat, than which it is generally much longer, and more flat-bottomed, and also sharper before.

LAUNCHING A SHIP OR BOAT, pushing them into the water from an ascent.

When the ships of the ancients, particularly those of Greece, were launched, they were ornamented with garlands and flowers; the mariners also adorned with crowns, who shouted with loud acclamations, and other expressions of mirth and joy; and being purified by a priest, with a lighted torch, and egg and brimstone, or after some other manner, were consecrated to the god whose image they bore. In the launching of ships now-a-days, the same or similar expressions of joy and feasting are used, colours are displayed, and sometimes music performed.

LAUND. *s.* (*lande*, Fr.) Lawn; a plain extended between woods (*Shakspeare*).

LAUNDER, in mineralogy, a name given in Devonshire, and other places, to a long and shallow trough, which receives the powdered ore after it comes out of the box, or coffer, which is a sort of mortar, in which it is powdered with iron pestles.

The powdered ore, which is washed into the launder by the water from the coffer, is always finest nearest the grate, and coarser all the way down.

LAUNDRESS. *s.* (*lavandiere*, French.) A woman whose employment is to wash clothes (*Camden*).

LAUNDRY. *s.* (as if *lavanderie*.) 1. The room in which clothes are washed (*Swift*). 2. The act or state of washing (*Bacon*).

LAVOISIER (Antoine Laurent), was born in Paris on the 26th of August 1743. His father, who directed his education, was opulent, and spared no cost for his improvement. The youth shewed a decided taste for the physical sciences. In 1764, government having proposed an extraordinary premium

for the best and cheapest mode of lighting the streets of a large city, Lavoisier obtained the gold medal; and his memoir, full of nice investigation, was printed by the Academy. Into that body he was received on the 13th May 1768, in spite of a formidable opposition; and to its service he ever after devoted his labours, and became one of its most useful associates and coadjutors.

His attention was successively occupied with every branch of physical and mathematical science. The pretended conversion of water into earth, the analysis of gypsum in the neighbourhood of Paris, the crystallization of salts, the effects produced by the *grande de loupe* of the garden of the Infanta, the project of bringing water from l'Yvette to Paris, the congelation of water, and the phenomena of thunder and the aurora borealis—all occupied his attention.

Journeys, undertaken in concert with Guettard into every district of France, enabled him to procure numberless materials towards a description of the lithological and mineralogical empire; these he arranged into a kind of chart, which wanted little of being completed. They served also as a foundation for a more laborious work of his on the revolutions of the globe, and the formation of *Couches de la Terre*; a work of which two beautiful sketches are to be seen in the Memoirs of the French Academy for 1772 and 1787. All the fortune and all the time of Lavoisier were devoted to the culture of the sciences; nor did he seem to have a preponderating inclination for any one in particular, until an event, such as seldom occurs in the annals of the human mind, decided his choice, and attached him thenceforth exclusively to chemistry; a pursuit which has since rendered his name immortal.

The important discovery of gases was just announced to the philosophical world. Black, Priestley, Scheele, Cavendish, and Macbride, had opened to physiologists a sort of new creation; they had commenced a new era in the annals of genius, which was to become equally memorable with those of the compass, printing, electricity, &c.

It was about the year 1770 that Lavoisier, struck with the importance and grandeur of this discovery, turned his attention to this inexhaustible fountain of truths, and instantly perceived, by a kind of instinct, the glorious career which lay before him, and the influence which this new science would necessarily have over the whole train of physical researches. Of those who had preceded him, the most indefatigable experimenter was Priestley; but facts the most brilliant remained frequently unproductive in his hands; on every occasion he was ready to frame some crude hypothesis, which he hastily he abandoned. Lavoisier was imbued with the true spirit of inductive philosophy; his observations, eminently precise and luminous, always pointed to general views. In 1774, he published his chemical opuscles, which contained a very neat history of all that had been done with respect to gases, and con-

cluded with the author's capital experiments, by which it was proved, that metals in calcination derive their augmentation of weight from the absorption of air. Soon afterward, he shewed, in opposition to Priestley, that nitrous acid is composed of air; a remark, of which the importance appeared in the sequel. His ingenuity as a chemist was now so well known, that in 1776 Turgot employed him to inspect the manufacture of gunpowder. He introduced some valuable improvements, and, suppressing the odious visits in quest of the materials of saltpetre, he yet quintupled its produce. The gunpowder would now carry 120 toises, when formerly it would not reach 90. This superiority was indeed acknowledged in the last war.

It had been alleged, that by frequent distillation water is converted into earth. This question Lavoisier resolved in 1778, having shewn that the earthy sediment was owing to the continual erosion of the internal surface of the retort. In that same year he made a more interesting discovery; namely, that the respirable portion of the atmosphere is a constituent, principle of all acids, and which he therefore denominated oxygen; a most important fact, and the first great step towards the new chemistry; which the composition of water, ascertained in 1783, triumphantly completed.

Lavoisier possessed decisive advantages over his contemporaries; he studied a geometrical accuracy of investigation; and his wealth enabled him to make experiments on a large scale, and to use instruments of the most perfect construction. He was able to hold in his house, twice every week, assemblies, to which he invited every literary character that was most celebrated in geometrical, physical, and chemical studies; in these instructive *conversations*, discussions, not unlike such as preceded the first establishment of academies, regularly took place. Here the opinions of the most eminent literati in Europe were canvassed; passages the most striking and novel, out of foreign writers, were recited and animadverted on; and theories were compared with experiments. Here learned men of all nations found easy admission; Priestley, Fontana, Blagden, Ingenhousz, Landriani, Jacquin, Watt, Bolton, and other illustrious physiologists and chemists of England, Germany, and Italy, found themselves mixed in the same company with La Place, La Grange, Borda, Cowan, Meunier, Vandermonde, Monge, Morveau, and Berthollet. Happy hours passed in these learned interviews, wherein no subject was left uninvestigated that could possibly contribute to the progress of the sciences, and the amelioration and happiness of man. One of the greatest benefits resulting from these assemblies, and the influence of which was soon afterwards felt in the academy itself, and consequently in all the physical and chemical works that have been published for the last twenty years in France, was the agreement established in the methods of reasoning between the natural philosophers and the geometers. The precision, the se-

verity of style, the philosophical method of the latter, was insensibly transfused into the minds of the former; the philosophers became disciplined in the tactics of the geometers, and were gradually moulded into their resemblance.

It was in the assemblage of these talents that Lavoisier embellished and improved his own. When any new result from some important experiment presented itself, a result which threatened to influence the whole theory of the science, or which contradicted theories till then adopted, he repeated it before this select society. Many times successively he invited the severest objections of his critical friends; and it was not till after he had surmounted their objections, to the conviction and entire persuasion of the society; it was not till after he had removed from it all mystery and obscurity, that he ventured to announce to the world any discovery of his own.

At length he combined his philosophical views into a consistent body, which he published in 1789, under the title of *Elements of Chemistry*; a book which is a most beautiful model of scientific composition, clear, logical, and elegant. It would be foreign to our purpose to attempt an exposition of the principles, or to expatiate on the merits, of this celebrated system; which, within the space of a very few years, has been almost universally adopted, and which, though it must unavoidably be much shaken by the recent splendid discoveries of Mr. Davy, is still a monument of genius.

The last, but not the least useful, of Lavoisier's philosophical researches, on the Perspiration of Animals, was read to the Academy on the 4th May 1791, and of which part was published in the volume for 1790. He found, by some delicate experiments, made in conjunction with Seguin, that a man in 24 hours perspires 45 ounces; that he consumes 33 ounces of vital air; that he discharges from the lungs 8 cubic feet of carbonic acid gas, of which one-third is carbon and two-thirds are oxygen; that the weight of water discharged from the lungs amounts to 23 ounces, of which 3 are hydrogen and 20 oxygen, exclusive of 6 ounces of water already formed, lost in pulmonary perspiration. These discoveries were directed to the improvement of medicine.

We have mentioned the assistance which Lavoisier received while he was digesting his new system of chemistry; but we must add, that to him pertains exclusively the honour of a founder. His own genius was his sole conductor, and the talents of his associates were chiefly useful in illustrating discoveries he himself had made; he first traced the plan of the revolution he had seen a long time conceiving; and his colleagues had only to pursue and execute his ideas.

In the twenty volumes of the *Academy of Sciences*, from 1772 to 1790, are the memoirs of Lavoisier, mixed with all the great phenomena of the sciences, the progress of combustion, generation, and corruption, the nature and analysis of atmospheres, and the formation and fixation of organic bodies, the properties of

the matter of heat; the composition of acids; the augmentation of the ponderosity of burnt bodies; the decomposition and recombination of water; the dissolution of metals; vegetation, fermentation, and animalization. For more than 15 years consecutive, Lavoisier pursued, with unshaken constancy, the route he had marked out for himself, without making a single false step, or suffering his ardour to be damped by the numerous and increasing obstacles which constantly beset him.

Many were the services rendered by Lavoisier, in a public and private capacity, to manufactures, to the sciences, and to artists. He was treasurer to the academy after Buffon and Laplace, and introduced economy and order into the accounts. He was also a member of the Board of Consultation, and took an active share in whatever was going forwards. When the new system of measures was agitated, and it was proposed to determine a degree of the meridian, he made accurate experiments on the expansion of metals, and constructed a metalline thermometer. By the National Convention he was consulted on the means of improving the manufacture of assignats, and of increasing the difficulties of forging them.

Like a good citizen, Lavoisier turned his thoughts to political economy. Between the years 1775 and 1785, he allotted 240 sesterces in that country to experimental agriculture, and increased the annual produce by one-half. In 1791, he was invited by the Constituent Assembly to digest a plan for simplifying the collection of the taxes. This gave occasion to an excellent report, afterwards printed with the title of *Territorial Riches of France*. At this time, also, he was appointed commissioner of the national treasury, in which he effected some beneficial reforms.

During the horrors of the Robespierrean dictatorship, Lavoisier told La Lande that he foresaw he should be stripped of his property, but that he would work for his bread. The profession of apothecary would have suited him the best. But his doom was already fixed. On the 8th of May 1794, confounded with 28 farmers-general, he suffered on the scaffold, being declared guilty of having "adulterated meat with water and ingredients destructive of the health of the citizen." He requested leave to complete some experiments necessary for the service of the country, in which he had been some time engaged, and offered to lay down his life without when he had finished his work. The next day, however, the president of the tribunal, and the two great savans or philosophers, who were the course of justice could not be prevailed upon to grant his request.

Lavoisier was tall, and of a graceful, agreeable appearance. He was mild, sociable, and easy in his manners, and in his manner of dress was perfectly plain and simple. Many of his friends, however, with the gift of eloquence, but more with a genius to woo the sciences, have considered their obligations to him as requiring that they should be the companions whom he followed in silence, and

without the ostentation of virtue. In the countenance of the department of the Loire and Char, where he possessed considerable estates, he would frequently visit the cottages of indigence and distress; and long will his memory be cherished there. But his reputation, influence, virtues, and wealth, gave him a great preponderance, which unfortunately provoked the jealousy of a crew of homicides, who made a sport of sacrificing the lives of the best of men to a sanguinary idol.

This great and good man, married, in 1771, Marie-Anni-Pierette Paulze, daughter of a farmer-general; a woman whose wit and accomplishments constituted the charm of his life; who assisted him in his labours, and even engraved the figures of his last work. Since the death of Lavoisier, she has married another philosopher, Count Rumford.

LAVOISIERIAN THEORY. The modern or pneumatic theory of chemistry, so denominated from its illustrious inventor, and which erected itself upon the ruins of the Stahlian or phlogistic theory. See the article **CHEMISTRY**.

LAVONIA. In botany, a genus of the class syngenesia, order polygamia æqualis. Receptacle naked; down three-awned, glandular at the top; calyx ovate, somewhat imbricate. Two species: one a native of Jamaica, one of Ceylon.

LAVOLTA. *s.* (*la volte*, French.) An old dance, in which was much turning and much capering (*Shakespeare*).

LAVORO (Terra di), a province of Naples, 63 miles in length, and 35 in breadth; bounded on the W. by Campagna di Roma, on the N. by Abruzzo Ulteriore and Citeriore, on the E. by the Molise and Principato Ulteriore, and on the S. by Principato Citeriore. It is proper for tillage, whence it took its name; and it is fertile in excellent vines and fruits. There are also mineral springs, and mines of sulphur. Naples is the capital.

LAURA, *Laurea*, primarily signifying village, street, or hamlet, a name given to the residences of the ancient monks. Authors cannot agree about the difference between a laura and a monastery: some pretend, that a laura was a monastery, wherein there lived at least a thousand monks; but this is in no-wise credible. The more natural opinion is, that the ancient monasteries were the same with the modern, consisting of large buildings, divided into halls, chapels, and cells, possessed by the monks, each of whom had his apartment; but the laura were a kind of villages, whereof each house was inhabited by one or two monks at the most; so that the houses of the Chartreux seem, in some measure, to represent the ancient laura, and those of the other monks proper monasteries. The term laura was only understood of the religious places in Egypt, and the East, where their houses stood apart from each other, and were not joined by any common cloister, the monks that inhabited them only meeting in public once a week.

LAUREATE or **PORT LAUREATE**, *s.* of

L A U R E A T E.

ficer of the household of the kings of Britain, whose business consists only in composing an ode annually on his majesty's birth-day, and on the new year; sometimes also, though rarely, on occasion of any remarkable victory. Of the first institution of poets laureate, Mr. Wharton has given the following account in his *History of English Poetry*. "Great confusion has entered into this subject, on account of the degrees in grammar, which included rhetoric and versification, anciently taken in our universities, particularly at Oxford: on which occasion, a wreath of laurel was presented to the new graduate, who was afterwards styled *Poeta Laureatus*. These scholastic laureations, however, seem to have given rise to the appellation in question. I will give some instances at Oxford, which at the same time will explain the nature of the studies for which our academical philologists received their rewards. About the year 1470, one John Watson, a student in grammar, obtained a concession to be graduated and laureated in that science, on condition that he composed one hundred Latin verses in praise of the university, and a Latin comedy. Another grammarian was distinguished with the same badge, after having stipulated, that, at the next public act, he would affix the same number of hexameters on the great gates of St. Mary's church, that they might be seen by the whole university. This was at that period the most convenient mode of publication. About the same time, one Maurice Byrchensaw, a scholar in rhetoric, supplicated to be admitted to read lectures, that is, to take a degree in that faculty; and his petition was granted, with a provision that he should write one hundred verses on the glory of the university, and not suffer Ovid's *Art of Love*, and the *Elegies of Pamphylus*, to be studied in auditory. Not long afterwards, one John Bulman, another rhetorician, having complied with the terms imposed, of explaining the first book of Tully's *Offices*, and likewise the first of his *Epistles*, without any pecuniary emolument, was graduated in rhetoric; and a crown of laurel was publicly placed on his head by the hands of the chancellor of the university. Robert Whittington affords the last instance of a rhetorical degree at Oxford. He was a secular priest, and eminent for his various treatises in grammar, and for his facility in Latin poetry: having exercised his art many years, and submitting to the customary demand of an hundred verses, he was honoured with the laurel in the year 1512.

"With regard to the poet laureate of the kings of England, he is undoubtedly the same that is styled the *king's versifier*, and to whom 100 shillings were paid as his annual stipend in the year 1251. But when or how that title commenced, and whether this officer was ever solemnly crowned with laurel at his first laureation, I will not pretend to determine, after the researches of the learned Schaefer on this question have proved unsuccessful. It seems most probable, that the barbarous and ignominious custom of versifying gradually gave way to an ap-

pellation of more elegance and dignity: or rather, that at length those only were in general invited to this appointment, who had received academical sanction, and had merited a crown of laurel in the universities for their abilities in Latin composition, particularly Latin versification. Thus the king's laureate was nothing more than 'a graduated rhetorician employed in the service of the king.' That he originally wrote in Latin, appears from the ancient title *versificator*; and may be moreover collected from the two Latin poems, which Baston and Gulielmus, who appear to have respectively acted in the capacity of royal poets to Richard I. and Edward II. officially composed on Richard's crusade, and Edward's siege of Stirling castle."

On this subject, Fuller (in his *Worthies of England*, c. x. p. 27.) makes the following observation: "As for our English poets, some have assumed unto themselves the title of laureat, as John Kay, in his dedication of *The Siege of Rhodes to King Edward the Fourth*, subscribing himself his humble poet laureat. Others have, in compliment, given the title to such persons as were eminent in that faculty; and nothing is more usual than to see their pictures before their books, and statues on their tombs, ornamented accordingly. However, all this is done by civil courtesy, or common custom; no ceremonious creation in court or university."

So early as the thirteenth century, Henry d'Avranches, a Frenchman (*Henricus Abrincensis*), was entertained by our Henry III. as a poet attached to his court; and under the title of Master Henry the versifier, received from that monarch an annual stipend, which seems to have been ten pounds a-year.

In the 36th year of the same king's reign (1258); forty shillings a-year and a pipe of wine were granted to Rickard, the king's harper; which perhaps gave rise, at a subsequent period, to a similar bounty to the poet laureat.

Gulielmus Peregrinus, who composed a poem on the crusade of Richard I. appears to have been the royal poet of that time; and Robert Baston, whom Bass calls *poeta Oxoni laureatus*; and whom Edward II. carried with him to the siege of Stirling castle, to record his Scottish exploits in verse, may be considered as exercising the same office under that monarch. Of those versifiers, as they were then called, the compositions produced in their character of poets laureat were in Latin.

Chaucer, perhaps in the time of Edward III. and Richard II. as a poet, and as receiving a royal pension, not without a due title of rank; and in the time of Henry IV. Henry Spogan, master of arts, who, if we may credit Ben Jonson, made verses for the king's tomb, and wrote in the *Sanctus* hymn, and several other parts of the service, was the first who wrote in English. But whether these poets were ever crowned with laurel, or whether they were ever regu-

L A U R E A T E.

this office; nor does the title of poet laureat occur earlier than the time of Edward IV., to whom Jon Kay (Caius), about the year 1470, dedicating a prose translation of a Latin history of the Siege of Rhodes, styles himself *humble poet laureate*. None of his poetry, however either in Latin or English, is known to be extant.

Andrew Bernard, a Frenchman, and an Augustine monk, who was blind, was successively poet laureat and historiographer to Henry VII. and Henry VIII. and was living in 1592.

In 1489, John Skelton was laureated as a rhetorician at Oxford, and a few years afterwards was permitted to wear the laurel publicly at Cambridge. Previously to which he had been honoured by Henry VII. with a grant to wear either some peculiar dress, or some additional ornament on his ordinary apparel. That he was poet laureat to Henry VIII. may be presumed from the titles of some of his works, but there is not sufficient proof of his ever having received an annual salary, which is a criterion for forming a conjecture, at least, concerning the possession of the office, for none of the persons who may be considered as filling the station before Dryden, except Andrew Bernard, are expressly denominated poets laureate in any authentic record.

Thomas Churchyard, a voluminous poetaster in the time of Queen Elizabeth, in consequence of having addressed many of the noblemen of her court for near 40 years, in such rhymes as he could spin, is called by one of his contemporaries the old court poet; this has given rise to a conjecture that he was particularly countenanced and patronised by the queen, and formally placed at the head of the poetical band of that time; but, undoubtedly, Elizabeth had no poet laureate till in February, 1590-1, she conferred on Edmund Spenser a pension of 30*l.* a year; from which time to his death in 1598-9, he may properly be considered as filling the office, though not expressly styled Laureat in his patent.

Samuel Daniel has been represented by Anthony Wood, and others, as the next successor to the laurel, but he never was thus honoured; for from the death of Spenser to the year 1616 the poetical throne was vacant, though in that period Daniel, Jonson, Dekker, and others, furnished the court with pageants and masques, and may, during that interval, be considered as voluntary laureates. About four months before the death of Shakespeare, January 1, 1615-16, King James granted to Ben Jonson a pension of one hundred marks a year (66*l.* 13*s.* 4*d.*) during his life, "in consideration of his good and acceptable services past and future;" a grant which invested him with all the dignity and functions of poet laureat. This consideration, however, is common to many other crown grants not conferred on poets; nor did any patent expressly mention the duty and peculiar services expected from a poet laureat, before of Charles I. to the same person, in this office

are, for the first time, specifically pointed out. On the 23d of April, 1630, that king, "in consideration of good and acceptable services done by the said Benjamin Jonson, and especially to encourage him to proceed in those services of his wit and pen which we have enjoined unto him, and which we expect from him," was pleased to augment his annuity of one hundred marks to one hundred pounds per annum, during life, payable from the preceding Christmas. Old Ben had not long before been struck with the palsy, on which account, perhaps, as well as to gratify his well-known propensity, his majesty, by the same instrument, granted him a tierce of Canary wine yearly, during his life, out of the royal cellars at Whitehall.

It has been generally supposed that Sir William d'Avenant succeeded to the bays immediately on Jonson's death, in August, 1637; but he then received no favour from the crown. About sixteen months afterwards, December, 13, 1638, letters patent passed the great seal, granting an annuity of one hundred pounds a year to the said William d'Avenant, during his majesty's pleasure. By this patent no Canary wine was given, nor is any mention made of the office of poet laureat, or the duties belonging to it.

In 1670, some time after the death of Sir William d'Avenant, Dryden, was made poet laureat by letters patent, and held the office till he was compelled to forego it in consequence of the revolution.

On the 29th of August, 1689, he was succeeded by Shadwell.

Shadwell's successor was Nahum Tate, December 23d, 1692, with an annual pension of one hundred pounds, and a butt of Canary wine.

On the death of Tate, 1716, the laurel was given to Rowe; who dying in December, 1718, the Rev. Laurence Eusden was, in the following year, invested with this office.

On the death of Eusden, September 27, 1730, Colley Cibber was appointed poet laureat. His reign extended to the end of the year 1767.

To him succeeded William Whitehead, who dying April 14, 1785, the Rev. Thomas Warton obtained the laurel, which he held for five years.

Shortly after his death, which happened May 21, 1790, Henry James Pye, esq. was appointed poet laureat, and now fills the poetical throne.

There is no grant in the chapel of the rolls, constituting Rowe poet laureat. The practice of conferring this office by a warrant signed and sealed by the lord chamberlain, nominating A. B. to the office, with the accustomed fees thereunto belonging, then commenced, and has prevailed from that time to the present.

LAUREATE. *a.* (*laureatus*, Lat.) Decked or invested with a laurel (*Pope*).

LAUREATION. *s.* (from *laureatus*.) In the Scottish universities, the act or state of

L A U

plant, *daphne laureola* of Linnæus, is recommended to excite a discharge from the skin, in the same way as that of thymelæa.

LAURINGEN, a town of Germany, in the bishopric of Wurtzburg, 24 miles N.W. of Bamberg, and 30 N.E. of Wurtzburg. Lon. 10. 21 E. Lat. 50. 5 N.

LAURO-CERASUS. (*lauro-cerasus*, from

laurus, the laurel, and *cerasus*, the cherry tree, so called because it has leaves like the laurel). Common or cherry laurel. *Prunus lauro-cerasus* of Linnaeus. *P. floribus* racemosis foliis semper virentibus dorso biglandulosis. Class *icosandria*. Order *monogynia*. The leaves of the lauro-cerasus have a bitter styptic

taste, accompanied with a flavour resembling that of bitter almonds, or other kernels of the drupaceous fruits: the flowers also manifest a similar flavour. The powdered leaves applied to the nostrils excite sneezing, though not so strongly as tobacco. The kernel-like flavour which these leaves impart being generally esteemed grateful, has sometimes induced them to be employed for culinary purposes, and especially in custards, puddings, blancmange, &c.; and as the properties of this sapid matter of the leaf to the quantity of the milk is commonly inconsiderable, but effects have seldom ensued. But as the poisonous quality of this laurel is now indubitably proved, the public ought to be cautioned against its internal use. See PRUNUS.

The following communication to the Royal Society, by Dr. Madden, of Dublin, contains the first and principal proofs of the deleterious effects of this vegetable upon mankind :—"A very extraordinary accident that fell out here some months ago, has discovered to us a most dangerous poison, which was never before known to be so, though it has been in frequent use among us. The thing I mean is a simple water, distilled from the leaves of the *hustocerasus*; the water is at first milky, but the oil which comes over the helm with it, being in good measure separated from the phlegm, by passing it through a flannel bag it becomes as clear as common water. It has the smell of bitter almonds, or peach kernel, and has been for many years in frequent use among our housewives and cooks, to give that agreeable flavour to their creams and puddings. It has also been much in use among our doctors of drugs; and the proportions they generally use it in has been one part of hush-water to four of brandy. Nor has this practice, however frequent, ever been attended with any apparent ill consequences, till some time in the month of September last, when it happened that one Martha Boyce, a servant, who had been a person that sold great quantities of this water, got a bottle of it home for herself, and gave it to her mother. She took about a pint of it in French Brandy, and was so much affected thereby, that she was obliged to go to bed, and in a few days she died."

and went away. Francis Eaton drank the test. In a quarter of an hour after Mary Whaley had drank the water (as I am informed), she complained of a violent disorder in her stomach, soon after lost her speech, and died in about an hour, without vomiting or purging, or any convulsion. The shopkeeper, F. Eaton, sent word to her sister, Ann Boyse, of what had happened, who came to her upon the message, and affirmed that it was not possible the cordial (as she called it) could have occasioned the death of the woman; and, to convince her of it, she filled out about three ounces, and drank it. She continued talking with F. Eaton about two minutes longer, and was so earnest to persuade her of the liquor's being inoffensive, that she drank about two spoonfuls more, but was hardly well seated in her chair, when she died without the least green or convulsion. Frances Eaton, who, as before observed, had drank somewhat more than a spoonful, found no disorder in her stomach or elsewhere; but, to prevent any ill consequences, she took a vomit immediately, and has been well ever since. Dr. Madden mentions another case, of a gentleman at Kilkenny, who mistook a bottle of laurel-water for a bottle of wine. What quantity he drank is uncertain, but he died in a few minutes, complaining of a violent disorder in his stomach. In addition to this, we may refer to the unfortunate case of Sir Theodosius Boughton, whose death, in 1780, an English jury declared to be occasioned by this poison. In this case, the active principle of the lauro-cerasus was concentrated by repeated distillations, and given to the quantity of one ounce, the suddenly fatal effects of which must be still in the recollection of the public. To brute animals this poison is almost instantaneously mortal, as amply appears by the experiments of Madden, Mortimer, Nicholls, Fontana, Langrish, Vater, and others. The experiments conducted by these gentlemen shew that the laurel-water is destructive to animal life, not only when taken into the stomach, but also on being injected into the intestines, or applied externally to different organs of the body. It is remarked by Abbe Fontana, that this poison, even when applied in a very small quantity, to the eyes, or to the back part of the mouth, without touching the stomach, or being carried into the stomach, is capable of killing an animal in a few minutes. When applied in a much larger quantity to wounds, it has so little effect, that the weakest animals, such as

are not valuable to the most active part of the nervous system, and if we judge from the results, as analogous to the effects of the poison, we may either

the flowers and leaves. It is of importance to notice, that this is much less powerful in its action upon human subjects than upon dogs, rabbits, pigeons, and reptiles. To poison man, the essential oil of the lauro-cerasus must be separated by distillation, as in the spirituous or common laurel-water; and unless this is strongly imbued with the oil, or given in a large dose, it proves innocent. Dr. Cullen observes, that the sedative power of the lauro-cerasus acts upon the nervous system in a different manner from opium and other narcotic substances, whose primary action is upon the animal functions; for the lauro-cerasus does not occasion sleep, nor does it produce local inflammation, but seems to act directly upon the vital powers. Abbe Fontana supposes that this poison destroys animal life, by exerting its effects upon the blood; but the experiments and observations from which he draws this opinion are evidently inconclusive. It may also be remarked, that many of the Abbe's experiments contradict each other. Thus, it appears from the citation given above, that the poison of this vegetable, when applied to wounds does not prove fatal; but future experiments led the Abbe to assert, that the oil of the lauro-cerasus, "whether given internally, or applied to the wounds of animals, is one of the most terrible and deadly poisons known." Though this vegetable seems to have escaped the notice of Stoerck, yet it is not without advocates for its medical use. Linnæus informs us, that in Switzerland it is commonly and successfully used in pulmonary complaints. Langrish mentions its efficacy in agues; and as Bergius found bitter almonds to have this effect, we may by analogy conclude, that this power of the lauro-cerasus is well established. Baylies found, that it possessed a remarkable power of diluting the blood, and from experience, recommended it in all cases of disease supposed to proceed from too dense a state of that fluid; adducing particular instances of its efficacy in rheumatism, asthma, and in schirrous affections. Nor does this author seem to have been much afraid of the deleterious quality of lauro-cerasus, as he directs a pound of its leaves to be macerated in a pint of water, of which he gives from 30 to 60 drops, three or four times a day.

LAURUS, (*Laurus*, L. & A. f. from *laus*, praise, because it was usual to crown the heads of eminent men with branches of it). Bay. In botany a genus of the class enneandria, order monogynia. Calyxless; corol six-parted, resembling a calyx; nectary three glands surrounding the germ, and each ending in five stylics; inner filaments supporting two glands each; drupe one-seeded. Thirty-four species; chiefly natives of the East and West Indies, or South America; one or two of the south of Europe. The

LAU

1. *L. latifolia*. Broad-bay. Leaves lanceolate, venous, petiole; flowers four-lobed, discoid. There are four or five varieties from a difference of the leaf, which is broad-striped, narrow, or wavy.

2. *L. Cinnamomum*. Cinnamon-tree. Leaves three-nerved, ovate, oblong; the nerves disappearing towards the tip. The tree is covered with a smooth bark; the flowers are panicled. The liber or inner bark of the branches constitutes the cinnamon of the shops. The trunk of the tree grows to the height of twenty or thirty feet. It is a native of Ceylon. For the rest see CINNAMON.

3. *L. Cassia*. Wild Cinnamon. *Cassia lignea*-tree. Leaves triply nerved, lanceolate. Its fruit is the *Cassia-lignea* of the dispensatories. It is a native of Malabar. See *CASSIA-LIGNEA*.

4. *L. Camphora*. Camphor-tree. Leaves triply-nerved; lance-ovate, whitish underneath; flowers on long peduncles, white, and consisting of six petals, each producing a shining purple berry of the size of a pear, but top-shaped. It is a native of the woods of Japan, and exudes an inspissated resinous secretion, which is the Camphor of the shops. See CAMPHOR.

5. *L. Persca*. Alligator pear-tree. Leaves ovate, coriaceous, transversely veined, perennial; flower corymbed, of a dirty-white, or yellow colour, with an agreeable odour, diffusing itself to a considerable distance. The branches of this tree are soft and succulent; its fruit is of the size and shape of a large pear, and has a delicious and grateful flavour. It is a native of the West Indies.

6. *L. Benzoin*. Benjamin-tree. Leaves nerveless, ovate, acute, at both ends, entire, annual, veined underneath; stamens from six to nine; flowers yellow, not succeeded by berries in this country. The tree is a native of Virginia, rising from fifteen to twenty feet. It is sometimes confounded with the true *Bennetia-tree*, which is the *Styrax Benzoin*. See STYRAX.

7. *L. Sassafras*. Sassafras-tree. Leaves entire, three-lobed, downy underneath, from three to six inches long, with small yellowish flowers succeeded by black berries in its native country, which is Virginia. The wood affords the Sassafras of the shops.

8. *L. Caustica*. Leaves oval, wrinkled, perennial, reticulate with veins; flowers yellow and four-cleft. A poisonous tree of Chili.

9. *L. Retivalis*. Deciduous Bay. Leaves veined, oblong, pointed, annual, wrinkled underneath; branches superaxillary. A native of Virginia, with small white flowers succeeded by red berries.

10. *L. Indica*. Indian bay. Leaves veined, lanceolate, perennial, lat; branches covered with scars; flowers racemose; trunk upright, from twenty to thirty feet

LAU

high, branching regularly; flowers whitish-green, succeeded in its native soil by large oval black berries. A native of Malabar.

The leaves and berries of *L. nobilis*, which is a native of Italy, but cultivated in our own gardens, possess various medicinal qualities, has a sweet fragrant smell, and an aromatic adstringent taste. The laureus of honorary memory, the distinguished favourite of Apollo, may be naturally supposed to have had no inconsiderable fame as a medicine; but its pharmaceutic uses are so limited in the practice of the present day, that this dignified plant is now rarely employed, except in the way of enema, or as an external application; thus, in the old London pharmacopoeia, the leaves are directed in the *decoctum pro fomento*, and the berries in the *emplastrum cumini*. A preparation which is confirmed in the new edition.

LAURUSTINUS, in botany. See VIRGIL.

LAUS, in ancient geography, a river of Italy, separating Lucania from the Bruttii, and running from east to west into the Tuscan sea. This river is now called Laino.

LAUS PERENNIS. (Lat.) The name given by papistical writers to the perpetual psalmody preserved at Antioch by an order of monks established there in the early ages of Christianity, and whose discipline obliged them to render it equally perennial with the vestal fire, or perpetual lamps of antiquity.

LAUSANNE, an ancient town of Switzerland, capital of the Pays de Vaud, with a famous college, and a bishop's see. It contains 7000 inhabitants. It is built on such a steep ascent, that, in some places, the horses cannot, without great difficulty, draw up a carriage; and foot-passengers ascend to the upper part of the town by steps. Its lofty situation affords the most sublime views in nature, commanding the lake of Geneva, the Pays de Vaud, and the rugged coast of Chablais. The church, the town-house, and other public buildings, are magnificent. It is seated between three hills, 20 miles N.E. of Geneva, and 80 S. W. of Bern. Lon. 6. 50. E. lat. 46. 31. N.

LAUSHRANT, in botany, a species of *Daphnogenon*, which see.

LAUSUS, son of Numitor, and brother of Ilia. He was put to death by his uncle Amulius, who usurped his father's throne. (Ovid).—A son of Menestius, king of the Tyrrhenians, killed by Aeneas in the war which his father and Turnus made against the Trojans.

LAUTERBURG, a village of Switzerland, six miles S. of Schaffhausen. It is situated in a valley of the same name, celebrated for its picturesque and romantic scenery. See STYRAX.

LAUTERBURG, a town of Württemberg, in the kingdom of Prussia.

LAUTERBURG, a town of Germany, in the

whole of Upper Rhine, but subject to the French. It is 10 miles S. E. of Weinsburg. Lon. 8. 28. E. lat. 48. 48. N.

LAUTERBECK, a town of Germany, in the circle of Upper Rhine, and county of Veldenz, situate on the Glan, 84 miles N. of Deux Ponts, and 46 S. of Coblenz. Lon. 7. 17. E. lat. 49. 39. N.

LAUZENTE, a town of France, in the departments of Lot and Garonne, 15 miles N. E. of Marmande. Lon. 0. 23. E. lat. 44. 38. N.

LAW. *s.* (leg, Saxon.) 1. A rule of action (*Dryden*). 3. A decree, edict, statute, or custom, publicly established (*Davies*). 3. Judicial process (*Shakspeare*). 4. Conformity to law; any thing lawful (*Shakspeare*). 5. An established and constant mode or process (*Shakspeare*). 6. The Mosaic institution: distinguished from the *prophets*, and the *gospel*. 7. Jurisprudence; the study of law.

LAW, in its most general and comprehensive sense, signifies a rule of action (as above defined), and is applied indiscriminately to all kinds of action, whether animate or inanimate, rational or irrational. Thus we say, the laws of motion, of gravitation, of optics, of mechanics, as well as the laws of nature and of nations. And it is that rule of action which is prescribed by some superior, and which the inferior is bound to obey.

Thus when the Supreme Being formed the universe, and created matter out of nothing, he impressed certain principles upon that matter, from which it can never depart, and without which it would cease to be. When he put that matter into motion, he established certain laws of motion, to which all moveable bodies conform. And, to descend from the greatest operations to the smallest, when a workman forms a clock, or other piece of mechanism, he establishes at his own pleasure, certain arbitrary laws for its direction, to which, so long as it conforms, it continues in perfection, and answers the end of its formation.

If we advance farther from mere inactive matter to vegetable and animal life, we shall find them still governed by laws; more numerous indeed, but equally fixed and invariable. The whole progress of plants, from the seed to the root, and from thence to the seed again; the method of animal nutrition, digestion, secretion, and all other branches of vital economy;—are not left to chance, or the will of the creature itself, but are performed in a wondrous involuntary manner, and guided by unerring rules laid down by the great Creator.

Thus then is the general signification of law, a rule of action dictated by some superior being; and, in those creatures that have neither the power to think nor to will, such laws must be necessarily obeyed, so long as the creature continues in existence: for its subsistence depends on that obedience. But laws, in their more confined sense, and in which it is our present business to consider them, denote the rules, not of action in general, but of human action or conduct; that is, the precepts by which men, the objects of an arbitrary deity, a creature endowed with free reason and free will, are commanded to

LAW

make use of their faculties in the general regulation of his conduct.

Man, considered as a creature, must necessarily be subject to the laws of his Creator, for he is entirely a dependent being. A being independent of any other has no rule to pursue but such as he prescribes to himself; but a state of dependence will inevitably oblige the inferior to take the will of him on whom he depends as the rule of his conduct, not indeed in every particular, but in all those points wherein his dependence consists. This principle therefore has more or less extent and effect, in proportion as the superiority of the one and the dependence of the other is greater or less, absolute or limited. And consequently, as man depends absolutely upon his Maker for every thing, it is necessary that he should in all points conform to his Maker's will.

This will of his Maker is called the law of nature. For as God, when he created matter, and endued it with a principle of mobility, established certain rules for the perpetual direction of that motion, so, when he created man, and endued him with free-will to conduct himself in all parts of life, he laid down certain immutable laws of human nature, whereby that free-will is in some degree regulated and restrained, and gave him also the faculty of reason to discover the purport of those laws.

Considering the Creator only as a being of infinite power, he was able unquestionably to have prescribed whatever laws he pleased to his creature man, however unjust or severe. But as he is also a being of infinite wisdom, he has laid down only such laws as were founded in those relations of justice that existed in the nature of things antecedent to any positive precept. These are the eternal immutable laws of good and evil, to which the Creator himself in all his dispensations conforms, and which he has enabled human reason to discover, so far as they are necessary for the conduct of human actions. Such, among others, are these principles. That we should live honestly, should hurt nobody, and should render to every one his due; to which three general precepts Justinian has reduced the whole doctrine of law.

But if the discovery of these first principles of the law of nature depended only upon the due exertion of right reason, and could not otherwise be obtained than by a chain of metaphysical disquisitions, mankind would have wanted some inducement to have quickened their inquiries, and the greater part of the world would have rested content in mental indolence, and ignorance its inseparable companion. As therefore the Creator is a being, not only of infinite power and wisdom, but also of infinite goodness, he has been pleased so to contrive the constitution and frame of humanity, that we should want no other prompter to inquire after and pursue the rule of right, but only our own self-love, that universal principle of action. For he has so intimately connected, so inseparably interwoven, the laws of eternal justice with the happiness of each individual, that the latter cannot be attained but by observing the former; and if the former be punctually obeyed, it cannot but induce the latter. In consequence of which mutual connection of justice and human felicity, he has not perplexed the law of nature with a multitude of abstracted rules and precepts, referring merely to the fitness or unfitness

ness of things, as some have vainly surmised; but has graciously reduced the rule of obedience to this one paternal precept, "that man should pursue his own happiness." This is the foundation of what we call ethics, or natural law. For the several articles into which it is branched in our systems, amount to no more than demonstrating, that this or that action tends to man's real happiness; and therefore very justly concluding, that the performance of it is a part of the law of nature; or, on the other hand, that this or that action is destructive of man's real happiness, and therefore that the law of nature forbids it.

This law of nature, being coeval with mankind, and dictated by God himself, is of course superior in obligation to any other. It is binding over all the globe, in all countries, and at all times: no human laws are of any validity, if contrary to this; and such of them as are valid derive all their force, and all their authority, mediately or immediately, from this original.

But in order to apply this to the particular exigencies of each individual, it is still necessary to have recourse to reason: whose office it is to discover, as was before observed, what the law of nature directs in every circumstance of life; by considering, what method will tend the most effectually to our own substantial happiness. And if our reason were always, as in our first ancestor before his transgression, clear and perfect, untroubled by passions, unclouded by prejudice, unimpaired by disease or intemperance, the task would be pleasant and easy; we should need no other guide but this. But every man now finds the contrary in his own experience; that his reason is corrupt, and his understanding full of ignorance and error.

This has given manifold occasion for the benign interposition of divine providence; which, in compassion to the frailty, the imperfection, and the blindness of human reason, hath been pleased, at sundry times and in divers manners, to discover and enforce its laws by an immediate and direct revelation. The doctrines thus delivered, we call the revealed or divine law, and they are to be found only in the Holy Scriptures. These precepts, when revealed, are found upon comparison to be really a part of the original law of nature, as they tend in all their consequences to man's felicity. But we are not from thence to conclude, that the knowledge of these truths was attainable by reason in its present corrupted state; since we find, that, until they were revealed, they were hid from the wisdom of ages. As then the moral precepts of this law are indeed of the same original with those of the law of nature, so their intrinsic obligation is of equal strength and perpetuity. Yet undoubtedly the revealed law is of infinitely more authenticity than that moral system which is framed by ethical writers, and designated the natural law: because one is the law of nature, expressly declared so to be by God himself; the other is only what, by the assistance of human reason, we imagine to be that law. If we could be as certain of the latter as we are of the former, both would have an equal authority: but till then they can never be put in any competition together.

Upon these two foundations, the law of nature and the law of revelation, depend all human laws: that is, every law which should be

suffered to contradict these. There are, it is true, a great number of indifferent points, in which both the divine law and the natural leave a man at his own liberty; but which are found necessary, for the benefit of society, to be restrained within certain limits. And herein it is that human laws have their greatest force and efficacy; for, with regard to such points as are not indifferent, human laws are only declaratory of, and act in subordination to, the former. To instance in the case of murder: this is expressly forbidden by the divine, and demonstrably by the natural, law; and from these prohibitions arises the true unlawfulness of this crime. Those human laws that annex a punishment to it, do not at all increase its moral guilt, or superadd any fresh obligation in *foro conscientia* to abstain from its perpetration. Nay, if any human law should allow or enjoin us to commit it, we are bound to transgress that human law, or else we must offend both the natural and the divine. But with regard to matters that are in themselves indifferent, and are not commanded or forbidden by those superior laws; such, for instance, as exporting of wool into foreign countries; here the inferior legislature has scope and opportunity to interpose, and to make that action unlawful which before was not so.

If man were to live in a state of nature, unconnected with other individuals, there would be no occasion for any other laws than the law of nature and the law of God. Neither could any other law possibly exist: for a law always supposes some superior who is to make it; and in a state of nature we are all equal, without any other superior but him who is the author of our being. But man was formed for society; and, as is demonstrated by the writers on this subject, is neither capable of living alone, nor indeed has the courage to do it. However, as it is impossible for the whole race of mankind to be united in one great society, they must necessarily divide into many; and from separate states, common wealths, and nations, entirely independent of each other, and yet liable to a mutual intercourse. Hence arises a third kind of law to regulate this mutual intercourse, called the law of nations: which, as none of these states will acknowledge a superiority in the other, cannot be dictated by either; but depends entirely upon the rules of natural law, or upon mutual compacts, treaties, leagues, and agreements, between these several communities: in the construction also of which compacts we have no other rule to resort to but the law of nature; being the only one to which both communities are equally subject: and therefore the civil law very justly observes, *quod naturalis ratio inter omnes homines censuit, vocatur jus gentium*.

To the consideration, then, of the law of nature, the revealed law, and the law of nations, succeeds that of the municipal or civil law: that is, the rule by which particular states, communities, or nations, are governed: being thus defined by Justinian, "*Quod est jus civile vocatur lex municipalis*." The civil or municipal law, in compliance with certain necessities, for though, strictly, that expression denotes the particular customs or constitution of a particular free state, yet it may be understood properly to signify the rule that governs all actions which are governed by the laws of that state.

L A W.

Municipal law, thus understood, is properly defined to be "a rule of civil conduct prescribed by the supreme power in a state, commanding what is right, and prohibiting what is wrong." Let us endeavour to explain its several properties, as they arise out of this definition.

And, first, it is a rule: not a transient sudden order from a superior to or concerning a particular person; but something permanent, uniform, and universal. Therefore a particular act of the legislature to confiscate the goods of Titius, or to attain him of high treason, does not enter into the ideas of a municipal law: for the operation of this act is spent upon Titius only, and has no relation to the community in general; it is rather a sentence than a law. But an act to declare that the crime of which Titius is accused shall be deemed high treason; this has permanency, uniformity, and universality, and therefore is properly a rule. It is also called a rule, to distinguish it from advice or counsel, which we are at liberty to follow or not as we see proper, and to judge upon the reasonableness or unreasonableness of the thing advised: whereas our obedience to the law depends not upon our approbation, but upon the maker's will. Counsel is only matter of persuasion, law is matter of injunction; counsel acts only upon the willing, law upon the unwilling also.

It is also called a rule, to distinguish it from a compact or agreement; for a compact is a promise proceeding from us; law is a command directed to us. The language of a compact is, "I will, or will not, do this;" that of a law is, "Thou shalt, or shalt not, do it." It is true there is an obligation which a compact carries with it; equal in point of conscience to that of a law: but then the original of the obligation is different. In compacts, we ourselves determine and promise what shall be done, before we are obliged to do it: in laws, we are obliged to act without ourselves determining or promising any thing at all. Upon these accounts law is defined to be "a rule."

Municipal law is also "a rule of civil conduct." This distinguishes municipal law from the natural or revealed: the former of which is the rule of moral conduct; the latter, not only the rule of moral conduct, but also of faith. These regard man as a creature; and point out his duty to God, to himself, and to his neighbour, considered in the light of an individual. But municipal or civil law regards him also as a citizen, and bound to other duties towards his neighbour than those of mere nature and religion: duties which he has engaged in by enjoying the benefits of the common union; and which demand of him more than that he do contribute, on his part, to the subordination and peace of the society.

It is likewise "a rule prescribed." Because a law, as such, is contained in the breast of the legislator, without communicating itself by some external sign, and is not properly a law. It is a rule, that may therefore be applied to the person who is under it. But the manner in which the law is to be made, is matter of civil policy, and may be modified by national custom and local practice, which requires a private consideration, and is the case of all laws. The manner of making it is not the subject of the law, but of the political system. It may be modified, and the manner of making it may be modified, but the law itself remains the same with regard to pre-

clamations, and such acts of parliament as are appointed to be publicly read in churches and other assemblies. It may, lastly, be notified by writing, printing, or the like; which is the general course taken with all our acts of parliament. Yet, whatever way is made use of, it is incumbent on the promulgators to do it in the most public and perspicuous manner; not like Caligula, who (according to Dio Cassius) wrote his laws in a very small character, and hung them up upon high pillars, the more effectually to ensnare the people. There is still a more unreasonable method than this, which is called making of laws *ex post facto*; when, after an action (indifferent in itself) is committed, the legislator then for the first time declares it to have been a crime, and inflicts a punishment upon the person who has committed it. Here it is impossible that the party could foresee that an action, innocent when it was done, should be afterwards converted to guilt by a subsequent law: he had therefore no cause to abstain from it; and all punishment for not abstaining must of consequence be cruel and unjust. All laws should be therefore made to commence in *future*, and be notified before their commencement; which is implied in the term "prescribed." But when this rule is in the usual manner notified or prescribed, it is then the subject's business to be thoroughly acquainted therewith; for if ignorance of what he might know were admitted as a legitimate excuse, the laws would be of no effect, but might always be eluded with impunity.

But further: Municipal law is "a rule of civil conduct prescribed by the supreme power in a state." For legislature, as was before observed, is the greatest act of superiority that can be exercised by one being over another. Wherefore it is requisite to the very essence of a law, that it be made by the supreme power. Sovereignty and legislature are indeed convertible terms; one cannot subsist without the other.

This will naturally lead us into a short inquiry concerning the nature of society and civil government; and the natural inherent right that belongs to the sovereignty of a state, wherever that sovereignty be lodged, of making and enforcing laws.

The only true and natural foundations of society are the wants and fears of individuals. Not that we can believe, with some theoretical writers, that there ever was a time when there was no such thing as society; and that, from the impulse of reason, and through a sense of their wants and weaknesses, individuals met together in a large plain, entered into an original contract, and chose the tallest man present to be their governor. This notion, of an actually existing unconnected state of nature, is too wild to be seriously admitted; and besides, it is plainly contradictory to the revealed accounts of the primitive origin of mankind, and their preservation 3000 years afterwards: both which were effected by the means of single families. These formed the first society among themselves, which every day extended its limits; and when it grew too large to subsist with convenience in that pastoral state wherein the patriarchs appear to have lived, it necessarily subdivided itself by various migrations into more. Afterwards, as agriculture increased, which employs and can maintain a much greater number of hands, migrations became less frequent; and various tribes, which had formerly separated, reunited again; some-

L A W.

times by compulsion and conquest, sometimes by accident, and sometimes perhaps by compact. But though society had not its formal beginning from any convention of individuals, actuated by their wants and their fears; yet it is the sense of their weakness and imperfection that keeps mankind together; that demonstrates the necessity of this union; and that therefore is the solid and natural foundation, as well as the cement, of society. And this is what we mean by the original contract of society; which, though perhaps in no instance it has ever been formally expressed at the first institution of a state, yet in nature and reason must always be understood and implied in the very act of associating together: namely, that the whole should protect all its parts, and that every part should pay obedience to the will of the whole; or, in other words, that the community should guard the rights of each individual member, and that (in return for this protection) each individual should submit to the laws of the community; without which submission of all, it was impossible that protection could be certainly extended to any.

For when society is once formed, government results of course, as necessary to preserve and to keep that society in order. Unless some superior be constituted, whose commands and decisions all the members are bound to obey, they would still remain as in a state of nature, without any judge upon earth to define their several rights, and redress their several wrongs. But as all the members of society are naturally equal, it may be asked, In whose hands are the reins of government to be entrusted? To this the general answer is easy; but the application of it to particular cases has occasioned one half of those mischiefs which are apt to proceed from misguided political zeal. In general, all mankind will agree, that government should be reposed in such persons, in whom those qualities are most likely to be found, the perfection of which is among the attributes of him who is emphatically styled the Supreme Being; the three grand requisites, namely, of wisdom, of goodness, and of power: wisdom, to discern the real interest of the community; goodness, to endeavour always to pursue that real interest; and strength or power, to carry this knowledge and intention into action. These are the natural foundations of sovereignty, and these are the requisites that ought to be found in every well constituted frame of government.

How the several forms of government we now see in the world at first actually began, is matter of great uncertainty, and has occasioned infinite disputes. It is not our business or intention to enter into any of them. However they began, or by what right soever they subsist, there is and must be in all of them a supreme, irresistible, absolute, uncontrolled authority, in which the *jura summi imperii*, or the rights of sovereignty, reside. And this authority is placed in those hands, wherein (according to the opinion of the founders of such respective states, either expressly given or collected from their tacit approbation) the qualities requisite for supremacy, wisdom, goodness, and power, are the most likely to be found.

The political writers of antiquity will not allow more than three regular forms of government; the first, when the sovereign power is lodged in an aggregate assembly consisting of all the mem-

bers of a community, which is called a democracy; the second, when it is lodged in a council composed of select members, and then it is styled an aristocracy; the last, when it is entrusted in the hands of a single person, and then it takes the name of a monarchy. All other species of government, they say, are either corruptions of, or reducible to, these three.

By the sovereign power, as was before observed, is meant the making of laws; for wherever that power resides, all others must conform to and be directed by it, whatever appearance the outward form and administration of the government may put on. For it is at any time in the option of the legislature to alter that form and administration by a new edict or rule, and to put the execution of the laws into whatever hands it pleases: and all the other powers of the state must obey the legislative power in the execution of their several functions, or else the constitution is at an end.

In a democracy, where the right of making laws resides in the people at large, public virtue or goodness of intention is more likely to be found than either of the other qualities of government. Popular assemblies are frequently foolish in their contrivance, and weak in their execution; but generally mean to do the thing that is right and just, and have always a degree of patriotism or public spirit. In aristocracies there is more wisdom to be found than in the other forms of government; being composed, or intended to be composed, of the most experienced citizens: but there is less honesty than in a republic, and less strength than in a monarchy. A monarchy is indeed the most powerful of any, all the sinews of government being knit and united together in the hand of the prince; but then there is imminent danger of his employing that strength to improvident or oppressive purposes.

Thus these three species of government have all of them their several perfections and imperfections. Democracies are usually the best calculated to direct the end of a law; aristocracies, to invent the means by which that end shall be obtained; and monarchies, to carry those means into execution. And the ancients, as was observed, had in general no idea of any other permanent form of government but these three: for though Cicero declares himself of opinion, "*esse optime constitutam rempublicam, quæ ex tribus generibus illis, regali, optimo, et populari, sit modice confusa*," yet Tacitus treats this notion of a mixed government, formed out of them all, and partaking of the advantages of each, as a visionary whim, and one that, if effected, could never be lasting or secure.

But, happily for us of this island, the British constitution has long remained, and we trust will long continue, a standing exception to the truth of this observation. For, as with us the executive power of the laws is lodged in a single person, they have all the advantages of strength and dispatch that are to be found in the most absolute monarchy: and as the legislature of the kingdom is entrusted to two distinct orders, entirely independent of each other, the king, secondly; the lords spiritual and temporal, which is an aristocracy, and the commons, selected for their wisdom, and their industry, their valour, and their property, and, thirdly, the house of commons, chosen by the people from several hundred constitu-

makes is a kind of democracy; as this aggregate body, actuated by different springs, and attentive to different interests, composes the British parliament, and has the supreme disposal of every thing, there can no inconvenience be attempted by either of the three branches, but will be withstood by one of the other two, each branch being armed with a negative power sufficient to repel any innovation which it shall think inexpedient or dangerous.

Here, then, is lodged the sovereignty of the British constitution; and lodged as beneficially as is possible for society. For in no other shape could we be so certain of finding the three great qualities of government so well and so happily united. If the supreme power were lodged in any one of the three branches separately, we must be exposed to the inconveniencies of either absolute monarchy, aristocracy, or democracy; and so want two of the three principal ingredients of good polity, either virtue, wisdom, or power. If it were lodged in any two of the branches; for instance, in the king and house of lords; our laws might be providentially made and well executed, but they might not always have the good of the people in view: if lodged in the king and commons, we should want that circumspection and mediatory caution, which the wisdom of the peers is to afford: if the supreme rights of legislature were lodged in the two houses only, and the king had no negative upon their proceedings, they might be tempted to encroach upon the royal prerogative, or perhaps to abolish the kingly office, and thereby weaken (if not totally destroy) the strength of the executive power. But the constitutional government of this island is so admirably tempered and compounded, that nothing can endanger or hurt it, but destroying the equilibrium of power between one branch of the legislature and the rest. For if ever it should happen, that the independence of any one of the three should be lost, or that it should become subservient to the views of either of the other two, there would soon be an end of our constitution. The legislature would be changed from that which was originally set up by the general consent and fundamental act of the society; and such a change, however effected, is, according to Mr. Locke (who perhaps carried his theory too far), at once an entire dissolution of the bands of government; and the people are thereby reduced to a state of anarchy, with liberty to constitute to themselves a new legislative power.

Having thus cursorily considered the three usual species of government, and our own singular constitution settled and compounded from them all, we proceed to observe, that, as the power of making laws constitutes the supreme authority, so wherever the supreme authority in any state resides, it is the right of that authority to make laws that are within the sphere of our dominion, and to exercise the right of legislation. And this may be observed from the very end and intention of government. For a state is a collective body composed of a multitude of individuals, who are united by ties of fellowship, and mutual assistance, and have a common interest in the preservation of their lives, liberties, and estates. It is therefore the right of that body, as such, to set laws to themselves, and as much as possible to secure themselves from the violence of many natural passions, which would otherwise be destructive of their peace and safety. It is the duty of the legislative power to make laws that are within the sphere of our dominion, and to exercise the right of legislation. And this may be observed from the very end and intention of government. For a state is a collective body composed of a multitude of individuals, who are united by ties of fellowship, and mutual assistance, and have a common interest in the preservation of their lives, liberties, and estates. It is therefore the right of that body, as such, to set laws to themselves, and as much as possible to secure themselves from the violence of many natural passions, which would otherwise be destructive of their peace and safety.

pered and disposed into a lasting harmony; as to constitute and produce that one uniform will of the whole. It can therefore be no otherwise produced than by a political union; by the consent of all persons to submit their own private wills to the will of one man, or of one or more assemblies of men, to whom the supreme authority is entrusted; and this will of that one man, or assemblage of men, is in different states, according to their different constitutions, understood to be law.

Thus far as to the right of the supreme power to make laws: but farther, it is its duty likewise. For since the respective members are bound to conform themselves to the will of the state, it is expedient that they receive directions from the state declaratory of that its will. But as it is impossible, in so great a multitude, to give injunctions to every particular man, relative to each particular action, therefore the state establishes general rules, for the perpetual information and direction of all persons in all points, whether of positive or negative duty: and this, in order that every man may know what to look upon as his own, what as another's; what absolute and what relative duties are required at his hands; what is to be esteemed honest, dishonest, or indifferent; what degree every man retains of his natural liberty, and what he has given up as the price of the benefits of society; and after what manner each person is to moderate the use and exercise of those rights which the state assigns him, in order to promote and secure the public tranquillity.

From what has been advanced, the truth of the former branch of our definition is (we trust) sufficiently evident; that "municipal law is a rule of civil conduct, prescribed by the supreme power in a state." We proceed now to the latter branch of it; that it is a rule so prescribed, "commanding what is right, and prohibiting what is wrong."

Now, in order to do this completely, it is first of all necessary that the boundaries of right and wrong be established and ascertained by law. And when this is once done, it will follow of course, that it is likewise the business of the law, considered as a rule of civil conduct, to enforce these rights, and to restrain or redress these wrongs. It remains therefore only to consider, in what manner the law is said to ascertain the boundaries of right and wrong; and the methods which it takes to command the one and prohibit the other.

For this purpose, every law may be said to consist of several parts: one, declaratory; whereby the rights to be observed, and the wrongs to be eschewed, are clearly defined and laid down; another, directory; whereby the subject is instructed and enjoined to observe those rights; and to abstain from the commission of those wrongs; a third, remedial; whereby a method is pointed out to recover a man's private rights, or redress his private wrongs: to which may be added a fourth, usually termed the sanction, or vindicatory branch of the law; whereby it is signified what evil or penalty shall be incurred by such as commit any public wrongs, and transgress or neglect their duty.

With regard to the first of these, the declaratory part of the municipal law; this depends not so much upon the law of revelation or of nature, as upon the wisdom and the will of the legislature. This doctrine, which before was slightly touched,

deserves a more particular explanation. Those rights, then, which God and nature have established, and are therefore called natural rights, such as are life and liberty, need not the aid of human laws to be more effectually invested in every man than they are; neither do they receive any additional strength when declared by the municipal laws to be inviolable. On the contrary, no human legislature has power to abridge or destroy them, unless the owner shall himself commit some act that amounts to a forfeiture. Neither do divine or natural duties (such as, for instance, the worship of God, the maintenance of children, and the like), receive any stronger sanction from being also declared to be duties by the law of the land. The case is the same as to crimes and misdemeanors, that are forbidden by the superior laws, and therefore styled *mala in se*, such as murder, theft, and perjury; which contract no additional turpitude from being declared unlawful by the inferior legislature. For that legislature in all these cases acts only, as was before observed, in subordination to the Great Lawgiver, transcribing and publishing his precepts. So that, upon the whole, the declaratory part of the municipal law has no force or operation at all, with regard to actions that are naturally and intrinsically right or wrong.

But with regard to things in themselves indifferent, the case is entirely altered. These become either right or wrong, just or unjust, duties or misdemeanors, according as the municipal legislator sees proper, for promoting the welfare of the society, and more effectually carrying on the purposes of civil life. Thus our own common law has declared, that the goods of the wife do instantly upon the marriage become the property and right of the husband; and our statute law has declared all monopolies a public offence: yet that right, and this offence, have no foundation in nature; but are merely created by the law, for the purposes of civil society. And sometimes, where the thing itself has its rise from the law of nature, the particular circumstances and mode of doing it become right or wrong, as the laws of the land shall direct. Thus, for instance, in civil duties; obedience to superiors is the doctrine of revealed as well as natural religion: but who those superiors shall be, and in what circumstances, or to what degrees they shall be obeyed, is the province of human laws to determine. And so, as to injuries or crimes, it must be left to our own legislature to decide, in what cases the seizing another's cattle shall amount to the crime of robbery; and where it shall be a justifiable action, as when a landlord takes them by way of distress for rent.

Thus much for the declaratory part of the municipal law: and the directory stands much upon the same footing; for this virtually includes the former, the declaration being usually collected from the direction. The law that says, "Thou shalt not steal," implies a declaration that stealing is a crime. And we have seen, that, in things naturally indifferent, the very essence of right and wrong depends upon the direction of the law to do or to omit them.

The remedial part of a law is so necessary a consequence of the former two, that laws must be very vague and imperfect without it. For in what rights be declared, is not directed to be observed, if there were no method of recovering and asserting those rights when wrong-

fully withheld or invaded. This is what we mean properly, when we speak of the protection of the law. When, for instance, the declaratory part of the law has said, "that the field or inheritance which belonged to Titius's father is vested by his death in Titius," and the directory part has "forbidden any one to enter on another's property without the leave of the owner;" if Gaius, after this, will presume to take possession of the land, the remedial part of the law will then interpose its office; will make Gaius restore the possession to Titius, and also pay him damages for the invasion.

With regard to the sanction of laws, or the evil that may attend the breach of public duties; it is observed, that human legislators have for the most part chosen to make the sanction of their laws rather vindictory than remuneratory, or to consist rather in punishments than in actual particular rewards: because, in the first place, the quiet enjoyment and protection of all our civil rights and liberties, which are the sure and general consequence of obedience to the municipal law, are in themselves the best and most valuable of all rewards: because also, were the exercise of every virtue to be enforced by the proposal of particular rewards, it were impossible for any state to furnish stock enough for so profuse a bounty; and farther, because the dread of evil is a much more forcible principle of human actions than the prospect of good. For which reasons, though a prudent bestowing of rewards is sometimes of exquisite use, yet we find that those civil laws, which enforce and enjoin our duty, do seldom, if ever, propose any privilege or gift to such as obey the law; but do constantly come armed with a penalty denounced against transgressors, either expressly defining the nature and quantity of the punishment, or else leaving it to the discretion of the judges, and those who are intrusted with the care of putting the laws in execution.

Of all the parts of a law the most effectual is the vindictory. For it is but lost labour to say, "Do this, or avoid that," unless we also declare, "This shall be the consequence of your non-compliance." We must therefore observe, that the main strength and force of a law, consists in the penalty annexed to it. Herein is to be found the principal obligation of human laws.

Legislators and their laws are said to compel and oblige: not that, by any natural violence, they so constrain a man as to render it impossible for him to act otherwise than as they direct, which is the strict sense of obligation; but because, by declaring and exhibiting a penalty against offenders, they bring it to pass that no man can easily choose to transgress the law; since, by reason of the impending correction, compliance is in a high degree preferable to disobedience. And, even where rewards are proposed as well as punishments threatened, the obligation of the law seems chiefly to consist in the penalty; for rewards, in their nature, can only persuade and allure; nothing is compulsory but punishment.

It is true, it hath been said, and very justly, by the principal of our ethical writers, that human laws are binding upon men in conscience. But if that were the only obligation to obey the law, the good only would regard the law, and the bad would not; and then it is manifest, that laws in this respect are in vain, and are no more than mere suggestions. Indeed, we are bound, by rights; and then, when the law has announced the field

to belong to Titius, it is a matter of conscience no longer to withhold or to invade it. So also in regard to natural duties, and such offences as are *mala in se*: here we are bound in conscience, because we are bound by superior laws; before those human laws were in being, to perform the one and abstain from the other. But in relation to those laws which enjoin only positive duties, and forbid only such things as are not *mala in se*, but *mala prohibita* merely, without any intermixture of moral guilt, annexing a penalty to non-compliance; here seems to be conscience no farther concerned, than by directing a submission to the penalty, in case of our breach of these laws: for otherwise the multitude of penal laws in a state would not only be looked upon as an impolitic, but would also be a very wicked thing; if every such law were a snare for the conscience of the subject. But in these cases the alternative is offered to every man; "either abstain from this, or submit to such a penalty:" and his conscience will be clear, whichever side of the alternative he thinks proper to embrace. Thus, by the statutes for preserving the game, a penalty is denounced against every unqualified person that kills a hare, and against every person who possesses a partridge in August. And so too, by other statutes, pecuniary penalties are inflicted for exercising trades without serving an apprenticeship thereto, for erecting cottages without annexing four acres of land to each, for not burying the dead in woollen, for not performing statute-work on the public roads, and for innumerable other positive misdemeanours. Now these prohibitory laws do not make the transgression a moral offence, or sin: the only obligation in conscience is to submit to the penalty, if levied. It must, however, be observed, that we are here speaking of laws that are simply and purely penal, where the thing forbidden or enjoined is wholly a matter of indifference, and where the penalty inflicted is an adequate compensation for the civil inconvenience supposed to arise from the offence. But where disobedience to the law involves in it also any degree of public mischief or private injury, there it falls within our former distinction, and is also an offence against conscience.

We have now gone through the definition laid down of a municipal law; and have shown that it is "a rule of civil conduct—prescribed—by the supreme power in a state—commanding what is right, and prohibiting what is wrong:" in the explication of which we have endeavoured to interweave a few useful principles, concerning the nature of civil government, and the obligation of human laws. Before we conclude this part, it may not be amiss to add a few observations concerning the interpretation of laws.

When we first entered upon the construction of the English laws, the inquiry was to state the case to the several judges, and take his opinion upon it. This was formerly a bad method of interpretation. It was to leave the legislature to decide, whether the law was in itself just or unjust, and whether it was or was not expedient and appropriate. The members of the assembly were called in to give their opinion upon it, and the judges were to give their opinion upon it, though they ought to be perfectly independent of every political consideration. The judges were to give their opinion upon the law, as it stood, and not as it should be. The judges were to give their opinion upon the law, as it stood, and not as it should be. The judges were to give their opinion upon the law, as it stood, and not as it should be.

edicts, he could not but think that the heathen and the answers of such persons as Commodus and Calpurnia should be regarded as laws. But Justinian thought otherwise, and he has preserved them all. In like manner the canon laws, or decretal epistles of the popes, are all of them rescripts in the strictest sense. Contrary to all true forms of reasoning, they argue from particulars to generals.

The fairest and most rational method to interpret the will of the legislator, is by exploring his intentions at the time when the law was made; by signs the most natural and probable. And these signs are either the words, the context, the subject-matter, the effects and consequence, or the spirit and reason of the law. Let us take a short view of them all.

1. Words are generally to be understood in their usual and most known signification; not so much regarding the propriety of grammar, as their general and popular use. Thus the law mentioned by Puffendorf, which forbade a layman to lay hands on a priest, was adjudged to extend to him who had hurt a priest with a weapon. Again: terms of art, or technical terms, must be taken according to the acceptation of the learned in each art, trade and science. So in the act of settlement, where the crown of England is limited "to the princess Sophia, and the heirs of her body being protestants," it becomes necessary to call in the assistance of lawyers, to ascertain the precise idea of the words "heirs of her body;" which in a legal sense comprise only certain of her lineal descendants. Lastly, where words are clearly repugnant in two laws, the latter law takes place of the elder; *leges posteriores priores contrarias abrogant*, is a maxim of universal law, as well as of our own constitution. And accordingly it was laid down by a law of the twelve tables at Rome, *Sed populus postremum jussit, id jus ratum esto*.

2. If words happen to be still dubious, we may establish their meaning from the context; with which it may be of singular use to compare a word or a sentence, whenever they are ambiguous, equivocal, or intricate. Thus the proeme, or preamble, is often called in to help the construction of an act of parliament. Of the same nature and use is the comparison of a law with other laws that are made by the same legislator, that have some affinity with the subject, or that expressly relate to the same point. Thus, when the law of England declares murder to be felony without benefit of clergy, we must resort to the same law of England to learn what the benefit of clergy is: and, when the common law censures simoniacal contracts, it affords great light to the subject to consider what the canon law has adjudged to be simony.

3. As to the subject-matter, words are always to be understood as having a regard thereto; for that is always supposed to be in the eye of the legislator, and all his expressions directed to that end. Thus, when a law of Edward III. forbids all ecclesiastical persons to purchase provisions at fairs, it might seem to prohibit the buying of grain and other victual; but when we consider that the statute was made to repress the usurpations of the papal see, and that the monasteries were harassed by the pope with selling provisions, we shall see that the restraint intended to be laid upon such provisions only.

4. As to the effects and consequences, the rule is, that where words bear either mean, or any

absurd signification, if literally understood, we must a little deviate from the received sense of them. Therefore the Bolognian law, mentioned by Plessendorf, which enacted, "that whoever drew blood in the streets should be punished with the utmost severity," was held, after long debate, not to extend to the surgeon who opened the vein of a person that fell down in the street with a fit.

5. But, lastly, the most universal and effectual way of discovering the true meaning of a law, when the words are dubious, is by considering the reason and spirit of it, or the cause which moved the legislator to enact it. For when this reason ceases, the law itself ought likewise to cease with it. An instance of this is given in a case put by Cicero, or whoever was the author of the rhetorical treatise inscribed to Hierennius. There was a law, that those who in a storm forsook the ship should forfeit all property therein, and the ship and lading should belong entirely to those who staid in it. In a dangerous tempest, all the mariners forsook the ship, except only one sick passenger, who by reason of his disease was unable to get out and escape. By chance the ship came safe to port. The sick man kept possession, and claimed the benefit of the law. Now here all the learned agree, that the sick man is not within the reason of the law; for the reason of making it was, to give encouragement to such as should venture their lives to save the vessel: but this is a merit which he could never pretend to, who neither staid in the ship upon that account, nor contributed any thing to its preservation.

From this method of interpreting laws by the reason of them, arises what we call equity: which is thus defined by Grotius, "the correction of that, wherein the law (by reason of its universality) is deficient." For since in laws all cases cannot be foreseen or expressed, it is necessary, that, when the general decrees of the law come to be applied to particular cases, there should be somewhere a power vested of defining those circumstances, which (had they been foreseen) the legislator himself would have expressed. And these are the cases which, according to Grotius, "lex non exacte definit, sed arbitrio boni viri permittit."

Equity thus depending, essentially, upon the particular circumstances of each individual case, there can be no established rules and fixed precepts of equity laid down, without destroying its very essence, and reducing it to a positive law. And, on the other hand, the liberty of considering all cases in an equitable light must not be indulged too far; lest thereby we destroy all law, and leave the decision of every question entirely in the breast of the judge. And law, without equity, though hard, and disagreeable, is much more desirable for the public good, than equity without law; which would make every judge a legislator, and introduce most infinite confusion; as there would then be almost as many different rules of action in London, as there are differences of capacity and sentiment in the human mind.

Having then considered the nature of laws in general, we shall proceed to give a view of the particular law of our own country. The English law, however, being too extensive to admit of detail in a summary, we shall only here give such a sketch of it as may be sufficient to show the nature and spirit of it, and the principles of it.

parts themselves are explained as large, called their proper names, in the general alphabet.

PART II.—*The Law of England.*—The principal law of England, or the rule of civil conduct prescribed to the inhabitants of that kingdom, may, with sufficient propriety, be divided into two kinds: the *lex non scripta*, the unwritten or common law; and the *lex scripta*, the written or statute law.

The *lex non scripta*, or unwritten law, includes not only general customs, or the common law properly so called; but also the particular customs of certain parts of the kingdom, and likewise those particular laws that are by custom observed only in certain courts and jurisdictions.

In calling these parts of the law *leges non scriptae*, we would not be understood as if all those laws were at present merely oral, or communicated from the former ages to the present solely by word of mouth. It is true indeed, that in the profound ignorance of letters which formerly overspread the whole western world, all laws were entirely traditional; for this plain reason, that the nations among which they prevailed had but little idea of writing. Thus the British as well as the Gallic druids committed all their laws, as well as learning, to memory; and it is said of the primitive Saxons here, as well as their brethren on the continent, that *leges sola memoria et usu retinebant*. But, with us at present, the monuments and evidences of our legal customs are contained in the records of the several courts of justice, in books of reports and judicial decisions, and in the treatises of learned sages of the profession, preserved and handed down to us from the times of highest antiquity. However, we therefore style these parts of our law *leges non scriptae*, because their original institution and authority are not set down in writing, as acts of parliament are: but they receive their binding power, and the force of laws, by long and immemorial usage, and by their universal reception throughout the kingdom: in like manner as Aulus Gellius defines the *jus non scriptum* to be that which is *facile et illiterate hominum consensu et moribus expressum*.

Our ancient lawyers, and particularly Fortescue, insist with abundance of warmth, that these customs are as old as the primitive Britons, and continued down through the several mutations of government and inhabitants, to the present time, unchanged and unadulterated. This may be the case as to some. But in general, as Mr. Selden in his notes observes, this assertion must be understood with many grains of allowance; and ought only to signify, as the truth seems to be, that there never was any formal exchange of one system of laws for another: though doubtless, by the intermixture of several nations, the Romans, the Picts, the Saxons, the Danes, and the Normans, they must have sensibly introduced, and incorporated many of their own customs with those that were before established; thereby, in all probability, improving the nature and wisdom of the whole, by the accumulated wisdom of several nations and ages. Our laws, both *lex non scripta* and *lex scripta*, are in our language, and in our manner of writing, the richest, the most, and the most perfect.

And indeed, for many reasons, they are the most perfect. First, as they are the most ancient, they are the most venerable, and the most sacred. Secondly, as they are the most extensive, they are the most useful, and the most necessary. Thirdly, as they are the most uniform, they are the most consistent, and the most equitable. Fourthly, as they are the most certain, they are the most stable, and the most permanent. Fifthly, as they are the most just, they are the most reasonable, and the most humane. Sixthly, as they are the most wise, they are the most prudent, and the most politic. Seventhly, as they are the most virtuous, they are the most noble, and the most glorious. Eighthly, as they are the most beautiful, they are the most elegant, and the most graceful. Ninthly, as they are the most useful, they are the most profitable, and the most advantageous. Tenthly, as they are the most necessary, they are the most essential, and the most indispensable. Eleventhly, as they are the most sacred, they are the most inviolable, and the most inviolable. Twelfthly, as they are the most venerable, they are the most respected, and the most respected. Thirteenthly, as they are the most ancient, they are the most valuable, and the most valuable. Fourteenthly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. Fifteenthly, as they are the most uniform, they are the most consistent, and the most consistent. Sixteenthly, as they are the most certain, they are the most stable, and the most stable. Seventeenthly, as they are the most just, they are the most reasonable, and the most reasonable. Eighteenthly, as they are the most wise, they are the most prudent, and the most prudent. Nineteenthly, as they are the most virtuous, they are the most noble, and the most noble. Twentiethly, as they are the most beautiful, they are the most elegant, and the most elegant. Twenty-firstly, as they are the most useful, they are the most profitable, and the most profitable. Twenty-secondly, as they are the most necessary, they are the most essential, and the most essential. Twenty-thirdly, as they are the most sacred, they are the most inviolable, and the most inviolable. Twenty-fourthly, as they are the most venerable, they are the most respected, and the most respected. Twenty-fifthly, as they are the most ancient, they are the most valuable, and the most valuable. Twenty-sixthly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. Twenty-seventhly, as they are the most uniform, they are the most consistent, and the most consistent. Twenty-eighthly, as they are the most certain, they are the most stable, and the most stable. Twenty-ninthly, as they are the most just, they are the most reasonable, and the most reasonable. Thirtiethly, as they are the most wise, they are the most prudent, and the most prudent. Thirty-firstly, as they are the most virtuous, they are the most noble, and the most noble. Thirty-secondly, as they are the most beautiful, they are the most elegant, and the most elegant. Thirty-thirdly, as they are the most useful, they are the most profitable, and the most profitable. Thirty-fourthly, as they are the most necessary, they are the most essential, and the most essential. Thirty-fifthly, as they are the most sacred, they are the most inviolable, and the most inviolable. Thirty-sixthly, as they are the most venerable, they are the most respected, and the most respected. Thirty-seventhly, as they are the most ancient, they are the most valuable, and the most valuable. Thirty-eighthly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. Thirty-ninthly, as they are the most uniform, they are the most consistent, and the most consistent. Fortiethly, as they are the most certain, they are the most stable, and the most stable. Forty-firstly, as they are the most just, they are the most reasonable, and the most reasonable. Forty-secondly, as they are the most wise, they are the most prudent, and the most prudent. Forty-thirdly, as they are the most virtuous, they are the most noble, and the most noble. Forty-fourthly, as they are the most beautiful, they are the most elegant, and the most elegant. Forty-fifthly, as they are the most useful, they are the most profitable, and the most profitable. Forty-sixthly, as they are the most necessary, they are the most essential, and the most essential. Forty-seventhly, as they are the most sacred, they are the most inviolable, and the most inviolable. Forty-eighthly, as they are the most venerable, they are the most respected, and the most respected. Forty-ninthly, as they are the most ancient, they are the most valuable, and the most valuable. Fiftiethly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. Fifty-firstly, as they are the most uniform, they are the most consistent, and the most consistent. Fifty-secondly, as they are the most certain, they are the most stable, and the most stable. Fifty-thirdly, as they are the most just, they are the most reasonable, and the most reasonable. Fifty-fourthly, as they are the most wise, they are the most prudent, and the most prudent. Fifty-fifthly, as they are the most virtuous, they are the most noble, and the most noble. Fifty-sixthly, as they are the most beautiful, they are the most elegant, and the most elegant. Fifty-seventhly, as they are the most useful, they are the most profitable, and the most profitable. Fifty-eighthly, as they are the most necessary, they are the most essential, and the most essential. Fifty-ninthly, as they are the most sacred, they are the most inviolable, and the most inviolable. Sixtiethly, as they are the most venerable, they are the most respected, and the most respected. Sixty-firstly, as they are the most ancient, they are the most valuable, and the most valuable. Sixty-secondly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. Sixty-thirdly, as they are the most uniform, they are the most consistent, and the most consistent. Sixty-fourthly, as they are the most certain, they are the most stable, and the most stable. Sixty-fifthly, as they are the most just, they are the most reasonable, and the most reasonable. Sixty-sixthly, as they are the most wise, they are the most prudent, and the most prudent. Sixty-seventhly, as they are the most virtuous, they are the most noble, and the most noble. Sixty-eighthly, as they are the most beautiful, they are the most elegant, and the most elegant. Sixty-ninthly, as they are the most useful, they are the most profitable, and the most profitable. Seventiethly, as they are the most necessary, they are the most essential, and the most essential. Seventy-firstly, as they are the most sacred, they are the most inviolable, and the most inviolable. Seventy-secondly, as they are the most venerable, they are the most respected, and the most respected. Seventy-thirdly, as they are the most ancient, they are the most valuable, and the most valuable. Seventy-fourthly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. Seventy-fifthly, as they are the most uniform, they are the most consistent, and the most consistent. Seventy-sixthly, as they are the most certain, they are the most stable, and the most stable. Seventy-seventhly, as they are the most just, they are the most reasonable, and the most reasonable. Seventy-eighthly, as they are the most wise, they are the most prudent, and the most prudent. Seventy-ninthly, as they are the most virtuous, they are the most noble, and the most noble. Eightiethly, as they are the most beautiful, they are the most elegant, and the most elegant. Eighty-firstly, as they are the most useful, they are the most profitable, and the most profitable. Eighty-secondly, as they are the most necessary, they are the most essential, and the most essential. Eighty-thirdly, as they are the most sacred, they are the most inviolable, and the most inviolable. Eighty-fourthly, as they are the most venerable, they are the most respected, and the most respected. Eighty-fifthly, as they are the most ancient, they are the most valuable, and the most valuable. Eighty-sixthly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. Eighty-seventhly, as they are the most uniform, they are the most consistent, and the most consistent. Eighty-eighthly, as they are the most certain, they are the most stable, and the most stable. Eighty-ninthly, as they are the most just, they are the most reasonable, and the most reasonable. Ninetiethly, as they are the most wise, they are the most prudent, and the most prudent. Ninety-firstly, as they are the most virtuous, they are the most noble, and the most noble. Ninety-secondly, as they are the most beautiful, they are the most elegant, and the most elegant. Ninety-thirdly, as they are the most useful, they are the most profitable, and the most profitable. Ninety-fourthly, as they are the most necessary, they are the most essential, and the most essential. Ninety-fifthly, as they are the most sacred, they are the most inviolable, and the most inviolable. Ninety-sixthly, as they are the most venerable, they are the most respected, and the most respected. Ninety-seventhly, as they are the most ancient, they are the most valuable, and the most valuable. Ninety-eighthly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. Ninety-ninthly, as they are the most uniform, they are the most consistent, and the most consistent. One hundredthly, as they are the most certain, they are the most stable, and the most stable. One hundred-firstly, as they are the most just, they are the most reasonable, and the most reasonable. One hundred-secondly, as they are the most wise, they are the most prudent, and the most prudent. One hundred-thirdly, as they are the most virtuous, they are the most noble, and the most noble. One hundred-fourthly, as they are the most beautiful, they are the most elegant, and the most elegant. One hundred-fifthly, as they are the most useful, they are the most profitable, and the most profitable. One hundred-sixthly, as they are the most necessary, they are the most essential, and the most essential. One hundred-seventhly, as they are the most sacred, they are the most inviolable, and the most inviolable. One hundred-eighthly, as they are the most venerable, they are the most respected, and the most respected. One hundred-ninthly, as they are the most ancient, they are the most valuable, and the most valuable. One hundred-tenthly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. One hundred-eleventhly, as they are the most uniform, they are the most consistent, and the most consistent. One hundred-twelfthly, as they are the most certain, they are the most stable, and the most stable. One hundred-thirteenthly, as they are the most just, they are the most reasonable, and the most reasonable. One hundred-fourteenthly, as they are the most wise, they are the most prudent, and the most prudent. One hundred-fifteenthly, as they are the most virtuous, they are the most noble, and the most noble. One hundred-sixteenthly, as they are the most beautiful, they are the most elegant, and the most elegant. One hundred-seventeenthly, as they are the most useful, they are the most profitable, and the most profitable. One hundred-eighteenthly, as they are the most necessary, they are the most essential, and the most essential. One hundred-nineteenthly, as they are the most sacred, they are the most inviolable, and the most inviolable. One hundred-twentiethly, as they are the most venerable, they are the most respected, and the most respected. One hundred-twenty-firstly, as they are the most ancient, they are the most valuable, and the most valuable. One hundred-twenty-secondly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. One hundred-twenty-thirdly, as they are the most uniform, they are the most consistent, and the most consistent. One hundred-twenty-fourthly, as they are the most certain, they are the most stable, and the most stable. One hundred-twenty-fifthly, as they are the most just, they are the most reasonable, and the most reasonable. One hundred-twenty-sixthly, as they are the most wise, they are the most prudent, and the most prudent. One hundred-twenty-seventhly, as they are the most virtuous, they are the most noble, and the most noble. One hundred-twenty-eighthly, as they are the most beautiful, they are the most elegant, and the most elegant. One hundred-twenty-ninthly, as they are the most useful, they are the most profitable, and the most profitable. One hundred-thirtiethly, as they are the most necessary, they are the most essential, and the most essential. One hundred-thirty-firstly, as they are the most sacred, they are the most inviolable, and the most inviolable. One hundred-thirty-secondly, as they are the most venerable, they are the most respected, and the most respected. One hundred-thirty-thirdly, as they are the most ancient, they are the most valuable, and the most valuable. One hundred-thirty-fourthly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. One hundred-thirty-fifthly, as they are the most uniform, they are the most consistent, and the most consistent. One hundred-thirty-sixthly, as they are the most certain, they are the most stable, and the most stable. One hundred-thirty-seventhly, as they are the most just, they are the most reasonable, and the most reasonable. One hundred-thirty-eighthly, as they are the most wise, they are the most prudent, and the most prudent. One hundred-thirty-ninthly, as they are the most virtuous, they are the most noble, and the most noble. One hundred-fortiethly, as they are the most beautiful, they are the most elegant, and the most elegant. One hundred-forty-firstly, as they are the most useful, they are the most profitable, and the most profitable. One hundred-forty-secondly, as they are the most necessary, they are the most essential, and the most essential. One hundred-forty-thirdly, as they are the most sacred, they are the most inviolable, and the most inviolable. One hundred-forty-fourthly, as they are the most venerable, they are the most respected, and the most respected. One hundred-forty-fifthly, as they are the most ancient, they are the most valuable, and the most valuable. One hundred-forty-sixthly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. One hundred-forty-seventhly, as they are the most uniform, they are the most consistent, and the most consistent. One hundred-forty-eighthly, as they are the most certain, they are the most stable, and the most stable. One hundred-forty-ninthly, as they are the most just, they are the most reasonable, and the most reasonable. One hundred-fiftiethly, as they are the most wise, they are the most prudent, and the most prudent. One hundred-fifty-firstly, as they are the most virtuous, they are the most noble, and the most noble. One hundred-fifty-secondly, as they are the most beautiful, they are the most elegant, and the most elegant. One hundred-fifty-thirdly, as they are the most useful, they are the most profitable, and the most profitable. One hundred-fifty-fourthly, as they are the most necessary, they are the most essential, and the most essential. One hundred-fifty-fifthly, as they are the most sacred, they are the most inviolable, and the most inviolable. One hundred-fifty-sixthly, as they are the most venerable, they are the most respected, and the most respected. One hundred-fifty-seventhly, as they are the most ancient, they are the most valuable, and the most valuable. One hundred-fifty-eighthly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. One hundred-fifty-ninthly, as they are the most uniform, they are the most consistent, and the most consistent. One hundred-sixtiethly, as they are the most certain, they are the most stable, and the most stable. One hundred-sixty-firstly, as they are the most just, they are the most reasonable, and the most reasonable. One hundred-sixty-secondly, as they are the most wise, they are the most prudent, and the most prudent. One hundred-sixty-thirdly, as they are the most virtuous, they are the most noble, and the most noble. One hundred-sixty-fourthly, as they are the most beautiful, they are the most elegant, and the most elegant. One hundred-sixty-fifthly, as they are the most useful, they are the most profitable, and the most profitable. One hundred-sixty-sixthly, as they are the most necessary, they are the most essential, and the most essential. One hundred-sixty-seventhly, as they are the most sacred, they are the most inviolable, and the most inviolable. One hundred-sixty-eighthly, as they are the most venerable, they are the most respected, and the most respected. One hundred-sixty-ninthly, as they are the most ancient, they are the most valuable, and the most valuable. One hundred-seventiethly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. One hundred-seventy-firstly, as they are the most uniform, they are the most consistent, and the most consistent. One hundred-seventy-secondly, as they are the most certain, they are the most stable, and the most stable. One hundred-seventy-thirdly, as they are the most just, they are the most reasonable, and the most reasonable. One hundred-seventy-fourthly, as they are the most wise, they are the most prudent, and the most prudent. One hundred-seventy-fifthly, as they are the most virtuous, they are the most noble, and the most noble. One hundred-seventy-sixthly, as they are the most beautiful, they are the most elegant, and the most elegant. One hundred-seventy-seventhly, as they are the most useful, they are the most profitable, and the most profitable. One hundred-seventy-eighthly, as they are the most necessary, they are the most essential, and the most essential. One hundred-seventy-ninthly, as they are the most sacred, they are the most inviolable, and the most inviolable. One hundred-eightiethly, as they are the most venerable, they are the most respected, and the most respected. One hundred-eighty-firstly, as they are the most ancient, they are the most valuable, and the most valuable. One hundred-eighty-secondly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. One hundred-eighty-thirdly, as they are the most uniform, they are the most consistent, and the most consistent. One hundred-eighty-fourthly, as they are the most certain, they are the most stable, and the most stable. One hundred-eighty-fifthly, as they are the most just, they are the most reasonable, and the most reasonable. One hundred-eighty-sixthly, as they are the most wise, they are the most prudent, and the most prudent. One hundred-eighty-seventhly, as they are the most virtuous, they are the most noble, and the most noble. One hundred-eighty-eighthly, as they are the most beautiful, they are the most elegant, and the most elegant. One hundred-eighty-ninthly, as they are the most useful, they are the most profitable, and the most profitable. One hundred-ninetiethly, as they are the most necessary, they are the most essential, and the most essential. One hundred-ninety-firstly, as they are the most sacred, they are the most inviolable, and the most inviolable. One hundred-ninety-secondly, as they are the most venerable, they are the most respected, and the most respected. One hundred-ninety-thirdly, as they are the most ancient, they are the most valuable, and the most valuable. One hundred-ninety-fourthly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. One hundred-ninety-fifthly, as they are the most uniform, they are the most consistent, and the most consistent. One hundred-ninety-sixthly, as they are the most certain, they are the most stable, and the most stable. One hundred-ninety-seventhly, as they are the most just, they are the most reasonable, and the most reasonable. One hundred-ninety-eighthly, as they are the most wise, they are the most prudent, and the most prudent. One hundred-ninety-ninthly, as they are the most virtuous, they are the most noble, and the most noble. One hundredthly, as they are the most beautiful, they are the most elegant, and the most elegant. One hundred-firstly, as they are the most useful, they are the most profitable, and the most profitable. One hundred-secondly, as they are the most necessary, they are the most essential, and the most essential. One hundred-thirdly, as they are the most sacred, they are the most inviolable, and the most inviolable. One hundred-fourthly, as they are the most venerable, they are the most respected, and the most respected. One hundred-fifthly, as they are the most ancient, they are the most valuable, and the most valuable. One hundred-sixthly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. One hundred-seventhly, as they are the most uniform, they are the most consistent, and the most consistent. One hundred-eighthly, as they are the most certain, they are the most stable, and the most stable. One hundred-ninthly, as they are the most just, they are the most reasonable, and the most reasonable. One hundred-tenthly, as they are the most wise, they are the most prudent, and the most prudent. One hundred-eleventhly, as they are the most virtuous, they are the most noble, and the most noble. One hundred-twelfthly, as they are the most beautiful, they are the most elegant, and the most elegant. One hundred-thirteenthly, as they are the most useful, they are the most profitable, and the most profitable. One hundred-fourteenthly, as they are the most necessary, they are the most essential, and the most essential. One hundred-fifteenthly, as they are the most sacred, they are the most inviolable, and the most inviolable. One hundred-sixteenthly, as they are the most venerable, they are the most respected, and the most respected. One hundred-seventeenthly, as they are the most ancient, they are the most valuable, and the most valuable. One hundred-eighteenthly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. One hundred-nineteenthly, as they are the most uniform, they are the most consistent, and the most consistent. One hundred-twentiethly, as they are the most certain, they are the most stable, and the most stable. One hundred-twenty-firstly, as they are the most just, they are the most reasonable, and the most reasonable. One hundred-twenty-secondly, as they are the most wise, they are the most prudent, and the most prudent. One hundred-twenty-thirdly, as they are the most virtuous, they are the most noble, and the most noble. One hundred-twenty-fourthly, as they are the most beautiful, they are the most elegant, and the most elegant. One hundred-twenty-fifthly, as they are the most useful, they are the most profitable, and the most profitable. One hundred-twenty-sixthly, as they are the most necessary, they are the most essential, and the most essential. One hundred-twenty-seventhly, as they are the most sacred, they are the most inviolable, and the most inviolable. One hundred-twenty-eighthly, as they are the most venerable, they are the most respected, and the most respected. One hundred-twenty-ninthly, as they are the most ancient, they are the most valuable, and the most valuable. One hundred-thirtiethly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. One hundred-thirty-firstly, as they are the most uniform, they are the most consistent, and the most consistent. One hundred-thirty-secondly, as they are the most certain, they are the most stable, and the most stable. One hundred-thirty-thirdly, as they are the most just, they are the most reasonable, and the most reasonable. One hundred-thirty-fourthly, as they are the most wise, they are the most prudent, and the most prudent. One hundred-thirty-fifthly, as they are the most virtuous, they are the most noble, and the most noble. One hundred-thirty-sixthly, as they are the most beautiful, they are the most elegant, and the most elegant. One hundred-thirty-seventhly, as they are the most useful, they are the most profitable, and the most profitable. One hundred-thirty-eighthly, as they are the most necessary, they are the most essential, and the most essential. One hundred-thirty-ninthly, as they are the most sacred, they are the most inviolable, and the most inviolable. One hundred-fortiethly, as they are the most venerable, they are the most respected, and the most respected. One hundred-forty-firstly, as they are the most ancient, they are the most valuable, and the most valuable. One hundred-forty-secondly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. One hundred-forty-thirdly, as they are the most uniform, they are the most consistent, and the most consistent. One hundred-forty-fourthly, as they are the most certain, they are the most stable, and the most stable. One hundred-forty-fifthly, as they are the most just, they are the most reasonable, and the most reasonable. One hundred-forty-sixthly, as they are the most wise, they are the most prudent, and the most prudent. One hundred-forty-seventhly, as they are the most virtuous, they are the most noble, and the most noble. One hundred-forty-eighthly, as they are the most beautiful, they are the most elegant, and the most elegant. One hundred-forty-ninthly, as they are the most useful, they are the most profitable, and the most profitable. One hundred-fiftiethly, as they are the most necessary, they are the most essential, and the most essential. One hundred-fifty-firstly, as they are the most sacred, they are the most inviolable, and the most inviolable. One hundred-fifty-secondly, as they are the most venerable, they are the most respected, and the most respected. One hundred-fifty-thirdly, as they are the most ancient, they are the most valuable, and the most valuable. One hundred-fifty-fourthly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. One hundred-fifty-fifthly, as they are the most uniform, they are the most consistent, and the most consistent. One hundred-fifty-sixthly, as they are the most certain, they are the most stable, and the most stable. One hundred-fifty-seventhly, as they are the most just, they are the most reasonable, and the most reasonable. One hundred-fifty-eighthly, as they are the most wise, they are the most prudent, and the most prudent. One hundred-fifty-ninthly, as they are the most virtuous, they are the most noble, and the most noble. One hundred-sixtiethly, as they are the most beautiful, they are the most elegant, and the most elegant. One hundred-sixty-firstly, as they are the most useful, they are the most profitable, and the most profitable. One hundred-sixty-secondly, as they are the most necessary, they are the most essential, and the most essential. One hundred-sixty-thirdly, as they are the most sacred, they are the most inviolable, and the most inviolable. One hundred-sixty-fourthly, as they are the most venerable, they are the most respected, and the most respected. One hundred-sixty-fifthly, as they are the most ancient, they are the most valuable, and the most valuable. One hundred-sixty-sixthly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. One hundred-sixty-seventhly, as they are the most uniform, they are the most consistent, and the most consistent. One hundred-sixty-eighthly, as they are the most certain, they are the most stable, and the most stable. One hundred-sixty-ninthly, as they are the most just, they are the most reasonable, and the most reasonable. One hundred-seventiethly, as they are the most wise, they are the most prudent, and the most prudent. One hundred-seventy-firstly, as they are the most virtuous, they are the most noble, and the most noble. One hundred-seventy-secondly, as they are the most beautiful, they are the most elegant, and the most elegant. One hundred-seventy-thirdly, as they are the most useful, they are the most profitable, and the most profitable. One hundred-seventy-fourthly, as they are the most necessary, they are the most essential, and the most essential. One hundred-seventy-fifthly, as they are the most sacred, they are the most inviolable, and the most inviolable. One hundred-seventy-sixthly, as they are the most venerable, they are the most respected, and the most respected. One hundred-seventy-seventhly, as they are the most ancient, they are the most valuable, and the most valuable. One hundred-seventy-eighthly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. One hundred-seventy-ninthly, as they are the most uniform, they are the most consistent, and the most consistent. One hundred-eightiethly, as they are the most certain, they are the most stable, and the most stable. One hundred-eighty-firstly, as they are the most just, they are the most reasonable, and the most reasonable. One hundred-eighty-secondly, as they are the most wise, they are the most prudent, and the most prudent. One hundred-eighty-thirdly, as they are the most virtuous, they are the most noble, and the most noble. One hundred-eighty-fourthly, as they are the most beautiful, they are the most elegant, and the most elegant. One hundred-eighty-fifthly, as they are the most useful, they are the most profitable, and the most profitable. One hundred-eighty-sixthly, as they are the most necessary, they are the most essential, and the most essential. One hundred-eighty-seventhly, as they are the most sacred, they are the most inviolable, and the most inviolable. One hundred-eighty-eighthly, as they are the most venerable, they are the most respected, and the most respected. One hundred-eighty-ninthly, as they are the most ancient, they are the most valuable, and the most valuable. One hundred-ninetiethly, as they are the most extensive, they are the most comprehensive, and the most comprehensive. One hundred-ninety-firstly, as they are the most uniform, they are the most consistent, and the most consistent. One hundred-ninety-secondly, as they are the most certain, they are the most stable, and the most stable. One hundred-ninety-thirdly, as they are the most just, they are the most reasonable, and the most reasonable. One hundred-ninety-fourthly, as they are the most wise, they are the most prudent, and the most prudent. One hundred-ninety-fifthly, as they are the most virtuous, they are the most noble, and the most noble. One hundred-ninety-sixthly, as they are the most beautiful, they are the most elegant, and the most elegant. One hundred-ninety-seventhly, as they are the most useful, they are the most profitable, and the most profitable. One hundred-ninety-eighthly, as they are the most necessary, they are the most essential, and the most essential. One hundred-ninety-ninthly, as they are the most sacred, they are the most inviolable, and the most inviolable. One hundredthly, as they are the most venerable, they are the most respected, and the most respected.

L A W

has grown so various, that he found it expedient to compile his dome-book, or *liber judicialis*, for the general use of the whole kingdom. This book is said to have been extant so late as the reign of Edward IV. but is now unfortunately lost. It contained, we may probably suppose, the principal maxims of the common law, the penalties for misdemeanors, and the forms of judicial proceedings. Thus much may at least be collected from that injunction to observe it, which we find in the laws of King Edward the elder, the son of Alfred. "Omnibus qui reipublice præsunt etiam atque etiam mando, ut omnibus æquos se præbeant iudices, perinde ac in iudiciali libro scriptum habetur: nec quiquam formident quin jus commune audacter libereque dicant."

But the irruption and establishment of the Danes in England, which followed soon after, introduced new customs, and caused this code of Alfred, in many provinces, to fall into disuse, or at least to be mixed and debased with other laws of a coarser alloy. So that, about the beginning of the 11th century there were three principal systems of laws prevailing in different districts. 1. The Mercen Lage, or Mercian laws, which were observed in many of the inland counties, and those bordering on the principality of Wales, the retreat of the ancient Britons; and therefore very probably intermixed with the British or Druidical customs. 2. The West Saxon Lage, or laws of the West Saxons, which obtained in the counties to the south and west of the island, from Kent to Devonshire. These were probably much the same with the laws of Alfred above-mentioned, being the municipal law of the far most considerable part of his dominions, and particularly including Berkshire, the seat of his peculiar residence. 3. The Dane Lage, or Danish law, the very name of which speaks its original and composition. This was principally maintained in the rest of the midland counties, and also on the eastern coast, the part most exposed to the visits of that piratical people. As for the very northern provinces, they were at that time under a distinct government.

Out of these three laws, Roger Hoveden and Ranulph Cestrensis inform us, King Edward the confessor extracted one uniform law, or digest of laws, to be observed throughout the whole kingdom; though Hoveden and the author of an old manuscript chronicle assure us likewise, that this work was projected and begun by his grandfather, King Edgar. And indeed a general digest of the same nature has been constantly found expedient, and therefore put in practice by other great nations, which were formed out of the assemblies of little provinces, governed by their particular customs. As in Portugal, under King Edward, about the beginning of the 16th century; in Spain, under Alonso X. who about the year 1260, executed the plan of his father, to collect and reduce all the provincial customs to one uniform law, in the collection which he called the *partidas*. And in Sweden, where the laws were the universal body of customs, till the year 1296, when the particular customs of every province were reduced to one law, being made into one uniform law for the whole kingdom.

Thus, we see, that King Edgar and his son, King Edward, were not the first who have been so much concerned in the collection of laws, and the reduction of them to one uniform law, as is commonly supposed.

and improvements in the experience of a century and a half had suggested. For Alfred is generally styled by the same historians the *legum Anglicanarum conditor*, as Edward the confessor is the restitutor. These, however, are the laws which our histories so often mention under the name of the laws of Edward the confessor; which our ancestors struggled so hardly to maintain, under the first princes of the Norman line; and which subsequent princes so frequently promised to keep and to restore, as the most popular act they could do, when pressed by foreign emergencies or domestic discontents. These are the laws, that so vigorously withstood the repeated attacks of the civil law, which established in the 12th century a new Roman empire over the most of the states on the continent; states that have lost, perhaps upon that account, their political liberties; while the free constitution of England, perhaps upon the same account, has been rather improved than debased. These, in short, are the laws which gave rise and origin to that collection of maxims and customs which is now known by the name of the common law. A name either given to it, in contradistinction to other laws, as the statute law, the civil law, the law merchant, and the like; or, more probably, as a law common to all the realm, the *jus commune* or *folcright*, mentioned by king Edward the elder, after the abolition of the several provincial customs and particular laws before-mentioned.

But though this is the most likely foundation of this collection of maxims and customs; yet the maxims and customs, so collected, are of higher antiquity than memory or history can reach; nothing being more difficult than to ascertain the precise beginning and first spring of an ancient and long established custom. Whence it is, that in our law the goodness of a custom depends upon its having been used time out of mind; or, in the solemnity of our legal phrase, time whereof the memory of man runneth not to the contrary. This it is that gives it its weight and authority; and of this nature are the maxims and customs which compose the common law, or *lex non scripta*, of this kingdom.

This unwritten, or common law, is properly distinguishable into three kinds: 1. General customs; which are the universal rule of the whole kingdom, and form the common law in its stricter and more usual signification. 2. Particular customs; which for the most part affect only the inhabitants of particular districts. 3. Certain particular laws; which by custom are adopted and used by some particular courts, of pretty general and extensive jurisdiction.

1. As to general customs, or the common law properly so called; this is that law, by which proceedings and determinations in the king's ordinary courts of justice are guided and directed. This, for the most part, settles the course in which lands descend by inheritance; the manner and form of acquiring and transferring property; the solemnities and obligation of contracts; the rules of expounding wills, testaments, and acts of parliament; the respective remedies of civil injuries; the several species of temporal offences, with the manner and degree of punishment; and an infinite number of matters particular, which differ themselves as extensively as the ordinary distribution of common justice requires. Thus, for example, that there shall be four superior courts of record, the chancery, the king's bench, the common pleas, and the exchequer; that the

eldest son alone is heir to his ancestor;—that property may be acquired and transferred by writing;—that a deed is of no validity unless sealed and delivered;—that wills shall be construed more favourably, and deeds more strictly;—that money lent upon bond is recoverable by action for debt;—that breaking the public peace is an offence, and punishable by fine and imprisonment:—all these are doctrines that are not set down in any written statute or ordinance; but depend merely upon immemorial usage, that is, upon common law, for their support.

Some have divided the common law into two principal grounds or foundations: 1. Established customs; such as that, where there are three brothers, the eldest brother shall be heir to the second, in exclusion of the youngest: and, 2. Established rules and maxims; as, “that the king can do no wrong, that no man shall be bound to accuse himself,” and the like. But these seem to be one and the same thing. For the authority of these maxims rests entirely upon general reception and usage; and the only method of proving that this or that maxim is a rule of the common law, is by shewing that it hath been always the custom to observe it.

But here a very natural, and very material, question arises: How are these customs or maxims to be known, and by whom is their validity to be determined? The answer is, By the judges in the several courts of justice. They are the depository of the laws; the living oracles who must decide in all cases of doubt, and who are bound by an oath to decide according to the law of the land. Their knowledge of that law is derived from experience and study; from the *viginti annorum incubrationes*, which Fortescue mentions; and from being long personally accustomed to the judicial decisions of their predecessors. And indeed these judicial decisions are the principal and most authoritative evidence, that can be given, of the existence of such a custom as shall form a part of the common law. The judgment itself, and all the proceedings previous thereto, are carefully registered and preserved under the name of records, in public repositories set apart for that particular purpose; and to them frequent recourse is had, when any critical question arises, in the determination of which former precedents may give light or assistance. And therefore, even so early as the conquest, we find the *prædictorum memoria eventorum* reckoned up as one of the chief qualifications of those who were held to be *legibus patriæ optime instituti*. For it is an established rule, to abide by former precedents, where the same points come again in litigation: we will to keep the scale of justice even and steady, and not liable to waver with every new judge's opinion; as also because the law in that case being solemnly declared and determined, what before was uncertain, and perhaps indifferent, is now become a permanent rule, which it is not in the breast of any subsequent judge to alter or vary from according to his private sentiments: he being sworn to determine, not according to his own private judgment, but according to the known laws and customs of the land; not introducing a new law, but to maintain and support the old one. Yet this ancient maxim is not always the former determination, in cases of equity contrary to custom, such as that it is contrary to the *divine law*. But even in such cases, the subsequent judges do not pretend to make a new law, but to elucidate the old one

from misrepresentation. For if it be found that the former decision is manifestly absurd or unjust, it is declared, not that such a sentence was bad law, but that it was not law; that is, that it is not the established custom of the realm, as has been erroneously determined. And hence it is that our lawyers are with justice so copious in their encomiums on the reason of the common law; that they tell us, that the law is the perfection of reason, that it always intends to conform thereto, and that what is not reason is not law. Not that the particular reason of every rule in the law can at this distance of time be always precisely assigned; but it is sufficient that there be nothing in the rule flatly contradictory to reason, and then the law will presume it to be well founded. And it hath been an ancient observation in the laws of England, that whenever a standing rule of law, which the reason perhaps could not be remembered or discerned, hath been wantonly broken in upon by statutes or new resolutions, the wisdom of the rule hath in the end appeared from the inconveniences that have followed the innovation.

The doctrine of the law then is this: That precedents and rules must be followed, unless flatly absurd or unjust: for though their reason be not obvious at first view, yet we owe such a deference to former times, as not to suppose they acted wholly without consideration. To illustrate this doctrine by examples. It has been determined, time out of mind, that a brother of the half blood shall never succeed as heir to the estate of his half brother, but it shall rather escheat to the king, or other superior lord. Now this is a positive law, fixed and established by custom; which custom is evidenced by judicial decisions; and therefore can never be departed from by any modern judge without a breach of his oath and the law. For herein there is nothing repugnant to natural justice; though the artificial reason of it, drawn from the feudal law, may not be quite obvious to every body. And therefore, on account of a supposed hardship upon the half brother, a moderate judge might wish it had been otherwise settled; yet it is not in his power to alter it. But if any court were now to determine, that an elder brother of the half blood might enter upon and seize any lands that were purchased by his younger brother, no subsequent judges would scruple to declare that such prior determination was unjust, was unreasonable, and therefore was not law. So that the law, and the opinion of the judge, are not always convertible terms, nor one and the same thing; since it sometimes may happen that the judge may mistake the law. Upon the whole, however, we may take it as a general rule, “That the decisions of courts of justice are the evidence of what is common law.” In the same manner as in the civil law, what the *prætor* had once determined was to serve for a guide for the future.

The decisions therefore of courts are held in the highest regard, and are not only considered as authentic records in the records of the several courts, but are printed and published by the authority of parliament, and are the basis of the law. And it is the duty of every judge to follow the precedents, and not to create a new law, but to maintain and support the old one. Yet this ancient maxim is not always the former determination, in cases of equity contrary to custom, such as that it is contrary to the *divine law*. But even in such cases, the subsequent judges do not pretend to make a new law, but to elucidate the old one

also to explain the records; which always, in matters of consequence and nicety, the judges direct to be searched. The reports are extant in a regular series from the reign of king Edward II. inclusive; and from his time to that of Henry VIII. were taken by the prothonotaries, or chief clerks of the court, at the expence of the crown, and published annually, whence they are known under the denomination of the *year-books*. And it is much to be wished that this beneficial custom had, under proper regulations been continued to this day; for though king James I. at the instance of lord Bacon, appointed two reporters, with a handsome stipend, for this purpose; yet that wise institution was soon neglected, and from the reign of Henry VIII. to the present time this task has been executed by many private and cotemporary hands; who sometimes through haste and inaccuracy, sometimes through mistake and want of skill, have published very crude and imperfect (perhaps contradictory) accounts of one and the same determination. Some of the most valuable of the ancient reports are those published by lord chief justice Coke; a man of infinite learning in his profession, though not a little infected with the pedantry and quaintness of the times he lived in, which appear strongly in all his works. However, his writings are so highly esteemed, that they are generally cited without the author's name.

Besides these reporters, there were also other authors, to whom great veneration and respect are paid by the students of the common law. Such are Glanvil and Bracton, Britton and Fleta, Littleton and Fitzherbert, with some others of ancient date, whose treatises are cited as authority; and are evidence that cases have formerly happened in which such and such points were determined, which are now become settled and first principles. One of the last of the methodical writers in point of time, whose works are of any intrinsic authority in the courts of justice, and do not entirely depend on the strength of their quotations from older authors, is the same learned judge we have just mentioned, Sir Edward Coke; who hath written four volumes of Institutes, as he is pleased to call them, though they have little of the institutional method to warrant such a title. The first volume is a very extensive comment upon a little excellent treatise of tenures, compiled by judge Littleton in the reign of Edward IV. This comment is a rich mine of valuable common-law learning, collected and heaped together from the ancient reports and year-books, but greatly defective in method. The second volume is a comment upon many old acts of parliament, without any systematical order; the third, a more accurate and methodical digest of the pleas of the crown; and the fourth, an account of the several species of courts.

And thus much for the firm ground and chief corner stone of the law of England, which is general immutability. If any objection lay from time to time, occurred in the decisions of the courts, or in the opinions of the judges, they are preserved, and are not to be altered. In the reports, and in the books, they are preserved in the same manner, and are not to be altered. In the reports, and in the books, they are preserved in the same manner, and are not to be altered.

our practice in making it of equal authority with, when it is not contradicted by, the written law. "For since (says Julianus) the written law binds us for no other reason but because it is approved by the judgment of the people, therefore those laws which the people have approved without writing ought also to bind every body. For where is the difference, whether the people declare their assent to a law by suffrage, or by a uniform course of acting accordingly?" Thus did they reason while Rome had some remains of her freedom; but, when the imperial tyranny came to be fully established, the civil laws speak a very different language. *Quod principis placuit legis habet vigorem, cum populus ei et in eum omne suum imperium et potestatem conferat*, says Ulpian. *Imperator solus et conditor et interpres legis existimatur*, says the code. And again, *Sacrilægis instar est reucripto principis obuari*. And indeed it is one of the characteristic marks of British liberty, that the common law depends upon custom; which carries this internal evidence of freedom along with it, that it probably was introduced by the voluntary consent of the people.

II. The second branch of the unwritten laws of England are particular customs, or laws which affect only the inhabitants of particular districts.

These particular customs, or some of them, are without doubt the remains of that multitude of local customs before-mentioned, out of which the common law, as it now stands, was collected at first by king Alfred and afterwards by king Edgar and Edward the Confessor: each district mutually sacrificing some of its own special usages, in order that the whole kingdom might enjoy the benefit of one uniform and universal system of laws. But, for reasons that have been now long forgotten, particular counties, cities, towns, manors, and lordships, were very early indulged with the privilege of abiding by their own customs, in contradistinction to the rest of the nation at large: which privilege is confirmed to them by several acts of parliament.

Such is the custom of gavelkind in Kent and some other parts of the kingdom (though perhaps it was also general till the Norman conquest); which ordains, among other things, that not the eldest son only of the father shall succeed to his inheritance, but all the sons alike; and that, though the ancestor be attained and hanged, yet the heir shall succeed to his estate, without any escheat to the lord.—Such is the custom that prevails in divers ancient boroughs, and therefore called borough-english, that the youngest son shall inherit the estate, in preference to all his elder brothers.—Such is the custom in other boroughs, that a widow shall be entitled, for her dower, to all her husband's lands; whereas at the common law she shall be endowed of one-third part only.—Such also are the special and particular customs of manors, of which every one has more or less, and which bind all the copyhold tenants that hold of the said manors.—Such likewise is the custom of holding divers inferior courts, with power of trying causes, in cities and trading towns; the right of holding which, when no royal grant can be shown, depends entirely upon immemorial and established usage.—Such, lastly, are many peculiar customs within the city of London, with regard to trade, apprentices, widows, orphans, and a variety of other matters. All these are contrary to the general law of the land, and are good only by special usage; though

the customs of London are also confirmed by act of parliament.

To this head may most properly be referred a particular system of customs used only among one set of the king's subjects, called the custom of merchants, or *lex mercatoria*: which, however different from the general rules of the common law, is yet engrafted into it, and made a part of it; being allowed, for the benefit of trade, to be of the utmost validity in all commercial transactions; for it is a maxim of law, that *cuiuslibet in sua arte credendum est*.

The rules relating to particular customs regard either the proof of their existence; their legality when proved; or their usual method of allowance. And first we will consider the rules of proof.

As to gavelkind, and borough-english, the law takes particular notice of them; and there is no occasion to prove that such customs actually exist, but only that the lands in question are subject thereto. All other private customs must be particularly pleaded; and as well the existence of such customs must be shewn, as that the thing in dispute is within the custom alleged. The trial in both cases (both to shew the existence of the custom, as "that in the manor of Dale lands shall descend only to the heirs male, and never to the heirs female;" and also to shew "that the lands in question are within that manor") is by jury of 12 men, and not by the judges; except the same particular custom has been before tried, determined, and recorded, in the same court.

The customs of London differ from all others in point of trial: for if the existence of the custom be brought in question, it shall not be tried by a jury, but by certificate from the lord mayor and aldermen by the mouth of their recorder; unless it be such a custom as the corporation is itself interested in, as a right of taking toll, &c. for then the law permits them not to certify on their own behalf.

When a custom is actually proved to exist, the next inquiry is into the legality of it; for if it is not a good custom, it ought to be no longer used. *Nihil usus abolendus est*, is an established maxim of the law. To make a particular custom good, the following are necessary requisites:

1. That it have been used so long, that the memory of man runneth not to the contrary. So that, if any one can shew the beginning of it, it is no good custom. For which reason, no custom can prevail against an express act of parliament; since the statute itself is a proof of a time when such a custom did not exist.

2. It must have been continued. Any interruption would cause a temporary ceasing: the revival gives it a new beginning, which will be within time of memory, and thereupon the custom will be void. But this must be understood with regard to an interruption of the right; for an interruption of the possession only, for 10 or 20 years, will not destroy the custom. As if the inhabitants of a parish have a customary right of watering their cattle at a certain pool, the custom is not destroyed though they did not use it for 10 years; it only becomes more difficult to prove: but if the right be any how discontinued for a day, the custom is quite at an end.

3. It must have been peaceable, and acquiesced in; not subject to contention and dispute. For as customs owe their original to common consent, their being immemorially disputed, either at law or otherwise, is a proof that such consent was wanting.

4. Customs must be reasonable; or rather, taken negatively, they must not be unreasonable. Which is not always, as Sir Edward Coke says, to be understood of every unlearned man's reason; but of artificial and legal reason, warranted by authority of law. Upon which account a custom may be good, though the particular reason of it cannot be assigned; for it sufficeth, if no good legal reason can be assigned against it. Thus a custom in a parish, that no man shall put his beasts into the common till the third of October, would be good; and yet it would be hard to shew the reason why that day in particular is fixed upon, rather than the day before or after. But a custom, that no cattle shall be put in till the lord of the manor has first put in his, is unreasonable, and therefore bad; for peradventure the lord will never put in his, and then the tenants would lose all their profits.

5. Customs ought to be certain. A custom, that lands shall descend to the most worthy of the owner's blood, is void; for how shall this worth be determined? But a custom to descend to the next male of the blood, exclusive of females, is certain, and therefore good. A custom to pay two-pence an acre in lieu of tithes, is good; but to pay sometimes two-pence and sometimes three-pence, as the occupier of the land pleases, is bad for its uncertainty. Yet a custom, to pay a year's improved value for a fine on a copyhold estate, is good; though the value is a thing uncertain: for the value may at any time be ascertained; and the maxims of law is, *Id certum est quod certum reddi potest*.

6. Customs, though established by consent, must be (when established) compulsory: and not left to the option of every man, whether he will use them or no. Therefore a custom, that all the inhabitants shall be rated toward the maintenance of a bridge, will be good: but a custom, that every man is to contribute thereto at his own pleasure, is idle and absurd, and indeed no custom at all.

7. Lastly, customs must be consistent with each other. One custom cannot be set up in opposition to another. For if both are really customs, then both are of equal antiquity, and both established by mutual consent: which to say of contradictory customs, is absurd. Therefore, if one man prescribes that by custom he has a right to have windows looking into another's garden, the other cannot claim a right by custom to stop up or obstruct those windows: for these two contradictory customs cannot both be good, nor both stand together. He ought rather to deny the existence of the former custom.

Next, as to the allowance of special customs. Customs, in derogation of the common law, must be construed strictly. Thus, by the custom of gavelkind, an infant of fifteen years may by one species of conveyance (called a *feoffment*) convey away his lands in fee simple, or for ever. Yet this custom does not empower him to use any other conveyance, or even to lease them for seven years; for the custom must be strictly pursued. And moreover, all special customs must submit to the king's prerogative. Therefore, if the king purchases lands of the owners of gavelkind, where all the sons shall equally inherit, yet, upon the king's demise, his eldest son shall succeed to those lands alone, and thus make for the second part of the law, an exception to those particular customs, which are not of public or domestic use.

III. The third branch of this subject is, how

44

Inter-popes, in Latin, called Extravagantes Communium. And all these together, Gratian's decretals, Gregory's decretals, the sixth decretal, the Clementine constitutions, and the Extravagants of John and his successors, form the *corpus juris canonici*, or body of the Roman canon law.

Besides these pontifical collections, which during the times of popery were received as authentic in this island, as well as in other parts of Christendom, there is also a kind of national canon law, composed of legatine and provincial constitutions, and adapted only to the exigencies of this church and kingdom. The legatine constitutions were ecclesiastical laws, enacted in national synods, held under the cardinals Otho and Othobon, legates from Pope Gregory IX. and Pope Clement IV. in the reign of King Henry III. about the years 1220 and 1268. The provincial constitutions are principally the decrees of provincial synods, held under divers Archbishops of Canterbury, from Stephen Langton, in the reign of Henry III. to Henry Chichele in the reign of Henry V.; and adopted also by the province of York in the reign of Henry VI. At the dawn of the reformation, in the reign of King Henry VIII. it was enacted in parliament, that a review should be had of the canon law; and till such review should be made, all canons, constitutions, ordinances, and synodals provincial, being then already made, and not repugnant to the law of the land or the king's prerogative, should still be used and executed. And, as no such review has yet been perfected, upon this statute now depends the authority of the canon law in England.

As for the canons enacted by the clergy under James I. in the year 1603, and never confirmed in parliament, it has been solemnly adjudged upon the principles of law and the constitution, that where they are not merely declaratory of the ancient canon law, but are introductory of new regulations, they do not bind the laity, whatever regard the clergy may think proper to pay them.

There are four species of courts, in which the civil and canon laws are permitted, under different restrictions, to be used. 1. The courts of the archbishops and bishops, and their derivative officers, usually called Courts Christian, (*curie Christianitatis*), or the Ecclesiastical Courts. 2. The Military Courts. 3. The Courts of Admiralty. 4. The Courts of the two Universities. In all, their reception in general, and the different degrees of that reception, are grounded entirely upon custom; corroborated in the latter instance by act of parliament, ratifying those charters which confirm the customary law of the universities. The more minute consideration of them will fall under their proper articles. It will suffice at present to remark a few particulars relative to them all, which may serve to inculcate more strongly the doctrine laid down concerning them.

1. And first, the courts of common law have the superintendency over these courts; to keep them within their jurisdictions; to determine wherein they exceed them; to restrain and prohibit such excesses; and (in case of contumacy) to punish the officer who executes, and, in some cases, the judge who enforces, the sentence as declared to be illegal.

2. The common law has reserved to itself the negation of all such acts of parliament as encroach either the extent of these courts, or the

matters depending before them. And, therefore, if these courts either refuse to allow these acts of parliament, or will execute them in any other sense than what the common law puts upon them, the king's courts at Westminster will grant prohibitions to restrain and control them.

3. An appeal lies from all these courts to the king, in the last resort; which proves that the jurisdiction exercised in them is derived from the crown of England, and not from any foreign potentate, or intrinsic authority of their own. And, from these three strong marks and ensigns of superiority, it appears beyond a doubt, that the civil and canon laws, though admitted in some cases by custom in some courts, are only subordinate and *leges sub graviore lege*; and that thus admitted, restrained, altered, new-modelled, and amended, they are by no means with us a distinct independent species of laws, but are inferior branches of the customary or unwritten laws of England, properly called the King's Ecclesiastical, the King's Military, the King's Maritime, or the King's Academical, Laws.

Let us next proceed to the *leges scripte*, the written laws of the kingdom: which are statutes, acts, or edicts, made by the king's majesty, by and with the advice of the lords spiritual and temporal and commons in parliament assembled. The oldest of these now extant, and printed in our statute books, is the famous *magna charta*, as confirmed in parliament 9 Hen. III. though doubtless there were many acts before that time, the records of which are now lost, and the determinations of them perhaps at present currently received for the maxims of the old common law.

The manner of making these statutes being explained under the articles Dill and Parliament, we shall here only take notice of the different kinds of statutes; and of some general rules with regard to their construction.

First, as to their several kinds. Statutes are either general or special, public or private. A general or public act is an universal rule that regards the whole community: and of this the courts of law are bound to take notice judicially and *ex officio*, without the statute being particularly pleaded, or formerly set forth, by the party who claims an advantage under it. Special or private acts are rather exceptions than rules, being those which only operate upon particular persons and private concerns; such as the Romans, entitled *senatus decreta*, in contradistinction to the *senatus consulta*, which regarded the whole community; and of these the judges are not bound to take notice, unless they be formally shown and pleaded. Thus, to shew the distinction, the statute 13 Eliz. c. 10. to prevent spiritual persons from making leases for longer terms than 21 years, or three lives, is a public act; it being a rule prescribed to the whole body of spiritual persons in the nation: but an act to enable the bishop of Chester to make a lease to A. B. for 99 years, is an exception to this rule; it concerns only the parties and the bishop's successors, and is therefore a private act.

Statutes also are either declaratory of the common law, or remedies of some defect therein. Declaratory, where the old custom of the kingdom is almost fallen into disuse, or become disputable; in which case the parliament has thought proper, to preserve the antiquity, and thus avoiding all doubt and difficulty, to declare what the common law is, and ever hath been.

Then the statute of treasons; 25 Edw. III. cap. 2. which not make any new species of treasons; but only, for the benefit of the subject, declares and enumerates those several kinds of offence which before were treason at the common law. Remedial statutes are those which are made to supply such defects, and abridge such superfluities, in the common law, as arise either from the general imperfection of all human laws; from change of time and circumstances, from the mistakes and unadvised determinations of unlearned judges, or from any other cause whatsoever. And this being done, either by enlarging the common law where it was too narrow and circumscribed, or by restraining it where it was too lax and luxuriant, hath occasioned another subordinate division of remedial acts of parliament into enlarging and restraining statutes. To instance again in the case of treason. Clipping the current coin of the kingdom was an offence not sufficiently guarded against by the common law: therefore it was thought expedient by statute 5 Eliz. c. 11. to make it high treason, which it was not at the common law; so that this was an enlarging statute. At common law, also, spiritual corporations might lease out their estates for any term of years, till prevented by the statute 13 Eliz. before-mentioned: this was therefore a restraining statute.

Secondly, the rules to be observed with regard to the construction of statutes, are principally these which follow:

1. There are three points to be considered in the construction of all remedial statutes; the old law, the mischief, and the remedy; that is, how the common law stood at the making of the act; what the mischief was, for which the common law did not provide; and what remedy the parliament hath provided to cure this mischief. And it is the business of the judges so to construe the act, as to suppress the mischief and advance the remedy. Let us instance again in the same restraining statute of 13 Eliz. c. 10. By the common law, ecclesiastical corporations might let as long leases as they thought proper: the mischief was, that they let long and unreasonable leases, to the impoverishment of their successors. The remedy applied by the statute was, by making void all leases by ecclesiastical bodies for longer terms than three lives, or 21 years. Now in the construction of this statute it is held, that leases, though for a longer term, if made by a bishop, are not void during the bishop's continuance in his see; or, if made by a dean and chapter, they are not void during the continuance of the dean; for the act was made for the benefit and protection of the successor. The mischief is therefore sufficiently suppressed by vacating them after the determination of the interest of the grantor; but the leases, during their continuance, being not within the mischief, are not within the remedy.

2. A statute, which treats of things or persons of an inferior rank, cannot by any general words be extended to those of a superior. So a statute, treating of bishops, prebendaries, parsons, vicars, and others having spiritual promotion, is held not to extend to bishops, though they have spiritual promotion; bishops being the highest persons named, and bishops being of a still higher order.

3. Penal statutes must be construed strictly. Thus the statute 2 Edw. VI. c. 12. having enacted that those who are convicted of stealing horses

should not have the benefit of clergy, the judges conceived that this did not extend to him who should steal but one horse, and therefore procured a new act for that purpose in the following year. And, to come nearer to our own times, by the statute 14 Geo. II. c. 34. stealing sheep or other cattle was made felony without benefit of clergy. But these general words, "or other cattle," being looked upon as much too loose to create a capital offence, the act was held to extend to nothing but mere sheep. And therefore, in the next sessions, it was found necessary to make another statute, 15 Geo. II. c. 33. extending the former to bulls, cows, oxen, steers, bullocks, heifers, calves, and lambs, by name.

4. Statutes against frauds are to be liberally and beneficially expounded. This may seem a contradiction to the last rule; most statutes against frauds being in their consequences penal. But this difference is here to be taken: where the statute acts upon the offender, and inflicts a penalty, as the pillory, or a fine, it is then to be taken strictly; but when the statute acts upon the offence, by setting aside the fraudulent transaction, here it is to be construed liberally. Upon this footing the statute of 13 Eliz. c. 5. which voids all gifts of goods, &c. made to defraud creditors and others, was held to extend by the general words to a gift made to defraud the queen of a forfeiture.

5. One part of a statute must be so construed by another, that the whole may (if possible) stand: *ut res magis valeat quam pereat*. As if land be vested in the king and his heirs by act of parliament, saving the right of A; and A has at that time a lease of it for three years; here A shall hold it for his term of three years, and afterwards it shall go to the king. For this interpretation furnishes matter for every clause of the statute to work and operate upon. But,

6. A saving totally repugnant to the body of the act is void. If therefore an act of parliament vests land in the king and his heirs, saving the right of all persons whatsoever; or vests the land of A in the king, saving the right of A: in either of these cases the saving is totally repugnant to the body of the statute, and (if good) would render the statute of no effect or operation; and therefore the saving is void, and the land vests absolutely in the king.

7. Where the common law and a statute differ, the common law gives place to the statute; and an old statute gives place to a new one. And this upon the general principle laid down in the last section, that *leges posteriores priores contrarias abrogant*. But this is to be understood only when the latter statute is couched in negative terms, or by its matter necessarily implies a negative. As if a former act says, that a juror upon such a trial shall have twenty pounds a-year, and a new statute comes and says he shall have twenty marks; here the latter statute, though it does not express, yet necessarily implies, a negative, and virtually repeals the former. For if twenty marks be made qualification sufficient, the former statute which requires twenty pounds is at an end. But if both the acts be merely affirmative, and the substance such that both may stand together, here the latter does not repeal the former, but they shall both have a concurrent efficacy. If by a former law an offence be indictable at the quarter sessions, and a later law makes the same offence indictable at the assizes; here the jurisdiction of the assizes is not taken away, but both have a concurrent

jurisdiction, and the offender may be prosecuted at either: unless the new statute subjoins express negative words; as, that the offence shall be indictable at the assizes, and not elsewhere.

8. If a statute, that repeals another, is itself repealed afterwards, the first statute is hereby revived, without any formal words for that purpose. So when the statutes of 26 and 35 Hen. VIII. declaring the king to be the supreme head of the church, were repealed by a statute 1 and 2 Philip and Mary, and this latter statute was afterwards repealed by an act of 1 Eliz. there needed not any express words of revival in queen Elizabeth's statute, but these acts of king Henry were impliedly and virtually revived.

9. Acts of parliament derogatory from the power of subsequent parliaments bind not. So the statute 11 Hen. VII. c. 1. which directs, that no person for assisting a king *de facto* shall be attainted of treason by act of parliament or otherwise, is held to be good only as to common prosecutions for high treason; but will not restrain or clog any parliamentary attainder. Because the legislature, being in truth the sovereign power, is always of equal, always of absolute authority: it acknowledges no superior upon earth, which the prior legislature must have been if its ordinances could bind the present parliament. And upon the same principle, Cicero, in his letters to Atticus, treats with a proper contempt these restraining clauses, which endeavour to tie up the hands of succeeding legislatures. "When you repeal the law itself (says he) you at the same time repeal the prohibitory clause which guards against such repeal."

10. Lastly, acts of parliament that are impossible to be performed are of no validity; and if there arise out of them collaterally any absurd consequences, manifestly contradictory to common reason, they are with regard to those collateral consequences void. We lay down the rule with these restrictions; though we know it is generally laid down more largely, that acts of parliament contrary to reason are void. But if the parliament will positively enact a thing to be done which is unreasonable, we know of no power that can control it: and the examples usually alleged in support of this sense of the rule do none of them prove, that where the main object of a statute is unreasonable, the judges are at liberty to reject it; for that were to set the judicial power above that of the legislature, which would be subversive of all government. But where some collateral matter arises out of the general words, and happens to be unreasonable; there the judges are in decency to conclude that this consequence was not foreseen by the parliament, and therefore they are at liberty to expound the statute by equity, and only *quoad hoc* disregard it. Thus if an act of parliament gives a man power to try all causes that arise within his manor of Dale; yet, if a cause should arise in which he himself is party, the act is construed not to extend to that, because it is unreasonable that any man should determine his own quarrel. But, if we could conceive it possible for the parliament to enact, that he should try as well his own causes as those of other persons, there is an agent that has power to defeat the intent of the legislature, when touched in such evident and express words as leave no doubt whether it was the intent of the legislature or not.

These are the several grounds of the laws of England; over and above which, equity is also frequently called in to assist, to moderate, and to

explain them. What equity is, and how impossible in its very essence to be reduced to *stare* rules, hath been shewn above. It may be sufficient, therefore, to add in this place, that, besides the liberality of sentiment with which our common-law judges interpret acts of parliament, and such rules of the unwritten law as are not of a positive kind, there are also courts of equity established for the benefit of the subject, to detect latent frauds and concealments which the process of the courts of law is not adapted to reach; to enforce the execution of such matters of trust and confidence, as are binding in conscience, though not cognizable in a court of law; to deliver from such dangers as are owing to misfortune or oversight; and to give a more specific relief, and more adapted to the circumstances of the case, than can always be obtained by the generality of the rules of the positive or common law. This is the business of the courts of equity, which however are only conversant in matters of property. For the freedom of our constitution will not permit, that in criminal cases a power should be lodged in any judge to construe the law otherwise than according to the letter. This caution, while it admirably protects the public liberty, can never bear hard upon individuals. A man cannot suffer more punishment than the law assigns, but he may suffer less. The laws cannot be strained by partiality to inflict a penalty beyond what the letter will warrant; but, in cases where the letter induces any apparent hardship, the crown has the power to pardon.

The objects of the laws of England are, 1. The rights of persons. 2. The rights of things. 3. Private wrongs. 4. Public wrongs. See the words PERSONS, RIGHTS, WRONGS, PROPERTY, CRIMES, PUNISHMENTS, JURY, PLEADINGS, &c.

Law-Language. In England, all law proceedings were formerly written, as indeed all public proceedings were, in Norman or law French, and even the arguments of the counsel and decisions of the court were in the same barbarous dialect. An evident and shameful badge, it must be owned, of tyranny and foreign servitude; being introduced under the auspices of William the Norman and his sons: whereby the observation of the Roman satirist was once more verified, that *Gallia caudicibus decuit sacunda Britannas*. This continued till the reign of Edward III. who, having employed his arms successfully in subduing the crown of France, thought it unbecoming the dignity of the victors to use any longer the language of a vanquished country. By a statute, therefore, passed in the 36th year of his reign, it was enacted, that for the future all pleas should be pleaded, shown, defended, answered, debated, and judged, in the English tongue, but be entered and enrolled in Latin: in like manner as Don Alonso X. king of Castile (the great-grandfather of our Edward III.) obliged his subjects to use the Castilian tongue in all legal proceedings; and as, in 1336, the German language was established in the courts of the empire. And perhaps, if our legislature had then directed that the writs, *habeas corpus*, *prohibere*, *certiorari*, &c. which are mandates from the king to his subjects to perform certain acts or to appear at certain times, should have been framed in the English language, according to the rule of our ancient law, it had not been very improper. But the custom of enrollment of those writs and the proceedings thereon, which was calculated for the benefit of peo-

terity, was more serviceable (because more durable) in a dead and immutable language than in any flux or living one. The practitioners, however, being used to the Norman language, and therefore imagining they could express their thoughts more aptly and more concisely in that than in any other, still continued to take their notes in law French; and of course, when those notes came to be published, under the denomination of reports, they were printed in that barbarous dialect; which, joined to the additional terrors of a Gothic black letter, has occasioned many a student to throw away his Plowden and Littleton, without venturing to attack a page of them. And yet, in reality, upon a nearer acquaintance, they would have found nothing very formidable in the language; which differs in its grammar and orthography as much from the modern French, as the diction of Chaucer and Gower does from that of Addison and Pope. Besides, as the English and Norman languages were concurrently used by our ancestors for several centuries together, the two idioms have naturally assimilated, and mutually borrowed from each other: for which reason the grammatical construction of each is so very much the same, that we apprehend an Englishman (with a week's preparation) would understand the laws of Normandy, collected in their grand customier, as well, if not better, than a Frenchman bred within the walls of Paris.

The Latin which succeeded the French for the entry and enrolment of pleas, and which continued in use for four centuries, answers so nearly to the English (sometimes word for word) that it is not at all surprising it should generally be imagined to be totally fabricated at home, with little more art or trouble than by adding Roman terminations to English words. Whereas in reality it is a very universal dialect, spread throughout all Europe at the irruption of the northern nations; and particularly accommodated and moulded to answer all the purposes of the lawyers with a peculiar exactness and precision. This is principally owing to the simplicity, or (if the reader please) the poverty and baldness of its texture, calculated to express the ideas of mankind just as they arise in the human mind, without any rhetorical flourishes, or perplexed ornaments of style: for it may be observed, that those laws and ordinances, of public as well as private communities, are generally the most easily understood, where strength and perspicuity, not harmony or elegance of expression, have been principally consulted in compiling them. These northern nations, or rather their legislators, though they refused to make use of the Latin tongue in promulgating their laws, as being more durable and more generally known to their conquered subjects than their own Teutonic dialects, yet (either through choice or necessity) have frequently interspersed therein some words of a Gothic origin; which is, more or less, the case in every country of Europe; and therefore not to be regarded as very peculiar elements in our English legal system. The truth is, what is generally understood as law-Latin is in reality a more universal language, calculated for eternal duration, and may be apprehended both in ancient and modern times; and on those accounts that suited as general as those memorials which have been the subject of the rules of action. The ancient statutes or maxims have endured from the earliest ages, while the more modern and more

elegant structures of Attica, Rome, and Palmyra, have sunk beneath the stroke of time.

As to the objection of locking up the law in a strange and unknown tongue, this is of little weight with regard to records; which few have occasion to read, but such as do, or ought to, understand the rudiments of Latin. And besides, it may be observed of the law-Latin, as the very ingenious Sir John Davis observes of the law-French, "that it is no very easy to be learned, that the meanest wit that ever came to the study of the law doth come to understand it almost perfectly in ten days without a reader."

It is true, indeed, that the many terms of art with which the law abounds are sufficiently harsh when latinized (yet not more so than those of other sciences), and may, as Mr. Selden observes, give offence "to some grammarians of squeamish stomachs, who would rather choose to live in ignorance of things the most useful and important, than to have their delicate ears wounded by the use of a word unknown to Cicero, Salust, or the other writers of the Augustan age." Yet this is no more than must unavoidably happen when things of modern use, of which the Romans had no idea, and consequently no phrases to express them, come to be delivered in the Latin tongue. It would puzzle the most classical scholar to find an appellation, in his pure latinity, for a constable, a record, or a deed of feoffment: it is therefore to be imputed as much to necessity as ignorance, that they were styled in our forensic dialect, *constabularius*, *recordum*, and *feoffamentum*.

Law of marque, a law by which those who are driven to make use of it, take the goods, or shipping, of the party that has done them wrong, and of whom they cannot get ordinary justice, whenever they can take him within their own bounds or precincts. 27 Ed. III. cap 17.

Law of the staple, the same with Law merchant.

Law, merchant, a summary sort of law, originally differing from the common law, though now adopted, and become a part of the laws of the kingdom. One point of it consists in this, that if there be two joint merchants of wares, and one of them dies, his executor shall have the moiety; which is not allowed in the case of others, not merchants. See **CUSTOM**.

Law, spiritual, is the ecclesiastical or canon law, allowed and authorized in this realm, so far as it is not against the common law, nor against the statutes and customs of the kingdom. And according to such ecclesiastical laws, the ordinary and other ecclesiastical judges proceed in cases within their cognizance.

Law, in Scripture History, one of the three divisions of the Old Testament, comprehending Genesis, Exodus, Leviticus, Numbers, Deuteronomy. See **CANON**.

Laws, Game. See **GAME LAWS**.

Laws of Motion. See **AXIOMS**.

Law (John), a famous projector, born at Edinburgh. He went to Paris, where he raised himself to affluence, and obtained several great places by the famous scheme of a national bank, and the Mississippi company, which he pretended was to pay off the debt of the nation and enrich individuals; but the whole fabric fell to the ground and ruined thousands of families. Law escaped popular vengeance, and got away to France where he died in poverty in 1729. He was an

L A W.

thor of a small volume on money and paper

Law (Samund), D. D. bishop of Carlisle, was born in the parish of Cartmel in Lancashire, in the year 1703. His father, who was a clergyman, held a small chapel in that neighbourhood; but the family had been situated at Askham, in the county of Westmoreland. He was educated for some time at Cartmel school, afterwards at the free grammar-school at Kendal; from which he went, very well instructed in the learning of grammar schools, to St. John's College in Cambridge.

Soon after taking his first degree, he was elected fellow of Christ-college, and during his residence there, he became known to the public by a translation of Archbishop King's Essay upon the Origin of Evil, with copious notes; in which many metaphysical subjects, curious and interesting in their own nature, are treated of with great ingenuity, learning, and novelty. To this work was prefixed, under the name of a Preliminary Dissertation, a very valuable piece, written by the reverend Mr. Gay of Sidney college. Whilst at Christ-college, he also undertook and went through a very laborious part in preparing for the press an edition of Stephens's Thesaurus.

Dr. Law held the see of Carlisle almost 19 years; during which time he twice only omitted spending the summer months in his diocese. In the year 1787 he paid this visit in a state of great weakness and exhaustion; and died at Rose about a month after his arrival there, on the 14th day of August, and in the 84th year of his age.

The life of this prelate was spent in incessant reading and thought, almost entirely directed to metaphysical and religious inquiries. Besides the works already mentioned, he published, in 1734 or 1735, a very ingenious inquiry into the Ideas of Space, Time, &c. in which he combats the opinions of Dr. Clarke and his adherents on these subjects.

The bishop was interred with due solemnity in his cathedral church, in which a handsome monument is erected to his memory.

Law (Rev. William) a religious writer of considerable eminence, was born at King's Cliffe, Northamptonshire, in 1686. Of his education very little is known: he took the degrees of A. B. and A. M. at Oxford, and left that university about the year 1712. Mr. Law was a bachelor all his life-time. Such was his love of privacy and a state of reflection, that it was very seldom indeed that he passed more than two hours in the company of any person. With a very small patrimony he was remarkably charitable, particularly to his poor neighbours, the manufacturers of wooden-ware, in and about King's Cliffe: in this benevolent disposition he was joined by the two Miss Gibbons, with whom he resided; their object being not to encourage the idle and dissolute, but to promote and facilitate the good intentions of the industrious. Such was the little value this extraordinary man set on money, that he gave the copies of all his works intended for publication to his bookseller; but for one of them Messrs. Richardson and Urquhart, insisted upon his acceptance of one hundred guineas. He died April 9th, 1761, aged 75.

Gibbon, the celebrated historian, with whose

aunts, our divine lived, gives the following character of Mr. Law and his writings:—"Mr. Law died at an advanced age of a suppression of urine, in 1761, at the house of Mrs. Heather Gibbon, known by the name of the Cliffe, in Northamptonshire, where she still resides. In that family he has left the reputation of a worthy and eminently pious man, who believed all that he professed, and practised all that he enjoined. The character of a non-juror, which he held to the last, is a sufficient evidence of the tenaciousness of his principles in church and state; and the sacrifice of his interest to his conscience will be always respectable.

"His theological writings, which our domestic concerns induced me to read, preserve an amiable, though imperfect sort of life, in my opinion; but here, perhaps, I pronounce with more confidence than knowledge. His last compositions seemed tinctured too much with the mystic enthusiasm of Jacob Behmen; and his discourse on the absolute unlawfulness of the stage, may be called a ridiculous intemperance of sentiment and language.

"But these sallies of phrenzy must not extinguish the praise that is due to Mr. Law, as a wit and a scholar. His arguments on topics of less absurdity, (our readers will recollect that Mr. Gibbon thought all religion absurd) is specious and acute; his manner is lively, his style forcible and clear; and, had not the vigour of his mind been clouded by enthusiasm, he might be ranked with the most agreeable and ingenious writers of the times.

"While the Baugorian controversy was a fashionable theme, he entered the lists. He resumed the contest again with Bishop Hoadly, in which his non-juring principles appear; though he approves himself equal to both prelates.

"On the appearance of the 4th Fable of the Bees," he drew his pen against the licentiousness of the doctrine of that writer; and morality and religion must rejoice in his applause and victory.

"Mr. Law's master-piece, the "Serious Call," is still read as a popular and powerful book of devotion. His precepts are rigid, but they are formed and derived from the Gospel; his satire is sharp, but his wisdom is from the knowledge of human life; and many of his portraits are not unworthy the pen of La Bruyere. If there yet exists a spark of piety in his reader's mind, he will soon kindle it to a flame; and a philosopher must allow that he is more consistent in his principles than any of the tribe of mystic writers. He handles with equal severity and truth the strange contradiction between faith and practice in the christian world. Under the names of Flavia and Miranda, he has admirably described Mr. Gibbon's two aunts, the worldly and the pious sisters."

We had intended to transcribe the opinions of Dr. Johnson and Mrs. Hannah More, as to the character and talents of Mr. Law: but such a sketch as the above from the hand of such a man as Mr. Gibbon, will supersede the necessity of making any other quotation. Mr. Law's works were, 1. A Serious Call to a Devout and Holy Life, adapted to the state and condition of all orders of christians. 2. A Practical Treatise upon Christian Perfection. 3. Three Letters to the Bishop of Bangor. 4. Remarks upon a late book, entitled; "The Rights of the Poor or Private Vice, Public Benefit." 5. The same

L A W

lute unlawfulness of Stage Entertainments fully demonstrated. 6. The Case of Reason, or Natural Religion, fairly and fully stated. 7. An earnest and serious Answer to Dr. Trapp's Discourse of the Folly, Sin, and Danger, of being righteous over much. 8. The Grounds and Reasons of Christian Regeneration. 9. A Demonstration of the gross and fundamental errors of a late book, called "A plain Account of the Nature and end of the Sacrament of the Lord's Supper," affectionately addressed to all orders of men, and more especially to all the younger clergy. 10. An Appeal to all that doubt or disbelieve the Truths of the Gospel. 11. The Spirit of Prayer; or the soul rising out of the vanity of Time into the Riches of Eternity. 12. The Spirit of Love. 13. The Way to Divine Knowledge. 14. A short but sufficient confutation of the Rev. Dr. Warburton's projected Defence (as he calls it) of Christianity, in his Divine Legation of Moses. 15. A Collection of Letters on the most interesting and important subjects on several occasions. 16. Of Justification by Faith and Works; a Dialogue between a Methodist and a Churchman. 17. An humble, earnest, and affectionate Address to the Clergy.

LA'WFUL. *a.* (*law and full.*) Agreeable to law; allowed by law (*Shakspeare*).

LA'WFULLY. *ad.* (*from lawful.*) Legally; agreeably to law (*South*).

LA'WFULNESS. *s.* (*from lawful.*) Legality; allowance of law (*Bacon*).

LA'WGIVER. *s.* (*law and giver.*) Legislator; one that makes laws (*Bacon*).

LA'WGIVING. *a.* (*law and giving.*) Legislative (*Waller*).

LAWES (Henry), a celebrated musician, and the Purcell of his time. He was a servant to Charles I. in his public and private music, and set some of the works of almost every poet of eminence in that reign. The Comus of Milton, and several of the lyrics of Waller, were set by him; and both these poets have done him honour in their verses. He composed a considerable number of psalm-tunes in the *Cantica Sacra*, for three voices and an organ; and many more of his compositions are to be seen in a work called *Select Airs and Dialogues*; also in the *Treasury of Music*, and the *Musical Companion*. He died in 1662.

LAWES (William), was brother to the former, and a most capital musician. He made above 30 several sorts of music for voices and instruments; nor was there any instrument then in use, but he composed to it as aptly as if he had studied that alone. In the music school at Oxford are two large manuscript volumes of his works in score for various instruments. He was a commissary under general Gerard in the civil war, and, to the great regret of the king, was killed at the siege of Chester in 1645.

LAWING or Dees, called also expediting, a cruel and unforgivable way of limiting their activity, and partially disabling them from following the dictates of their nature, by cutting out the ball or the three claws of the fore feet. It is done to prevent

L A W

dogs, in the neighbourhood of forests, from chasing the game.

LAWINGEN, a town in Germany, in the circle of Suabia; formerly imperial, now subject to the duke of Neuburg. Here the duke of Bavaria, in 1704, fortified his camp to defend his country against the British forces and their allies commanded by the duke of Marlborough, who forced their intrenchments. It is seated on the Danube, in Long. 10. 29. E. Lat. 38. 32. N.

LA'WLESS. *a.* (*from law.*) 1. Unrestrained by any law; not subject to law (*Raleigh Roscommon*). 2. Contrary to law; illegal (*Dryden*).

LA'WLESSLY. *ad.* (*from lawlessly.*) In a manner contrary to law (*Shakspeare*).

LA'WMAKER. *s.* (*law and maker.*) Legislator; one who makes laws; a lawgiver (*Hook*).

LAWN. *s.* (*land, Danish; lawn, Welsh*). 1. An open space between woods (*Pope*). 2. (*linon, French.*) Fine linen, remarkable for being used in the sleeves of bishops (*Prior*).

LAWRENCE, St. the largest river of N. America, proceeding from Lake Ontario, from which it runs 700 miles to the Atlantic. It is navigable for large ships of war, as far as Quebec, which is above 400 miles; but beyond Montreal, it is so full of shoals and rocks, that it will not admit large vessels without danger. It is here called the Iroquois.

LAWSONIA. Egyptian Privet. In botany a genus of the class octandria, order monogynia. Calyx four-cleft; petal four; stamens four pair; capsule four-celled, many seeded. Five species, natives of Asia, mostly of the East Indies. From one or two of these species, *L. inermis*, or *L. spinosa*, and perhaps from both the nations, obtain the powder which they term henna or alhenna, and which is used for the purpose of dyeing their nails of a fine golden colour. Their powder is obtained by nituration of the leaves of the plants.

LA'WSUIT. *s.* (*law and suit.*) A process in law; a litigation (*Swiss*).

LA'WYER. *s.* (*from laws.*) Professor of law; advocate; pleader (*Whitgift*).

LAX. *a.* (*laxus, Latin.*) 1. Loose; not confined (*Millon*). 2. Disunited; not strongly combined (*Wood*). 3. Vague; not rigidly exact (*Baker*). 4. Loose in body, so as to go frequently to stool (*Quincy*). 5. Slack; not tense (*Holder*).

LAX. *s.* A looseness; a diarrhoea.

LAX. in botany, synonymous with flaccidus, and opposed to strictus.—Libere in arcum flexibiles. Delin. Pl.—A lax, loose, flaccid, or flexible stem. Easily bent, in opposition to stiff.—It is applied also to the glume.

LAXATION. *s.* (*laxatio, Latin.*) 1. The act of loosening or slackening. 2. The state of being loosened or slackened.

L A Y

LAXATIVE. *s.* (*laxatif*, French.) Having the power to ease costiveness (*Arbuth.*)

LAXATIVE. *s.* A medicine slightly purgative; a medicine that relaxes the bowels without stimulation (*Dryden*).

LAXATIVENESS. *s.* (from *laxative*.) Power of easing costiveness.

LAXATOR TYMPANI, in myology. (*Laxator, oris*, *m.* from *laxo*, to loosen; so called from its office to relax the drum of the ear.) *Externus mallet* of Albinus. *Anterior mallet* of Winslow. *Obliquus auris* of Douglas. A muscle of the internal ear, that draws the malleus obliquely forwards towards its origin; consequently, the membrana tympani is made less concave or is relaxed.

LAXENBURG, a town of Austria, with a palace, where the princes of the house of Austria go for pleasure. It is seated on a small river, 10 miles S. of Vienna. Long. 16. 28. E. Lat. 48. 5. N.

LAXMA'NNIA. In botany a genus of the class syngenesia, order polygamia segregata. Calyx many leaved, the outer leaves spreading. Calycle one-leaved, one flowered, two-awned; florets tubular all hermaphrodite; receptacle chaffy; downless. One species; a native of New South Wales.

LAXITY. *s.* (*laxitas*, Latin.) 1. Not compression; not close cohesion; slackness of contexture (*Bentley*). 2. Contrariety to rigorous precision: as, laxity of expression. 3. Looseness; not costiveness (*Brown*). 4. Slackness; contrariety to tension (*Quincy*). 5. Openness; not closeness (*Digby*).

LAXNESS. *s.* Laxity; not tension; not precision; not costiveness (*Holder*).

LAY. Preterit of *lie*.

To **LAY.** *v. a.* (leogan, Saxon.) 1. To place; to put; to reposit (*Milton*). 2. To place along (*Ecclus*). 3. To beat down corn or grass (*Bacon*). 4. To keep from rising; to settle; to still (*Ray*). 5. To fix deep; to lay foundations (*Bacon*). 6. To put; to place (*Shakspeare*). 7. To bury, to inter (*Acts*). 8. To station or place privily (*Proverbs*). 9. To spread on a surface (*Watts*). 10. To paint; to enamel (*Locke*). 11. To put into any state of quiet (*Bacon*). 12. To calm; to still; to allay (*B. Jonson*). 13. To prohibit a spirit to walk (*L'Estrange*). 14. To set on the table (*Hovea*). 15. To propagate plants by fixing their twigs in the ground (*Merr.*) 16. To wager; to stake (*Dryden*). 17. To reposit any thing (*Psalm*). 18. To exclude eggs (*Bacon*). 19. To apply with violence (*Ezekiel*). 20. To apply nearly (*L'Estrange*). 21. To add; to conjoin (*Isaiah*). 22. To put in state (*Donne*). 23. To scheme; to contrive (*Chapman*). 24. To charge as a payment (*Temple*). 25. To impute, to charge (*Temple*). 26. To suppose as evil or punishment (*Stat.*) 27. To suppose as a duty, or a rule of action (*Wycherley*). 28. To exhibit; to offer (*Atter.*) 29. To know by violence (*Dryden*). 30. To place in contempt (*Montague*). 31. To lay apart; to reject; to put away (*James*). 32. To lay aside; to put away; not to retain

L A Y

(*Heb. Granville*). 33. To lay away; to put from one; not to keep (*Esther*). 34. To lay before; to expose to view; to show; to display (*Waks*). 35. To lay by; to reserve for some future time (*Corinthians*). 36. To lay by; to put from one; to dismiss (*Bacon*). 37. To lay down; to deposit as a pledge, equivalent, or satisfaction (*John*). 38. To lay down; to quit; to resign (*Dryden*). 39. To lay down; to commit to repose (*Dryd.*) 40. To lay down; to advance as a proposition (*Stillingfleet*). 41. To lay for; to attempt by ambush, or insidious practices (*Knolles*). 42. To lay forth; to diffuse; to expatiate (*L'Estrange*). 43. To lay forth; to place when dead in a decent posture (*Shakspeare*). 44. To lay hold of; to seize; to catch (*Locke*). 45. To lay in; to store; to treasure (*Add.*) 46. To lay on; To apply with violence (*Locke*). 47. To lay open; to show; to expose (*Shak.*) 48. To lay over; to incrust; to cover; to decorate superficially (*Habb*). 49. To lay out; to expend (*Boyle*). 50. To lay out; to display; to discover (*Atterbury*). 51. To lay out; to dispose; to plan. 52. To lay out; with the reciprocal pronoun, to exert; to put forth (*Smalridge*). 53. To lay to; to charge upon (*Sidney*). 54. To lay to; to apply with vigour (*Tuls*). 55. To lay to; to harass; to attack (*Dan.*) 56. To lay together; to collect; to bring into one view (*Addison*). 57. To lay under; to subject to (*Addison*). 58. To lay up; to confine to the bed or chamber (*Temple*). 59. To lay up; to store; to treasure; to reposit for future use (*Hooker*).

To **LAY.** *v. n.* 1. To bring eggs (*Mori.*) 2. To contrive; to form a scheme (*Daniel*). 3. To lay about; to strike on all sides; to act with great diligence and vigour (*South*). 4. To lay at; to strike; to endeavour to strike (*Job*). 5. To lay in for; To make overtures of oblique invitation (*Dryden*). 6. To lay on; to strike; to beat without intermission (*Dryden*). 7. To lay on; To act with vehemence; used of expenses (*Shakspeare*). 8. To lay out; To take measures (*Woodw.*) 9. To lay upon; to importune (*Knolles*).

LAY. *s.* (from the verb.) 1. A row; a stratum; a layer (*Bacon*). 2. A wager (*Graunt*).

LAY, a kind of ancient poem among the French, consisting of very short verses. There were two sorts of lays; the great and the little. The first was a poem consisting of twelve couplets of verses, of different measures. The other was a poem consisting of sixteen or twenty verses, divided into four couplets.

These lays were the lyric poetry of the old French poets, who were imitated by some among the English. They were principally used as melancholy subjects, and are said to have been formed on the model of the trochæic stanzas of the Greek and Latin tragedies. Father Maignan gives us an extraordinary instance of one of these

L A Z

ancient lays, in his Treatise of French Poetry :

Sur l'appuis du monde
Que faut-il qu'on fonde
D'espoir ?
Cette mer profonde,
En debris feconde,
Fait voir
Calme au matin, l'onde
Et l'orage y gronde
Le soir.

LAY-BROTHERS, among the Romanists, those pious but illiterate persons, who devote themselves in some convent to the service of the religious.

LAY-CLERK. A vocal officiate in a cathedral, who takes a part in the services and anthems, but is not of the priesthood.

LAY. *s.* (ley, leag, Saxon.) Grassy ground; meadow; ground unploughed; lea (*Dryden*).

LAY. *a.* (*laci*us Latin; λαιος.) Not clerical; regarding or belonging to the people as distinct from the clergy (*Dryden*).

LAY'ER. *s.* (from *lay*.) 1. A stratum, or row; a bed; one body spread over another (*Fvelyn*). 2. A sprig of a plant (*Miller*). 3. A hen that lays eggs (*Mortimer*).

LAYMAN. *a.* (*lay* and *man*.) 1. One of the people distinct from the clergy (*Gov of the Tongue*). 2. An image used by painters in contriving attitudes (*Dryden*).

LAYSTALL. *s.* A heap of dung (*Spenser*).

LAZAR. *s.* (from *Lazarus* in the gospel.)

One deformed and nauseous with filthy and pestilential diseases (*Dryden*).

LAZAR-HOUSE. *s.* (*lazaret*, French;

lazaretto, Italian; from *lazar*.) A house for the reception of the diseased; a hospital (*Milton*).

LAZULITE. In mineralogy. See **LAZULUS**.

LAZULUS. Lazulite. *Lapis Lazuli*. Lazulith. Werner. In mineralogy a genus of the class earths, order siliceous. Consisting of silic with a less proportion of alumine and carbonat of lime, and a small quantity of sulphat of lime and oxyd of iron; opaque, hardish, blue, dense, without internal lustre, breaking into indeterminate fragments, producing a white powder when pounded; neither losing its colour, nor effereffescing from acids sprinkled on it, melting easily in the fire into a frothy slag. One species only, found in the confect of Siberia, Tartary and China, in America, and various parts of Europe, generally in solid masses, and usually full of veins of quartz, limestone, and pyrites; colour sky-blue, often with white or yellow spots or veins; if calcined it effereffescs a little with acids, and forms with them a gelatinous mass; it retains its colour a long time in the fire, but at last becomes brown: when boiled in concentrated vitriolic acid it dissolves slowly and loses its tinge. It is used for extracting that fine colour called *ultramarine*, and is manufactured into various

L E A

vessels, and used in Mosaic work. Specific gravity from 2,760, to 2,945: contains silic 46.0. Alumine 14.5; carbonat of lime 6.5; oxyd of iron 3.0; water 2.0; according to Margraff's analysis.

LAZZARONI, a peculiar description of the lowest class of people, that have, for a number of years, constituted a very singular, as well as a very considerable, part of the poor of Naples.

LA'ZILY. *ad.* (from *lazy*.) Idly; sluggishly; heavily (*Locke*).

LA'ZINESS. *s.* (from *lazy*.) Idleness; sluggishness; listlessness; tardiness (*Dryd.*)

LA'ZING. *a.* (from *lazy*.) Sluggish; idle (*South*).

LA'ZY. *a.* (*lÿser*, Danish.) 1. Idle; sluggish; unwilling to work (*Pope*). 2. Slow; tedious (*Clarendon*).

LD. is a contraction of lord.

LEA. *s.* (ley, a fallow; leag, a pasture, Sax.) Ground enclosed; not open (*Milton*).

LEA, a river, which rises near Luton, in Bedfordshire, flows to Hertford and Ware, and dividing Essex from Hertfordshire and Middlesex, falls into the Thames below Blackwall. By this river large quantities of corn and malt are brought out of Hertfordshire to London.

LEACHDALE. See **LEECHDALE**.

LEAD. (*Plumbum*. Lat. *lÿg*. Germ.) A metal of a blueish-white colour, almost silver-white when recently melted, but which very soon tarnishes. It gives a peculiar smell when rubbed or heated. Its specific gravity, according to Brisson, is 11,352. It is very malleable, readily extending under the hammer into very thin leaves, but its tenacity is less than that of any other metal, for a wire one-tenth of an inch in diameter, will break with a weight of 3lbs.

For the systematic character and different species and varieties of this metal, see the article *Plumbum*. Under the present lead we shall 1. Explain the mode of smelting and reducing its ores; 2. Their assay and analysis; and 3. The Oxyds of the metal and their various applications to the purposes of arts, manufactures and commerce.

1. *Smelting and Reduction of Lead Ore*.—The only ore of lead purchased in the large way is *galena*, and the method of treating this is very simple, partly on account of the richness of the ore, and partly on account of the low price of the metal itself, which therefore will not admit of any but the most summary methods of bringing it into a marketable state.

When first brought up from the mine, this ore is dressed by women and boys, who with a hand hammer separate the greater part of the adhering impurities, consisting of blende, iron, pyrites, quartz, calcareous matter, &c. The residue being broken into pieces of about the size of a hazel nut, is washed from all the adhering clay and dirt, and is then ready to be smelted. The furnace used for this purpose is the common reverberatory with a low arch. A ton or more of the ore is spread on the floor of the furnace, and by means of a pre-heated flame it is soon brought to a red heat. In this state it is occasionally stirred with iron rakes to expose fresh surfaces to the action of the flame, and facilitate the separation

LEAD.

of the sulphur. In a short time the mass begins to acquire a pasty consistence; upon which the heat is lowered, and the ore is kept at a dull red till the sulphur is nearly all got rid of: the fire being then increased, the ore is brought to a state of perfect fusion, and visibly consists of two fluids; the lower is the metallic lead; the upper is a vitreous slag still holding a considerable portion of lead, but mixed with various impurities. In this state of the process the fire is damped; and a few spadefuls of quick-lime are thrown into the fluid mass: by this the scoræ are suddenly solidified, and are raked to the side of the furnace. The tap-hole is then opened, and the lead runs into moulds placed to receive it, when it congeals into oblong masses called pigs, weighing about 60lbs. each.

As soon as the lead has run out of the furnace, the tap-hole is closed, the scoræ are replaced in the bed, and being quickly raised to a glowing red heat, are soon melted. The greatest part of the lead that they contained by this means collects into a mass at the bottom: a little lime is thrown in as before, the scoræ thus rendered solid are raked aside, and the lead which they covered is let off into a mould. This second scoræ, though still holding from five to eight per cent. of lead is now removed from the furnace and applied to no purpose but that of mending roads; the expence of separating the last portions of metal, being more than the value of the produce. The lead of the first running is the best: that procured from the scoræ being sensibly harder and less malleable on account of the iron that it contains. (For more on this subject see Mr. Sadler's Essay, in Nicholson's Journal, No. 60, N. S.)

2. *Assay and Analysis of the Ores.*—The analysis, as well as the reduction of the ores of lead, is very simple. In general the moist way is the most accurate.

Lead is readily separated from silver, by making a solution of both in nitric acid and adding muriatic acid as long as any precipitate appears. The silver falls down in the form of luna cornea, and with it a quantity of muriat of lead; and if the mixture stand some hours undisturbed, this latter salt also forms needles of crystals on the surface of the luna cornea. All the silver falls down in this manner, but part only of the lead, and the muriat of lead is separated from the luna cornea by boiling water, 23 pints of which will dissolve 1 of muriat of lead, but not a particle of the muriat of silver. The solution of muriat of lead is still more easily affected by digesting in dilute nitric acid, which dissolves it readily, but not the luna cornea.

Lead is separated from bismuth by dissolving both to saturation in nitric acid, either concentrated, or diluted with no more than a fourth of water, and then pouring the concentrated solution into a large quantity of water. The oxyd of bismuth then separates as a heavy white powder, and the lead remains dissolved. Some bismuth however remains, but to the solution may then be added a saturated solution of sulphur of soda, which will precipitate the lead only in the form of a white pulverulent sulphat of lead. But when all the bismuth is to be obtained for the purpose of analysis, and not merely to be separated from the lead, it is better after the bismuth has first precipitated, to add muriatic acid to the clear solution, which will throw down the silver

if there be any, and also some muriat of lead mixed with some of the bismuth that remains in the solution, and which last, if redissolved in nitric acid, will again be decomposed by water as before. The whole muriat of lead may then be dissolved in water and nitric acid, and converted into a sulphat by means of sulphat of soda as before.

Lead is separated also from iron and copper by dissolving both in nitric or muriatic acid, and adding sulphat of soda to precipitate the lead. If the nitric acid be used, some of the oxyd of iron will first precipitate as a brown red ochre, which should be removed.

The same method will separate lead from tin, cobalt and zinc.

The composition of the sulphat of lead artificially formed in these processes has been given with some small variation by different chemists. Klaproth estimates it as follows: 100 parts sulphat of lead dried at a low red heat, are composed of 73,56 of oxyd of lead, and 26,04 of sulphuric acid; and the above oxyd of lead is composed of 69,44 of metallic lead and 4,52 of oxygen. This is not the only state of oxygenation of which lead is capable, but it is that in which, according to Klaproth, it is inferred to exist in all the native salts and oxyds of this metal hitherto analyzed.

But where the muriat of lead is free from other admixture, the quantity of metal may be estimated without converting it into a sulphat by the following data: 100 parts of lead dissolved in nitric acid, and decomposed by dropping in muriatic acid as long as any turbidness ensued, and evaporated to perfect dryness (but short of volatilization of any part of the combined muriatic acid) produced 133 of muriat of lead; and consequently 100 parts of dry muriat of lead indicate 75.2 nearly of metallic lead, and (if oxygenated in the same degree as in the sulphat) 4,69 of oxygen, or 80,09 of oxyd of lead. The muriat of lead may also be reduced by dissolving it in water, and immersing a rod of iron, whereby the lead will be precipitated in the metallic state in fine lamellæ.

3. *Oxyds of Lead, and their various uses in arts, manufactures and commerce.*—Lead is the least sonorous of all the metals, giving when struck, a very flat, heavy sound. It melts long before being red hot. The melting part has been variously given, owing to the known irregularity of the mercurial thermometers at very high temperatures. Morveau gives it at 590°. Mr. Crichton at 612°. When slowly cooled it crystallizes in quadrangular pyramids. Heated fully to redness it smokes and sublimates in the open air, giving a grey oxyd, which settles on the sides of the vessel that contains it, or, if in large quantity, mixes with the atmosphere around, and collects in the chimnies of the furnaces where it is melted.

Lead in all forms and combinations is poisonous when taken in any quantity, and a frequent exposure to its vapour, or much handling it, gradually produces dangerous bowel complaints, paralytic symptoms and other maladies.

Though the surface of lead at common temperature soon tarnishes, this metal will remain exposed to air and all weather for a great length of time without further change, the oxydized surface protecting the inner part from destruction; and hence the durability of leaden roofs, pipes,

LEAD.

So, yet in process of years the whole becomes thoroughly eroded. Water has but little direct action on this metal either hot or cold, not being decomposed by it as it is by iron and some other metals; but it slowly assists the action of the air, for lead becomes corroded sooner in a damp than in a dry atmosphere.

When lead is melted in free exposure to the air, it becomes almost immediately covered with a wrinkled pellicle of a dirty grey colour, and if this be skimmed off, others form in succession, till the whole metal is changed into a yellowish-grey oxyd, the weight of which was one of the earliest observations made on the effect of calcination in increasing the weight of metals. This grey oxyd, by a further continuance of heat with constant stirring, passes through various shades of a greenish-yellow to a deep dun-yellow, owing to a successive absorption of oxygen. The highest state of oxygenation to be produced by a mere calcination has a beautiful high red colour with more or less scarlet; where the oxyd is called minium or read lead, a substance well known as a pigment, and especially as a flux in glass-making, for which last it is largely employed.

Minium, however, cannot be made with any certainty in the small way by mere calcination in the air, whatever length of time this may be continued, the colour of the oxyd never rising higher than a dun-yellow: it is only produced in manufactories in the large way by frequent stirring. The process is thus described by Dr. Watson, in his Chemical Essays, as employed in Derbyshire. The furnace is very much like a baker's oven with a low vaulted roof, and on each side of the furnace are two party walls rising from the floor of the surface, but not reaching to the roof. In the interval between these walls, and the sides of the furnace, the coal is burned, and the flame draws over the top of the party walls, and striking the roof is thence reflected down upon the surface of a quantity of lead which is laid on the floor of the furnace. The metal soon melts and instantly becomes covered with a pellicle which is successively raked off till the whole is changed into a greenish-yellow powder. This is taken out, ground in a mill, and washed to separate the portion of lead that still remains in the metallic state, by which it becomes an uniform yellow colour, and is then thrown back into the furnace and constantly stirred, so that every part may be equally exposed to the action of the flame, and in about forty-eight hours of calcination it is converted into red lead.

In Italy red lead is made from litharge, which saves the previous calcination.

We have stated that the oxyd of lead becomes yellow before it turns red. The substance called Massicot, and used as a yellow pigment, is generally made of this yellow oxyd, but the finer sorts of Massicot are said to have an addition of muriat of ammonia, and therefore to be a muriated oxyd of lead, not essentially different from that fine oxyd called Naples yellow.

Litharge is another of the oxyds of lead, made by the simple action of heat and air. It is produced in the process of extracting silver from lead. The silver holding lead is put into a large shallow dish made of stoneware, and therefore very porous, and is kept all red-hot in a wind-furnace, at the back of which enters the pipe of large bellows that directs a blast of air on the surface of

the red-hot metal. This converts it into a sandy yellowish-white glistening oxyd, which is raked off successively to expose new surfaces till nearly the whole of the lead is thus changed into litharge. There are slight variations in the colour of litharge, some kinds having more of a silvery gloss, others being of a dull red-yellow. Part of it is again reduced into very pure and soft lead, and the rest is selected for sale. The waste of lead by volatilization (a waste that takes place in the formation of all oxyds produced by a strong heat) is many times more in reducing lead into litharge than into minium, so that, though there is a large gain of oxygen from the air, the litharge weighs considerably less than the lead from which it was produced. Part of it, however, is lost by soaking into the test, a porous vessel in which it is made.

All the oxyds of lead, when strongly heated to a full redness, very readily ran into a glass which has a clear topaz-yellow colour, and is the most powerful flux known of every vitrifiable matter, so that in a very short time the vitrified oxyd corrodes all the common crucibles and runs through them like a sieve, and even the closest porcelain can only retain it for a time.

There is another oxyd of this metal generally known by the name of the brown oxyd, which was first discovered by Scheele, and has various peculiar qualities. It is procured by adding nitric acid to minium. It is a tasteless powder of a flea-brown colour, very fine and light.

There is also an artificial white carbonat of lead produced by decomposing any of the salts of this metal by a carbonated alkali.

Lead is soluble in moist acids. All the salts have a sweetish taste, and are strongly styptic or astringent in the mouth. The muriat of lead or the salt produced by a solution in muriatic acid was termed by the older chemists *plumbum corneum* in analogy with the corresponding salt from silver denominated *luna cornea*.

From the carbonic acid employed as a solvent is produced cerusse or white lead, which is a carbonated oxyd; this metal is usually prepared in the first process of making acetate of lead. This is sometimes said to be an acetous oxyd, an acetate or subacetate of lead, but not with perfect correctness: for though the acetous acid is the means of its formation, this last will not dissolve lead when in close vessels; but with access of air it first oxydates it and then dissolves the oxyd. Or the solution may be obtained by adding oxyd of lead or carbonated oxyd to vinegar, and digesting for a time. For the preparation of cerusse or white lead in the larger way, see the article CRUSSI. Acetate or sugar of lead is prepared nearly in the same manner as the cerusse, by means of lead sheets put into pots with vinegar, and digested a sufficient time. It may also be made by dissolving cerusse or litharge in vinegar, and probably the natural carbonat may answer the same purpose.

The alkaline earths also dissolve the oxyds of lead: lime-water boiled for a long time on litharge forms a solution which has been long known as a recipe for blackening hair and other animal materials. When evaporated in a close vessel it deposits small transparent crystals of lime with oxyd of lead. This solution is decomposed by the alkaline sulphats and muriats, and also by sulphurated hydrogen.

The fat oils dissolve the oxyds of lead with great ease, and undergo a remarkable change in

LEA

the process, being thereby rendered drying or capable of speedily hardening into a firm varnish when exposed to the air. Some oils, especially olive oil, acquire at once a very firm consistence, and a very considerable adhesive property, when gently warmed. It is in this state employed in medicine under the name of white diachylon plaster; or emplastrum plumbi; as it is called in the new pharmacopoeia.

The other medical preparations of lead are the *liquor plumbi acetatis*: *Plumbi superacetatis*; and *liquor plumbi acetatis dilutus*.

To **LEAD**. *v. a.* (from the noun.) To fit with lead in any manner (*Bacon*).

To **LEAD**. *v. a.* preter. *I led*, part. *led*. (*Latin*, Saxon). 1. To guide by the hand (*Luke*). 2. To conduct to any place (*Sam.*) 3. To conduct as head or commander (*South*). 4. To introduce by going first (*Fairfax*). To guide; to show the method of attaining (*Watts*). 6. To draw; to entice; to allure (*Clarend.*) 7. To induce; to prevail on by pleasing motives. (*Swift*). 8. To pass; to spend in any certain manner (*Atterbury*).

To **LEAD**. *v. n.* 1. To go first, and show the way (*Genesis*). 2. To conduct as a commander (*Temple*). To show the way, by going first (*Wotton*).

LEAD. *s.* (from the verb.) Guidance first place (*Herring*).

LEADEN. *a.* (leaden, Saxon.) 1. Made of lead (*Wilkins*). 2. Heavy; unwilling; motionless dull (*Shakspeare*).

LEADER. *s.* (from *lead*.) 1. One that leads, or conducts. 2. Captain; commander (*Hayward*). 3. One who goes first (*Shakspeare*). 4. One at the head of any party or faction (*Swift*). 5. A performer who in a concert takes the principal violin, receives the time and style of the several movements from the conductor, and communicates them to the rest of the band.

The Leader, after the conductor, holds the most important station in the orchestra. It is to him that the other performers look for direction in the execution of the music, and it is on his steadiness, skill, and judgment, and the attention of the band to his motions, manner and expression that the consistency, truth, and force of effect, so in a great measure depend.

LEADING-NOTE. An expression applied to the sensible, or sharp seventh, of any key.

LEADHILLS, a village in Luncashire, situate among the mountains of Clydesdale, and said to be the highest human habitation in Great Britain. Here reside many hundreds of miners, with their families. These miners, though in a great measure, excluded from society by their situation, pay great attention to the cultivation of the mind, and have provided a circulating library for the instruction and amusement of the little community belonging to the village.

LEA

LEADING. *part. a.* Principal; chief (*Locke*).

LEADING-STRINGS. *s.* (*lead and strings*.) Strings by which children, when they learn to walk, are held from falling (*Dryden*).

LEADMAN. *s.* (*lead and man*.) One who begins or leads a dance (*Ben Jonson*).

LEAD-WORT, in botany. See **PLUMBAG**.

LEAF. *s.* *leaves*, plural. (*leaf*, Saxon.) 1. The green deciduous parts of plants and flowers (*Boyle*). 2. A part of a book, containing two pages (*Spenser*). 3. One side of a double door (*Kings*). 4. Any thing foliated, or thinly beaten (*Digby*).

LEAF. In botany. The organ of motion in a vegetable. Transpiring and attracting air and moisture, as the lungs do in animals; and affording shade to the vegetable. In reality, however, leaves are rather analogous to the muscles, although they be not as in them fixed by a tail, because in vegetables there is no voluntary motion. Leaves are either, 1. Simple, having one leaf only on a petiole, or proceeding from the same point—or, 2. Compound, having several leaves to one petiole: the component leaves are called leaflets.

LEAF-INSECT. See **CIMEX**.

LEAF, in clocks and watches, an appellation given to the notches of their pinions.

LEAF-GOLD, usually signifies fine gold beaten into plates of an exceeding thinness, which are well known in the arts of gilding, &c. See **AURUM**, **GOLD**, &c.

To **LEAF**. *v. n.* (from the noun.) To bring leaves; to bear leaves (*Broome*).

LEAFLESS. *a.* (from *leaf*.) Naked of leaves (*Government of the Tongue*).

LEAFLETS. In botany (*foliola*) small, or sub-leaves, sometimes called leaflets, but contrary to common analogy in our language in forming diminutives. For the same reason, if we use *leaf*, we must not use *foliole*.

LEAF-STALK. See **PELIOL**.

LEAFY. *Adjective*. Furnished with leaves; in opposition to leafless.—Or abounding in leaves, contrasted with such stems as have few.—It is applied not only to the stem, but to the head, spike, raceme and peduncle.

LEAGUE, a measure of length, containing more or fewer geometrical paces, according to the different lengths and customs of countries. A league at sea, where it is chiefly used by us, being a hundred and twenty French paces, or three English miles. The French league sometimes contains the same measure, and in some parts of France it consists of 2000 paces; the same or common league consists of 2400 paces, and the Italian league of 3000. The Spanish league is larger, than the French, it being reckoned at 2000 paces, or 20 French leagues, or 24 English statute miles. The Dutch and German leagues contain each four geographical miles. The

L E A

Persian leagues are pretty near of the same extent with the Spanish; that is, they are equal to four Italian miles: which is pretty near to what Herodotus calls the length of the Persian parasang, which contained 30 stadia, eight whereof, according to Strabo, make a mile. The word comes from *leuca*, or *leuge*, an ancient Gaulish word for an itinerary measure, and retained in that sense by the Romans. Some derive the word *leuca* from *λευκος*, "white;" as the Gauls, in imitation, of the Romans, marked the spaces and distances of their roads with white stones.

LEAGUE, an alliance or confederacy between princes and states for their mutual aid, either in attacking some common enemy, or in defending themselves. The word comes from *liga*, which in the corrupt Latin was used for a confederacy: *Qua quis cum alio ligatur*.

Leagues among the Greeks, were of three sorts: 1. *Σπονδή*, *Συμμαχία*, or *Ελευθερία*, whereby both parties were obliged to cease from hostilities, without even molesting the allies of each other; 2. *Επιμαχία*, whereby they engaged to lend assistance to each other in case of invasion; and, 3. *Συμμαχία*, whereby they engaged to have some friends and enemies, and to assist each other upon all occasions. All these leagues were confirmed with oaths and imprecations, and sacrifices. The victims most generally used were a boar, ram, or goat, sometimes all three; and sometimes bulls and lambs. They cut out the testicles of the animal, and stood upon them while they swore; and some of the hair of the victim was distributed to all present. Then they cut the animal's throat, which was called *σπονδισμός*, in Latin, *forte fœdus*.—This done, they repeated their oaths and imprecations, calling the gods to witness the honesty of their intentions. A libation was then made of wine, which at this time was mixed, to imply their conjunction and union: while this was pouring out, they prayed that the blood of him who should break the treaty might be poured out in like manner. Upon these occasions no part of the victim was eaten. Still farther to increase the solemnity of this obligation, the league was engraven upon brass, fixed up in palaces of public view, sometimes read at

the exchange of ambassadors upon the occasion, and frequently sent ambassadors, on some appointed day, to keep them in mind of their engagements to each other.

LEAGUE, *s. n.* To unite on certain terms, to confederate (*Scott*).

LEAGUER, *s. n.* (from *leuger*.) Confederated (*Phillips*).

LEAGUER, *s. n.* (from *leugen*, Dutch.) Siege; investment of a town (*Bohn*).

LEAK, *s. n.* (from *leak*, Dutch.) A breach or hole that lets in water (*Bohn*).

LEAK, *s. n.* To let water in or out

L E A

(*Shakspeare*). 2. To drop through a breach (*Dryden*).

LEAKAGE, *s. n.* (from *leak*.) Allowance made for accidental loss in liquid measures.

LEAKE (Sir John) was born at Rotherhithe in the year 1656, and was taught mathematics and gunnery by his father, who was master gunner of England. He entered early into the naval service, and in 1688 he was appointed to the command of a frigate, and after the revolution he distinguished himself by some important services, particularly the relief of Londonderry. In 1709 he was sent out as commodore of a squadron to drive the French from Newfoundland, which service he performed with great credit. On his return home he was made rear-admiral of the blue. The year following he was engaged with Admiral Rooke in taking Gibraltar, and for his services received the honour of knighthood. In 1705 he saved that important fortress from the combined attacks of France and Spain. The same year he was engaged in the reduction of Barcelona, and in 1706 he so seasonably relieved that place, that king Philip was obliged to raise the siege. This was followed by the reduction of the cities of Carthage and Alicant, and the island of Majorca. On the death of admiral sir Cloudesley Shovel he was appointed admiral of the white, and commander-in-chief of her majesty's fleet. In 1708 he convoyed the new queen of Spain to her consort king Charles, and was presented by her with a diamond ring worth 300*l*. He next reduced the islands of Sardinia and Minorca. Having thus terminated the campaign he returned to England, where he was chosen member of parliament for Rochester. On the death of the queen he lost his place, after which he lived privately at Greenwich, where died in 1730.

LEAKE (Stephen Martin), son of captain Martin, who married a sister of admiral Leake's lady. That gallant officer leaving no issue bequeathed his property to the captain; and his son out of gratitude took upon him the name of Leake. He was garter king at arms, and published. 1. Nummi Britannici Historia, 1726, 8vo.; 2. The Life of Sir John Leake, 8vo.; 3. The Statutes of the Order of the Garter, 4to. He died in 1773.

LEAKY, *s. n.* (from *leak*.) 1. Battered or pieced, so as to let water in or out (*Dryden*). 2. Loquacious; not close (*L'Estrange*).

LEAN, *v. n.* pret. *leaned* or *lent* (Saxon, Saxon; *lenen*, Dutch). 1. To incline against to rest against; (*Peacham*). 2. To propend; to tend toward (*Spenser*). 3. To be in a bending posture (*Dryden*).

LEAN, *a.* (from *lean*, Saxon). 1. Not fat; meagre; wanting flesh; bare-boned (*Milton*). 2. Not unctuous; thin; hungry (*Barnes*). 3. Low; poor; in opposition to great or rich (*Shakspeare*). 4. Jejunous; not com-

hensive; not embellished: as, a lean dissertation.

LEAN. *s.* That part of flesh which consists of the muscle without the fat (*Farquhar*).

LEANDER. See **HERO**.

LEANLY. *ad.* (from *lean*.) Meagrely; without plumpness.

LE'ANNESS. *s.* (from *lean*.) 1. Extenuation of body; want of flesh; meagreness. (*Ben Johnson*). 2. Want of matter; thinness; poverty (*Shakspeare*).

LEAO, in mineralogy. See **LAZULUS**.

To **LEAP.** *v. n.* (heapan, Saxon.) 1. To jump; to move upward or progressively without change of the feet (*Cowley*). 2. To rush with vehemence (*Sandys*). 3. To bound; to spring (*Luke*). 4. To fly; to start (*Shakspeare*).

To **LEAP.** *v. a.* 1. To pass over, or into, by leaping (*Prior*). 2. To compress, as beasts (*Dryden*).

LEAP. *s.* (from the verb.) 1. Bound; jump; act of leaping. 2. Space passed by leaping. *L'Estrange*. 3. Sudden transition (*Swift*). 4. An assault of an animal of prey (*L'Estr.*) 5. Embrace of animals (*Dryden*). 6. Hazard, or effect of leaping (*Dryden*).

LEAP, in music, is properly applicable to any disjunct degree, but is generally used to signify a distance consisting of several intermediate intervals.

LEAP-FROG. *s.* (*leap and frog*.) A play of children in which they imitate the jump of frogs (*Shakspeare*).

LEAP-YEAR. *s.* *Leap-year* or *bissextile* is every fourth year, and so called from its leaping a day more that year than in a common year: so that the common year hath 365 days, but the leap-year 366; and then February hath 29 days, which in common years hath but 28. See **BISSEXTILE**, **CHRONOLOGY**, and **YEAR**.

LEAR, the name of a British king, said in old chronicles to have succeeded his father Bladud, about A.M. 3160. The story of this king and his three daughters is well known from Shakspeare's excellent tragedy founded upon it.

LEARCHUS, a son of Athamas and Ino, was hanged to death against a wall by his father, in consequence of madness.

To **LEARN.** *v. a.* (leopman, Saxon.) 1. To gain the knowledge or skill of (*Knoles*). 2. To teach: obsolete (*Shakspeare*).

To **LEARN.** *v. n.* To take pattern (*Bacon*).

LEARNED. *a.* (from *learn*.) 1. Versed in science and literature (*Swift*). 2. Skilled; skillful; knowing (*Granville*). 3. Skilled in scholastic knowledge (*Locke*).

LEARNEDLY. *ad.* (from *learned*.) With knowledge; with skill (*Hooker*).

LEARNING. *s.* (from *learn*.) 1. Literature; skill in language or sciences; generally scholastic knowledge (*Prior*). 2. Skill in any thing good or bad (*Hooker*).

LEARNER. *s.* (from *learn*.) One who is yet in his rudiments; one who is acquiring some new art or knowledge (*Granville*).

LEASE (from the French *laisser*, *demitter*, "to let") in law, otherwise called a *Demise*, is a conveyance or letting of lands or tenements, in consideration of rent, or other annual recompence made for life, for years, or at will; but always for a less time than the interest of the lessor in the premises; for if it were of the whole interest, it would be more properly an assignment. He that demises or lets, is the lessor; and he to whom it is demised or let is the lessee.

A lease may either be made by writing or word of mouth, called in law, a lease by parol. The former is most usual; but by the statute of frauds, 29 Charles II. c. 3, all leases of lands, except leases not exceeding three years, must be made in writing, and signed by the parties themselves, or their agents duly authorized, otherwise they will operate only as leases at will. If a lease is but for half a year, or a quarter, or less time the lessee is respected as a tenant for years; a year being the shortest term of which the law in this case, takes notice: that is, he is entitled to the general privileges of a tenant for years, and is classed as such, though his term lasts only for the time specified.

To constitute a good lease, there must be a lessor not restrained from making the lease to the extent for which it is granted; a lessee capable of receiving it; and the interest demised must be a demisable interest, and be sufficiently and properly described. If it is for years, it must have a certain commencement and determination; it is to have all the usual ceremonies, as sealing, delivery, &c.; and there must be an acceptance of the thing demised.

Leases were formerly only to a sort of bailiffs, who tilled the land, and paid a part of the profits to the landlord; they were for very short terms, and the tenant's estate was little respected in the law. They are now granted for long terms, and are very beneficial interests.

The following points may be necessary to be specified here concerning leases. First, they must have a certain commencement and end. Leases for life must not be made to commence at a future day, and there must be a livery of seisin. They must now be stamped as a lease, to be valid; and any form of writing will constitute a lease, provided it contains words of present demise, or actual letting; but if it be only an agreement to let, it conveys no immediate title in law, but only an equitable right to have a lease, or to sue at law for not making one. If a lease is made to one for years, and at the same time to another for a longer time, the last lease is not void, but shall take effect after the first expires. A tenant for life can, in general, only grant a lease to endure during his life; but sometimes a power is annexed to such an estate, to grant leases for a specified time, and under particular limitations, all which must be strictly complied with, or the lease is void; and in-

stances have happened, where building-leases have been set aside, and persons ruined by having granted under-leases. An infant may make a lease, but may set it aside when he comes of age; and the Court of Chancery is empowered to grant leases for idiots, lunatics, infants and married women.

The rent must be reserved to the executor or the heir of the lessor, according as his estate is real or personal. Lessees are bound to repair, unless the contrary is specified; and although if the house is burnt by accident they are not bound to rebuild, yet they must if the fire be by negligence; and if there is a covenant to pay rent, and a covenant to repair, except in case of fire, yet rent is payable, although the house is not rebuilt by the landlord. If there is a covenant not to assign, lease, or under-let, without licence of the landlord, the tenant cannot even grant an under-lease.

Upon a lease at will, six months' notice to quit must generally be given by either party, to determine on the same day in the year when the lease commenced. Leases made by spiritual persons of their churchlands, must be strictly conformable to certain statutes called the enabling and disabling statutes. The tenant may, at the trial of an ejectment, insist upon his notice to quit being insufficient, although he made no objection when it was served. See further *Jacob's Law Dictionary*, title Leases.

LEASE and Release, a conveyance of the fee simple, right, or interest, in lands or tenements, under the statute of uses, 27 Henry VIII. c. 10, giving first the possession, and afterwards the interest, which in law is equivalent to a feoffment. It was invented to supply the place of livery of seisin, and is thus contrived; a lease, or rather bargain and sale, upon some pecuniary consideration, for one year, is made by the tenant of the freehold to the lessee or purchaser, which vests in him the use of the term for a year; and then the statute of uses, 27 Henry VIII. c. 10, immediately transfers the use into possession. He therefore, being thus in possession, is capable of receiving a release of the freehold in reversion; and accordingly, the next day a release is granted to him. In the lease, a pepper-corn is a good consideration to make the lessee capable of receiving a release. This mode of conveyance is become so usual, that it merits peculiar attention. See this matter very ably discussed by the annotator of the latter part of *Coke's Commentaries*, page 271, No. 1.

LEASES, value of. The purchaser of a lease may be considered as the purchaser of an annuity equal to the rack-rent of the estate; and the same principles, from which are deduced the present value of annuities to continue during any given term, will apply to the value of leases. The sum paid down for the grant of a lease is so much

money paid in advance for the annual rents, as they may become due; or, it may be considered as a sum which put out to interest, will enable the lessor to repay himself the rack-rent of the estate, or the yearly value of his interest therein, during the given term; therefore no more money should be demanded by the lessor, for the grant of the lease, than will enable him to do this at a given rate of interest. In order to find what this sum should be it would be necessary to ascertain separately the present value of each annual rent, or the sum which, put out to interest at the given rate, will enable the landlord to repay himself the several yearly rents as they become due. Thus, if a person has 100l. due to him a twelvemonths hence, and he wishes to have the value of the same advanced immediately, the sum that ought to be given as an equivalent thereto, allowing 5 per cent. interest, is 95l. 4s. 9½.; for this is the sum which, put out to interest at the rate of 5 per cent., will, at the end of the year, amount to 100l. So also, if a person has 100l. due to him at the end of two years, and he wishes to have the value advanced immediately, the sum that ought to be given as an equivalent thereto, is 90l. 14s. 3d. for this is the sum which put out at the same rate of interest, will, at the end of two years amount to 100l. In the same manner, if a person has 100l. due to him, at the end of three years, and he wishes to have the value of the same immediately, the sum that ought to be given as an equivalent thereto, is 80l. 7s. 8d. for this is the sum which put out at the same rate of interest, will, at the end of three years, amount to 100l. And if these three values are added together, they amount to 272l. 6s. 6d. which is the sum that ought to be paid down for the lease of an estate for three years, of the annual rent of 100l. Had the rate of interest been 6 per cent. or any higher rate, the answer would have come out less than the value above given; or, had it been 4 per cent. or any lower rate, the answer would have come out more than such value; whence it is obvious, that, in purchases of this kind, we ought previously to determine the rate of interest at which we are disposed to lay out our money.

Leases are frequently granted during a life; or for a specified term of years subject to termination, if a given life or lives should fail or become extinct within such terms; sometimes they depend on the longest of two or three lives, with liberty on the failure of one or more of the lives, to nominate others on payment of a fine. College and corporation leases are often of these kinds; and are almost as often estimated erroneously. The values of such leases, however, are correctly exhibited in a very useful collection of "Tables for the purchasing and renewing of Leases," by E. Bailey, of the Stock Exchange.

To LEASE, v. a. (from the noun.) To let by lease (*Agitare*).

To LEASE. *v. n.* (*leasen*, Dutch.) To glean; to gather what the harvest men leave (*Dryden*).

LEASER *s.* (from *lease*.) Gleaner; gatherer after the reaper (*Swift*).

LEASH. *s.* (*lêse*, French; *leise*, Dutch.) 1. A leather throng, by which a falconer holds his hawk, or a courser leads his greyhounds (*Shakespeare*). 2. A tierce; three: as a brace is two (*Hudibras*). 3. A band wherewith to tie any thing in general (*Denno*).

To LEASH. *v. a.* (from the noun.) To bind; to hold in a string (*Shakespeare*).

LEASING. *s.* (*leaze*, Saxon.) Lies, falsehood (*Prior*).

LEAST. *a.* the superlative of little. (*læst*, Saxon.) Little beyond others; smallest (*Locke*).

LEAST. *ad.* In the lowest degree; in a degree below others (*Pope*).

At LEAST. } To say no more; not
At the LEAST. } to demand or affirm
At LEASTWISE. } more than is barely
sufficient; at the lowest degree (*Milton*,
Hooker).

LEASY. *a.* Flimsy; of weak texture: not in use (*Ascham*).

LEATHER. *s.* (*ledep*, Saxon.) 1. Dressed hides of animals (*Shakespeare*). 2. Skin: ironically (*Swift*).

LEATHER. The dressed hides or skins of animals:—the preparation of which for the many important purposes to which they are applied is almost exclusively a chemical process in all its branches. These branches we shall therefore notice at some length.

By converting skins into leather various important points are attained: putrefaction is prevented, the material is rendered strong, tough and durable; and in many instances moisture is bid complete defiance to. The recent skin consists principally of the true cutis or membranous texture, the chemical composition of which is gelatin in a dense state, but still entirely soluble in water more or less easily according to its density. This however is penetrated with different vessels for blood, lymph, oil, &c. some of the contents of which must of necessity remain after the death of the animal, and is covered on the outside with the insensible article to which is attached the exterior covering of air, wool, fur, and the like. The chemical composition of the article and its investing hairy covering, appears to be condensed albumen insoluble in water, and nearly incapable of putrefaction, but readily separable from the true skin by slight mechanical violence after the adhesion has been weakened by insipient fermentation or putrefaction, or the chemical action of lime, alkalies, or acids.

Hence the first step in all the processes for making leather consists in separating from the cutis adhering impurities and foreign matters; the animal juices retained in its pores, and the cuticle with its hairy covering, except in a very few cases in which the latter is purposely left on. The true skin being thus obtained nearly pure, and its texture so far opened as readily to imbibe any substance in which it is macerated, is then converted into leather by different methods, of which there are two quite distinct from each other;

namely that of *tanning*, or impregnating it with the peculiar vegetable matter called tan; and *finishing*, in which it imbibes alum and other salts, and afterwards some soluble animal matter, such as the white of egg and sometimes blood. These two processes are also sometimes combined, by first tawing and then finishing with a slight tanning.

A large portion of the tanned leather also undergoes the further operation of *currying*, or imbuing with oil of some kind with much manual labour, in order to render it supple, flexible, and still more impenetrable by water.

As familiar examples of each we may observe that the thick sole-leather of shoes is tanned; the white kid-leather, as it is called, for fine gloves is tawed; the upper-leather for boots and shoes is tanned and curried; and the fine Turkey leather is tawed and afterwards finished with a slight tanning.

Tanned leather. The process of tanning varies considerably, not only in different countries, but even in different parts of the same country. The following is the method most approved and practised in London and its vicinity. The leather consists chiefly of three sorts, known by the name of *butts* or *backs*, *hides*, and *skins*. Butts are generally made from the stoutest and heaviest ox hides, and are managed as follows. After the horns are taken off, the hides are laid smooth in heaps for one or two days in the summer, and for five or six in the winter: they are then hung on poles, in a close room called a smoke-house, in which is kept a smouldering fire of wet tan; this occasions a small degree of putrefaction, by which means the air is easily got off, by spreading the hide on a sort of wooden horse or beam, and scraping it with a crooked knife. The hair being taken off, the hide is thrown into a pit or pool of water to cleanse it from the dirt, &c. which being done, the hide is again spread on the wooden beam, and the grease, loose flesh, extraneous filth, &c. carefully scrubbed out or taken off; the hides are then put into a pit of strong liquor called *ooze* or *woose*, prepared in pits called *latches* or *taps* kept for the purpose, by infusing ground bark in water; this is termed *colouring*: after which they are removed into another pit called a *scowering*, which consists of water strongly impregnated with vitriolic acid, or with a vegetable acid prepared from rye or barley. This operation (which is called *raising*), by distending the pores of the hides, occasions them more readily to imbibe the ooze, the effect of which is to astringe and condense the fibres, and give firmness to the leather. The hides are then taken out of the scowering, and spread smooth in a pit commonly filled with water, called a *binder*, with a quantity of ground bark strewed between each.

After lying a month or six weeks, they are taken up, and the decayed bark and liquor being drawn out of the pit, it is filled again with strong ooze, when they are put in as before, with bark between each hide. They now lie two or three months, at the expiration of which the same operation is repeated; they then remain four or five months, when they again undergo the same process; and after being three months in the last pit, are completely tanned, unless the hides are so remarkably stout as to want an additional pit or layer. The whole process requires from eleven to eighteen months, and sometimes two years, according to the substance of the hide, and dim-

LEATHER.

tion of the tanner. When taken out of the pit to be dried, they are hung upon poles; and after being compressed by a steel pin, and beat out smooth by wooden hammers called beetles, the operation is complete; and when thoroughly dry they are fit for sale. Butts are chiefly used for the soles of stout shoes.

The leather which goes under the denomination of *hides* is generally made from cow hides, or the lighter ox hides, which are thus managed. After the horns are taken off, and the hides washed, they are put into a pit of water saturated with lime, where they remain a few days, when they are taken out, and the hair scraped off on a wooden beam, as before described, they are then washed in a pit or pool of water, and the loose flesh, &c. being taken off, they are removed into a pit of weak ooze, where they are taken up and put down (which is technically termed handling) two or three times a day for the first week: every second or third day they are shifted into a pit of fresh ooze, somewhat stronger than the former, till at the end of a month or six weeks, they are put into a strong ooze, in which they are handled once or twice a week with fresh bark for two or three months. They are then removed into another pit, called a layer, in which they are laid smooth, with bark ground very fine, strewed between each hide. After remaining here two or three months, they are generally taken up, when the ooze is drawn out, and the hides put in again with fresh ooze and fresh bark; where after laying two or three months more, they are completely tanned, except a few very stout hides, which may require an extra layer: they are then taken out, hung on poles, and being hammered and smoothed by a steel pin, are, when dry, fit for sale. These hides are called *crop hides*; they are from ten to eighteen months in tanning, and are used for the soles of shoes.

Skins, is the general term for the cutis of calves, seals, hogs, dogs, &c. These, after being washed in water, are put in lime-pits, as before mentioned, where they are taken up and put down every third or fourth day, for a fortnight or three weeks, in order to dilate the pores and dissolve the gelatinous parts of the skin. The hair is then scraped off, and the flesh and excrescences being removed, they are put into a pit of water impregnated with pigeon-dung (called a gainer or mauling), forming a strong alkaline ley, which in a week or ten days, soaking out the lime, grease, and saponaceous matter (during which period they are several times scraped over with a crooked knife to work out the dirt and filth), softens the skins, and prepares them for the reception of the ooze. They are then put into a pit of weak ooze, in the same manner as the hides, and being frequently handled, are by degrees removed into a stronger and still stronger liquor, for a month or six weeks, when they are put into a very strong ooze, with fresh bark ground very fine, and at the end of two or three months, according to their substance, are sufficiently tanned; when they are taken out, hung on poles, dried and fit for sale. These skins are afterwards dressed and blacked by the currier; and are used for the upper-leathers of shoes, boots, &c. The lighter sort of hides, called *dressing-hides*, as well as horse-hides, are managed nearly in the same manner as skins; and are used for coach-work, harness-work, &c.

Such is the process commonly used in this country, or at least commonly used till of late. But a process of a more scientific nature, and en-

titled to practical attention as being far more speedy in its effect, was a few years since invented by Mr. Seguin, and is gradually raising itself upon the ruins of the old routine. In order to explain this new process it is necessary to attend to the following facts.

Skins swell up, and become soft by moisture, which renders them permeable to water. Hence they are easily destroyed by the putrid process which ensues, and they become dry and brittle when the moisture is evaporated. Accident, no doubt, occasioned the discovery of the means of preventing these inconveniences by the use of certain vegetable substances, particularly the bark of oak. It was seen that skins prepared with these substances acquired new properties; that without losing their flexibility they became less permeable to water; more firm, more compact, and in some measure incapable of putrefaction. These observations gave birth to the art of the tanner. This art, no doubt of high antiquity, because founded on one of the earliest wants of man in society, comprehends a succession of processes which was executed by habit and imitation, without a knowledge of the essential objects. The preparation of skins accordingly required several years, and frequently, in spite of the care, expense, and slowness of the operation, the tanning, was incomplete, the skin formed a soft and porous leather, which was soon destroyed by moisture. These defects essentially sprung from ignorance of the true principles of this operation, because no discovery had been made respecting the action of tan upon the skin, and the circumstances, or conditions, which might accelerate or retard the process.

To arrive at this knowledge in an accurate manner, it is necessary to consider, first, the nature and properties of tan, and secondly, the structure and composition of the skin. We shall not enter into the detail of such precautions as are requisite in the choice of oak bark, the time and manner of separating it from the tree, preserving it, or pulverising it. It will be sufficient for our object to remark, that water poured into a vessel upon tan acquires, after some hours infusion, at the common temperature of the atmosphere, a brown colour, an astringent taste, and becomes charged with the most soluble substances contained in the tan; that by drawing off the water, and adding a similar quantity to the tan repeatedly, the whole of the soluble parts may be successively extracted, the water ceases to acquire colour, and there remains in the tub a mere fibrous matter, or parenchymatous texture, insoluble in water, and no longer adapted to promote the operation of tanning. This residue is therefore always rejected in the manufactories as useless. It is only used by gardeners for their hot-beds, but might probably be advantageously applied in the fabrication of coarse paper.

It is therefore in the water of infusion, or the lixiviations of tan, that we must seek for the soluble substances which alone are efficacious in tanning. On examination of the water of the last filtration, it is found to be not only clearer, less impregnated, and less acid than the water of the first lixiviation, but likewise that it possesses all the properties of the gallic acid. It reddens the infusion of tournesol, acts upon metallic solutions, and more particularly it precipitates a black fecula from sulphat of iron, &c. And it is also found that a piece of fresh skin, deprived of its fat and sanguine humours, and macerated

LEATHER.

in this liquor, instead of becoming compact, is softened and swells up.

The liquor of the first lixiviation exhibits a very different character. It is more coloured and astringent; it not only exhibits the properties of the gallic acid, by the alterations it causes in the blue colours of vegetables, and the black precipitate it forms with the sulphat of iron; but it likewise possesses the remarkable quality of forming, with animal gelatine, or glue, a yellowish abundant precipitate, insoluble in water, not putrescible, which becomes hard and brittle by drying; and if a piece of skin properly prepared be immersed in this fluid, it becomes gradually more compact, and is converted into leather.

There exist, therefore, in the same fluid, two very different substances: the one, which precipitates a black matter from iron, is the gallic acid or principle; the other, which precipitates animal gelatine or glue, is called the tanning principle, on account of its efficacy in the preparation of leather.

To leave no doubt on this important point, it was proved by a number of experiments easy to be repeated. 1. That the liquor of the last lixiviation, though coloured, and of an astringent taste, affords no precipitate with glue; a fact, which seems to shew that the gallic acid contained in the bark is less soluble than the tanning principle. In fact, as has already been remarked, when water is successively poured on the tan, an infusion is at last obtained which no longer precipitates glue, though it precipitates sulphat of iron very well. 2. The liquor of the first lixiviation, after having been saturated with glue or animal gelatine, and forming an abundant precipitate with that substance, is entirely deprived of the tanning principle. It no longer differs from the liquor of the last filtrations, and contains merely a portion of the gallic acid. Hence the addition of sulphat of iron affords a new precipitate with this liquor. 3. As the tanning principle has a strong attraction to the animal gelatine, with which it always forms an insoluble precipitate, this property affords a very convenient re-agent to ascertain its presence immediately in any fluid, and to determine with precision its quantity. Accordingly, the infusion of tan poured into milk, whey, serum, broth, &c. forms with these liquors, a precipitate more or less abundant, according to the quantity of gelatine they contain.

This peculiar property of the tanning principle affords an application which may become of great importance in the art of treating diseases, to determine the nature of urine, and to ascertain some of its changes. In the healthy subject, all whose functions are duly exercised, the urine does not contain gelatine, nor afford a precipitate with the infusion of tan: on the contrary, in all the gastric affections, the urine is more or less charged with gelatine, and forms, with the infusion of tan, a precipitate more or less abundant. The same observation is applicable to acute and chronic diseases, in which the assimilating or digestive forces are troubled, deranged, or perverted. 4. The gallic acid, or, if other terms be preferred, the principle which precipitates the sulphat of iron, is often found alone, or at least without being accompanied by the tanning principle. Thus, quinquina, crude or torrefied coffee, the roots of the strawberry-plant, scrofularia, helleb, anise, the flowers of Roman camomile, and a vast multitude of plants vaguely comprised

under the title of astringents, contain the gallic acid only. All these form with the sulphat of iron a precipitate more or less coloured and abundant; but none of them produce the slightest change in the solution of animal glue. On the contrary, the tanning principle has never been found alone, but always united or combined with the gallic principle. It was long supposed to exist exclusively in the oak, the nut-gall, and sumac, the only substances used at the tan-works; but it is found more or less abundantly in the siliquastrum, the rose-tree, the larix, several species of pines, the acacias, the lotus, the squill, the roots of bistort, of rhubarb, of parella, and several other plants. We have also found this principle in the products of distillation of different vegetable substances, where it was in some measure formed during the operation.

From these different considerations, founded on experiment, the following general principles may be deduced: 1. Every substance of which the infusion is capable of precipitating animal jelly, possesses the tanning property. 2. Every substance which possesses the tanning property, likewise precipitates the sulphat of iron black. 3. Every substance which precipitates the sulphat of iron, but not the solution of glue, does not possess the tanning property.

These are the principles which form the basis of M. Seguin's new practice, and in coincidence with the principles a patent was some years since taken out by Mr. W. Desmond, who obtains the tanning principle by digesting oak-bark, or other proper material, in cold water, in an apparatus nearly similar to that used in the salt-petre works. That is to say, the water which has remained upon the powdered bark for a certain time, in one vessel, is drawn off by a cock, and poured upon fresh tan. This is again to be drawn off, and poured upon other fresh tan; and in this way the process is to be continued to the fifth vessel. The liquor is then highly coloured, and marks, as Mr. Desmond says, from six to eight degrees on the hydrometer for salts. He calls this the tanning lixivium. The criterion to distinguish the presence of the tanning principle is, that it precipitates glue from its aqueous solution; and the lixivium is also useful to examine how far other vegetable substances, as well as oak-bark, may be suitable to the purpose of tanning. The strong tanning liquor is to be kept by itself. It is found, by trials with the glue, that the tanning principle of the first digester which receives the clear water, is, of course, first exhausted; but the same tan will still give a certain portion of the astringent principle, or gallic lixivium, to water. The presence of this principle is ascertained by its striking a black colour when added to a small quantity of the solution of vitriol of iron, or green copperas. As soon as the water from the digester ceases to exhibit this sign, the tan is exhausted, and must be replaced with new. The gallic lixivium is reserved for the purpose of taking the hair off from hides. Strong hides, after washing, cleaning, and fleshing, in the usual way, are to be immersed for two or three days in a mixture of gallic lixivium, and a thousandth part, by measure of dense vitriolic acid. By this means the hair is detached from the hides, so that it may be scraped off with a round knife. When swelling or raising is required, the hides are to be immersed for ten or twelve hours in another vat, filled with water, and one five-hundredth part of the same vitriolic acid. The hides being then re-

LEATHER.

peatedly washed and dressed are ready for tanning; for which purpose they are to be immersed for some hours in a weak tanning lixivium, of only one or two degrees; to obtain which, the latter portions of the infusions are set apart, or else some of that which has been partly exhausted by use in tanning. The hides are then to be put into a stronger lixivium, where, in a few days, they will be brought to the same degree of saturation with the liquor in which they are immersed. The strength of the liquor will by this means be considerably diminished, and must therefore be renewed. When the hides are by this means completely saturated, that is to say, perfectly tanned, they are to be removed, and slowly dried in the shade. Calf-skins, goat-skins, and the like, are to be steeped in lime-water, after the usual fleshing and washing. These are to remain in the lime-water, which contains more lime than it can dissolve, and requires to be stirred several times a-day. After two or three days, the skins are to be removed, and perfectly cleared of their lime by washing and pressing in water. The tanning process is then to be accomplished in the same manner as for the strong hides; but the lixivium must be considerably weaker. Mr. Desmond remarks, that lime is used instead of the gallic lixivium for such hides as are required to have a close grain; because, the acid mixed with that lixivium always swells the skins more or less: but that it cannot, with the same convenience, be used with thick skins, on account of the considerable labour required to clear them of the lime; any part of which, if left, would render them harsh, and liable to crack. He recommends, likewise, as the best method to bring the whole surface of the hides in contact with the lixivium, that they should be suspended vertically in the fluid, by means of transverse rods or bars, at such a distance as not to touch each other. By this practice, much of the labour of turning and handling may be saved. Mr. Desmond concludes his specification by observing, that in some cases it will be expedient to mix fresh tan with the lixivium; and that various modifications of strength, and other circumstances, will present themselves to the operator. He affirms that, in addition to the great saving of time and labour in this method, the leather, being more completely tanned, will weigh heavier, wear better, and be less susceptible of moisture, than leather tanned in the usual way; that cords, ropes, and cables, made of hemp or sparcery, impregnated with the tanning principle, will support much greater weights without breaking, be less liable to be worn out by friction, and will run more smoothly on pulleys; inasmuch that, in his opinion, it will render the use of tar in many cases, particularly in the rigging of ships, unnecessary; and, lastly, that it may be substituted for the preservation of animal food instead of salt. The intelligent manufacturer will readily perceive, that this new method is founded on two particular circumstances, besides a more attentive management of the general process than has been usual. The first consists in the method of determining the presence and quantity of the tanning principle, by the hydrometer, and the precipitation of glue; the second, in applying this principle, in a concentrated state, more early in point of time than has, perhaps, been hitherto done. Our tanners, after the common previous processes, and unaliking by acids, by lime, or by piling the hides that they may heat and begin to putrify, apply the solution of tan, which they

call ooze, in a great number of pits in the tannery. They begin with the weakest solution, which has been used, and is of a lighter colour than the other; and they pass the hides, according to their judgment and experience, into oozes which are stronger and stronger; until at last, in certain cases, the hides come to be buried, for a certain time, in a solid mass of tan, or oak-bark. The oak-bark itself, in the pits, is not only the source from which the water extracts the tanning principle, but seems, likewise, in some measure, during the last stages of the process, to operate mechanically, by keeping the surfaces of the hides from touching each other.

How far this presumed improvement upon M. Seguin may answer we are not competent to determine: but as to M. Seguin's method itself there can be no doubt that it materially shortens the previous mode of tanning, and that very perfect leather has been produced by it. From the way in which the oozes are made, they must of necessity contain much more tan in proportion to extract and other vegetable matter than where the bark itself is suffered to remain in substance along with the one and skin for many months; as the tan is by far the most soluble of all the substances that are to be extracted by water, so that bark may be readily exhausted of tan, long before the extract resin, gallic acid, and other materials are got out. It is however affirmed, and we are afraid with some truth, that the leather prepared in this new method is less durable and more brittle than in the old way.

The only improvement that we are aware has since been introduced into the modern practice is that of using the weaker oozes warm, by which the skin is sooner penetrated with it, and a considerable saving of time is accomplished.

A very valuable series of experiments, however, have been entered into in regard to an artificial tannin substance that possesses the chief characteristic properties of tanning, or the tanning principles by Mr. Charles Hatchett which will be found given at large in the Philosophical Trans. for 1805, 1806, in which the ingenious experimenter seems very fairly to have established that there are few animal, vegetable, or even mineral substances of the inflammable class but what may be induced to yield a principle similar to that of tannin by the use either of sulphuric or nitric acid, and, what is of still higher consequence that the residuum or exhausted bark of the tan-pits being dried and roasted, and then moistened with diluted nitric acid (which must be softened to evaporate not much exceeding 300° till the bark becomes perfectly dry, on being digested in water will again yield a considerable proportion of tannin in a yellowish brown liquor that will abundantly precipitate gelatin: a process that may be repeated time after time, and with equal success till the whole of the bark has been converted into the tanning substance. But we shall have occasion to return to this subject in discussing the separate article TANNIN.

Tanned and Dressed-leather. All these are for the most part obtained from the lighter and more delicate skins of lambs, sheep, goats, and calves. Though there is no little difference between the dressing of shamoy-leather, alum-leather, Haddary leather, Morocco leather, parchment, and tanning; yet the skins which pass through the hands of the several workmen, ought to be for the most part, at least washed clean from blood and impurities in a running water; and to be dried

LEATHER.

worked with the hands, or pounded with wooden pestles in a vat; put into the pit (which is a hole lined either with wood, or with stone and mortar, filled with water in which quick-lime is dissolved) in order to loosen the hair, that it may be easily rubbed off without injuring the skin; drawn out, and set to drain on the edge of the pit; stretched on the leg or horse, in order to have the hair scraped off with a blunt iron knife, or wooden cylinder: the membranes on the fleshy side, and the scabs or roughness on the grain side, pared off with a sharp knife, and the skins rubbed with a whetstone, to take off any particles of the lime, or any thing else that may occasion hardness; thickened by different sorts of powder, whereby they become greater in bulk, and so much lighter, as gradually to rise to the surface of the water; stretched out green or half dried, and piled one over another; or put up separate after they are dried, and hung out to hair upon poles, lines, or any other way: which must be repeatedly done in the dressing of small skins. This alternate transition from the liquid of the air into that of water, and from water into the air, with the assistance of lime, salts, and oils, opens to the inmost fibres of the skin so effectually, as greatly to facilitate the introduction of substances proper for making them pliant without rendering them thinner.

In all these processes the grand point is thoroughly to cleanse the kind of skin employed, and to reduce it to as purified a state as possible, in which state it is called a *pell*, and is fit for any subsequent operation of tawing or dyeing, or oil-dressing or shammoing.

If the *pell* be to be tawed, they are put into a solution of alum and salt in warm water, in the proportion of about three pounds of alum and four pounds of salt to every 120 middle sized skins, and worked about therein till they have absorbed a sufficient quantity. This again gives the skin a remarkable degree of thickness and toughness. The skins are then taken out and washed in water, and then put into a vat of bran and water, and allowed to ferment for a time till much of the alum and salt is got out, and the unusual thickening produced by it is for the most part reduced. They are then taken to a lofty room with a stove in the middle, and stretched on hooks, and kept there till fully dry. The skins are then converted into a tough flexible, and quite white leather; but to give them a glossy finish, and to take off the harshness of feel still remaining, they are again soaked in water to extract more of the salt and put into a large pail, containing the yolks of eggs beat up with water. Here the skins are for a long time trodden, by which they so completely imbibe the substance of the egg that the supernatant liquor is rendered almost perfectly limpid; after this they are hung up in a loft to dry, and are finished by glossing with a warm iron. The essential difference therefore between *tawing* and *tawing* consists in this, that in the former case the *pell* is combined with tan, and other vegetable matters, and in the latter with something that it imbibes from the alum and salt (possibly alumina), and which certainly is never again extracted by the subsequent washing and branning.

Curried and Shammoed Leather. The common mode of currying leather for boots, shoes, &c. consists in first softening the hides as they come from the tan-pit partly by soaking in water, and by mechanical means; and then impreg-

nating it with some kind of oil, by which means it is rendered much more impervious by moisture, and proper to protect the feet from the inclemency of the seasons. The process is briefly as follows. The hide is first soaked thoroughly in water, then placed on a polished wooden beam with the flesh-side outwards, and pared with a broad sharp knife till all the inequalities are removed and it is reduced to the requisite thinness. It is then again washed and rubbed with a polished stone, and while still wet, is besmeared with currier's oil, generally fish-oil, or a mixture of this and tallow. When hung up to dry the moisture evaporates, and the oil, which cannot be dissipated by mere exposure, gradually takes the place of the moisture, and penetrates deeply into the pores of the leather. It is then dried either in the sun or in a stove room.

Blackening the leather is also a part of the currier's business, which is done on the grain-side simply by rubbing with an iron liquor, but on the flesh-side with a mixture of lamp black and oil.

Shammoed Leather, is generally sheep or doe-skin, prepared in the way mentioned for alum and tawed leather, and died if necessary, and then finished in oil. This forms the common wash leather, breeches leather, &c. and is the only kind which, when dyed will bear washing without the colour being materially injured.

Dyed Leather. The colours given to leather are various, sometimes dependant upon mere fancy, and sometimes upon real utility; and the materials employed are various, according to the country in which the process takes place.

English Morocco leather prepared from sheep-skins chiefly, and used so largely for coach-linings, pocket-books, and the best kind of book-binding is thus made. The skin cleansed and worked in the way already described, is taken from the lime-water, and the thickening thereby occasioned is brought down, not by tan-liquor as in tawing, but by a bath of dog's or pigeon's dung diffused in water, where it remains till sufficiently supplied, and the lime is quite got out, and it becomes a perfectly white, clean *pell*. If intended to be dyed red it is then sewed up very tight in the form of a sack with the grain-side outwards (the dye only being required on this side) and is immersed in a cochineal bath of a warmth just equal to what the hand can support, and is worked about for a sufficient time till it is uniformly dyed, a process that demands much skill and experience. The sack is then put into a large vat, containing sumach infused in warm water, and kept for some hours till it is sufficiently tanned. The skins intended to be blacked are merely sumached without any previous dyeing. The skins thus coloured are dried and polished as follows. They are first stretched very tight upon a smooth inclined board and rubbed over with a little oil to supple them. Those intended for black leather are previously rubbed over with an iron liquor by means of a stiff brush, which uniting with the gallic acid of the sumach instantly strikes a deep and uniform black, they are then rubbed by hand with a ball of glass cut into a polygonal surface, with much manual labour, which polishes them and makes them very firm and compact. Lastly they are grained or ribbed by rubbing the grained surface of the leather very strongly with a ball of box-wood, round the centre of which a number of small equidistant parallel grooves are cut in forming an equal num-

LEATHER.

ber of narrow ridges, the friction of which gives the leather the desired inequality of surface.

In the process for making *real Morocco leather*, the skins after coming from the bran are thrown into a second bath made of white figs mixed with water, which is thereby rendered slimy and fermentable. In this bath they remain four or five days, when they are thoroughly salted with sal-gem (or rock-salt) alone, and not with salt and alum; after which they are fit to receive the dye, which for the red is cochineal and alum, and for the yellow, pomegranate bark and alum. The skins are then tanned, dressed, supplied with a little oil, and dried.

Much excellent leather, and of various dyes is manufactured in different parts of Russia; for the peculiar processes of which we much refer the reader to Mr. Tooke's "View of the Russian Empire," vol. iii. p. 514. The *saffian* or *manoquin*, which is prepared largely at Astracan, is manufactured only from bucks' and goats' skins; and the usual colours are red and yellow. The *sha-green* which is also manufactured at Astracan, consists only of horse's, or ass's hides; and, of these, only of a small part cut from the crupper line along the back, in a semicircular form, about thirty-four inches upon the crupper, and twenty-eight along the back. The chief dyes are green, black and blue.

We shall just notice the substances from which the more common colours are obtained among ourselves, and the mode of applying them.

A blue is given by immersing the skin for the space of twenty-four hours in urine and indigo, after which it is boiled in alum; or this colour may be communicated by tempering the indigo with red wine, and steeping the skins in the mixture.

A red colour is obtained, by first washing the skins, which are then soaked for the space of two hours in galls, wrung out, and immersed in a liquor prepared by a solution of privet (*Ligustrum vulgare*, L.), alum, and verdigrise in water; when they are steeped in a dye made of Brazil-wood boiled with ley.—In order to communicate a purple, the skins are wetted with a solution of Roman alum in warm water; and when dry, they are rubbed by the hand with a decoction of log-wood in cold water.

Leather acquires a light-green tinge by applying to it sap-green diluted with boiled alum-water:—a dark-green cast is communicated by means of steel-filings and sal ammoniac, steeped in urine for a considerable time, and well rubbed into the skin, which is then to be dried in the shade.

A yellow colour is given, by anointing the skin with a decoction of aloes and linseed-oil, previously strained; or, by immersing it in a solution of dyer's green-wood. Lastly, if fustic-berries be boiled in alum-water, and the skins dipped in the liquor, they will acquire a light-orange shade; but, if a deeper hue be required, it will be necessary to substitute turmeric for the berries.

Water-proof-leather. Leather being an article of extensive utility, especially for shoes and boots, various processes have been contrived for rendering it water-proof. These generally consist in an additional dressing of some oily or resinous matter.

In the 2d vol. of *Medical Inquiries and Observations* (8vo. Philadelphia, 1793), Dr. Rush states the following mixture to be eminently cal-

culated for rendering shoes, &c. impermeable to water. One pound of linseed-oil, eight ounces of mutton suet, six-ounces of bees'-wax, and four ounces of resin, are to be melted together; and, while moderately warm, to be applied both to the upper leather, and the soles of boots.—Dr. Rush remarks that this cheap recipe was taken from *The Complete Fisherman*, a work published during the reign of Queen Elizabeth; and has, for many years, been employed with great success by the fishermen in America.

A patent was granted in 1794 to Mr. John Bellamy, for his new invented method of making all kinds of leather water-proof.—For this purpose, the patentee has contrived two compositions, which are prepared in the following manner:

First method: One gallon of nut-oil, and an equal quantity of poppy-oil, are to be mixed with three gallons of linseed-oil; or, one gallon of nut, or poppy-oil, may be added to three of that expressed from linseed: or, two gallons of the latter may be combined with one pint of nut, and a similar quantity of poppy-oil. These ingredients (in the proportions above mentioned, or such as the nature of the oil may require) are to be poured together in an iron-pot, and placed over a gentle fire: to each gallon of oil must be allowed one pound of white copperas, sugar of lead, colcothar, or any other drying substance. The whole is to remain for the space of six or seven hours over such a degree of heat, as it will bear without rising, till it becomes sufficiently dry; when it may be taken off; and, as soon as it is cool, the compound will be fit for use.

Second method: Gum resin, one pound; pitch, half a pound; tar and turpentine, of each four ounces, are to be added to one gallon of the oils prepared according to the first method: these ingredients are to be well mixed with the oils, first by gently heating the whole mass, then increasing the fire, till the whole become thoroughly incorporated.—The patentee specifies various proportions, in which the ingredients may be used; but experience will be the best guide to ascertain them. When the oils, prepared conformably to the first method, or the gums, &c. according to the second, are sufficiently cool, Mr. Bellamy directs a brush to be dipped in the preparation, which should be rubbed into the leather. As soon as that article is thoroughly impregnated, it ought to be laid on an even board, and the superfluous matter removed from its surface. With respect to sole leather, or similar thick substances, he observes, that they should first be gently warmed; the composition is to be applied till they are fully saturated; and, after being properly dried in a warm place, they will be ready for use.

In the *Memoirs of the Academy of Sciences of Turin*, for 1789, we meet with an interesting communication by M. de St. Real, on the means of rendering leather (especially that destined for soles) impermeable to water, without diminishing its strength.—This object, he conceives, may be effected, without any alteration in the usual method of tanning, by the common operations of currying; provided the skin be compressed in certain heavy rollers, after being previously immersed in beef fat, or oil. The additional greasing and pressing, will not greatly increase the price of sole leather, which, after being a whole year in tanning, imbibes water in a much smaller proportion, than cow-leather, when dressed with fat.—We regret that our limits do not permit us to specify the very ingenious experiments and

by Mr. ~~Real~~. Real; as we are convinced they will contribute to improve the art of tanning.

Another method of preventing leather from being penetrated by water, consists in exposing it with the flesh-side towards the fire: after which, a coat of warmed tar is to be applied with a proper brush, three or four times successively, according to the thickness of the leather, till the liquid matter penetrate through the whole skin. The durability and strength of shoes, &c. will be considerably increased, if, in laying on the last coat of tar, they be sprinkled over with a small quantity of fine iron-filings, which will, in a manner, fill up the pores of the leather. Lastly, shoes may be rendered impervious to moisture, by occasionally rubbing the soles with hot tar: thus the feet may be preserved dry and warm; an important object in this climate, especially during the winter season.

On subjects connected with this article, the reader may advantageously consult many of the volumes of the *Repertory of Arts*, as well as of the *Retrospect of Arts and Manufactures*.

LEATHERDRESSER. *s.* (*leather and dresser*.) He who prepares leather; he who manufactures hides for use (*Pope*).

LEATHER-EATER, in entomology. See *DERMESTES*.

LEATHERLY, or **LEATHERLIKE**. See *CORIACEOUS*.

LEATHER-MOUTHED. *a.* (*leather and mouth*.) By a leather-mouthed fish, I mean such as have their teeth in their throat; as the chub, or cheven, barbel (*Walton*).

LEATHERN. *a.* (from *leath* & *tr*.) Made of leather (*Philips*).

LEATHERSELLER. *s.* (*leather and seller*.) He who deals in leather.

LEATHERWOOD, in botany. See *DICCA*.

LEAVE. *s.* (*lece*, Saxon.) 1. Grant of liberty; permission; allowance (*Pope*). 2. Farewell; adieu (*Shakspeare*).

To LEAVE. *v. a.* pret. *I left*; *I have left*. 1. To quit; to forsake (*Ben Jonson*). 2. To desert; to abandon (*Ecclus*). 3. To have remaining at death (*Ecclus*). 4. Not to deprive of (*Taylor*). 5. To suffer to remain (*Bacon*). 6. Not to carry away (*Knoller*). 7. To reject; not to choose (*Steele*). 8. To fix as a token of remembrance (*Locke*). 9. To bequeath; to give as inheritance (*Dry*). 10. To give up; to resign (*Leviticus*). 11. To permit without interposition (*Locke*). 12. To cease to do; to desist from (*Samuel*). 13. To leave off; to desist from; to forbear (*Addison*). 14. To leave off; to forsake (*Arbutnot*). 15. To leave out; to omit; to neglect (*Addison*).

To LEAVE. *v. n.* 1. To cease; to desist (*Shakspeare*). 2. To leave off; to desist (*Knoller*). 3. To leave off; to stop (*Daniel*).

To LEAVE. *v. s.* (*leaver*, French.) To levy; to raise; a corrupt word (*Spenser*).

LEAVED. *a.* (from *leave*, of *leaf*.) 1. Furnished with foliage. 2. Made with leaves or folds (*Isidore*).

LEAVEN. *v.* *leaven* signifies sour dough, which acquires its acidity, when preserved

after kneading flour with yeast, in order to ferment a larger quantity of paste.—It is a very imperfect substitute for yeast; and, as it communicates to the bread an astringent taste which few persons relish, it ought to be used only where harm cannot be procured. See *BAKING*, *BARM*, *BREAD*.

To LE'AVEN. *v. a.* (from the noun.) 1. To ferment by something mixed (*Shaks*). 2. To taint; to imbue (*Prior*).

LE'AVER. *s.* (from *leave*.) One who deserts or forsakes (*Shakspeare*).

LEAVER, in mechanics. See *LEVER*.

LEAVES. *s.* The plural of *leaf*.

LE'AVINGS. *s.* (from *leave*.) Remnant; relics; offal; refuse (*Addison*).

LE'AVY. *a.* (from *leaf*.) Full of leaves; covered with leaves (*Sidney*).

LEBADEA, a town of Bœotia, near Mount Helicon. It received this name from the mother of Aspledon, and became famous for the oracle and cave of Trophonius (*Strab*).

LEBECNIA. In botany, a genus of the class diadelphia; order decandria. Calyx five-parted with acute divisions and rounded cavities; legume cylindrical, many-seeded. Eight species; all papilionaceous, Cape plants, with red or fuscous flowers.

LECH. *v. n.* (*lecher*, French.) To lick over (*Shakspeare*).

LECHEA. In botany, a genus of the class triandria; order trigynia. Calyx three-leaved; petals three, linear; capsule three-celled, three-valved, with the same number of inner ones: seed one. Four species: two of India, two of America; all herbaceous plants.

LE'CHER. *s.* A whoremaster (*Pope*).

To LE'CHER. *v. s.* (from the noun.) To whore (*Shakspeare*).

LE'CHEROUS. *a.* (from *lecher*.) Lewd; lustful (*Derham*).

LE'CHEROUSLY. *ad.* Lewdly; lustfully.

LE'CHEROUSNESS. *s.* (from *lecherous*.) Lewdness.

LE'CHERY. *s.* (from *lecher*.) Lewdness; lust (*Ascham*).

LECHLADE, a town in Gloucestershire, with a market on Tuesday; seated at the confluence of the river Lech with the Thames. A canal from the Severn joins the Thames near this town. It is 28 miles E. by S. of Gloucester, and 77 W. by N. of London. Lon. 1. 35. W. Lat. 51. 40. N.

LECHNICH, a town of Germany, in the circle of the Lower Rhine, and in the electorate of Cologne. Long. 6. 35. E. Lat. 50. 40. N.

LECTI, beds or couches, were of two kinds amongst the Romans, as being destined to two different uses, to lie upon at entertainments, and to repose upon for nightly rest. The first were called *lecti triclinarii*, the other *lecti cubicarii*. See *ENNS*.

LECTICA, was a litter or vehicle, in which the Romans were carried. It was of two kinds, covered and uncovered. The covered lectica is called by Pliny *cubiculum vesterum*,

LED

a traveller's bed-chamber: and indeed we are informed that Augustus frequently ordered his servants to stop his litter that he might sleep upon the road. This vehicle was carried by six or eight men called *lecticarii*.

LECTIO. *s.* (*lectio*, Latin.) A reading; a variety in copies (*Watts*).

LECTURE. *s.* (*lecture*, French.) 1. A discourse pronounced upon any subject (*Sidney Taylor*). 2. The act or practice of reading; perusal (*Brown*). 3. A magisterial reprimand; a pedantic discourse (*Addison*).

TO LECTURE. *v. a.* (from the noun.) 1. To instruct formally. 2. To instruct insofiently and dogmatically.

TO LECTURE. *v. n.* To read in public; to instruct an audience by a formal explanation or discourse.

LECTURER. *s.* (from *lecture*.) 1. An instructor; a teacher by way of lecture. 2. A preacher in a church hired by the parish to assist the rector or vicar (*Clarendon*).

LECTURESHIP. *s.* (from *lecture*.) The office of a lecturer (*Swift*).

LECYTHIS. In botany a genus of the class polyandria; order monogynia. Calyx six-leaved; petals six; nectary, tongue-shaped, bearing the stamens; pericarp opening transversely all round, many seeded. Eight species—all South American plants; trees or shrubs with alternate leaves.

LED. The part. pret. of *lead*.

LEDA, in fabulous history, a daughter of king Theopius and Eurythemis, married Tyndarus, king of Sparta. Being seen bathing in the river Eurotas by Jupiter, a few days after in her pregnancy, the god, struck with her beauty, resolved to deceive her. He persuaded Venus to change herself into an eagle, while he assumed the form of a swan, and, after this metamorphosis, Jupiter, as if fearful of the cruelty of the bird of prey, fled to the arms of Leda, who willingly sheltered the trembling swan. The caresses with which Leda received the swan, enabled Jupiter to avail himself of his situation, and in nine months after she brought forth two eggs, from one of which sprang Pollux and Helena, and from the other Castor and Clytemnestra. The two former were deemed the offspring of Jupiter, and the others claimed Tyndarus for their father. Homer and Herod make no mention of the metamorphosis of Jupiter into a swan (*Apollod.*).

LEDBURY, a town of Herefordshire in England. It is a well-built town seated on a rich clay soil, and inhabited mostly by clothiers, who carry on a pretty large trade. Long. 2. 17. W. Lat. 52. 4. N.

LEDESMA, an ancient and strong town of Spain, in the kingdom of Leon, seated on the river Tome. Long. 5. 25. W. Lat. 41. 2. N.

LEDGE. *s.* (*leggen*, Dutch.) 1. A row; layer; stratum (*Watson*). 2. A ridge rising above the rest, or projecting beyond the

LEE

rest (*Swift*). 3. Any prominent rising part (*Dryden*).

LEDGER, the principal book wherein merchants enter their accounts. See *BOOK-KEEPING*.

LEDGER-LINES. In music, those lines which are added above or beneath the five composing the staff, for the reception of such notes as are too high, or too low, to be placed upon or within it.

LEDHORSE, a sumpter horse.

LEDON, in botany. See *CISTUS*.

LEDUM. *March-cistus*; wild rosemary. In botany a genus of the class decandria; order, monogynia. Calyx five-cleft; corol flat, five-parted; capsule five-celled, opening at the base. Three species—north of Europe, and Carolina. One species is said by some botanists to be produced in Yorkshire and other counties of England, with a strawberry-like flower: but it is questionable whether the plant thus referred to belongs to this genus.

LE DRAN (Henry Francis), a famous French surgeon, who died in 1770, aged 85 years. His works are, 1. *Parallele des Differentes Manieres de tirer la Pierre de la Vessie*, 1730; 2. *Observations de la Chirurgie*, 2 vols. 12mo.; 3. *Traité des Opérations de Chirurgie*, 8vo.; 4. *Réflexions sur Plaies d'armes à feu*, 12mo.; 5. *Consultations sur la plupart des maladies qui sont du ressort de la Chirurgie*, 8vo.; 6. *Traité Economique de l'Anatomie des Corps humain*, 8vo. (*Watkins*).

LEE, a term in navigation, signifying that side, or quarter, towards which the wind blows.

LEE-WAY, of a ship, is the angle made by the point of the compass steered upon, and the real line of the ship's way, occasioned by contrary winds and a rough sea.

All ships are apt to make some lee-way; so that in casting up the log-board, something must be allowed for lee-way. But the lee-way made by different ships, under the same circumstances of wind and sails, will be different; and even the same ship, with different lading, and having more or less sail abroad, will make more or less lee-way. The ordinary rules of allowing for it are these: they were given by Mr. John Buckler to Mr. William Jones (Sir William Jones's father), who first published them about the year 1702.

1. When a ship is close-hauled, has all her sails set, the water smooth, and a moderate gale of wind, she is then supposed to make little or no lee-way. 2. Allow one point, when it blows so fresh that the small sails are taken in. 3. Allow two points, when the top-sail must be close reefed. 4. Allow two points and a half, when one top-sail must be handed. 5. Allow three points and a half, when both top-sails are to be taken in. 6. Allow four points, when the fore-course is handed. 7. Allow five points, when trying under the main sail only. 8.

Allow six points, when both main and fore-courses are taken in. 9. Allow seven points, when the ship tries a-hull, or all sails are hauled. When the wind has blown hard in either quarter, and shifts across the meridian into the next quarter, the lee-way will be lessened. But in all these cases, respect must be had to the roughness of the sea with the trim of the ship; and hence the mariner will be able to correct his course.

LEE, a village beautifully situated in Kent, near Blackheath. In the church-yard of this village the celebrated Dr. Halley is interred.

LEE (Nathaniel), a very eminent dramatic poet of the last century; was the son of a clergyman, who gave him a liberal education. He received his first rudiments of learning at Westminster School; from whence he went to Trinity College, Cambridge. Coming to London, however, his inclination prompted him to appear on the theatre; but he was not more successful in representing the thoughts of other men than many a genius besides, who have been equally unfortunate in treading the stage, although they knew so well how to write for it. He produced eleven tragedies, all of which contain a very great portion of true poetic enthusiasm. None, if any, ever felt the passion of love more truly; nor could any one describe it with more tenderness. Addison commends his genius highly; observing, that none of our English poets had a happier turn for tragedy, although his natural fire and unbridled impetuosity hurried him beyond all bounds of probability, and sometimes were quite out of nature. The truth is, this poet's imagination ran away with his reason; so that at length he became quite crazy, and grew so mad, that his friends were obliged to confine him in Bethlam, where he made that famous witty reply to a coxcomb scribbler, who had the cruelty to jeer him with his misfortune, by observing that it was an easy thing to write like a madman:—"No," said Lee, "it is not an easy thing to write like a madman; but it is very easy to write like a fool!" Lee had the good fortune to recover the use of his reason so far as to be discharged from his melancholy confinement; but he did not long survive his enlargement, dying at the early age of 34. Cibber, in his *Lives of the Poets*, says he perished unfortunately in a night-ramble in London streets. His *Theodosius* and *Alexander the Great* are stock plays, and to this day are often acted with great applause. The late Mr. Barry was particularly fortunate in the character of the Macedonian Hero.

LEE, in botany, a genus of the class pentandria, order monogynia. Corol one-lobed; nectary one-lobed; five-cleft erect, placed on the tube of the corol; berry inferior, one-seeded. Three species—two in-

digeneous to India—a shrubby and herbaceous plant; one a native of the Cape.

LEECH, in helminthology. See *Hirudo*.

LEEDS, a town of England, in the county of York, situated on the river Aire, and on the great canal which is navigable from Liverpool. It is governed by a mayor, recorder, twelve aldermen, twenty-four common councilmen, &c. but sends no members to parliament. Leeds has been a long time famous for the woollen manufacture, and is one of the largest and most flourishing towns in the county, yet had but one church till the reign of Charles I. It now contains three, a Presbyterian meeting-house, erected in 1691, called the New Chapel, which is the stateliest, if not the oldest, of that denomination in the north of England; and in the town and suburbs several other places of worship. In 1786 the first stone of a general infirmary was laid at Leeds, and which is since finished. It is noted for some medicinal springs. Here are two magnificent halls, both built about the year 1714; one used for an assembly-room, the other is the guild, or moot-hall. Its increase of building, in the year 1786, was nearly 400 houses. The antiquity of Leeds is very great, but it was not incorporated till the reign of Charles the First. The manufacture and trade of Leeds are principally in cloth, the market for which is not perhaps to be equalled in the world. There are two spacious halls for the accommodation of the clothiers, and also a third hall, where worsted goods are exposed to sale. At about six o'clock in the summer, and about seven in the winter, the market bell rings; upon which, in a few minutes, without hurry, noise, or the least disorder, the whole market is filled, all the benches covered with cloth, as close to one another as the pieces can lie longways, each proprietor standing behind his own piece. As soon as the bell has ceased ringing, the factors and buyers of all sorts enter the hall, and walk up and down between the rows, as their occasions direct. When they have pitched upon their cloth, they lean over to the clothier, and by a whisper, in the fewest words imaginable, the price is stated; one asks, the other bids, and they agree or disagree in a moment. In a little more than an hour all the business is done, ten or twenty thousand pounds worth of cloth, and sometimes much more, are bought and sold with a whisper only; the laws of the market here being more strictly observed than at any place in England. On account of the trade, the rivers Aire and Calder were made navigable, at the expense of several private merchants, without calling in the assistance of the nobility and gentry. By this means a communication was opened from Leeds and Wakefield to York and Hull; so that all the woollen manufactures exported are carried by water to Hull. There is another trade in

LEE

this part of the country, become very considerable since the opening of the above navigation, which is the carriage of coals down from Wakefield and Leeds; near both which places there are inexhaustible stores. These are carried quite down into the Ouse, and then either up that river to York, or down to the Humber, where the Trent and Ouse meet together, and which in a few miles falls into the sea. The number of inhabitants of Leeds in 1800, was 53,162; and since that period the population has increased. Distance from York 22 miles; from London 192. Long. 1. 29. W. Lat. 53. 48. N.

LEEF. *a.* (*leve*, Dutch.) Kind, fond (*Span.*)

LEEF OOGA, one of the Friendly Islands, in the South Pacific Ocean, visited by Captain Cook in 1776. Many parts of the country, near the sea, are sandy and barren; but in the internal parts, the marks of considerable population, and of an improved state of cultivation, are conspicuous. Many of the plantations are inclosed in such a manner, that the fences, running parallel to each other, form spacious public roads. Large spots, covered with the paper mulberry tree, were observed, and the plantations in general were abundantly stocked with plants and fruit trees. To these Captain Cook made some addition, by sowing the seeds of melons, Indian corn, &c. The island is seven miles in length; its breadth, in some places, is not above three.

LEEK, in botany. See *ALLIUM*.

LEEK, a town in Staffordshire, with a market on Wednesday; 18 miles north of Stafford, and 154 N. N. W. of London. Long. 1. 55. W. Lat. 53. 16. N.

LEER, or LEHR, a town of Westphalia, in East Friesland, on a river of the same name, which soon after falls into the Embs. It is 11 miles S. E. of Embden, and 24 W. N. W. of Oldenburg. Long. 7. 11. E. Lat. 53. 21. N.

LEER. *s.* (*leere*, Saxon.) 1. An oblique view (*Milton*). 2. A laboured cast of countenance (*Swift*).

To LEER. *v. n.* (from the noun.) 1. To look obliquely; to look archly (*Swift*). 2. To look with a forced countenance (*Dryd.*)

LEERDAM, a town of the United Provinces, in Holland, seated on the Linghe, 18 miles N. E. of Dort. Long. 5. 13. E. Lat. 51. 56. N.

LEEROT, a fortress of Westphalia, in East Friesland, seated at the confluence of the Lee with the Embs, 10 miles E. by S. of Embden.

LEERS, or LEERS, a town of Westphalia, in the bishopric of Biele; near which a battle was fought on the 1st of October, 1646, between the allies, commanded by Prince Charles of Lorraine, and the French under Count Saxe. It is four miles N. of Biele.

LEERSIA. In botany, a genus of the class triandria, order digynia. Calyxless,

LEG

glanous two-valved, closed. Four species, all American grasses; and one, *L. oryzoides*, common to Europe as well as America.

LEES, the grossest and most ponderous parts of liquors, which, being separated by fermentation, fall to the bottom. The word comes from the French *lie*; and that either from *limus*, "mud," or from *Lyens* one of the surnames of Bacchus; or, according to Du Cange, from *lia*, a corrupt Latin word signifying the same. The vinegar-makers make a great trade of the lees of wine dried and made into cakes, after having squeezed out the remains of the liquor in presses.

To LEES. *v. a.* To lose. This word is now nearly obsolete.

LEET, or COURT LEET (*leta vinus franci plegit*), is a court of record, ordained for punishing offences against the crown; and is said to be the most ancient court of the land. It inquires of all offences under high treason; but those who are to be punished with loss of life or member, are only inquirable and presentable here, and to be certified over to the justices of assize (Stat. 1. Edw. III.). And this court is called the view of frank pledge, because the king is to be there certified by the view of the steward, how many people are within every leet, and have an account of their good manners and government; and every person of the age of twelve years, who hath remained there for a year and a day, may be sworn to be faithful to the king, and the people are to be kept in peace, &c. A leet is incident to a hundred, as a court baron to a manor: for by grant of a hundred, a leet passeth; and a hundred cannot be without a leet.

LE'WARD. *a.* (*lee* and *peapb*, Saxon.) Toward the wind (*Arbuthnot*).

LE'WARD ISLANDS, that part of the Caribbee Islands in the West Indies, commencing at Dominica, and extending to Porto Rico.

LEEWE, a fortified town of Austrian Brabant, seated on the Geete, 12 miles E. of Louvain. Long. 5. 7. E. Lat. 50. 53. N.

LEFT. The participle preter. of *leave*.

LEFt. *a.* (*lyfte*, Dutch; *laevus*, Latin.) Sinistrous; not the right (*Dryden*).

LEFt-HANDED. *a.* (*left* and *hand*.) Using the left hand rather than the right (*Brown*).

LEFt-HANDEDNESS. *s.* (from *left-handed*.) Habitual use of the left-hand (*Donne*).

LEG, the lower extremity of animals, which serves both for their support and motion; it is generally divided into three parts; 1. the thigh; 2. the leg, properly so called; and, 3. the foot.

The human legs are subject to few complaints, except the common ulcers, the proper treatment of which we propose to state under that article. They are likewise apt to be sprained, fractured, or broken, in which cases great caution is requisite. See *SURGARY*, *ANATOMY*, &c.

Leg denotes 1. An act of obsequence; a bow

LEG

with the leg drawn back (*Hudibras*). 2. To stand on his own legs; to support himself (*Collier*). 3. That by which any thing is supported on the ground; as, the leg of a table.

LEGACY, is a bequest of a sum of money, or any personal effects of a testator, and these are to be paid by his representative, after all the debts of the deceased are discharged as far as the assets, or property liable to payment of debts and legacies, will extend. All the goods and chattels of the deceased are by law vested in the representative, who is bound to see whether there be left a sufficient fund to pay the debts of the testator, which, if it should prove inadequate, the pecuniary legacies must proportionably abate; a specific legacy, however, is not to abate unless there be insufficient without it to pay debts, that is, the general legacies must all be exhausted first. If the legatee die before the testator, it will in general be a lapsed legacy, and fall into the general fund, as it will also where it is given upon a contingency, as to A B, if he shall attain twenty-one. Where, however, from the general import of the will, it can be collected that the testator intended it a vested legacy, it will go to the representative of the deceased legatee. Thus, if a legacy is made payable, or to be paid, to the legatee at a certain age, and he die, under that age, it is a vested and transmissible interest in him; but it is otherwise if it is generally to him at or when he attains such age. If the legacy is to bear interest, it is vested though the words payable are omitted. So, if it is to A for life, and after the death of A to B, the legacy to B is vested in B upon the death of the testator, and will not lapse by the death of B in the lifetime of A.

In case of a vested legacy due immediately, and charged on land, or money in the funds, which yields an immediate profit, interest shall be payable from the death of the testator; but if it be charged on the personal estate only of the testator, which cannot be collected in, it will carry interest only from the end of the year after the death of the testator. A legacy to an infant ought not to be paid to his father; a legacy to a married woman can only be paid to her husband; and executors are not bound to pay a legacy without security to refund.

When all the debts and particular legacies are discharged, the residue or surplus must be paid to the residuary legatee, if any be so appointed in the will; but if there be none appointed or intended, it will go to the executor or next of kin. When this residue does not go to the executor, it is to be distributed among the testator's next of kin, according to the statute of distributions, except it is otherwise disposed of by particular customs, as those of London, &c. See **EXECUTOR**.

LEG

LEGAL. *a.* (*legal*, French.) 1. Done or conceived according to law (*Hale*). 2. Lawful; not contrary to law (*Milton*).

LEGALITY. *s.* (*legalité*, French.) Lawfulness.

TO LEGALIZE. *v. a.* (*legaliser*, French.) To authorize; to make lawful (*South*).

LEGALLY, *ad.* (from *legal*.) Lawfully; according to law (*Taylor*).

LEGATARY. *s.* (*legataire*, French.) One who has a legacy left (*Ayliffe*).

LEGATE, a cardinal or bishop, whom the pope sends as his ambassador to sovereign princes. See **AMBASSADOR**. There are three kinds of legates, viz. legates *a latere*, legates *de latere*, and legates by office, or *legati nati*: of these the most considerable are the legates *a latere*, the next are the legates *de latere*. See the article **LATERE**. Legates by office are those who have not any particular legation given them; but who, by virtue of their dignity and rank in the church, become legates: such are the archbishop of Rheims and Arles: but the authority of these legates is much inferior to that of the legates *a latere*. The power of a legate is sometimes given without the title. Some of the nuncios are invested with it.

LEGATEE, the person for whom a legacy is provided.

LEGATINE. *a.* (from *legate*.) 1. Made by a legate (*Ayliffe*). 2. Belonging to a legate of the Roman see (*Shakespeare*).

LEGATION. *s.* (*legatio*, Latin.) Deputation; commission; embassy (*Walton*).

LEGATOR. *s.* (from *lego*, Latin.) One who makes a will, and leaves legacies (*Dry*).

LEGEND, any idle or ridiculous story told by the Romanists concerning their saints, and other persons, in order to support the credit of their religion. The legend was originally a book used in the old Romish churches, containing the lessons to be read at divine service; hence the lives of the saints and martyrs came to be called legends, because chapters were read out of them at matins, and at the refectories of religious houses. Among these the golden legend, which is a collection of the lives of the saints, was received in the church with great applause, which it maintained for 200 years; though it is so full of ridiculous and romantic stories, that the Romanists themselves are now ashamed of it.

LEGEND is also used by authors to signify the words or letters engraven about the margins, &c. of coins. Thus the legend of a French crown was, *sit nomen domini benedictum*; that of a moidore, *in hoc signo vinces*; on those of the last emperors of Constantinople, we find *Iesus Christus vincit*, *basileus*, *the apt niles*, *leves Christi vincit*.

LEGEND is also applied to the inscription of medals, which serves to explain the figures or devices represented on them. In strictness, the legend differs from the in-

LEG

scription; this last properly signifying words placed on the reverse of a medal, in lieu of figures.

Every medal has properly two legends; that on the front, and that on the reverse. The first generally serves only to distinguish the person by his name, titles, offices, &c. the latter is intended to express his noble and virtuous sentiments, his good deeds, and the advantages the public has reaped by him. This, however, does not hold universally; for sometimes we find the titles shared between both sides, and sometimes also the legend.

LEGER. *s.* (from *legger*, Dutch.) Any thing that lies in a place; as, a *leger ambassador*, a *resident*; a *leger-book*, a book that lies in the counting-house (*Shakspeare*).

LEGERDEMAIN. *s.* (*legereté de main*, French.) Slight of hand; juggle; power of deceiving the eye by nimble motion; trick (*South*).

LEGERITY. *s.* (*legerité*, French.) Lightness; nimbleness; not in use (*Shakspeare*).

LEGGED. *a.* (from *leg*.) Having legs; furnished with legs.

LEGHENICH, or **LECHENICH**, a town of Germany, in the circle of Lower Rhine, and archbishopric of Cologne, 10 miles S. S. W. of Cologne, and 50 E. N. E. of Liege. Long. 6. 31. E. Lat. 50. 50. N.

LEGHORN, a strong and considerable city of Italy, in Tuscany. It has one of the best harbours in the Mediterranean; and, being a free port, its commerce is prodigious. The Jews have a handsome synagogue and schools, the Greeks and Armenians have churches of their own, and no religion is disturbed. The inhabitants are computed at 40,000. The streets are wide and straight, and almost all the houses of the same height. There are so many canals, that some have given it the title of New Venice. Near the harbour is a large building, in which they shut up every night the Turks and the galley-slaves. At a little distance is a lighthouse, on a small island. In 1741 this city suffered greatly by an earthquake. On June 27, 1798, it was entered by a French army, but the British subjects here, with their merchandize, and all the vessels in the harbour, previously departed. It is 10 miles S. of Pisa, 45 S. W. of Florence, and 145 N. W. of Rome. Long. 10. 17. E. Lat. 43. 34. N.

LEGIBLE. *a.* (*ligibilis*, Latin.) 1. Such as may be read (*Swift*). 2. Apparent; discoverable (*Collier*).

LEGIBLY. *ad.* (from *legible*.) In such a manner as may be read.

LEGION, in Roman antiquity, a corps of soldiers in the Roman armies, whose numbers were different at different times. The legion under Romulus consisted of 300 foot and 300 horse, and was soon after augmented to 4000, after the admission of the Sabines into the city. When Annibal was in Italy it consisted of 8000 soldiers, and

LEG

afterwards it was decreased to 4000, or 4500. Marius made it consist of 6200, besides 700 horse. This was the period of its greatness in numbers. Livy speaks of ten, and even eighteen, legions kept at Rome. Each legion was divided into ten cohorts, each cohort into three manipuli, and every manipulus into three centuries or ordines. The chief commander of the legion was called *legatus* (lieutenant). For a more minute description of the legion, the reader is referred to *Lempriere's Dictionary*, or *Kennel's Antiquities*.

LEGION is often employed to signify any great number.

LEGIONARY. *a.* (from *legion*.) 1. Relating to a legion. 2. Containing a legion. 3. Containing a great indefinite number. (*Brown*).

LEGISLATION. *s.* (from *legislator*, Lat.) The act of giving laws (*Littleton*).

LEGISLATIVE. *a.* (from *legislator*.) Giving laws; lawgiving (*Denham*).

LEGISLATOR (*lawgiver*, a person who frames the laws of a kingdom, or state, founded by him.

The principal ancient legislators are—Moses, legislator of the Hebrews; Mercurius Trismegistus, and Bocchyrus, of the Egyptians; Italus, of the Cœntrians; Theseus, Draco, and Solon, of the Athenians; Zoroaster, of the Bactrians; Charondas, of the Cappadocians; and Charondas, or Phaleas, of the Carthaginians; Androdarnas, of the Chalcidians; Eudoxus, of the Cnidians; Phido, of the Corinthians; Minos, of the Cretans; Pythagoras, of the Crotoniates, and most of the cities of the Græcia Major; Parmenides, and Zeno, of Elea, in Lucania; Xamolxis, of the Getæ; Phoroneus, of the Greeks; Bacchus, of the Indians; Saturn, of Italy; Macarius, of the Isle of Lesbos; Zaleucus, of the Locrians; Nicodorus Athleta, of the city of Mutina; Hippodamia, of Miletus; Charondas, of Rheggio; Lycurgus, of the Lacedæmonians; Archytas, of Tarentum; Philolaus, of the Thebans.

At Rome the people were in a great measure their own legislators; though Solon may be said, in some sense, to have been their legislator, as the decemviri, who were created for the making of laws, borrowed a great number from those of Solon.

With us the legislative power is lodged in the king, lords, and commons assembled in parliament.

The first laws among the Athenians seem to have been those of Theseus; for what we can find earlier than this period is involved in fable. After Theseus came Draco the Archon, whose laws were said, for their severity, to have been written with blood; by his laws every offence was punished with death; so that stealing an apple, and betraying their country, were treated as equal crimes. These laws were afterwards repealed by Solon, except such as related to murder. By way of distinction, Draco's

laws were called *νόμοι*, and Solon's *Νέμοι*. The laws of Solon were in a great measure suspended during the usurpation of Pisistratus; but, after the expulsion of his family, were revived with some additions by Clisthenes. After this, the form of government was again changed, first by the four hundred, and afterwards by the thirty tyrants; but these storms being over, the ancient laws were again restored in the archonship of Euclides, and others established at the instance of Diocles, Aristophon, and, last of all, of Demetrius the Phalerian. But many laws were enacted by the suffrages of the people on particular exigencies: the decrees of the senate continued to have the force of laws no longer than a year. If a new law was to be proposed to the assembly, it was necessary to write it upon a white tablet, and fix it up some days before the meeting, lest their judgment should be caught by surprise. The laws were carefully revised every year, and if any of them, from a change of circumstances, were found unsuitable or prejudicial, they were repealed: this was called *παραίρεσις των νόμων*, because the suffrages were given by holding up of hands. The first laws among the Grecians were unwritten and composed in verse, that the common people might with more ease commit them to memory. Solon panned his laws upon wooden tablets, called *Λέξεις*; and some authors, with great probability, assert, that they were written in the manner called *δυσπροσδον*, from left to right, and from right again to left, in the same manner as oxen walk the furrows in plowing, thus,

ΕΚΔΙΟΞ ΑΡ
ΛΕΞΙΜΩΝ

It was against the law for any person to erase a decree, and certain persons called *Γραμματεῖς* were appointed to prevent any corruption; whose business it was also to transcribe the old and enter the new ones.

LEGISLATURE. *s.* (from *legislator*, Lat.) The power that makes laws (*Swift*).

LEGITIMACY. *s.* (from *legitimate*.) 1. Lawfulness of birth (*Ayliffe*). 2. Genuineness; not spuriousness (*Woodward*).

LEGITIMATE. *s.* (from *legitimus*, Latin; *legitime*, French.) Born in marriage; lawfully begotten (*Taylor*).

To LEGITIMATE. *v. a.* (*legitimer*, Fr.) 1. To procure to any the rights of legitimate birth (*Ayliffe*). 2. To make lawful (*Decay of Piety*).

LEGITIMATELY. *ad.* (from *legitimate*.) 1. Lawfully. 2. Genuinely (*Dryden*).

LEGITIMATION. *s.* (*legitimation*, Fr.) 1. Lawful birth (*Locke*). 2. The act of investing with the privileges of lawful birth.

LEGIUNOARE. A town of Naples, in the province of Bari, 18 miles N. W. of Matera.

LEGNAGO. A fortified town of Italy; in the Venetian. It surrendered to the French

in 1796, and is seated on the Adige, 25 miles S. S. E. of Verona.

LEGNOTIS. In botany, a genus of the class polyandria; order monogynia. Calyx five-cleft; petals five, inserted into the receptacle, jagged; capsule three-celled. Two species—one of Jamaica, the other of Guaioua; both with axillary flowers.

LEGUME. In botany, *pericarpium bivalve, affigens semina secundum suturam alterum tantum*.—A pericarp of two valves, in which the seeds are fixed along one suture only. It is usually of a membranaceous texture, and commonly one-celled. Some legumes are two-celled; others jointed; others again divided transversely into several cells (*isthmis intercepta*), by contracting between the seeds.—The old English word was *cod*: and the legume of a pea is still called a *pea's-cod*.—Pod is used both for the legume and silique indifferently: but they are so distinct that they ought not to have the same appellation. It seems better, therefore, to anglicize the Latin terms: and with respect to this, it is become sufficiently familiar to the English ear. Dr. Withering calls it the shell.

LEGUMINOSÆ. In botany, leguminous plants. Such as have a legume for the pericarp. The same with the *papilionacci* of Tournefort. It is one of Ray's classes. The order decandria of the class diadelphia in Linnæus's system, contains these plants.

LEGUMINOUS. *s.* (*legumineux*, French; from *legumen*.) Belonging to pulse; consisting of pulse (*Arbutknot*).

LEIBNITZ, a town of Germany, in the duchy of Stiria, seated on the Sulm, 16 miles S. of Gratz.

LEIBNITZ (Godfrey William), an eminent mathematician and philosopher, was born at Leipsic in Saxony, in 1646. At the age of fifteen, he applied himself to mathematics at Leipsic and Jena; and in 1663, maintained a thesis *de Principiis Individuationis*.

The year following he was admitted Master of Arts. He read with great attention the Greek philosophers; and endeavoured to reconcile Plato with Aristotle, as he afterwards did Aristotle with Des Cartes. But the study of the law was his principal view; in which faculty he was admitted bachelor in 1665. The year following he would have taken the degree of doctor, but was refused it on pretence that he was too young; though, in reality, because he had raised himself several enemies by rejecting the principles of Aristotle and the Schoolmen.

Upon this he repaired to Altorf, where he maintained a thesis *de Casibus Perplexis*, with such applause, that he had the degree of doctor conferred on him.

In 1672 he went to Paris, to manage some affairs at the French Court for the Baron Boinebourg. Here he became acquainted with all the literati, and made farther and considerable progress in the study of ma-

LEIBNITZ.

thematics and philosophy, chiefly, as he says, by the works of Pascal, Gregory St. Vincent, and Huygens. In this course, having observed the imperfection of Pascal's arithmetical machine, he invented a new one, as he called it, which was approved of by the minister Colbert, and the Academy of Sciences, in which he was offered a seat as a member, but refused the offers made to him, as it would have been necessary to embrace the Catholic religion.

In 1673 he came over to England, where he became acquainted with Mr. Oldenburg, secretary of the Royal Society, and Mr. John Collins, a distinguished member of the society; from whom it seems he received some hints of the method of fluxions, which had been invented in 1684 or 1665, by the then Mr. Isaac Newton.

The same year he returned to France, where he resided till 1676, when he again passed through England, and Holland, in his journey to Hanover, where he proposed to settle. Upon his arrival there, he applied himself to enrich the duke's library with the best books of all kinds. The duke dying in 1679, his successor, Ernest Augustus, then bishop of Osnaburgh, shewed Mr. Leibnitz the same favour as his predecessor had done, and engaged him to write the History of the House of Brunswick. To execute this task, he travelled over Germany and Italy, to collect materials. While he was in Italy, he met with a pleasant adventure, which might have proved a more serious affair: Passing in a small bark from Venice to Mesola, a storm arose; during which the pilot, imagining he was not understood by a German, whom, being a heretic, he looked on as the cause of the tempest, proposed to strip him of his clothes and money, and throw him overboard. Leibnitz hearing this, without discovering the least emotion, drew a set of beads from his pocket, and began turning them with great seeming devotion. The artifice succeeded; one of the sailors observing to the pilot, that, since the man was no heretic, he ought not to be drowned.

In 1700 he was admitted a member of the Royal Academy of Sciences at Paris. The same year the elector of Brandenburg, afterwards king of Prussia, founded an academy at Berlin by his advice; and he was appointed perpetual president, though his affairs would not permit him to reside constantly at that place. He projected an academy of the same kind at Dresden; and this design would have been executed, if it had not been prevented by the confusions in Poland. He was engaged likewise in a scheme for an universal language, and other literary projects. Indeed his writings had made him long before famous over all Europe, and he had many honours and rewards conferred on him. Beside the office of privy counsellor of justice, which the elector of Hanover had given him, the emperor ap-

pointed him, in 1711, aulic counsellor; and the czar made him privy counsellor of justice, with a pension of 1000 ducats. Leibnitz undertook at the same time to establish an academy of sciences at Vienna; but the plague prevented the execution of it. However, the emperor, as a mark of his favour, settled a pension on him of 2000 florins, and promised him one of 4000 if he would come and reside at Vienna; an offer he was inclined to comply with, but was prevented by his death.

Meanwhile, the History of Brunswick being interrupted by other works which he wrote occasionally, he found, at his return to Hanover in 1714, that the elector had appointed Mr. Eccard for his colleague in writing that history. The elector was then raised to the throne of Great Britain, which place Leibnitz visited the latter end of that year, when he received particular marks of friendship from the king, and was frequently at court. He now was engaged in a dispute with Dr. Samuel Clarke, upon the subjects of free-will, the reality of space, and other philosophical subjects. This was conducted with great candour and learning; and the papers, which were published by Clarke, will ever be esteemed by men of genius and learning. The controversy ended only with the death of Leibnitz, Nov. 14, 1716, which was occasioned by the gout and stone, in the 70th year of his age.

As to his character and person.—He was of a middle stature, and a thin habit of body. He had a studious air, and a sweet aspect, though near-sighted. He was indefatigably industrious to the end of his life. He ate and drank little. Hunger alone marked the time of his meals, and his diet was plain and strong. He had a very good memory, and it was said could repeat the *Æneid* from beginning to end. What he wanted to remember, he wrote down, and never read it afterwards. He always professed the Lutheran religion, but never went to sermons; and when in his last sickness his favourite servant desired to send for a minister, he would not permit it, saying he had no occasion for one. He was never married, nor ever attempted it but once, when he was about 50 years old; and the lady desiring time to consider of it, gave him an opportunity of doing the same: he used to say, "that marriage was a good thing, but a wise man ought to consider of it all his life."

Leibnitz was author of a great multitude of writings; several of which were published separately, and many others in the memoirs of different academies. He invented a binary arithmetic, and many other ingenious matters. His claim to the invention of Fluxions, has been spoken of under that article. Henscius collected, with great care, every thing that Leibnitz had said, in different passages of his works, upon the principles of philosophy; and formed of

them a complete system, under the title of G. G. Leibnitzii Principia Philosophiæ more geometrico demonstrata, &c. 1728, in 4to. There came out a collection of our author's letters in 1734 and 1735, intitled, Epistolæ ad diversos theologi, juridici, medici, philosophici, mathematici, historici, et philologici argumenti e MSS. auctores: cum annotationibus suis primum divulgavit Christian Cortholus. But all his works were collected, distributed into classes by M. Dutens, and published at Geneva in six large volumes 4to. in 1768, intitled, Gothofredi Guillelmi Leibnitzii Opera Omnia, &c.

LEIBNITZIAN PHILOSOPHY, or the *Philosophy of Leibnitz*, is a system formed and published by its author in the last century, partly in emendation of the Cartesian, and partly in opposition to the Newtonian philosophy. In this philosophy, the author retained the Cartesian subtle matter, with the vortices and universal plenum; and he represented the universe as a machine that should proceed for ever, by the laws of mechanism, in the most perfect state, by an absolute inviolable necessity. After Newton's philosophy was published, in 1687, Leibnitz printed an Essay on the Celestial Motions in the Act. Erud. 1689, where he admits the circulation of the ether with Des Cartes, and of gravity with Newton; though he has not reconciled these principles, nor shewn how gravity arose from the impulse of this ether, nor how to account for the planetary revolutions in their respective orbits. His system is also defective, as it does not reconcile the circulation of the ether with the free motions of the comets in all directions, or with the obliquity of the planes of the planetary orbits; nor resolve other objections to which the hypothesis of the vortices and plenum is liable.

Soon after the period just mentioned; the dispute commenced concerning the invention of the method of Fluxions, which led Mr. Leibnitz to take a very decided part in opposition to the philosophy of Newton. From the goodness and wisdom of the Deity, and his principle of a sufficient reason, he concluded, that the universe was a perfect work, or the best that could possibly have been made; and that other things, which are evil or incommodious, were permitted as necessary consequences of what was best: that the material system, considered as a perfect machine, can never fall into disorder, or require to be set right; and to suppose that God interposes in it, is to lessen the skill of the author, and the perfection of his work. He expressly charges an impious tendency on the philosophy of Newton, because he asserts, that the fabric of the universe and course of nature could not continue for ever in its present state, but in a time would require to be re-established or renewed by the hand of its first

The perfection of the universe, in consequence of which it is capable of con-

tinuing for ever by mechanical laws in its present state, led Mr. Leibnitz to distinguish between the quantity of motion and the force of bodies; and, whilst he was in opposition to Des Cartes that the former varies, to maintain that the quantity of force is for ever the same in the universe; and to measure the forces of bodies by the squares of their velocities.

Mr. Leibnitz proposes two principles as the foundation of all our knowledge; the first, that it is impossible for a thing to be, and not to be at the same time, which he says is the foundation of speculative truth; and secondly, that nothing is without a sufficient reason why it should be so, rather than otherwise; and by this principle, he says, we make a transition from abstracted truths to natural philosophy. Hence he concludes that the mind is naturally determined, in its volitions and elections, by the greatest apparent good, and that it is impossible to make choice between things perfectly like, which he calls indiscernibles; from whence he infers, that two things perfectly like could not have been produced even by the Deity himself: and one reason why he rejects a vacuum, is because the parts of it must be supposed perfectly like to each other. For the same reason too, he rejects atoms, and all similar parts of matter; to each of which, though divisible *ad infinitum*, he ascribes a *monad* (Act. Lipsiæ 1698, p. 435) or active kind of principle, endued with perception and appetite. The essence of substance he places in action or activity, or, as he expresses it, in something that is between acting and the faculty of acting. He affirms that absolute rest is impossible, and holds that motion, or a sort of *nîus*, is essential to all material substances. Each monad he describes as representative of the whole universe from its point of sight; and yet he tells us, in one of his letters, that matter is not a substance, but a *substantiatum*, or *phenomenon bien fondé*. See also *Maclaurin's View of Newton's Philosophical Discoveries*, book 1, chap. 4. and *Pre-established HARMONY*.

LEICESTER, the capital of a county of the same name, in England, upon the river Leire, now called Soar. From its situation on the fosse-way, and the many coins and antiquities discovered here, it seems probable that it was a place of some note in the time of the Romans. In the time of the Saxons it was a bishop's see, and afterwards so repaired and fortified by Edelslads, that it became, according to Matthew Paris, a most wealthy place, having 52 parish churches; but in Henry the Second's reign it was in a manner quite ruined, for joining in rebellion against him with Robert Earl of Leicester. In the reign of Edward III. however, it began to recover by the favour of his son Henry Plantagenet, duke and earl of Lancaster, who founded and endowed a collegiate church and hospital here. It is a

borough and corporation, governed by a mayor, recorder, steward, bailiff, 24 : 'hermen, 48 common councilmen, a solicitor, a town-clerk, and two chamberlains. It had its first charter from king John. The freemen are exempt from paying toll in all the fairs and markets of England. It has three hospitals, that mentioned above, built by Henry Plantagenet, duke of Lancaster, and capable of supporting 100 aged people decently; another erected and endowed in the reign of Henry VIII. for 12 poor lazars; and another for six poor widows. The castle was a prodigious large building, where the Duke of Lancaster kept his court. The hall and kitchen still remain entire, of which the former is very spacious and lofty: and in the tower over one of the gate-ways is kept the magazine for the county militia. There was a famous monastery here, anciently called, from its situation in the meadows, St. Mary de Pratis, or Prez. In these meadows is now the course for the horse-race. It is said that Richard III. who was killed at the battle of Bosworth, lies interred in St. Margaret's church. The chief business of Leicester is the stocking-trade, which has produced in general to the amount of 60,000*l.* a year. In a parliament held here in the reign of Henry V. the first law for the burning of heretics was made, levelled against the followers of Wickliffe, who was rector of Lutterworth, in this county, and where his pulpit is said still to remain. The town suffered greatly in the civil wars, by two sieges upon the back of one another. It has given the title of earl to several noble families.

Leicester has a large market on Saturdays, and four fairs in the year. In 1800 the number of inhabited houses was 3205, uninhabited houses 85; inhabitants 16,953; electors about 2940. Long. 1. S. W. Lat. 52. 38. N.

LEICESTERSHIRE, an inland county of England, in form almost circular. It has Nottinghamshire and Derbyshire to the North; Rutlandshire and Lincolnshire on the east; Warwickshire on the West, from which it is parted by the Roman military way called Watling-street; and by Northamptonshire on the south; and is about 170 miles in circumference. As it lies at a great distance from the sea, and is free from bogs and marshes, the air is sweet and wholesome. It is a champaign country in general, and abundantly fertile in corn and grass, being watered by several rivers, as the Soare, or Sore, which passes through the middle of it, and abounds in excellent salmon and other fish; the Wreke, Trent, Eye, Sense, Auker, and Avon. These rivers being mostly navigable, greatly facilitate the trade of the county: there are also several canals. In some parts there is a great scarcity of fuel, both wood and coal; but in the more hilly parts there is plenty of both, together with great flocks of sheep.

Besides wheat, barley, oats, and pease, it produces the best beans in England. They grow so tall and luxuriant in some places, particularly about Barton in the Beans, that they look, towards the harvest-time, like a forest; and the inhabitants eat them not only when they are green, as in other places, but all the year round; for which reason their neighbours nickname them *bean-bellies*. They have plenty of very good wool, of which they not only make great quantities of stockings, but send a great quantity unmanufactured into other parts of England. They make great profit of their corn and pulse; and likewise breed great numbers of coach and dray horses, most of the gentlemen being graziers; and it is not uncommon to rent grass farms from 500*l.* to 2000*l.* a-year. It is in the midland circuit, and diocese of Lincoln; and sends four members to parliament, two for Leicester, and two for the county.

Leicestershire contains about 560, 00 acres of land, and 130,090 inhabitants, of whom about 26,000 are able to bear arms.

LEIGH, a town of England, in the county of Lancaster, which formerly had a market, but now neglected: 10 miles W. N. W. of Manchester, and 189 N. N. W. of London.

LEIGH, or **LEA**, a town of England, in the county of Essex, on the side of the river Thames: 21 miles E. S. E. of Billericay, and 39 E. of London.

LEIGHLIN, or **OLD LEIGHLIN**, a decayed town of Ireland, in the county of Carlow, the see of a bishop, founded in the 7th century, and united with Ferns in the year 1600; the cathedral serves for a parish church. It is a borough, and sent two members to the Irish Parliament: nine miles N. E. Kilkenny, and eight S. S. W. Carlow.

LEIGHLIN-BRIDGE, a town of Ireland, in the county of Carlow, situated on the river Barrow: seven miles S. Carlow, and eleven N. E. Kilkenny.

LEIGH'S-ISLAND, a small island on the south-east-coast of New Ireland, a little to the south-east of Cocoa Nut Island.

LEIGHTON, or **LEIGHTON-BUZZARD**, or **BRANDSBERT**, a town of England, in the county of Bedford, situated on the river Ouzel, on the borders of Buckinghamshire, with a weekly market on Tuesday: seven miles and a half WNW. Dunstable, and forty-one NW. London. Long. 0. 35. W. Lat. 51. 55. N.

LEIGHTON (Alexander), a Scotch presbyterian divine, born at Edinburgh in 1587, and memorable for the sufferings he underwent on account of some virulent tracts which he published against Charles I. and the church of England. For these he had his nose slit, his ears cut off, and a public whipping inflicted on him. In 1640 the parliament appointed him keeper of Lambeth palace, which was converted into a state prison. He died insane in 1644.

LEITCH (Robert), archbishop of Glasgow, was son of the preceding, and born at Edinburgh. He entered into orders, and became a most exemplary parish priest. His extraordinary merits recommended him to the magistrates of Edinburgh, who chose him president of their college. Soon after the restoration he was consecrated bishop of Dunblane, in which diocese he governed with great moderation, so that he was revered even by the greatest enemies of the episcopacy. The rest of the Scotch bishops acted in a different manner; on which despairing to see that church properly established he went to London, and resigned his bishopric. The king, however, obliged him to accept of the archbishopric of Glasgow, in which station he made another effort to moderate the violence of his brethren; but finding that all was in vain, he went to London and resigned his dignity. He then led a retired life in the county of Sussex, and died suddenly at an inn in London in 1684. The works of this excellent prelate are inestimable, particularly his Commentary on St. Peter.

LEINSTER, the eastern province of Ireland, which contains the twelve following counties, viz. Louth, Meath, Dublin, Wicklow, Wexford, Kilkenny, Carlow, Kildare, Queen's County, King's County. West Meath, and Longford. Leinster is bounded by Ulster on the north, by Connaught and Munster on the west and south-west, and by the sea on the south and east. Its length is 104 miles, the breadth about fifty-five miles, and the circuit 360 miles; and includes 992 parishes, one archbishopric, and three bishoprics. It is, in general, well cultivated, and enjoys good air and soil, and is the most populous, containing the capital and the seat of the government. The principal rivers are the Boyne, Barrow, Liffey, Noir, and May.

LEIPSIC, or **LEIPZIG**, a city of Germany, in the circle of Upper Saxony, and capital of a circle of the same name. This is one of the finest, and most celebrated towns in all Germany, situated in a pleasant and fertile plain, on the river Pleisse. Its circuit is estimated at 8954 paces; but the suburbs are well built, and large, and furnished with gardens. Between the town itself and the suburbs, a fine walk of lime trees was laid out, in the year 1702, which runs quite round the town. In the town ditches, also, are planted mulberry-trees. It is the seat of a very flourishing and famous university, which was founded and dedicated, in 1409, and consists of four nations, namely, of the Misanian, Saxon, Bavarian or Franconian, and the Polish, and contains in it six colleges; as also, of two good Latin schools, and likewise, of two celebrated societies, as, namely, a German society, and another for the encouragement of the liberal arts. Leipzig is also one of the four towns where the contin-

gents of the empire are paid in; and likewise, one of the principal trading towns in all Germany, inasmuch as it enjoys not only an important foreign trade, but also, at its three celebrated fairs, which are kept at Easter, Michaelmas, and the beginning of the new year, carries on a very extensive commerce, both in domestic and foreign wares. Leipsic is seated in a plain, between the rivers Saale and Mulde, near the confluence of the Pleyssse, the Elster, and the Barde, 40 miles N. W. of Dresden. Lon. 12. 25. E. Lat. 51. 19. N.

LEIPOPS'YCHIA (from *λειπω* to leave, and *ψυχη* the soul.) In medicine, syncope, swooning.

LEIPOTHYMIA, (*Leipothymia*, *α*, *φ*, *λειποθυμια*; from *λειπω*, to leave, and *θυμος*, the mind.) See **SYNCOPE**.

LEISMAN (Giovanni Antonio), a German painter, who died in 1698, aged 94. Pozzo mentions two excellent pictures by him, one is a landscape with dreary mountains and thick woods, out of which appears a gang of robbers preparing to assault some unfortunate travellers; the other is a seaport enriched with views of elegant buildings and antiquities (*Watkins*).

LEISNIG, a town of Upper Saxony, in the circle of Leipsic, seated on the Mulde, where are manufactures of cloth, lace, stockings, &c. It is 24 miles E.S.E. of Leipsic and 32 N.W. of Dresden. Lon. 12. 53. E. Lat. 51. 7. N.

LEISURABLE. *a*. (from *leisure*.) Done at leisure; not hurried; enjoying leisure (*Brown*).

LEISURABLY. *ad*. (from *leisureable*.) At leisure; without tumult or hurry (*Hooker*).

LEISURE. *s*. (*loisir*, French.) 1. Freedom from business or hurry; vacancy of mind; power to spend time according to choice (*Temple*). 2. Convenience of time (*Shakspeare*). 3. Want of leisure: not used (*Shakspeare*).

LEISURELY. *a*. (from *leisure*.) Not hasty; deliberate; done without hurry. (*Addison*).

LEISURELY. *ad*. (from *leisure*.) Not in a hurry; slowly; deliberately (*Addison*).

LEITH, a seaport in Edinburghshire, on the frith of Forth, two miles N. of Edinburgh, of which it is the port. It is large and populous, and being situate on both sides of the harbour, is divided into N. and S. Leith. The harbour is secured by a noble stone pier, at the mouth of a little river, called the Water of Leith; and is accommodated with an elegant draw bridge and a good quay. The commerce of Leith is very considerable; and the vessels employed in the London trade are, in general, of a large size; but the largest ships are those employed in the Greenland whale fishery. To Germany, Holland, and the Baltic, are exported lead, glass ware, linen, woollen stuffs, and a variety of other goods; as also to the other countries of Europe,

the West Indies, and America. Ships of great size are built at this port; and here are several extensive rope-walks. There are also flourishing manufactures of bottle-glass, window-glass, and crystal; a great carpet manufacture, a soap-work, and some iron forges. The number of inhabitants in Leith is estimated to be about 12,000. There are three churches, and an ancient hospital for disabled seamen. Lon. 3. 7. W. Lat. 56. 0. N.

LEITRIM, a county of Ireland, in the province of Connaught, bounded on the N. by Donegal Bay, on the N. E. by Fermanagh, on the E. by Cavan, on the S. E. by Longford, on the S. W. by Roscommon, and on the W. by Sligo. It is 42 miles long and 17 broad; is a fertile country, though mountainous, and produces great herds of black-cattle. It contains 21 parishes, and sent six members to parliament.

LEITRIM, the county-town of Leitrim, in Ireland; formerly a place of some note, of which St. Liegus was bishop. It is seated on the Shannon, five miles N. of Carrick, and 80 N.W. of Dublin. Lon. 8. 30. W. Lat. 53. 51. N.

LEIXLIP, a town of Ireland, in the county of Kildare, seated on the Liffey. It has a noble castle, with large gardens, on one side of which is a fine waterfall, called the salmon lepp. Near it are the ruins of the church and castle of Confy. Leixlip is eight miles W. of Dublin.

LELAND (John), antiquary-royal of England, was born in London, and educated at St. Paul's school, from whence he was sent to Christ's college, Cambridge, but afterwards he removed to All Soul's college, Oxford. On entering into orders he became chaplain to Henry VIII. who gave him the title of his antiquary. By virtue of the royal commission he searched various cathedrals and religious houses for curious records and secrets of antiquity, in which employment he spent six years, travelling over every part of the kingdom. Having completed his labours he was presented to the valuable living of Havely in Oxfordshire, and to a prebend in the church of Salisbury. In 1545 he presented his collections to the King under the title of a Newe Yeare's Gifte. This, however, was only the beginning of what he proposed to execute, but while he was intent upon his studies a phrenzy seized him, in which state he continued to his death in 1552. His *Itinerary and Collectanea* have been published by Hearne.

LELAND (John), well known by his writings in defence of Christianity, was born at Wigan in Lancashire in 1691, of eminently pious and virtuous parents. They took the earliest care to season his mind with proper instructions; but, in his sixth year, the small pox deprived him of his understanding and memory, and expunged all his former ideas. He continued in this deplorable state near a twelvemonth, when his fa-

culties seemed to spring up anew; though he did not retain the least trace of any impressions made on him before the distemper, yet he now discovered a quick apprehension and strong memory. In a few years after his parents settled in Dublin, which situation gave him an easy introduction to learning and the sciences. When he was properly qualified by years and study, he was called to be pastor to a congregation of Protestant dissenters in that city. He was an able and acceptable preacher, but his labours were not confined to the pulpit. The many attacks made on Christianity, and by some writers of no contemptible abilities, engaged him to consider the subject with the exactest care, and the most faithful examination. Upon the most deliberate inquiry, the truth and divine original, as well as the excellence and importance of Christianity, appearing to him with great lustre, he published answers to several authors who successively appeared in that cause. He was indeed a master in this controversy; and his history of it, styled "A View of the Deistical Writers that have appeared in England in the last and present century, &c." is very greatly and deservedly esteemed. In the decline of life he published another laborious work, entitled, "The Advantage and Necessity of the Christian Revelation, shown from the State of Religion in the ancient Heathen World, especially with respect to the Knowledge and Worship of the One true God; a Rule of moral Duty, and a State of future Rewards and Punishments; to which is prefixed, a long and preliminary Discourse on Natural and Revealed Religion," 2 vols. 4to. This noble and extensive subject, the several parts of which have been slightly and occasionally handled by other writers, Leland has treated at large with the greatest care, accuracy and candour. And, in his "View of the Deistical Writers," his cool and dispassionate manner of treating their arguments, and his solid confutation of them, have contributed more to depress the cause of atheism and infidelity, than the angry zeal of warm disputants. But not only his learning and abilities, but also his amiable temper, great modesty, and exemplary life, recommended his memory to general esteem and affection. He died in 1766.

LELAND (Dr. Thomas), a native of Dublin, and member of the college in that city, who distinguished himself by a *History of Ireland*, a *Life of Philip of Macedon*, and a translation of *Demosthenes*. He died in 1785, aged 63.

LELAPS, a dog that never failed to seize and conquer whatever animal he was ordered to pursue. He was given to Procris by Diana, and Procris reconciled herself to her husband by presenting him with that valuable present. According to some, Procris had received him from Minos, as a reward for the

LEM

dangerous wounds of which she had cured him.

LELY (Sir Peter), a very eminent painter, was born at Soest in Westphalia in 1617, where his father, a captain of foot, was in garrison. His name was Vander Vaas; but being born at the Hague, at a perfumer's who kept the sign of the Lily, he received the appellation of captain Du Lys, or Lely, which became the proper name of his son. He received his first instructions in painting from one De Grebber. The great encouragement given by Charles I. to painting, drew him to England in 1641, where he at first painted landscapes with small figures, and also historical compositions; but finding face-painting more encouraged, he applied to it, and soon excelled all his contemporaries; which procuring him great business, prevented his going to Italy, as he had intended: on which he procured the best drawings, prints, and paintings of the most celebrated Italians, and having at length the best collection of any one of his time, acquired an admirable style by his daily studying the works of those great masters. Thus in the correctness of his draughts, and in beauty of colouring, the graceful airs of his heads, the pleasing varieties of his postures, and in the gentle and loose management of his draperies, he excelled most of his predecessors, and will be a pattern to all succeeding artists. But the critics remark, that most of his faces have a languishing air, long eyes, and a drowsy sweetness peculiar to himself. He was a good history-painter, and his crayon draughts are also admirable. He was much favoured by king Charles II. who made him his principal painter, and conferred on him the honour of knighthood: he was also esteemed by persons of the greatest eminence in the kingdom. He died at London of an apoplexy, as he was drawing the duchess of Somerset, in the year 1680, and was buried in Covent-Garden church, where he has a marble monument.

LE'MAN. *s.* (*L'aimant*, the lover, French.) A sweetheart; a gallant (*Hanmer*).

LEMBRO, the ancient Imbros, an island of the Archipelago, on the coast of Romania, 22 miles in circumference, with a town of the same name and a harbour. Lon. 26. 0. E. lat. 40. 25. N.

LEMBURG, or **LEOPOLD**, a large commercial city of Poland, capital of the palatinate of Red Russia, and now of the Austrian kingdoms of Galicia and Lodomeria. It is well fortified, and defended by two citadels, one of which is on an eminence without the city. The square, churches, and public buildings, are magnificent. It has a Roman catholic archbishop, and an Armenian and Russian bishop. In 1672, it was besieged in vain by the Turks; but in 1704 was taken by storm, by Charles XII. of Sweden. It is seated on the Peltu, 20

LEM

miles N. W. of Kamienieck, and 150 E. of Cracow. Lon. 24. 26. E. lat. 49. 51. N.

LEMERY (Nicholas), a celebrated chemist, born at Rouen in Normandy in 1645. After having made the tour of France, he in 1672 commenced an acquaintance with M. Martyn, apothecary to Monsieur the Prince, and performed several courses of chemistry in the laboratory of this chemist at the Hotel de Condé, which brought him to the knowledge and esteem of the prince. He provided himself at length with a laboratory of his own, and might have been made a doctor of physic; but he chose to continue an apothecary, from his attachment to chemistry, in which he opened public lectures; and his confluence of scholars were so great as scarcely to allow him room to perform his operations. The true principles of chemistry in his time were but ill understood: Lemery was the first abolished the senseless jargon of barbarous terms, reduced the science to clear and simple ideas, and promised nothing that he did not perform. In 1681 he was disturbed on account of his religion, and came to England, where he was well received by Charles II: but affairs not promising him the same tranquility, he returned to France, and sought for shelter under a doctor's degree; but the revocation of the edict of Nantz drove him into the Romish communion to avoid persecution. He then became associate chemist and pensionary in the royal academy of sciences, and died in 1715. He wrote, *A course of chemistry*; *An universal pharmacopoeia*; *An universal treatise of drugs*; and, *A treatise of antimony*.

LEMISHOCHORTON. See **CORALLINA CORSICANA**.

LEMMA, *λημμα*, of *λαμβάνω*, I assume, in mathematics, denotes a previous proposition, laid down in order to clear the way for some following demonstration; and prefixed either to theorems, in order to render their demonstration less perplexed and intricate; or to problems, to make their resolution more easy and short. Thus, to prove a pyramid one third of a prism, or parallelopiped of the same base and height with it, the demonstration whereof in the ordinary way is difficult and troublesome, this lemma may be premised, which is proved in the rules of progression, that the sum of the series of the squares, in numbers in arithmetical progression, beginning from 0, and going on 1, 4, 9, 16, 25, 36, &c. is always subtriple of the sum of as many terms, each equal to the greatest; or is always one-third of the greatest term multiplied by the number of terms. Thus, to find the inflection of a curve line, this lemma is first premised, that a tangent may be drawn to the given curve, in a given point.

So, in physics, to the demonstration of most propositions, such lemmata as these

LEM

are necessary first to be allowed: that there is no penetration of dimensions; that all matter is divisible; and the like. As also in the theory of medicine, that where the blood circulates, there is life, &c.

LEMNA. Duck-weed. In botany, a genus of the class monœcia, order diandria. Calyx one-leaved; corollless; style one; capsule many seeded. Six species; of which four are common to the ponds of our own country; one to the South of Europe; and one to India.

LEMMING, in mastology. See *Mus*.

LEMN'ESCIA. In botany, a genus of the class polyandria, order monogynia. Calyx five-toothed; petals five; nectary cup-shaped, bearing the stamens capsule doubtful; five-celled with a single seed in each. One species: a tree of Guiana with scarlet flowers in a many flowered terminal corymb.

LEMNIAN EARTH, in mineralogy. See *ARGILLA*.

LEMNISCATE, in the higher geometry, the name of a curve in the form of a figure of 8. As fig. 7. pl. 93. If AP be represented by x , PQ by y , and the constant line AB or AC by a , the equations $ay = x\sqrt{a^2 - x^2}$, or $a^2y^2 = a^2x^2 - x^4$, expressing a line of the 4th order, will denote a lemniscate, having a double point in A. There may be other *LEMNISCATES*, as the *CASSINOID* or *CASSINEAN ellipse*; but the one above defined is the simplest.

This curve is manifestly quadrable. For, since $ay = x\sqrt{a^2 - x^2}$; the fluxion of the

curve or yx is $= \frac{x}{a} \cdot \sqrt{a^2 - x^2}$: of which

the fluent is $\frac{1}{3}a^2 - \frac{1}{3a}(a^2 - x^2)^{\frac{3}{2}}$, the gene-

ral area of the curve. This, when $x=a$ becomes simply $\frac{1}{2}a^2 = \text{AQB}$.

A right line may cut this curve in 2 points, as NQ; or in 4, as $mnpq$ even the right line BAC is conceived to cut the curve in 4 points, the double point A reckoning as 2. See *CURVE*.

For solutions of the problem "to assign equal arcs in the lemniscate," see Leybourn's *Mathematical Repository*, N. S. vol. 1. pp. 204—209.

LEMNOS, a celebrated island of the Archipelago, now called *STALIMENE*, situate near the strait of Gallipoli. It is above 112 miles in circumference according to Pliny, who says that it is often shadowed by Mount Athos, though at the distance of 87 miles. The poets made it sacred to Vulcan, who was hence called Lemnius Pater. Lemnos was also celebrated for its labyrinth, of which, not a trace remains; and what historians relate of it serves only to excite, but not to gratify, curiosity. The modern Greeks entertain the same opinion of that

LEM

earth of Lemnos, which is said to have cured Philoctetes, and which Galen went to examine. It is never dug up but on one particular day of the year, and then with great ceremony. This earth, called *Terra Sigillata*, formed into small loaves, and sealed with the grand signior's seal, is then dispersed over all Europe. The greatest virtues are attributed to it; and yet a chemist can discover nothing but a mere clayey earth, incapable of producing the effects that have been attributed to it. Lemnos is subject to the Turks; but the inhabitants are almost all Greeks, and very industrious. Its capital is of the same name, and the see of a Greek archbishop. Lon. 25. 28. E. Lat. 40. 3. N.

LEMON, in botany. See *LIMON* and *CITRUS*.

LEMON SCURVY GRASS. See *COCHLIARIA PORTENSIS*.

LEMONS, salt of, used to remove ink-stains from linen, is the native salt of sorrel, the super-oxalat of potash. The effect is produced by the oxalic acid dissolving with facility the oxyd of iron in the ink, on the combination of which with the tannin and gallic acid the colour depends; while, at the same time, it can be used without any risk of injury to the cloth, on which it has no effect. See *POTASH*.

LEMONADE. *s.* (from *lemon*.) Liquor made of water, sugar, and the juice of lemons (*Arbutnot*).

LEMUR. *Maucauco.* In zoology, a genus of the class mammalia, order primates. Fore-teeth, upper four, intermediate ones remote; lower, six, longer extended, compressed, parallel, approximate; grinders many, subulate, fore-most longer, sharper. Thirteen species, inhabiting Asia, Africa, or America. The following are the principal.

1. *L. Ecaudatus.* Tailless maucauco. Head and ears small; a sharp-pointed nose; and eyes surrounded with a white space, encircled with a black ring; a dark brown line, forked on the fore-head, extended along the back to the rump; body covered with a short, soft, and silky, ash-coloured and reddish fur; toes naked, with flat nails; those of the inner toe on each hind foot along, crooked, and sharp; length of the animal from the nose to the rump, is sixteen inches. It inhabits Ceylon and Bengal; lives in the woods, and feeds on fruits, is fond of eggs, and will greedily devour small birds. With the inactivity of a sloth, it creeps slowly along the ground; is very tenacious of its hold, and makes a plaintive noise.

2. *L. Tardigradus.* Loris. Tailless body tawny-ash. Back with a brown line; throat whitish; between the eyes a white longitudinal line; face hairy; ears urceolate, with bifoliate; hands, and feet, naked; nails rounded, those of the great toes subulate; teats two on the breast, two on

LEM

the upper part of the belly: size that of a squirrel. Inhabits Ceylon; agile, quick of hearing, monogamous.

3. *L. Mongor*. Mongor or woolly maucauco. Size of a cat, eyes lodged in a circle of black, and the space between them of the same colour; irids of an orange colour; short round ears; the end of the nose black; the rest of the nose, and the lower sides of its cheeks, white. When in full health, the whole upper part of the body covered with long soft and thick fur, a little curled or waved, of a deep brownish ash-colour; tail very long, and covered with the same sort of hair of the same colour; breast and belly white; hands and feet naked and dusky; nails, as in the two former species, flat; except that of the inner toe of the hind feet; it varies sometimes, with white or yellow paws, and a face wholly brown.

It inhabits Madagascar and the adjacent isles; turns its tail over its head to protect it from rain; feeds on fruits, and sleeps on trees; it is very good natured, and very sportive; but very tender; it is found as far as Celebes or Macassar.

Buffon gives the history of one that he had in his possession for several years. He says, that its tongue was rough like that of a cat; that when permitted, it would continue to lick a person's hand till it was inflamed, and often finished this operation with a severe bite. It amused itself with gnawing its own tail, and actually destroyed four or five vertebrae. Whenever it could escape, it went into the neighbouring shops in quest of fruits, sugar, and sweet-meats, opened the boxes that contained them, and helped himself. Dreaded cold and moisture; in cold weather never left the fire, and would stand on end to warm itself. Its movements were extremely brisk, and sometimes petulant; often slept during the day; but awoke with the slightest noise.

4. *L. Macao*. Vari. Tailed; black; collar bearded. Three other varieties: ♂ body brown; ♀ body white; ♂ black and white mixed. Very fierce in a wild state and makes so violent a noise in the woods, that it is easy to mistake the noise of two for that of an hundred; some have compared this noise to the roaring of a little lion. When taken young, and tamed, these animals are very gentle and good natured; their hind legs and thighs, like those of the two preceding species, are very long, which makes their pace sideling and bounding. It inhabits Madagascar.

5. *L. Prehensilis*. Little maucauco. Tail prehensile: size less than that of the black rat; a dark space round the eyes which are very large and full; the upper part of its body ash-coloured, the lower white; head round, nose sharp, and whiskers long; has two canine teeth in each jaw; four cutting teeth in the upper; six in the lower, and seven grinders on each side; ears large, roundish, naked, and membranaceous; toes

LEN

long, but of unequal lengths; the nails round, and very short, tail as long as the body.

6. *L. Volans*. Flying maucauco. Near three feet long, and as broad; very distinct from yet resembling the bat and flying squirrel; inhabits the country about Guzarat, the Molucca isles, and the Philippines; feeds on the fruits of trees, and is called by the Indians, Caguang, Colugo, and Gigua; head long; mouth and teeth small; ears also small, round, and membranous; from the neck to the hands, and thence to the hind feet, extends a broad skin like that of a flying squirrel; the same is continued from the hind feet to the tip of the tail, which is included in it; the body and outside of the skin covered with soft hair, hoary or black, and ash-colour; the inner side of the extended skin appears membranous, with little veins and fibres dispersed through it; the legs clothed with a soft yellow down; has five claws on each foot; the claws slender, very sharp, and crooked; with these it strongly adheres to whatever it fastens on; tail slender, and about a span long. From our ignorance of the form of its teeth, its genus is very doubtful; but it is placed here on the authority of Linnæus.

LEMURES, the manes of the dead. The ancients supposed that the souls, after death, wandered over the world, and disturbed the peace of its inhabitants. The good spirits were called *laræ familiares*, and the evil ones were known by the name of Larvæ, or Lemures. They terrified the good, and continually haunted the impious. The Romans celebrated festivals in their honor, called Lemuria or Lemuralia, in the month of May. They were first instituted by Romulus to appease the manes of his brother Remus, from whom they were called Remuria, and, by corruption, Lemuria.

LEMURIA and LEMURALIA. See LEMURES.

LENA, a large river of Siberia, which flows in a northerly direction, receives 16 other rivers, and falls into the Frozen Ocean, by several mouths.

LENÆA, a festival kept by the Greeks in honour of Bacchus, (called *Lenæus*, from *λῆνος*, a wine-press) at which there was much feasting and Bacchanalian jollity, accompanied with poetical contentions, and the exhibition of tragedies. The poor goat was generally sacrificed on the occasion, and treated with various marks of cruelty and contempt, as being naturally fond of browsing on the vine-shoots.

To LEND. *v. a.* preterit and part. pass. *lent*. (lænan, Saxon.) 1. To afford, or supply, on condition of repayment (*Dryden*). 2. To suffer to be used on condition that it be restored (*Shakspeare*). 3. To afford; to grant in general (*Addison*).

LENDER, *s.* (from *lent*). 1. One who lends any thing. 2. One who makes a trade of putting money to interest (*Addison*).

LEN

LENFANT (James), a learned French writer born in 1661. After studying at Saumur, he went to Heidelberg, where he received imposition of hands for the ministry in 1684. He discharged the functions of this character with great reputation there, as chaplain of the electress dowager Palatine, and pastor in ordinary to the French church. The descent of the French into the Palatinate obliged our author to depart from Heidelberg in 1688. He went to Berlin, where the elector Frederic, afterwards king of Prussia, appointed him one of the ministers. There he continued 39 years, distinguishing himself by his writings. He was preacher to the queen of Prussia, Charlotta Sophia; and after her death, to the late king of Prussia. In 1707 he took a journey to England and Holland, where he had the honour to preach before Queen Anne; and might have settled in London, with the title of chaplain to her majesty. In 1712 he went to Helmstadt, in 1715 to Leipsic, and in 1725 to Breslaw, to search for rare books and MSS. It is not certain whether it was he that first formed the design of the *Bibliothèque Germanique*, which began in 1720; or whether it was suggested to him by one of the society of learned men, which took the name of Anonymous, and who ordinarily met at his house. He died in 1728. His principal works are, 1. *The History of the Council of Constance*, 2 vols. 4to. 2. *A History of the Council of Pisa*, 2 vols. 4to. 3. *The New Testament translated from the Greek into the French*, with notes by Beauvobre and Lenfant, 2 vols. 4to. 4. *The History of Pope Joan*, from Spanheim's Latin dissertation. 5. *Several pieces in the Bibliothèque Choisie, La République des Lettres, La Bibliothèque Germanique*, &c.

LENGTH. *s.* (from *long*, Saxon.) 1. The extent of any thing material from end to end; the longest line that can be drawn through a body (*Bacon*). 2. Horizontal extension (*Dryden*). 3. A certain portion of space or time (*Locke*). 4. Extent of duration or space (*Locke*). 5. Long duration or protraction (*Addison*). 6. Reach or expansion of any thing (*Watts*). 7. Full extent; uncontracted state (*Addison*). 8. Distance (*Clarendon*). 9. End; latter part of any assignable time (*Hooker*). 10. *At Length*. At last; in conclusion (*Dryden*).

To LENGTHEN. *v. a.* (from *length*.) 1. To draw out; to make longer; to elongate (*Arbutnot*). 2. To protract; to continue (*Daniel*). 3. To protract pronunciation (*Dryden*). 4. *To LENGTHEN out*. To protract; to extend (*Dryden*).

To LENGTHEN. *v. n.* To grow longer; to increase in length (*Prior*).

LENGTHWISE. *ad.* (*length* and *wise*.) According to the length.

LENIENT. *a.* (*leniens*, Latin.) 1. Assuasive; softening; mitigating (*Pope*). 2. Laxative; emollient (*Arbutnot*).

LEN

LENIENT. *s.* An emollient, or assuasive application (*Wise man*).

To LENIFY. *v. a.* (*lenifier*, old French.) To assuage; to mitigate (*Dryden*).

LENITIVE. *a.* (*lenitif*, Fr. *lenis*, Lat.) Assuasive, emollient (*Arbutnot*).

LENITIVE. *s.* 1. Any thing medicinally applied to ease pain. 2. A palliative (*South*).

LE'NITY. *s.* (*lenitas*, Lat.) Mildness; mercy; tenderness; softness of temper (*Daniel*).

LENOX, or DUMBARTONSHIRE, a county of Scotland. See *DUMBARTONSHIRE*.

LENS. A piece of glass, or any other transparent substance, the surface of which are so formed, that the rays of light, by passing through it, are made to change their direction, either tending to meet in a point beyond the lens, or made to become parallel after converging or diverging; or, lastly, proceeding as if they had issued from a point before they fell upon the lens. Some lenses are convex, or thicker in the middle; some concave, or thinner in the middle; some plano-convex, or plano-concave; that is, with one side flat, and the other convex or concave; and some are called *meniscuses*, or convex on one side and concave on the other. See *DIOPTRICS*.

LENSES, BLOWN, are used only in the single microscope, and the usual method of making them has been to draw out a fine thread of the soft white glass, called crystal, and to convert the extremity of this into a spherule, by melting it at the flame of a candle. But this glass contains lead, which is disposed to become opaque by partial reduction, unless the management be very carefully attended to. We are informed, however, by Mr. Nicholson, that the hard glass used for windows seldom fails to afford excellent spherules. This glass is of a clear bright green colour when seen edgewise. A thin piece was cut from the edge of a pane of glass less than one-tenth of an inch broad. This was held perpendicularly by the upper end, and the flame of a candle was directed upon it by the blow-pipe, at the distance of about an inch from the lower end. The glass became soft, and the lower piece descended by its own weight to the distance of about two feet, where it remained suspended by a thin thread of glass about one five-hundredth of an inch in diameter. A part of this thread was applied edgewise to the lower blue part of the flame of the candle, without the use of the blow-pipe. The extremity immediately became white hot, and formed a globule. The glass was then gradually and regularly thrust towards the flame, but never into it, until the globule was sufficiently large. A number of these were made; and being afterwards examined, by viewing their focal images with a deep magnifier, proved very bright, perfect, and round. This, as the ingenious author observes, may prove an acceptable piece of information to those eminent men

(and there are many such), whose narrow circumstances, or remote situations, are obliged to have recourse to their own skill and ingenuity for experimental implements.

LENSES; GROUND, are such as are ground or rubbed into the desired shape, and then polished. Different shapes have been proposed for lenses; but several practical writers on optics have shewn that, after all, the spherical is the most practically useful. By many of the methods of grinding, however, the artificer, with his utmost care, can only produce an approximation to a truly spherical figure; and, indeed, gentlemen have, for the most part, nothing to depend on for the sphericity of the lenses of their telescopes, but the care and integrity of the workmen. In the forty-first volume of the Transactions of the Royal Society of London, a machine is described by Mr. Samuel Jenkins, which, as it is contrived to turn a sphere at one and the same time on two axes, cutting each other at right angles, will produce the segment of a true sphere merely by turning round the wheels, and that without any care or skill in the workmen. This machine is described at page 239. vol. ii. Dr. Gregory's Mechanics.

The following directions for grinding and polishing lenses, are given by Dr. Brewster, in the second volume of his edition of Ferguson's Select Lectures.

"Having fixed upon the proper aperture and focal distance of the lens, take a piece of sheet copper, and strike upon it a fine arch, with a radius equal to the focal distance of the lens, if it is to be equally convex on both sides, or with a radius equal to half that distance, if it is to be plano-convex, and let the length of this arch be a little greater than the given aperture. Remove with a file that part of the copper which is without the circular arch, and a convex gage will be formed. Strike another arch with the same radius, and having removed that part of the copper which is within it, a concave gage will be obtained. Prepare two circular plates of brass, about $\frac{1}{10}$ of an inch thick, and half an inch greater in diameter than the breadth of the lens, and solder them upon a cylinder of lead of the same diameter, and about an inch high. These tools are then to be fixed upon a turning lathe, and one of them turned into a portion of concave sphere, so as to suit the convex gage; and the other into a portion of a convex sphere, so as to answer the concave gage. When the surfaces of the brass plates are turned as accurately as possible, they must be ground upon one another alternately with flour emery till the two surfaces exactly coincide, and the grinding tools will then be ready for use.

"Procure a piece of glass, whose dispersive power is as small as possible, if the lens is not for achromatic instruments, and whose surfaces are parallel; and by means of a pair of large snuffers or pliers, cut it

into a circular shape, so that its diameter may be a little greater than the aperture of the lens. After the roughness is removed from its edges by a common grind-stone,* it is then to be fixed with black pitch to a wooden handle of a smaller diameter than the glass, and about an inch high, so that the centre of the handle may exactly coincide with the centre of the glass.

"When the glass is thus prepared for use, it is then to be ground with fine emery upon the concave tool, if it is to be convex, and upon the convex tool, if it is to be concave. To avoid circumlocution, we shall suppose that the lens is to be convex. The concave tool, therefore, which is to be used, must be firmly fixed to a table or bench, and the glass wrought upon it with circular strokes, so that its centre may never go beyond the edges of the tool. For every six circular strokes, the glass should receive two or three cross ones along the diameter of the tool, and in different directions. When the glass has received its proper shape, and touches the tool in every point of its surface, which may be easily known by inspection, the emery is to be washed away, and finer kinds successively substituted in its room, till by the same alternation of circular and transverse strokes, all the scratches and asperities are removed from its surface. After the finest emery has been used, the roughness which remains may be taken away, and a slight polish superinduced by grinding the glass with pounded pumice-stone, in the same manner as before. While the operation of grinding is going on, the convex tool should, at the end of every five minutes, be wrought upon the concave one for a few seconds, in order to preserve the same curvature to the tool and the glass. When one side is finished off with pumice-stone, the lens must be separated from its handle by inserting the point of a knife between it and the pitch, and giving it a gentle stroke. The pitch which remains upon the glass may be removed by

* When the focal distance of the lens is to be short, the surface of the piece of glass should be ground upon a common grindstone, so as to suit the gage as nearly as possible; and the plates of brass, before they are soldered on the lead, should be hammered as truly as they can into their proper form. By this means much labour will be saved, both in turning and grinding.

† Emery of different degrees of fineness may be made in the following manner: Take five or six clean vessels, and having filled one of them with water, put into it a considerable quantity of flour emery. Stir it well with a piece of wood, and after standing for five seconds, pour the water into the second vessel. After it has stood about twelve seconds, pour it out of this into a third vessel, and so on with the rest; and at the bottom of each vessel will be found emery of different degrees of fineness, the coarsest being in the first vessel, and the finest in the last.

LEN

rubbing it with a little oil, or spirits of wine; and after the finished side of the glass is fixed upon the handle, the other surface is to be ground and finished in the very same manner.

"When the glass is thus brought into its proper form, the next and the most difficult part of the operation is to give it a fine polish. The best, though not the simplest, way, of doing this, is to cover the concave tool with a layer of pitch, hardened by the addition of a little rosin, to the thickness of $\frac{1}{4}$ of an inch. Then having taken a piece of thin writing paper, press it upon the surface of the pitch with the convex tool, and pull the paper quickly from the pitch before it has adhered to it; and if the surface of the pitch is marked every where with the lines of the paper, it will be truly spherical, having coincided exactly with the surface of the convex tool. If any paper remains on the surface of the pitch, it may be removed by soap and water; and if the marks of the paper should not appear on every part of it, the operation must be repeated till the polisher, or bed of pitch, is accurately spherical. The glass is then to be wrought on the polisher by circular and cross strokes, with the oxyd of tin, called the flowers of putty in the shops, or with the red oxyd of iron, otherwise called colcothar of vitriol, till it has received on both sides a complete polish.* The polishing will advance slowly at first, but will proceed rapidly when the polisher becomes warm with the friction. When it is nearly finished, no more putty or water should be put upon the polisher, which should be kept warm by breathing upon it; and if the glass moves with difficulty from its adhesion to the tool, it should be quickly removed, lest it spoil the surface of the pitch. When any particles of dust or pitch insinuate themselves between the glass and the polisher, which may be easily known from the very unpleasant manner of working, they should be carefully removed, by washing both the polisher and the glass, otherwise the lens will be scratched, and the bed of pitch materially injured.

The operation of polishing may also be performed by covering the layer of pitch with a piece of cloth, and giving it a spherical form by pressing it with the convex tool when the pitch is warm. The glass is wrought as formerly, upon the surface of the cloth, with putty or colcothar of vitriol, till a sufficient polish is induced. By this

LEN

mode the operation is slower, and the polish less perfect; though it is best fitted for those who have but little experience, and would therefore be apt to injure the figure of the lens by polishing it on a bed of pitch.

"In this manner the small lenses of simple and compound microscopes, the eye glasses, and the object glasses, of telescopes, are to be ground. In grinding concave lenses, Mr. Imison, employs leaden wheels with the same radius as the curvature of the lens, and with their circumferences of the same convexity as the lens is to be concave. These spherical zones are fixed upon a turning lathe, and the lens, which is held steadily in the hand, is ground upon them with emery, while they are revolving on the spindle of the lathe. In the same way convex lenses may be ground and polished, by fixing the concave tool upon the lathe; but these methods, however simple and expeditious they may be, should never be adopted for forming the lenses of optical instruments, where an accurate spherical figure is indispensable. It is by the hand alone that we can perform with accuracy those circular and transverse strokes, the proper union of which is essential to the production of a spherical surface." (*Brewster's Ferguson*).

LENS, (*Lens*, *tis*, *f.* a *lentore*, from its glutinous quality.) The lentil. *Ervum lens*; *pedunculis subbifloris*; *seminibus compressis*, *convexis* of Linnæus; *φακός*; of the Greek writers. There are two varieties; the one with large, the other small seeds. They are eaten in many places as we eat peas, than which they are more flatulent, and more difficult to digest. A decoction of these seeds is used as a lotion to the ulcerations after small-pox, and it is said with success. See *ERVUM*, also *CRYSTALLINE LENS*.

LENT, a solemn time of fasting in the Christian church, observed as a time of humiliation before Easter, the great festival of our Saviour's resurrection. Those of the Romish church, and some of the Protestant communion, maintain, that it was always a fast of 40 days, and, as such, of apostolical institution. Others think it was only of ecclesiastical institution, and that it was variously observed in different churches, and grew by degrees from a fast of 40 hours to a fast of 40 days. This is the sentiment of Morton, Bishop Taylor, Du Moulin, Daillé, and others.

The Christians of the Greek church observe four lents: the first commences on the 15th of November; the second is the same with our Lent; the third begins the week after Whituntide, and continues till the festival of St. Peter and St. Paul; and the fourth commences on the first of August, and lasts no longer than till the 15th. These lents are observed with great strictness and austerity; but on Saturdays and Sundays they indulge themselves in drink-

* As colcothar of vitriol is obtained by the decomposition of sulphat of iron or martial vitriol, it sometimes retains a portion of this salt. When this portion of martial vitriol is decomposed by dissolution in water, the yellow ochre which results penetrates the glass, forms an incrustation upon its surface, and gives it a dull and yellowish tinge, which is communicated to the image which it forms.

LEO

ing wine and using oil, which are prohibited on other days.

LENT. The part. pass. of *lend*.

LENTEN. *a.* (from *lent*.) Such as is used in lent; sparing (*Shakspeare*).

LENTICULAR. *a.* (*lenticulaire*, French.) Double convex; of the form of a lens (*Ray*).

LENTIFORM. *a.* (*lens* and *forma*, Lat.) Having the form of a lens.

LENTIGINOUS. *a.* (from *lentigo*, Latin.) Scurfy; scurfuraceous.

LENTIGO. *s.* (Latin.) A freckle or scurfy eruption upon the skin (*Quincy*).

LENTIL, in botany. See **CICER**.

LENTISE, or **LENTISK**, in botany. See **PISFACIA**.

LENTISE PERUVIAN. See **SCHINUS**.

LENTANDO. (Ital.) In music, a word implying that the notes over which it is written are to be played from the first to the last with increasing slowness.

LENTEMENT. (French.) A word signifying that the movement to which it is prefixed is to be performed in a slow time.

LENTO. (Ital.) In music, a term implying a slow time.

LENTITUDE. *s.* (from *lentus*, Latin.) Sluggishness; slowness.

LENTNER. *s.* A kind of hawk (*Walton*).

LENTOR. *s.* (Lat.) 1. Tenacity; viscosity (*Bacon*). 2. Slowness; delay (*Arbutnot*). 3. (In physic.) That size, viscid, coagulated part of the blood, which, in malignant fevers, obstructs the capillary vessels (*Quincy*).

LENTOUS. *a.* (*lentus*, Lat.) Viscous; tenacious; capable to be drawn out (*Brown*).

LEO, in zoology. See **FELIS**.

LEO I. pope, surnamed the Great, was an Italian by birth, and had been employed by Popes Celestin I. and Sextus III. in several important affairs. He succeeded the latter pontiff in 440, and distinguished himself by his zeal against the manichees and other heretics, and in endeavouring to extend the papal see. His works amount to three vols. folio. He died in 461 (*Watkins*).

LEO II. was born in Sicily, and succeeded Agatho in the popedom, A. D. 682. He pretended an authority over the eastern church, and instituted holy water. He died in 683.

LEO III. succeeded Adrian I. in 795. The nephews of the preceding pope formed a conspiracy against Leo, and having seized upon him in a procession, dragged him into a monastery, where they sadly mangled him. He afterwards recovered, and sought an asylum in France. Charlemagne sent him back to Italy with a strong guard, and he entered Rome in triumph. He afterwards crowned that monarch emperor of the West; but on his death a new conspiracy was formed against Leo, which being discovered, he put his enemies to death. He died in 816 (*Watkins*).

LEO IV. a Roman, ascended the papal seat after Sergius II. in 847, and died in

LEO

855. The Saracens having invaded the ecclesiastical state in his time, he marched against them, and obtained a complete victory; after which he put the city of Rome into a state of defence, by building a wall all round it, and erecting strong fortifications.

LEO V. the successor of Benedict IV. in 703. He was driven from his seat a few months after his election, and died in prison.

LEO VI. a Roman, succeeded John, in 928, and died the year following. He is considered as an intruder by many of the Catholic historians.

LEO VII. a Roman, was elected pope on the death of John XI. in 936. He was a man of great zeal and piety, and died in 939.

LEO VIII. was elected pope on the deposition of John XII. in 963, by the authority of the Emperor Otho, hence Baronius and others treat him as an intruder. However his character stands high as a man of great probity, and many of the Catholics regard him with respect as a legitimate pontiff, and an honour to the chair. He died in 965.

LEO IX. who bears the distinction of a saint in the calendar, was born of an illustrious family, and became bishop of Toul, and in 1048 was chosen pope. He convened several councils for the reformation of the manners of the ecclesiastics, and to condemn the errors of Berenger on the eucharist. The Normans having marched into Italy, in 1053, he marched against them at the head of a Germany army; but was beaten and taken prisoner. The conquerors conducted him to Rome, where he died the year following (*Watkins*).

LEO X. whose proper name was John de Medicis, is a pope, ever to be remembered by Protestants, as having proved the cause of the reformation begun by Martin Luther. He had been honoured with a cardinal's hat at 14 years of age, and some years after with the dignity of legate, by Julius II. He was in that quality in the army which was defeated by the French, near Ravenna, in 1512, where he was taken prisoner. The soldiers, who had overcome him, showed him such great veneration, that they humbly asked his pardon for gaining the victory, besought him to give them absolution for it, and promised never to bear arms against the pope. When Pope Julius died, Leo was very ill of the venereal disease at Florence, and was carried to Rome in a litter. His hurrying about every night to the cardinals of his faction, occasioned the breaking of his ulcer; and the matter which ran from it exhaled such a stench, that all the cells in the conclave, which were separated only by thin partitions, were scented by it. Upon this the cardinals consulted the physicians of the conclave, to know what the matter was. They, being bribed,

LEO

said the Cardinal de Medicis could not live a month; which sentence occasioned his being chosen pope. Thus Cardinal de Medicis, then not 30 years of age, was elected pope upon a false information; and as joy is the most sovereign of all remedies, he soon after recovered his health, so that the old cardinals had reason to repent their credulity. He was better calculated for a temporal prince, being ambitious, politic, luxurious, a connoisseur in the fine arts, and an accomplished fine gentleman: thus qualified, it is no wonder that so young a pontiff, neglecting the true interest of his church, should avail himself of the folly of religious dupes, and publicly sell indulgences to support his prodigality, especially as he was known to disbelieve Christianity itself, which he called "A very profitable fable for him and his predecessors." In 1517, he published general indulgences throughout Europe (and ordered the priests to recommend them), in favour of those who would contribute any sum towards completing the church of St. Peter; and thus was the basis of the reformation. See LUTHER and INDULGENCE. Leo died in 1521.

It is but justice to add, that to this pope (whatever was his private conduct) was principally owing the revival of polite literature in Italy. He spared neither pains nor expense in recovering ancient manuscripts, and procuring good editions of them; he favoured the arts and sciences; and gloried in being the patron of learned and ingenious men, who in return have been very lavish in his praise. Mr. Pope, in his *Essay on Criticism*, bestows on him these harmonious lines:

But see! each muse in Leo's golden days
Starts from her trance, and trims her wither'd bays;

Rome's ancient genius, o'er its ruins spread,
Shakes off the dust, and rears his rev'rend head.

Then sculpture and her sister arts revive:
Stones leap to form, and rocks begin to live;
With sweeter notes each rising temple rung;
A Raphael painted, and a Vida sung.

Mr. Roscoe has lately published, "The Life and Pontificate of Leo."

LEO (St.), a small but strong town of Italy, in the territory of the church and duchy of Urbino, with a bishop's see. It is seated on a mountain, near the river Mar-
 rechia, in Lon. 12. 25. E. Lat. 43. 57. N.

LEO, the *Lion*, a considerable constellation of the northern hemisphere, being one of the 48 old constellations, and the fifth sign of the zodiac. It is marked thus ♌, as a rude sketch of the animal.

The Greeks fabled that this was the Nemean lion, which had dropped from the moon, but being slain by Hercules, was raised to the heavens by Jupiter, in commemoration of the dreadful conflict, and in honour of that hero. But the hieroglyphi-

LEO

cal meaning of this sign, so depicted by the Egyptians long before the invention of the fables of Hercules, was probably no more than to signify, by the fury of the lion, the violent heats occasioned by the sun when he entered that part of the ecliptic.

The stars in the constellation Leo, in Ptolemy's catalogue, are 27, besides 8 unformed ones, now counted in later times in the constellation Coma Berenices, in Tycho's 30, in that of Hevelius 49, and in Flamsteed's 95; one of them, of the first magnitude, in the breast of the Lion, is called Regulus, and Cor Leonis, or Lion's Heart.

LEO MINOR, the *Little Lion*, a constellation of the northern hemisphere, and one of the new ones that were formed out of what were left by the ancients, under the name of *Stellæ Informes*, or unformed stars, and added to the 48 old ones. It contains 53 stars in Flamsteed's catalogue.

LE'OD. *s.* The people; or, rather, a nation, country, &c. (*Gibson*).

LE'OF. *s.* *Leaf* denotes love; so *leafwin* is a winner of love (*Gibson*).

LEOMINSTER, a town of Herefordshire, in England, seated on the river Lug, which waters the north and east sides of the town, and over which there are several bridges. It is a large, handsome, populous borough; and is a great thoroughfare betwixt South-Wales and London, from which last it is distant 113 measured miles. In King John's reign it was burnt, but soon rebuilt. It was incorporated by queen Mary, and is governed by a high steward, bailiff, recorder, 12 capital burgesses (out of whom the bailiff is chosen), and a town-clerk. Its market is on Friday, and its fairs, which are all noted for horses and black-cattle, on February 13th, Tuesday after Midlent Sunday, May 13th, July 10th, September 4th, and November 1st. The market was on Thursday till it was changed, on a petition from the cities of Hereford and Worcester complaining of their loss of trade; since which, the vast trade it had in wool and wheat is much lessened. The best flax is said to grow here, and it has been equally noted for the best wheat, barley, and the finest bread. The inhabitants drive a considerable trade not only in wool, but in gloves, leather, hat-making, &c. and there are several rivers in and about the town, on which they have mills and other machines. Near its church are some remains of its priory; and on a neighbouring hill are the ruins of a palace, called to this day *Com's fort-castle*. It has several good inns, and sends two members to parliament. Lon. 27. 45. W. Lat. 52. 20. N.

LEON, a province of Spain, with the title of a kingdom; bounded on the north by Asturias; on the west by Galicia and Portugal; and on the south by Estremadura and Castile, which also bounds it on the east. It is about 125 miles in length, and

100 in breadth; and is divided into two almost equal parts by the river Duero, or Douro. It produces all the necessaries of life, and Leon is the capital town.

LUON, an ancient and large episcopal town of Spain, and capital of the kingdom of that name, built by the Romans in the time of Galba. It has the finest cathedral church in all Spain. It was formerly more rich and populous than at present, and had the honour of being the capital of the first Christian kingdom in Spain. It is seated between two sources of the river Esra, in Lon. 5. 13. W. Lat. 42. 55. N.

LEONARDA DA VINCI. See VINCI.

LEONATAS, one of Alexander's generals, distinguished himself in Alexander's conquest of Asia, and once saved the king's life in a dangerous battle. After the death of Alexander, at the general division of the provinces, he received for his portion that part of Phrygia which borders on the Hellespont. Like the rest of the generals of Alexander, he was ambitious of power and dominion, and aspired to the sovereignty of Macedonia. He passed from Asia into Europe to assist Antipater against the Athenians, and was killed in a battle which was fought soon after his arrival. (*Curt. Plut. &c.*)

LEONIDAS, a celebrated king of Lacedæmon, of the family of the Eurysthenidæ, opposed Xerxes, king of Persia, who had invaded Greece with about five millions of souls. He was offered the kingdom of Greece by the enemy, if he would not oppose his views; but Leonidas heard the proposal with indignation, and observed, that he preferred death for his country, to an unjust, though extensive dominion over it. The battle was fought at Thermopylæ, and the 300 Spartans, who alone had refused to abandon the action, withstood the enemy during three successive days, till Ephialtes, a Trachinian, perfidiously conducted a detachment of Persians by a secret path up the mountains, which suddenly fell upon the rear of the Spartans, and crushed them to pieces. Only one ingloriously escaped of the 300; he returned home, where he was treated with insult and reproaches. This celebrated battle taught the Greeks to despise the numbers of the Persians, and to rely upon their own intrepidity. Temples were raised to the fallen hero, and festivals, called Leonideæ, yearly celebrated at Sparta, in which free-born youths contended. (*Herodot. Justin. &c.*)—There were other Greeks of this name, but of inferior note, one of whom was also king of Lacedæmon, 387 years B. C.

LEONINE, in poetry, is applied to a kind of verses which rhyme at every hemistich, the middle always chiming to the end.

In this kind of verse we find several ancient hymns, epigrams, prophecies, &c. For

instance; Muretus, speaking of the poetry of Lorenzo Gamba of Bresse, says,
*Brixia vestrates, quæ condunt carmina vates
Non sunt nostrates tergere digna nates.*

The following one is from the school of Salerno:

Ut vites pœnam, de potibus incipe cœnam.

The origin of the word is somewhat obscure: Pasquier derives it from one Leoninus, or Leonius, who excelled in this way, and dedicated several pieces to pope Alexander III. others derive it from pope Leo; and others, from the beast called lion, because it is the loftiest of all verses.

M. Fauchet makes the leonine rhyme the same with what the French call the rich, and we the double rhyme, i. e. where two syllables have the same orthography, accentuation, and pronunciation, with two others.

LEONINE, is sometimes used adjectively, to denote lion-like.

LEONIS COR, Lion's heart, a fixed star, of the first magnitude, in the sign Leo; called also Regulus, Basilicus, &c.

LEONTICE. Lion's-leaf. In botany, a genus of the class hexandria, order monogynia. Calyx six-leaved, deciduous; corol six-petalled; nectary six-leaved, spreading, placed on the claws of the petals. Five species. two indigenous to the levant and Archipelago: one to the Alps; one to Siberia and one to Virginia.

LEONTINI, or LEONTIUM (anc. geog.), a town of Sicily on the south side of the river Terias, 20 miles north-west of Syracuse. The territory, called Campi Leontini, was extremely fertile (*Cicero*): these were the Campi Læstrigonii, anciently so called; the seat of the Læstrigons, according to the commentators on the poets. The name Leontini is from Leo, the impression on their coin being a lion. Now called Lentini, a town situated in the Val di Noto, in the south-east of Sicily.

LEONTIUM, a celebrated courtesan of Athens, who studied philosophy under Epicurus, and became one of his warmest pupils. She prostituted herself to the philosopher's scholars, and as some have asserted, even to Epicurus himself. (*Vid. Epicurus*.) Leontium not only professed herself a warm admirer and follower of the doctrines of Epicurus, but she even wrote a book in support of them against Theophrastus. This book was valuable, if we believe the testimony and criticism of Cicero.

LE'ONTODON. Dandelion. In botany, a genus of the class syngenesia, order polygamia æqualis. Receptacle naked; calyx double; down simple pedicelled. Five species, natives of Europe; of which the two following are common to our own country.

1. *L. Taraxacum*. Outer calyx reflected; scape one-flowered; leaves pinnate, gla-

LEO

brous, with lanceolate toothed lobes. It is found in our pastures, on the banks of ditches, and road-sides. The leaves when young and tender make a good salad, and the French eat both these and the root. It has been long supposed to be a powerful diuretic, whence the vulgar name assigned to it of *Piss-a-bed*. In many of our dispensaries it still retains a place under the name of *Taraxacum*: which see.

2. *L. palustris*. Outer calyx erect, oppressed, with ovate scales; scape one-flowered; leaves sinuate, toothed, nearly glabrous. Found in our marshes or wet moors.

LEONURUS. Mother-wort. Lion's-tail. In botany, a genus of the class didynamia, order gymnospermia. Calyx five-sided, five-toothed; upper lip of the corol concave, villous, entire; lower lip three-parted, with the middle segment undivided; anthers sprinkled with shining dots. Six-species, chiefly natives of Siberia, one of our own country, one common to Java.

1. *L. Cardiaca*, with spear-shaped, three lobed leaves, on the foot-stalks being the *Cardiaca* of other botanists, or common Mother-wort. 2. *L. Marrubiastrum*, with oval, spear-shaped, serrated leaves, and sessile, prickly cups, or the *Marrubiastrum*, or hore-bound shaped. 3. *L. Crispus*, with leaves divided into three parts, which are cut in their edges, and with hairy cups. 4. *L. Supinus*, with leaves divided into three parts, which terminate with narrow blunt segments. 5. *L. Tartaria*, three-parted, segments slightly cut. Calyxes unarmed. 6. *L. Sibericus*, three parted, upper lip of the corol concave, straight.

The first species is a perennial plant, and grows not only in many parts of England, but in other countries of Europe. It is never cultivated in gardens, except for the sake of variety. The other species are biennial plants, which grow naturally in different parts of Europe, and are raised from seeds sown in the spring, upon a bed of common earth.

LEOPARD, in mastology. See **FELIS**.

LEOPARD'S-BANE, in botany. See **DORONICUM**.

LEOPARD'S-BANE, MOUNTAIN. See **ARNICA**.

LEOPOLD I. emperor of Germany, was the second son of Ferdinand III. and of Mary Anne of Spain. He was born in 1640, became king of Hungary in 1655, king of Bohemia in 1656, and emperor in 1658. He had two great powers to contend with, France on the one side, and the Turks on the other; and suffered in his war with both. France took from him Alsace, and many other frontier places of the empire; and the Turks would have taken Vienna, had they not been compelled to raise the siege by John Sobieski king of Poland. Prince Eugene of Savoy, a young and enterprising general in the imperial service, gave also a turn to the affairs of Leopold, whose

LEP

tyranny, however, was so great, that his Hungarian subjects were nearly on the point of revolting when he died in 1705. (*Watkins*).

LEOPOLD II. the son of the emperor Francis I., and of Maria Theresa of Austria, was born at Vienna in 1747, and succeeded his father in the duchy of Tuscany in 1765, which he governed with great wisdom; but the toleration which he granted to the protestants occasioned great discontents among the people, fomented by the bishops and priests. In 1790 he succeeded the emperor Joseph II., and no sooner was he gone to Vienna, than the malcontents openly shewed themselves in opposition to the measures he had adopted. But, by a summary punishment of the ringleaders, this insurrection was soon quelled. In 1791 Leopold concluded a peace with the Turks. The revolution in France gave him considerable uneasiness; but he was very irresolute in his conduct; and before he had come to any determination on the subject of war, carried off by a fever, March 1, 1792. He was succeeded by his son Francis (*Watkins*).

LEOSTHENES, an Athenian general, who, after Alexander's death, drove Antipater to Thessaly, where he besieged him in the town of Lamia. The success which for a while attended his arms, was soon changed by a fatal blow which he received from a stone thrown by the besieged, B. C. 323. The orator Hyperides pronounced the funeral oration over his body at Athens. (*Diod. Strab.*)—Another Athenian general, condemned for bad success which attended his arms.

LEOTYCHIDES, a king of Sparta, son of Menares, of the family of the Proclidae. He was set over the Grecian fleet, and, by his courage and valor, he put an end to the Persian war at the famous battle of Mycale. The battle of Platæa, in which the Greeks obtained a signal victory, was fought on the same day that the Persian fleet was destroyed at Mycale. Leotychides was accused of a capital crime by the Ephori, and, to avoid the punishment which his guilt seemed to deserve, he fled to the temple of Minerva at Tegea, where he perished, B. C. 469, after a reign of 22 years. He was succeeded by his grandson Archidamus. (*Paus. Diod.*)—A son of Agis, king of Sparta, by Timæa. The legitimacy of his birth was disputed, and Agesilaus was appointed in his place. C. Nep. &c.

LEPANTO, a strong and very considerable town of Turkey in Europe, and in Livadia, with an archbishop's see and a strong fort. It is built on the top of a mountain, in form of a sugar-loaf; and is divided into four towns, each surrounded by walls, and commanded by a castle on the top of a mountain. The harbour is very small, and may be shut up by a chain, the entrance being but 50 feet wide. It was taken from the Turks by the Venetians in

LEP

1687; ~~the~~ afterwards evacuated, and the castle demolished in 1699, in consequence of the treaty of Carlowitz. It was near this town that Don John of Austria obtained the famous victory over the Turkish fleet in 1571. The produce of the adjacent country is wine, oil, corn, and rice. Turkey leather is also manufactured here. The wine would be exceedingly good if they did not pitch their vessels on the inside; but this renders the taste very disagreeable to those who are not accustomed to it. The Turks have six or seven mosques here, and the Greeks two churches. It is seated on a gulph of the same name, in E. lon. 22. 13. N. lat. 38. 34.

LEPAS. Acorn-shell. In zoology, a genus of the class vermes, order testacea. Animal a triton; shell affixed at the base, and consisting of many unequal erect valves. Thirty-one species, of which eleven are common to the rocks and shells of our own coast: the rest are chiefly Indian and Mediterranean frequenters, we shall instance a specimen or two.

1. *L. tintinnabulum*. Shell conic, obtuse, bell-shaped, rugged and fixed. There is a variety of a white colour. Inhabits European, Indian and American seas; found occasionally on the British coasts; frequently adhering to the bottoms of ships and pieces of wreck. Shell purple, varied with white and red, or blueish; sometimes cylindrical or a little thicker; the elevated valves are perpendicularly striate, the depressed ones transversely; pieces of the lid nearly equal.

2. *L. Cornubiensis*. Shell with a dilated base, and rather narrow aperture; valves grooved near the lower edges. Inhabits the coasts of Cornwall; resembles a limpet.

3. *L. Anatifera*. Duck-bernacl. Shell compressed, five-valved, smooth, seated on a peduncle.

6. Another variety, shell rounded.

7. The longer valve spinous on the back.

8. Cancellate; with fine striæ; cinereous. Inhabits most seas, and is generally found fixed in clusters to the bottoms of vessels, and old pieces of floating timber; generally whitish, with a blue cast; the margins of the valves yellow; sometimes marked with a ray or two dotted with black; peduncle long, coriaceous, black and very much wrinkled towards the shell, and growing paler and pellucid towards the base, extensile; sometimes, though rarely, red; valves finely striate; the two larger ones triangular; the two top ones nearly triangular, and about half the size; the other narrow, long, curved, rounded at the back, a little protuberant at the base, and inclosing the rest. This species was formerly supposed to be the origin of the Bernacle duck or goose.

LEPER. *s.* (*lepra, leprosus*, Latin.) One infected with a leprosy (*Hakewill*).

LEP

LEPEROUS. *a.* (formed from *leprous*.) Causing leprosy (*Shakspeare*).

LEPIDAGATHIS. In botany, a genus of the class didynamia, order angiospermia. Calyx many-leaved, imbricate; corol two-lipped, the upper lip very small, lower lip three-parted; capsule two-celled, two-valved. One species; an East Indian plant with diffused, branched, woody stems.

LEPIDIUM. Pepper-wort. In botany, a genus of the class tetradynamia, order siliculosa. Silicle emarginate, elliptic, the valves carinate, but not margined, contrary to the partition. Twenty-eight species; chiefly European plants; a few natives of Asia and America: three common to our own wastes and moist shades. Of these last the more frequent is *L. latifolium*, with ovate-lanceolate leaves, undivided and serrate. The whole plant has a hot acid taste like pepper, and is often used with other esculents instead of this spice, when it was formerly known by the name of *Poor-man's Pepper*.

LEPIDOLITE, in mineralogy. See *MICA*.

LEPIDOPTERA. In zoology, the third order of the Linnæan class insecta, thus ordinarily characterised, wings four, covered with fine imbricate scales; tongue involute, spiral; body hairy. See *ZOOLOGY*.

LEPISMA. In zoology, a genus of the class insecta, order aptera. Lip membranaceous, rounded, emarginate: feelers four; two setaceous, two capitate; antennae setaceous; body imbricate with scales; tail ending in setaceous bristles; legs six, formed for running. Seven species; habitations, Europe, Asia, or America; two common to England.

The residence of the lepisma is usually in gardens and damp houses. In the former, they retreat under mouldy boards or flagstones; and in the latter, they are seen about window sashes, and old boxes that have remained for some time in a humid situation. When their haunts are disturbed, they make off with a great velocity, that they are but seldom caught; and when that happens, they are often destroyed, being, from their softness, easily crushed. The lawn and pupa are six-footed, active, and swift.

1. *L. saccharina*. Colour a shade of lead, brightening into silver: its most conspicuous member is the tail, which consists of three long threads, slender and fine; which, if viewed with a microscope, are covered with tufts of hair. Antennae pisma long and filiform; in some, nearly equal to the length of the body: feet six in number, presenting a short and truncated appearance at their insertion: they are received into a groove in the body of the animal, where each has its origin, covered with an oval scale. Towards the tail there are six other appendices, much shorter, which may be termed false feet, as they seem to give

No assistance to the progressive motion of the animal.

This insect appears to have been first discovered in America, among sugar; but it is now naturalized in Europe, and found as already related.

2. *L. Polypoda*. Skipping; tail triple; segments of the abdomen villous on each side beneath, each armed with a spine on each side. There is another variety, with the tail ending in five bristles. Inhabits England and Europe generally; found on sandy sea-shores among stones and rubbish, and takes prodigious leaps by means of the spring under its tail.

LEPORINE, *a.* (*leporinus*, Lat.) Belonging to a hare; having the nature of a hare.

LEPRA, (*Lepra*, *a.*, *f.* from *λεπτός*, a scale; named from its appearance). The leprosy. A disease in the class *cachexia*, and order *impetiginos* of Cullen, characterized by the skin being rough and chapped, with white surfaceous scales and crusts, under which is frequently a moisture, with itching.

LEPRA ALBA. SEC LEPRA ALPHOS.

LEPRA GRÆCORUM. Dr. Willan describes this disease as characterized by scaly patches, of different sizes, but having always nearly a circular form. In this country, three varieties of the disease are observed, which he has described under the titles of *Lepra vulgaris*, *Lepra alphas*, *Lepra nigricans*.

1. The *Lepra vulgaris* exhibits first small distinct elevations of the cuticle, which are reddish and shining, but never contain any fluid; these patches continue to enlarge till they nearly equal the dimensions of a crown-piece. They have always an orbicular, or oval form; are covered with dry scales, and surrounded by a red border. The scales accumulate on them so as to form a thick prominent crust, which is quickly reproduced, whether it fall off spontaneously, or may have been forcibly detached. This species of lepra sometimes appears first at the elbow, or on the fore-arm; but more generally about the knee. In the latter case the primary patch forms immediately below the patella, within a few weeks, several other scaly circles appear along the fore part of the leg and thigh, increasing by degrees till they come nearly into contact. The disease is then often stationary for a considerable length of time. If it advance further, the progress is towards the hip and loins; afterwards to the sides, back, shoulders; and about the same time to the arms and hands. In the greater number of cases the hairy scalp is the part last affected: although the circles formed on it remain for some time distinct, yet they finally unite, and cover the whole surface on which the hair grows, with a white scaly incrustation. This appearance is attended, more especially in hot weather, with a troublesome itching, and with a watery discharge for several hours, when any portion of the crust is detached, which takes place

from very slight impressions. The pubis in adults is sometimes affected in the same manner as the head: and if the subject be a female, there is usually an internal *pruritus pudendi*. In some cases of the disorder, the nails, both of the fingers and toes, are thickened, and deeply indented longitudinally. When the lepra extends universally, it becomes highly disgusting in its appearance, and inconvenient from the stiffness and torpor occasioned by it in the limbs. The disease, however, even in this advanced stage, is seldom disposed to terminate spontaneously. It continues nearly in the same state for several years, or sometimes during the whole life of the person affected, not being apparently connected with any disorder of the constitution.

2. *Lepra alphas*. The scaly patches in the alphas are smaller than those of the lepra vulgaris, and also differ from them in having their central parts depressed or indented. This disorder usually begins about the elbow, with distinct, eminent asperities, of a dull red colour, and not much longer than papillæ. These in a short time dilate to nearly the size of a silver penny. Two or three days afterwards, the central part of them suffers a depression, within which small white powdery scales may be observed. The surrounding border, however, still continues to be raised, but retains the same size and the same red colour as at first. The whole of the fore-arm, and sometimes the back of the hand, is spotted with similar patches: they seldom become confluent excepting round the elbow, which in that case is covered with a uniform crust. This affection appears in the same manner upon the joint of the knee, but without spreading far along the thigh or leg. Dr. Willan has seldom seen it on the trunk of the body, and never on the face. It is a disease of long duration, and not less difficult to cure than the foregoing species of lepra: even when the scaly patches have been removed by persevering in the use of suitable applications, the cuticle still remains red, tender, and brittle, very slowly recovering its usual texture. The alphas, as above described, frequently occurs in this country.

3. The *Lepra nigricans* differs little from the lepra vulgaris, as to its form or distribution. The most striking difference is in the colour of the patches, which are dark and livid. They appear first on the legs and fore-arms, extending afterward to the thighs, loins, neck, and hands. Their central part is not depressed as in the alphas. They are somewhat smaller in size than the patches of the lepra vulgaris, and not only is the border livid or purplish, but the livid colour of the base likewise appears through the scaly incrustation, which is seldom very thick. It is further to be observed, that the scales are more easily detached than in the other forms of lepra, and that the surface remains longer excoriated, discharging

LEP

lymph ~~affected~~ the intermixture of blood, till a new, ~~different~~ form, which is usually hard, bumpy, and irregular. The lepra nigricans affects persons whose occupation is attended with much fatigue, and exposes them to cold or damp, and to a precarious or improper mode of diet, as soldiers, brewers, labourers, butchers, stage-coachmen, sculler-men, &c.; some women are also liable to it who are habituated to poor living and constant hard labour.

LEPRA'RIA. In botany, a genus of the class cryptogamia, order algæ. Fructification in a powdery, or floscular substance, mostly clothing a thin crustaceous frond. Twenty-eight species, of which four are common to our own country. The whole may be thus subdivided.

A. Continued, without visible frond: the tribe denominated Pulveraria.

B. Continued: frond crustaceous. The common tribe Lepraria.

C. In floscular rigid. Masses; frond crustaceous. The tribe Spiloma.

D. In distinct or clustered white globular mealy spots, generally margined; frond crustaceous. The tribe Variolaria.

The crust and fructification of the different species vary much in colour, as well as in substance. The former is thin, membranaceous, thick, fleshy or tartareous; and both, white, yellow, green, rosy, grey, carmine or black.

LEPREOS, a son of Pyrgæus, who built a town in Elis, which he called after his own name. He laid a wager that he would eat as much as Hercules; upon which he killed an ox and eat it up. He afterwards challenged Hercules to a trial of strength, and was killed.

LEPROSITY. *s.* (from *leprous*.) Squamous disease (*Bacon*).

LE'PROSY. See **LEPRA**.

LE'PROUS. *a.* (*lepra*, Lat. *lepreux*, Fr.) Infected with a leprosy (*Donne*).

LEPSIS. (Greek.) A term used in the ancient music for that of the three branches of the *melopæia*, by which the composer discerned whether he ought to place the notes of his melody in the lower part of the octave, called *hypatoides*, the upper part, called *neteides*, or among the middle sounds, called *mesoides*.

LEPTIS, the name of two cities of Africa, one of which, called Major, was near the Syrtæ, and had been built by a Tyrian or Sidonian colony. The other, called Minor, was about 18 Roman miles from Adrumetum. It paid every day a talent to the republic of Carthage, by way of tribute.

LEPTOCEPHALUS. In zoology, a genus of the class pisces, order apodalia. Head small, narrow; body extremely thin, compressed; without pectoral fins. One species only, *L. Morisii*, Morris, found in the sea near Holyhead; four inches long.

LEPTOSPERMUM. In botany, a genus of the class icomandria, order monogynia.

LEP

Calyx five-cleft, half superior; petals five; with claws, longer than the stamens; stigma capitate; capsule four or five-celled; seeds angular. Twelve species; all natives of New Holland.

LEPTURA. Wood-beetle. In zoology, a genus of the class insecta, order coleoptera. Antennas setaceous; feelers four; filiform; shells tapering towards the tip; thorax slender, rounded. A hundred and twenty-five species: a few inhabitants of America, the rest natives of Europe. Twenty common to our own country. Those with entire lip, are the tribe Donacia of Fabricius; those with bifid lip, forming the greatest number, the tribe Leptura, of the same entomologist. The following are chiefly worthy of notice.

1. *L. Aquatica.* Hind-thigh two-toothed; shells shining green; hind-shanks five-toothed: antennæ blackish, the joints pale, testaceous at the tip; head with a line down the middle; thorax channelled; shells tri-ate, punctured, truncate, with short appendages at each margin; body beneath downy; ~~shells~~ testaceous. Inhabits Europe, on aquatic plants.

2. *L. Sagittaria.* Hind-thighs one-toothed; shells green-gold, minutely punctured, truncate; abdomen and legs golden; antennæ blackish; head brassy, channelled. Inhabits Germany.

3. *L. Vulgaris.* Hind-thighs unarmed; body silvery-green; shells striate, punctured, with transverse small lines; mouth, antennæ, and legs rufous. Inhabits Europe.

The entire tribe bears a near resemblance to the cerambyx; and most of them are very brilliant and beautiful. The larvæ are commonly found in the perforated trunks of trees, devouring the pulverised wood.

LEPUS. Hare. Rabbit. In zoology forty-teeth two, upper double, the interior ones less. The whole of these are timid; live on vegetable food; run by a kind of leap; toes five before, four behind. Fifteen species, the greater number with tails, a few without. Inhabit the four quarters of the globe. The following are the principal species.

1. *L. Timidus.* *Common Hare.* Of which there are three varieties; one with horns; one straw coloured and the variety usually found, and hence a well known animal. Its long ears are tipped with black; very large and prominent; chin white; has long white whiskers. The hair or fur on its face, back and sides, is white at the bottom, black in the middle, and tipped with tawny red. Its throat and breast are red; belly white; tail black above, and white beneath: feet covered with hair, even to the bottom. A large hare weighs eight pounds and a half. It is said, that in the Isle of Man some have been known to weigh twelve. Perhaps the hares in that island, are larger nearly in the same proportion as the native breed of horses are less than others. The length of a common hare, from the nose to the tail, is two feet. It inhabits all parts of Europe, most parts of Asia, Japan, Ceylon, Egypt and Barbary. It is a watchful,

LEPUS.

solid animal, always lean; and runs swifter up a hill than on even ground: whence when started, it endeavours to run up hill. Often escapes the hounds by various artful doublings; frequently sleeps all day in its seat, and feeds by night; returns to its form by the same road that it left it: does pair. The rutting season is February or March, when the male pursues the female by the sagacity of its nose. They breed often in the year; and bring three or four at a time. admit the male during the time of their gestation, and have frequently superfetations. The male and female are liable to be mistaken the one for the other. The mother suckles her young about twenty days. The fur is of great use in the manufacture of hats. They are very subject to fleas, yet the Dalecarlians make a cloth of the fur, which, it is said, preserves the wearer from the attack of these insects.

Hares feed on vegetables, and are very fond of the bark of young trees, except that of the alder and lime, which, it is said, they never touch. They are great lovers of birch, parsley and pink. Their flesh was a forbidden food among the ancient Britons: the Romans, on the contrary, held it in great esteem.

Inter quadrupedes gloria præcipue leporis, was the opinion of Martial; and Horace, who was likewise a bon vivant, says, that every man of taste must prefer the wing:

Fecundi leporis sapiens sectabitur armos.

At present the flesh of the female is preferred to that of the male; and that of those bred on dry hilly ground, to that of those which reside in marshy or wet places.

The hare and the rabbit afford to man the double advantage arising from their number and utility. Hares sleep much, but always with their eyes open. They have neither eye-lids nor eye-lashes. Their eyes seem to be bad; but they have an acute sense of hearing, and enormous ears in proportion to the size of their bodies. These long ears they move with great facility, and employ them as a rudder to direct their course, which is so rapid, that they outstrip all other animals. The period of their natural life is about seven years: the males live longer than the females. They pass their days in solitude and silence, frequently in fear and trembling; as a falling leaf is sufficient to alarm them. Their voice is never heard, but when they are seized or wounded. It is then a sharp loud cry, and has some resemblance to the human voice. They are easily tamed, but never acquire that degree of attachment which is necessary to make them domestic; and usually take the first opportunity of regaining their liberty. They have been trained to beat a drum, to perform gestures in cadence, &c. They want not instinct sufficient for their own preservation, nor sagacity for escaping their enemies. The sportsman has frequent opportunities of observation, and can recount many instances of their surprising sagacity, though they have not all equal experience and cunning. See hunting and hare hunting. They turn more or less white with age. And are thought to be larger and stronger, in proportion to the coldness of the climate. A perpetual enmity is carried on against them, not only by men and dogs, but also by cats, foxes, wolves, and birds of prey, such as owls, buzzards, vultures, and eagles; so that it is almost a miracle that any of them escape destruction.

VOLE VI.

Those with horns may be seen in the mountains in this species; the horns are small, and pointed. Roebuck. Such instances have occurred in Norway; and Pallas adds another near Astrakhan.

In Cook's voyages mention is made of straw-coloured animals like dogs, which run like hares, and have since been admitted as a variety into this species.

2. *L. variabilis. Varying Hare.* The varying hare has a soft down upon it, which is grey in summer, with a slight mixture of black and tawny. Ears shorter, and legs more slender than those of the common hare: tail entirely white, even in summer: feet closely and warmly covered with fur. In winter, the whole animal changes to a snowy whiteness, except the tips and edges of the ears, which remain black; as do also the soles of the feet, on which, in Siberia, the fur is doubly thick. It is less than the common species. It inhabits the highest Scottish Alps, Norway, Lapland, Russia, Siberia, Kamtschatka, the banks of the Wolga, and Hudson's Bay. In Scotland, it keeps on the tops of the highest hills, and never descends into the vales, nor mixes with the common hares. Does not run fast, but takes shelter in the clefts of rocks: is easily tamed; full of frolic, and fond of honey, and caraway comfits: It eats its own dung before a storm: It changes its colour in September, and resumes its grey coat in April. In the extreme cold of Greenland only, it is always white. Both this, and the preceding species are common in Siberia, and on the banks of the Wolga. The one never changes colour; the other, a native of the same place, constantly assumes the whiteness of the snow during the winter. This it does, not only in the open air and in a state of liberty; but, as has been proved by experiment, even when kept tame, and preserved in apartments kept warm with stoves, in which it experiences the same changes of colour, as if it had remained on the snowy plains.

They assemble, and are seen in troops of five or six hundred, migrating in spring, and returning in autumn. Compelled by the want of subsistence, they quit in winter the lofty hills, and seek the plains and wooded parts, where vegetables abound. Towards spring, they return to their mountain quarters.

Mr. Muller says he once saw two black hares of a wonderful fine gloss, and black as jet. Another of the same kind was taken near Casan in winter 1768. These of course form a second variety and the specimens are much larger than the common kind. In the southern and western parts of Russia, there is a mixed breed of hares, between this and the common species, forming a third variety. This sustains, during winter only, a partial loss of colour. The sides, and more exposed parts of the ears and legs, in that season, become white: the other parts retain their colours. This variety is unknown beyond the Urallian Chain. They are called by the Russians russacks. They are taken in great numbers in snares, and their skins exported to England, and other places, for the manufacture of hats. The Russians and Tartars, like the Britons of old, hold the flesh of hares in detestation, esteeming it impure: that of the variable hare, in its white state, is excessively insipid.

3. *L. Americanus. American Hare.* Ears tufted with grey; upper part of the tail black,

Y y

L E P U S.

lower white: neck and body mixed with ash, rust colour, and black. Legs of a pale ferruginous colour; belly white. Fore-legs shorter, and hind ones longer in proportion than those of the common hare. Measures eighteen inches in length, and weighs from three to four pounds and a half. Inhabits all parts of North America. In New Jersey, and the colonies to the south of that province, these animals retain their colour during the whole year. But to the northward, on the approach of winter, they change their short summer fur, for one very long, silky and silvery, even to the roots, the edges of the ears only preserving their deeper hue. At that time, it is in the highest season for the table, and is of vast use to those who winter in Hudson's Bay, where they are taken in great abundance in springs made of brass wire, placed in hedges, constructed on purpose, with holes before the snares for the hares or rabbits to pass through.

They breed once or twice a-year, and have from five to seven at a time. Do not migrate, like the preceding, but always haunt the same places. Do not burrow, but lodge under fallen timber, and in hollow trees. Breed in the grass; but, in the spring, shelter their young in hollow trees, to which they also run when pursued. The hunters force them out of those retreats, by means of a hooked stick, or by making a fire, and driving them out by the smoke.

4. *L. Caniculus. Rabbit.* Of which there are five varieties from difference of colour; brownish-grey; white with red eyes, black; black and white; silvery grey, feet brown. The ears of the rabbit are almost naked. The colour of its fur, in a wild state, is brown: its tail black above, and white beneath. Inhabits the temperate and the warm parts of Europe, and even the hottest parts of Asia and Africa. Is not originally British, but succeeds here admirably well. Will not live in Sweden, and the northern countries, except kept in houses. Strabo tells us, that they were imported into Italy from Spain. They are not natives of the western hemisphere, but have been carried thither, and increase greatly in South America. Are exceedingly prolific: breed seven times in a year, and produce eight young at a time. If we suppose this to happen regularly, one pair may produce in four years the amazing number of 1,274,840. Are more prolific than the common hare: which two species, though similar, never intermix. Rabbits pair, and are said to be faithful to their mates. They live to the age of eight or nine years. The offspring is said to pay great deference to their first father. Upon a call, which they are accustomed to obey, he always put himself at their head, and arrives first. He then stands at the mouth of their hole till they had all gone in. In warrens, they keep in their burrows during the middle of the day, and come out in the morning and evening to feed. The males are apt to destroy the young; but their burrows protect them from those enemies that destroy such vast numbers of young hares. Their skins are a great article of commerce; vast numbers of them are exported to China: their fur, like that of the other hares, is of great use in hat manufactories. 5. *L. Angorensis Angora rabbit.* Like the goat and cat of the same place, remarkable for its hair, which is long, waved, and of a silky fineness: a beautiful and valuable animal.

6. *L. Sacatus. Hooded rabbit.* A doub

skin over its back, into which it can withdraw its head; and another under its throat, into which it can withdraw its fore-feet. Has small holes in the loose skin on its back, to admit light to its eyes when its head is covered. Body ash-coloured: head and ears brown. Habitation unknown. See RABBIT.

7. *L. Tolai. Baikal Hare.* Tail short but longer than that of the rabbit; in the male, the ears are longer in proportion than those of the varying hare: fur of the same colour with that of the common hare. Red about the neck and feet. Tail black above, and white beneath. Size between that of the common, and that of the varying hare. The name here given it marks its country. It extends from the lake Baikal as far as Tibet. The Tanguts call it Rangwo, and consecrate it to the spots of the moon. It agrees with the common rabbit in the colour of its flesh; but does not burrow. When pursued, runs for shelter straight to the holes of the rocks, without any circuitous doublings, like those of the common hare; so that it agrees in nature, neither with the hare nor the rabbit. The Mongols call it Tolai. Its fur is bad, and is of no use in commerce.

8. *L. Capensis. Cape Hare.* Ears dilated in the middle. On the outside naked, and of a rose colour: inside and edges covered with short grey hairs. Crown and back dusky, mixed with tawny; cheeks and sides ash-coloured: breast, belly, and legs, rust-coloured. Tail, which it carries upwards, of a pale ferruginous colour, and bushy. Of the size of a rabbit, and inhabits the country for three days march north of the Cape of Good Hope. It is there called the mountain hare: for it lives only in the rocky mountains, and does not burrow. It is difficult to shoot it, as, on the sight of man, it instantly runs into the fissures of the rocks. The same species probably extends as high as Senegal. 9. *L. Viscaccia. Peruvian hare.* Hair very soft, and of a mouse-colour; tail pretty long, bristly and turned up; ears and whiskers like those of the common rabbit. In the time of the Incas, their hair was spun, and wove into cloth, which was so fine, as to be used only by the nobility. Inhabit the colder parts of Peru.

10. *L. Brasiliensis. Brazilian hare.* Tailless, has very large ears, and a white ring round its neck. Face of a reddish colour, chin white; eyes black; colour like that of the common hare, only a little darker; belly whitish. Some want the ring round the neck. They live in the woods; are very prolific; and are reckoned very good meat. Do not burrow. Are found both in Brazil and in Mexico, where they are called Citi.

11. *L. Alpinus. Alpine hare.* Short brown rounded ears, a long head, and very long whiskers, with two very long hairs above each eye. Fur ferruginous, tipped with white, and intermixed with several long dusky hairs; but, at the first look, the whole animal seems of a bright bay. Is only about nine inches long. This species are first seen on the Altaic Chain, and extend to lake Baikal in Tartary, and thence to Kamchatka and the Fox Isles. They inhabit always the middle region of the snowy mountains, in the roughest places, wooded, and abounding with herbs and moisture. Sometimes burrow; but are more frequently found in crevices between the rocks, in pairs, or more, according to convenience. In cloudy weather they assemble

LEPUS.

and lie on the rocks, and emit a sound, so like that of a sparrow, as to deceive the hearer. On the report of a gun, they run into their holes; but soon come out again, supposing it to be a clap of thunder, to which they are so much used in their lofty habitations. By wonderful instinct, they make a provision against the rigorous season in their inclement seats. Towards autumn, a company of them collect vast heaps of choice herbs and grasses, nicely dried, which they place either beneath the overhanging rocks, or in the chasms, or round the trunk of some tree. The way to these heaps is marked by a worn path. The heaps are formed like conoid ricks of hay, and are of various sizes, according to the number of the society employed in forming them. They are sometimes of a man's height, and many feet in diameter, but usually about three feet.

Thus, they wisely provide their winters stock, otherwise they must perish, being prevented by the depth of the snow from quitting their retreats in quest of food.

They select the best of vegetables; and crop them when in the fullest vigour. These they make into the best and greenish hay, by the judicious manner in which they dry them. These ricks too are the origin of fertility amidst the rocks; for their remains, mixed with the dung of the animals, rotting, in the otherwise barren chasms, create a soil productive of vegetables.

These ricks are also of great service to those who devote themselves to the laborious employment of sable hunting. Being obliged to go far from home, their horses would often perish for want, if not supported by the casual provisions of these industrious little animals. The people of Jakutz are said to feed both their horses and cattle with the reliques of the winter stock of these hares. Such supply may be serviceable to some in the spring, when their own stock is exhausted; but, should they depend solely on these feeble mountaineers, they would deserve to lose both horses and cattle every hard winter.

These hares are neglected as food by man; but they are the prey of sables, and of the Siberian weasel, which are joint inhabitants of the same mountains. They are likewise greatly infested by the *Oestrus leporinus*, a species of gadfly, which, in August and September, lodges its eggs in their skin, and often proves fatal to these feeble and defenceless, though industrious creatures.

12. *L. Ogotona*. *Ogoton hare*. Oblong oval ears, a little rounded; shorter whiskers than the former species; fur long and smooth; light grey in the middle; white at the ends, intermixed with a few dusky hairs; with a yellowish spot on the nose; and a space about the rump of the same colour. Lunbs also yellowish on the outside, and belly white. It is only about six inches long. The male weighs from six ounces and a half, to seven and a quarter; the female, from four to four and three quarters. Inhabits the same countries as the Alpine hare, and lives in the open vallies, and on gravelly or rocky naked mountains, under heaps of stones; but in a sandy soil burrows leaving two or three entrances. Their holes run obliquely; and in these they make their nests of short grass. They wander chiefly in the night. Voice excessively shrill, in a note like that of a sparrow, twice or

thrice repeated, but very easily to be distinguished from that of the Alpine hare. Fond of the bark of a sort of service tree, and of the dwarf elm. Before the approach of severe cold, they collect great quantities of herbs, and fill their holes with them. Directed by the same instinct as the former species, they rear in autumn, their ricks of hay, of a hemispherical form, about a foot high and wide. In the spring, these elegant heaps disappear. They copulate in the spring. About the latter end of June, the young are observed to be full grown. They are the prey of hawks, magpies and owls; but the cat manual makes the greatest havoc among them. The ermine and fitchet are equally their enemies.

13. *L. Pusillus*. *Callung hare*. Named by the Tartars *Ittsitskan*, or the barking mouse; has a longer head in proportion to its size, which is very diminutive, than is usual with hares. Head thickly covered with fur, even to the tip of the nose. Has large whiskers: ears large and rounded; legs very short; soles furred beneath. Its whole coat very long, soft and smooth; with a thick long fine down beneath, of a brownish lead colour. The hair of the same colour, of a light grey towards the ends, and tipped with black. The lower parts of the body hoary: the sides and ends of the fur yellowish. Length about six inches: weight from three ounces and a quarter, to four and a half. In winter scarcely two and a half. This tribe inhabit the south-east parts of Russia; but are found no where, in the east, beyond the river Oby. They delight in sunny vallies, and hills covered with herbs, especially those near the edges of woods, to which they run on any alarm. They live so concealed a life, as very rarely to be seen; but are often taken in winter in the snares laid for the ermines. They choose, for their burrows, a dry spot, amidst bushes, covered with a firm sod, preferring the western sides of the hills. Their place would scarcely be known, but for their excrements; and even these they drop, by a wise instinct, under some bush, lest their dwelling should be discovered by their enemies among the animal creation.

It is their voice alone that betrays their abode. Their cry is like the piping of a quail, but deeper, and so loud, as to be heard at the distance of half a German mile. It is repeated, by just intervals, three, four, and often six times. This cry is emitted at night, and in the morning, but seldom in the day, except in rainy or cloudy weather. It is common to both sexes; but the female is silent for some time after parturition, which happens about the beginning of May. She brings forth six at a time, blind and naked; suckles them often, and covers them carefully with the materials of her nest.

These most harmless and inoffensive creatures never go far from their holes. They feed, and make their little excursions by night; drink often; sleep little, and are easily made tame. They will scarcely bite when handled; yet the males have been observed, when in confinement, to attack each other, and to express their anger by a grunting noise.

LEPUS, the hare, in astronomy, a constellation of the southern hemisphere; whose stars in Ptolemy's catalogue are 19; in that of Tycho 19; in the Britannic catalogue 19; viz. 0. 0. 3. 6. 4. 4.

LER

LERCHRA. In botany, a genus of the class monadelphia, order pentandria. Calyx five-toothed; corol funnel-form, five-cleft; anthers five, seated on the tube of the germ; style one; capsule three celled, many seeded. One species, an irregular shrub of the East-Indies.

LERE, s. (Lape, Saxon.) A lesson, lore; doctrine; obsolete (*Spenser*).

LERIA, or LEIRIA, a strong town of Estremadura in Portugal, with a castle and bishop's see. It contains about 3500 inhabitants, and was formerly the residence of the kings of Portugal. Lon. 7. 50. W. Lat. 39. 40. N.

LERIDA, an ancient, strong, and large town of Spain, in Catalonia, with a bishop's see, an university, and a strong castle. This place declared for king Charles after the reduction of Barcelona in 1705: but it was retaken by the duke of Orleans in 1707, after the battle of Almanza. It is seated on a hill near the river Nègra, and in a fertile soil, in Lon. 0. 35. E. Lat. 41. 31. N.

LERINA, or PLANASIA, (anc. geog.), one of the two small islands over against Antipolis, called also Lerinas and Lirinus. Now St. Honorat, on the coast of Provence, scarce two leagues to the south of Antibes.

LERINS, the name of two islands in the Mediterranean sea, lying on the coast of Provence in France, five miles from Antibes; that near the coast, called St. Margaret, is guarded by invalids, state prisoners being sent thither. It was taken by the English in 1746, but Marshal Belleisle retook it in 1747. The other is called St. Honorat; and is less than the former, but has a Benedictine abbey.

LERMA, a town of Spain, in Old Castile, seated on the river Arlanza, with the title of a duchy. Lon. 3. 5. W. Lat. 42. 2. N.

LERNA, a county of Argolis, celebrated for a grove and a lake, where, according to the poets, the Danaides threw the heads of their murdered husbands. It was there also that Hercules killed the famous hydra. *Virg. Strab. &c.*—There was a festival, called Larnæ, celebrated there in honour of Bacchus, Proserpine, and Ceres.

LERNÆA. In zoology, a genus of the class vermes, order mollusca. Body oblong, somewhat cylindrical, naked; tentacles or arms two or three on each side and round, by which it affixes itself; ovaries two, projecting like tails from the lower extremity. These are eyeless, and very troublesome to fishes, adhering very firmly to them, and principally to their gills and fins. Fifteen species chiefly found adhering to fishes in the north seas, about three or four to those on our own coast. The following are those mostly worthy noticing.

1. *L. Branchialis.* Body round, flexuous; mouth lateral and seated between three slightly branched horns. Inhabits the North Seas on the gills of cod-fishes, and is eaten

LES

by the Greenlanders: about two inches long.

2. *L. Cyprinacea.* Body cylindrical, clavate behind: thorax forked; tentacles lunate at the tip; about half an inch long, and of the size of a straw, round, pale and somewhat pellucid: tentacles four, two of them lunate at the tip. Inhabits the ponds of our own country; fixt to the sides of carp, rouch and crucian.

3. *L. Salmonea.* Salmon-louse. Body obovate; thorax, inversely heart-shaped; arms two, approximate linear. Inhabits the gills of salmon: six lines long.

LEARNICA, formerly a large city in the island of Cyprus, as appears from its ruins; but is now no more than a large village, seated on the southern coast of that island, where there is a good road, and a small fort for its defence.

LERO (anc. geog.), one of the two small islands in the Mediterranean, opposite to Antipolis, and half a mile distant from it to the South. Now St. Margarita over against Antibes on the coast of Provence.

LERO, or Lerós, an island of the Archipelago, and one of the Sporades, remarkable, according to some authors, for the birth of Patroclus. Lon. 26. 15. E. Lat. 37. 0. N.

LE ROY *le vent*, a form of words, by which the royal assent is signified by the clerk of the parliament to public bills; to private bills this assent is expressed by *soit fait comme il est désiré*.

Le Roy s'avisa. By these words to a bill, prevented to the king by his parliament, is understood his absolute denial of that bill in a more civil way; and the bill thereby becomes wholly null and void. See **PARLIAMENT**.

LERRY. s. (from *lere*.) A rating; a lecture.

LERWICK, the chief town of the Shetland Islands, situate on the east side of Mainland, the principal island. It is the rendezvous of the fishing busses from Britain, Holland, Denmark, and other parts. Lon. 1. 30. W. Lat. 60. 20. N.

LESBONAX, a philosopher of Mitylene, who flourished in the first century. There are two orations under his name in Alduss's edition of ancient orators, and a treatise *De figuris Grammaticis*, printed at Leyden in 1739.

LESBOS, a large island in the Ægean sea, on the coast of Æolia, of about 168 miles in circumference. It has been severally called *Pelagias*, from the Pelasgi by whom it was first peopled; *Macaria*, from Macareus who settled in it; and *Lesbos*, from the son-in-law and successor of Macareus who bore the same name. The chief towns of Lesbos were Methymna and Mitylene. It was originally governed by kings, but they were afterwards subjected to the neighbouring powers. The wine which it produced was greatly esteemed by the ancients, and

LES

still is in the same repute among the moderns. The Lesbians were so debauched and dissipated, that the epithet of Lesbian was often used to signify debauchery and extravagance.

LESCAILLE (Catherine), a native of Holland, and called by some the Dutch Sappho. She died in 1711. Her works chiefly consist of tragedies, very irregular, but discovering in many respects strong marks of superior genius.

LESCAR, a town of France, in the department of the Lower Pyrenees. It was lately a bishop's see; and is seated on a hill, three miles N.W. of Pau, and 42 S.E. of Bayonne. Lon. 0. 7. W. Lat. 43. 17. N.

LESGUIS, one of the seven Caucasian nations, between the black Sea and the Caspian. Their country is indifferently called by the Georgians, Lesgistan, or Daghestan. It is bounded on the south and east by Persia and the Caspian; on the SW. and W. by Georgia, the Ossi, and Kisti; and on the N. by the Kisti and Tartar tribes. It is divided into a variety of districts, generally independent, and governed by chiefs elected by the people. The Lesguis are supposed to be descended from the tribes of mountaineers, known to ancient geographers under the name of Lesgæ or Ligyes. The strength of their country, which is a region of mountains whose passes are known only to themselves, has probably, at all times, secured them from foreign invasion. They subsist by raising cattle, and by predatory expeditions into the countries of their more wealthy neighbours. During the troubles in Persia, towards the beginning of this century, they repeatedly sacked the towns of Shamachie and Ardebil, and ravaged the neighbouring districts. In their persons and dress, and general habits of life, as far as these are known to us, they greatly resemble the Circassians.

LESINA, a town of Naples, in Capitanata, with a bishop's see, 26 miles N.W. of Manfredonia, and 86 N.N.E. of Naples. Lon. 15. 14. E. Lat. 41. 44. N.

LESION. See LÆSION.

LESKEARD, a borough in Cornwall, with a market on Saturday. It had formerly a castle, now in ruins, and is one of the coinage of the towns for tin. It sends two members to parliament, is governed by a mayor, and has a considerable manufacture of yarn. It is 31 miles E.N.E. of Truro, and 221 W. by S. of London. Lon. 4. 36. W. Lat. 50. 27. N.

LESLIE (John), bishop of Clogher, was born in Scotland of a good family, and educated at Aberdeen and at Oxford. His first preferment was the bishopric of the Orkneys, from whence he was removed to Raphoe in Ireland, in 1693. He built there a stately palace in the form of a castle, in which he endured a long siege against Oliver Cromwell. On being obliged to surrender he retired to Dublin, where he held

LES

several ordinations. In 1661 he was translated to Clogher. He died in 1671, aged above 100 years, and having been above half a century a bishop.

LESLIE (Charles), son of the preceding, was born in Ireland, and educated at Dublin, where he took his degree of M. A., and on entering into orders, became chancellor of the diocese of Connor. He rendered himself very obnoxious to the popish party, by disputing successfully with some of their priests, and converting thereby several persons, particularly a gentleman of some consequence among them. He signalized himself also in many other respects against the arrogance of the papists, who took great liberties in consequence of James II. being of their religion. But though Mr. Leslie opposed strenuously the popish principles, he could not bring himself to alienate his allegiance from that monarch, and thereby lost all his preferments at the revolution. He then commenced political writer, and published several smart works in defence of hereditary right, and non-resistance. He also wrote some admirable pieces against the quakers, dissenters, socialists, and deists. Becoming obnoxious on account of his politics, he was obliged to withdraw secretly to France, where he joined the pretender, and had liberty to officiate in a private chapel, according to the rites of the church of England. He accompanied that prince to Italy, and endeavoured to convert him to protestantism; but being disappointed, and also indifferently treated, he returned to his own country, and died at his house at Glaslough, in the county of Monaghan, in 1722. His theological works have been collected into 2 vols. folio. They shew great depth of judgment, and most extensive reading.

The most celebrated of Mr. Leslie's works is his "Short and Easy Method with the Deists, wherein the certainty of the Christian Religion is demonstrated by Infallible Proof, from four Rules, which are incompatible to any imposture that ever yet has been, or can possibly be." This valuable little tract was written at the suggestion of the Duke of Leeds, who said "if christianity were a truth, there must be some short way of showing it to be so; and he wished Mr. Leslie would think of it." Such a hint to such a man was effectual; and produced this little book in three days. Mr. Leslie argues that the truth of a matter of fact may be certainly known, if it be attended with certain marks, such as no "false fact" can certainly have. These marks are four. It is required, first, that the fact be a sensible fact, such as men's outward senses can judge of; secondly, that it be notorious, performed publicly in the presence of witnesses; thirdly, that there be memorials of it, or monuments, and actions kept up in memory of it; fourthly, that such monuments and actions begin with the fact. It is

the design of Mr. Leslie to shew how these four marks all meet in the facts of Revelation. Dr. Conyers Middleton, feeling how necessary it was to his principles, that he should some way rid himself of the weight of Leslie's argument, looked out for some "false fact" to which the four criteria might be applied: and this he did for 20 years together, without being able to find one. This we state upon the authority of Dr. Berkeley son to the celebrated Bishop of Cloyne. We do not learn, however, that Dr. Middleton abandoned his deistical notions, notwithstanding he was thus compelled to acknowledge that the argument was triumphantly in favour of Christianity. What is there in credulity, bigotry, superstition, or enthusiasm, half so ridiculous and lamentable, as the pertinacious adherence to dangerous error here exhibited? After this short account of Mr. Leslie's book, it is almost needless to add that we warmly recommend it to every candid enquirer after truth.

LESS. A negative or private termination. (leaf, Sax. *loos*, Dut.) joined to a substantive it implies the absence or privation of the thing expressed by that substantive: as, a witless man, a man without wit.

LESS. *a.* (leaf, Saxon.) The comparative of little: opposed to greater (*Locke*).

LESS. *s.* Not so much; opposed to more, or to as much (*Exodus*).

LESS. *ad.* In a smaller degree; in a lower degree (*Dryden*).

LESSE'E. *s.* The person to whom a lease is given.

To LESSEN. *v. a.* (from less.) 1. To make less; to diminish in bulk. 2. To diminish the degree of any state or quality; to make less intense (*Denham*). 3. To degrade; to deprive of power or dignity (*Atterbury*).

To LESSEN. *v. n.* To grow less; to shrink; to be diminished (*Temple*).

LESSER. *a.* A corruption of less (*Pope*). LESSER. *ad.* (formed by corruption from less.) (*Shakespeare*).

LESSES. *s.* (*laissées*, French.) The dung of beasts left on the ground.

LESSER-TONE, in music. See TONE.

LESSING (Gotthold Ephraim), a German poet, was the son of a minister at Kametz, and educated at Meissen, from whence he was sent to Leipsic, where he applied himself to dramatic poetry, and finished a comedy called the Young Scholar, but led rather an irregular life, which gave his father great uneasiness. On leaving Leipsic, he went to Berlin, where he formed an acquaintance with Voltaire. Here he wrote and translated several books, and formed many plans which he did not live to execute. He was for some time secretary to general Tauenzien, at Breslaw, where he gave way to play so that his literary labours were suspended.

LESSON. *s.* (*leçon*, French.) 1. Any thing read or repeated to a teacher, in order

to improvement (*Denham*). 2. Precept; notion inculcated (*Spenser*). 3. Tune pricked for an instrument (*Davies*). 4. A rating lecture (*Sidney*).

To LESSON. *v. a.* (from the noun.) To teach; to instruct (*Shakespeare*).

LESSON, among ecclesiastical writers, portions of the Holy Scriptures, read in Christian churches, at the time of divine service.

In the ancient church, reading the Scriptures was one part of the service of the Catechumens, at which all persons were allowed to be present, in order to obtain instruction.

The church of England, in the choice of lessons, proceeds as follows: for the first lesson on ordinary days, she directs, to begin at the beginning of the year with Genesis, and so continue on, till the books of the Old Testament are read over, only omitting the Chronicles, which are for the most part the same with the books of Samuel and Kings, and the other particular chapters in other books, either because they contain names of persons, places, or other matters less profitable to ordinary readers.

The course of the first lessons for Sundays is regulated after a different manner. From Advent to Septuagesima Sunday, some particular chapters of Isaiah are appointed to be read, because that book contains the clearest prophecies concerning Christ. Upon Septuagesima Sunday Genesis is begun, because that book, which treats of the fall of man, and the severe judgment of God inflicted on the world for sin, best suits with a time of repentance and mortification. After Genesis, follow chapters out of the books of the Old Testament, as they lie in order; only on festival Sundays, such as Easter, Whitsunday, &c. the particular history relating to that day is appointed to be read; and on the Saints' days, the church appoints lessons out of the moral books, such as Proverbs, Ecclesiastes, Ecclesiasticus, &c. as containing excellent instructions for the conduct of life.

As to the second lessons, the church observes the same course both on Sundays and week days: reading the gospels and Acts of the Apostles in the morning, and the epistles in the evening, in the order that they stand in the New Testament: excepting on saints-days and holy days, when such lessons are appointed, as either explain the mystery, relate the history, or apply the example to us.

Lesson, was formerly used by most musical composers to signify those exercises for the harpsicord or piano-forte which are now more generally called sonatas. The length, variety, and style, of lessons, are not regulated by any acknowledged rule, but entirely depend on the fancy and abilities of the composer, and the class of practitioners for whose use the pieces are designed. The word lesson is also applied to that instruc-

LES

tion which a master communicates to his pupil at each visit or sitting.

LESSOR. *s.* One who lets any thing to farm, or otherwise, by lease (*Denh. Ayliffe*).

LEST. *conj.* (from the adjective *least*.) That not; I hide it lest it may be lost; that is, I hide it that it may not be lost (*Addis*).

LESTOFF. See **LOWESTOFF**.

L'ESTRANGE (Sir Roger), a noted writer in the 17th century, was descended from an ancient family, seated at Haunstanton-hall in the county of Norfolk, where he was born in 1616, being the youngest son of sir Hammond L'Estrange baronet, a zealous royalist. Having in 1644 obtained a commission from king Charles I. for reducing Lynn in Norfolk, then in possession of the parliament, his design was discovered, and his person seized. He was tried by a court martial at Guildhall in London, and condemned to die as a spy; but was reprieved, and continued in Newgate for some time. He afterward went beyond sea; and in August 1653 returned to England, where he applied himself to the protector Oliver Cromwell, and having once played before him on the bass-viol, he was by some nicknamed Oliver's fiddler. Being a man of parts, master of an easy humorous style, but withal in narrow circumstances, he set up a newspaper, under the title of *The Public Intelligencer*, in 1663; but which he laid down, upon the publication of the first London gazette in 1665, having been allowed, however, a consideration by government. Some time after the Popish plot, when the Tories began to gain the ascendant over the Whigs, he, in a paper called the *Observer*, became a zealous champion for the former. He was afterwards knighted, and served in the parliament called by king James II. in 1685. But things taking a different turn in that prince's reign, in point of liberty of conscience, from what most people expected, our author's observations were disused, as not at all suiting the times. However, he continued licenser of the press till king William's accession, in whose reign he met with some trouble as a disaffected person. However, he went to his grave in peace, after he had in a manner survived his intellectuals. He published a great many political tracts, and translated several works from the Greek, Latin, and Spanish; viz. Josephus's works, Cicero's Offices, Seneca's Morals, Erasmus's Colloquies, Æsop's Fables, and Bonas's Guide to Eternity. The character of his style has been variously represented; his language being observed by some to be easy and humorous, while Mr. Gordon says, "that his productions are not fit to be read by any who have taste or good-breeding. They are full of phrases picked up in the streets, and nothing can be more low or nauseous."

LESTRE, a town of France, in the department of the channel, and chief place of a canton, in the district of Valognes;

LET

one league and three quarters E. Valognes; and four and a half N. Carentan.

LESTWITHIEL, a town of England, in the county of Cornwall, situated on the river Fowey, which was formerly navigable, so far for vessels of considerable burden, but the river is now choked up, and the trade of the town, which was once flourishing is now in a state of decay. Near it are the ruins of a castle, formerly the residence of the earls of Cornwall. It is, however, a corporation, and sends two members to the British parliament; thirty-one miles E.N.E. Truro, and 280 W.S.W. London. Lon. 4. 48. W. Lat. 50. 27. N.

To LET. *v. a.* (ætan, Saxon) 1. To allow; to suffer; to permit (*Dryden*). 2. A sign of the optative mood used before the first, and imperative before the third person. Before the first person singular it signifies relation, fixed purpose, or ardent wish (*Judges*). 3. Before the first person plural, let implies exhortation: let us die bravely (*Mark*). 4. Before the third person, singular or plural, let implies permission: let him go free (*Dryden*). 5. Before a thing in the passive voice, let implies command: let the door be opened (*Dryden*). 6. Let has an infinitive mood after it without the particle to (*Dry.*) 7. To leave (*J. Estrange*). 8. To more than permit (*Shakspeare*). 9. To put to hire; to grant to a tenant (*Swift*). 10. To suffer any thing to take a course which requires no impulsive violence (*Joshua*). 11. To permit to take any state or course (*Sid.*) 12. To let blood, is elliptical for to let out blood. To free it from confinement; to suffer it to stream out of the vein (*Shaks.*) 13. To let in to admit (*Knolles*). 14. To let in, or into. To procure admission (*Locke*). 15. To let off; to discharge (*Swift*). 16. To let out; to lease out; to give to hire or farm.

To LET. *v. a.* (lettan, Saxon.) 1. To hinder; to obstruct; to oppose (*Dryden*). 2. To let, when it signifies to permit or leave, has let in the preterit and part. passive; but when it signifies to hinder, it has letted; as, many things have letted me.

To LET. *v. n.* To forbear; to withhold himself (*Bacon*).

LET. *s.* (from the verb.) Hindrance: obstacle; obstruction; impediment (*Hooker*).

LET, the termination of diminutive words, from lyce, Saxon, little, small: as rivulet, a small stream; hamlet, a little village.

LETLADE. See **LECHLADE**.

LETHARGIC. *a.* (*lethargique*, French.) Sleepy by disease, beyond the natural power of sleep (*Hammond*).

LETHARGICNESS. *s.* Morbid sleepiness; drowsiness to a disease (*Herbert*).

LETHARGIED. *a.* (from *lethargy*.) Laid asleep; entranced (*Shakspeare*).

LETHARGY. *lethargus.* A heavy and constant sleep, with scarce any intervals of waking; when awakened, the person answers, but ignorant or forgetful of what he

504

LÊTHÊ, in Mythology, one of the rivers of hell, whose waters the souls of the dead drank after they had been confined for a certain space of time in Tartarus. The draught caused them to forget whatever they had done, seen, or heard before, as the name implies, λῆθη, oblivion.—Lethæ is a river, of Africa near the Syrtes, which runs under the ground, and some time after rises again, whence the origin of the fable of the Lethæan streams of oblivion.—There are also two other rivers of this name, one in Spain, the other in Bœotia.

LETRIM. See **LETRIN.**
LETTER, *litera*, a character either in print or writing, by which any people have agreed to express one of the sounds, used in conveying their thoughts to each other in speech.

Letter is by some defined, a simple uncompounded sound of the voice, that cannot be subdivided into any more simple, and generally marked with a particular character.

Where a sign or character does not express a sound entirely simple, but one resolvable into several, it is not so properly a letter as an abbreviation, containing in itself as many letters as its power does simple sounds. This is evident in the Latin *&*, *x*, and the Greek *ξ*, *ψ*, &c. which are composed of *e*, *t*, *k*, *s*, *κσ*, *ωσ*, *στ*, &c.

The letters *f, g, h, k, q, x, y, z*, were unknown to the ancient Romans, as is proved by Dausquius in his Orthography, where he traces the origin of the several letters. See *F, G, H, &c.*

The Hebrews divide their letters into guttural, as *a, h, ch, gn*, aleph, he, chaph, hain, expressed by אוחח; dental, as *z, s, ts, r, sh, zain, samech, tsade, resh, schin*, expressed by נצצרש; labial, as *b, m, n, p*, beth, mem, vau, pho, expressed by the word בוקמ; lingual, or those chiefly formed by the tongue, as *d, t, l, n, th, dalet, teth, lamed, nun, than*, expressed by דלתנח; and

•

Printers distinguish their letters into capital, majuscule, initial, or upper case letters, which serve for the titles of books, proper names, &c. And minuscule, small, or under-case letters; which are again divided, according to their size, into pearl, nonpareil, pica, great canon, &c. They have also their flourished letters, engraven on wood or metal, which take place of the illuminated letters of the ancient manuscripts.

Letters make the first part or elements of grammar; an assemblage of these compose syllables, of those words, and of these sentences.

As the difference of articulate sounds was intended to express the different ideas of the mind, so one letter was originally intended to signify only one sound, and not as at present, to express sometimes one sound, and sometimes another; which practice has brought a great deal of confusion into the languages, and rendered the learning of the modern tongues infinitely more difficult than it would otherwise have been. This consideration, together with the poverty of all the known alphabets, and their want of some letters to express certain sounds by, has occasioned several attempts towards an universal alphabet, to contain an enumeration of all such single sounds or letters as are used in any language. A thing of very considerable use; a specimen of which is given us by Mr. Lodwick, in the Philosophical Transactions. See Universal Character.

Yet as to the first letters, what they were, who first invented them, and among what people they were first in use, there is still room to doubt; however, setting aside conjectures and prejudice, the business of antiquity seems to lie between the Egyptians and Chinese. Philo attributes the first invention of letters to Abraham; Josephus, St. Irenæus, and others, to Enoch; Bilibander, to Adam; Eusebius, Clement Alexandrinus. Corn. Agrippa, &c. to Moses;

Pomponius Mela, Herodian, Rufus Festus, Pliny, Lucan, &c. to the P^hœnicians; St. Cyprian, to Saturn; Tacitus, to the Egyptians, &c. The most probable opinion is, that they were communicated by God himself to Moses, when he gave him the Decalogue. See LANGUAGE.

Grammarians distinguish letters into vowels, consonants, mutes, liquids, diphthongs, and characteristics. They are likewise divided into capital and small letters. They are also denominated from the shape and turn of the letters; and in writing are distinguished into different hands, as round-text, German-text, round-hand, Italian, &c. and in printing, into Roman, Italic, and black letter.

The term *Letter*, or *Type*, among printers, not only includes the CAPITALS, SMALL-CAPITALS, and small letters, but all the points, figures, and other marks cast and used in printing; and also the large ornamental letters, cut in wood or metal, which take place of the illuminated letters used in manuscripts. The letters used in printing are cast at the ends of small pieces of metal, about three quarters of an inch in length; and the letter being not indented, but raised, easily gives the impression, when, after being blacked with a glutinous ink, paper is closely pressed upon it. See the articles PRINTING and TYPE. A fount of letters includes small letters, capitals, small capitals, points, figures, spaces, &c; but besides, they have different kinds of two-line letters, only used for titles, and the beginning of books, chapters, &c. See FOUNT.

LETTER, a writing addressed and sent to a person. See EPISTLE. The art of epistolary writing, as the translator of Pliny's Letters has observed, was esteemed by the Romans in the number of liberal and polite accomplishments, and we find Cicero mentioning with great pleasure, in some of his letters to Atticus, the elegant specimen he had received from his son of his genius in this way. It seems indeed to have formed part of their education; and, in the opinion of Mr. Locke, it well deserves to have a share in ours. "The writing of letters (as that judicious author observes) enters so much into all the occasions of life, that no gentleman can avoid shewing himself in compositions of this kind. Occurrences will daily force him to make this use of his pen, which lays open his breeding, his sense, and his abilities, to a severer examination than any oral discourse." It is to be wondered we have so few writers in our own language who deserve to be pointed out as models upon such an occasion. After having named Sir William Temple, it would perhaps be difficult to add a second. The elegant writer of Cowley's life mentions him as excelling in this uncommon talent; but as that author declares himself of opinion, "That letters which pass between familiar friends, if they are written as they should be, can scarce ever be fit to see the light," the world is deprived of what no doubt would have been well worth its inspection. A late distinguished genius treats the very attempt as ridiculous. VOL. VI.

culous, and professes himself a mortal enemy to what they call a *fine letter*. His aversion, however, was not so strong, but he knew to conquer it when he thought proper; and the letter which closes his correspondence with bishop Atterbury is, perhaps, the most genteel and manly address that ever was penned to a friend in disgrace. The truth is, a fine letter does not consist in saying fine things, but in expressing ordinary ones in an uncommon manner. It is the *proprie communia dicere*, the art of giving grace and elegance to familiar occurrences, that constitutes the merit of this kind of writing. Mr. Gay's letter concerning the two lovers who were stuck dead with the same flash of lightning, is a master-piece of the sort; and the specimen he has there given of his talents for this species of composition, makes it much to be regretted we have not more from the same hand. The letters of Cowper, Lady Mary Wortley Montague, and Miss Talbot, may also be mentioned as models in their respective kinds.

LETTER. A servant of the post-office is within the penalty of 5 Geo. III. c. 25, which makes it a capital felony to secrete a letter containing any bank-note, though he has not taken the oath required by 9 Anne c. 10. But to secrete a letter containing money, is not an offence within the statutes concerning the servants of the post-office.

The rate of postage of general-post letters is regulated by distance in the following proportions:

For every letter not exceeding 15 miles, 4*d*, 30 miles, 5*d*, 50 miles, 6*d*, 80 miles, 7*d*, 120 miles, 8*d*, 170 miles, 9*d*, 230 miles, 10*d*, 300 miles, 11*d*. Where the distance is under or above 160 miles, and more than 300 miles, an additional 1*d*, and so on for every further 100 miles, and all letters to and from Ireland conveyed by packet-boats shall be paid 2*d* above all other rates. For all letters to or from Portugal, or the British dominions in America, 1*s*; and to any places without the king's dominions, 4*d* additional, and all foreign letters must be charged with the full inland rates of postage.

No letter shall be rated higher than as a triple letter, if less than 1 oz. in weight, and if an oz. than as four single letters; and so in proportion of 4 of an oz. as a letter. These rates were settled by 41 Geo. III. c. 7.

All letters on his majesty's business are free; also all peers and members of the house of commons may send daily 10 letters free and receive 1*s*, not exceeding 1 oz. each in weight, provided the franked letters sent by them shall be indorsed with their name, and the date when the letters are put in written at full length, and the whole direction to be in the hand-writing of such member of parliament. Also, provided such member of parliament shall be within 20 miles of the post town, where letters are put in franked by him, or where letters are received directed to him. 43 Geo. III. c. 31.

LETTER OF ATTORNEY, is an instrument giving to a second person the authority to do

any lawful act in the stead of the maker. They are sometimes revokable and sometimes not; in the latter case the word irrevocable is inserted. The authority must be strictly pursued: and if the attorney does less than the power it shall be void; if more, it shall be good as far as the power goes, and void as to the rest; but both these rules have many exceptions. See 1 Inst. 258.

LETTER OF CREDIT, is where a merchant or correspondent writes a letter to another, requesting him to credit the bearer with a certain sum of money.

LETTER OF LICENCE, is a written permission granted to a person under embarrassment, allowing him to conduct his affairs for a certain time without being molested. Such instrument will bind all the creditors by whom it is executed, and it generally contains certain stipulations to be observed by all parties.

LETTERS (Threatening). To send letters threatening to accuse a person of any crime punishable with death or any infamous punishment, and knowingly to send any anonymous or fictitious letter threatening to kill any, or to set fire to their tenements or property, with a view of extorting money or valuables from them, is in the first instance punishable with fine, imprisonment, pillory, whipping, or transportation for seven years, and in the other instance is felony without benefit of clergy.

LETTERS PATENT. See **PATENTS**, and **EXEMPLIFICATION OF PATENTS**.

LETTERS (Close), are grants of the king specially distinguished from letters patent, in that the letters close, being not of public concern, but directed to particular persons, are closed up and sealed.

LETTERS OF MARQUE, are extraordinary commissions, granted to captains or merchants for reprisals, in order to make a reparation for those damages they have sustained, or the goods they have been deprived of by strangers at sea.

These appear to be always joined to those of reprise, for the reparation of a private injury; but under a declared war the former only are required.

LETTER. s. (from *let.*) 1. One who lets or permits. 2. One who hinders. 3. One who gives vent to any thing: as, a blood letter.

To **LETTER. v. a.** (from the noun) To stamp with letters (*Addison*).

LETTERED. a. (from *letter.*) Literate; educated to learning (*Collier*).

LETTUCE, in botany. See **LACTUCA**.

LETTUCE (Hare's). See **SONCHUS**.

LETTUCE (Lamb's). See **VERONICA**.

LETTUCE (Wild). See **PRENANTHES**.

LEVANT, properly signifies the quarter where the sun rises, but is generally applied to the coasts of Asia, along the Mediterranean, and especially Asiatic Turkey, from Alexandria in Egypt, to the Black Sea, and including the islands of Cyprus, Rhodes, and the Archipelago.

LEVANTINE VALLEY, a valley of

Switzerland on the confines of Italy, lying between Mount St. Gothard and Lake Maggiore. It is divided into two parts by the river Tesino; and is right leagues long, but the breadth inconsiderable. The lower part is populous, rich in pasturage, and produces much hemp and flax. The houses are entirely of wood, and have externally the appearance of Swiss cottages, but a neglect of cleanliness proves the vicinity and greater similarity to the Italians. It is a bailiwick, subject to the canton of Uri; and Ossogna, the residence of the bailiff, consists only of a few houses.

LEVATOR, in anatomy, a name given to various muscles, which act as levers in raising the limbs or organs.

LEVATOR ANGULI ORIS. (*levator*, from *levo*, to lift up; so named from its office, which is to lift up the part to which it is affixed.) Elevator labiorum communis of Douglas. Caninus of Winslow. A muscle situated above the mouth, which draws the corner of the mouth upwards, and makes that part of the cheek opposite to the chin prominent, as in smiling. It arises thin and fleshy from the hollow of the superior maxillary bone, between the root of the socket of the first grinder and the foramen infra orbitarium, and is inserted into the angle of the mouth and under lip, where it joins with its antagonist.

L. ani This muscle arises from the os pubis, within the pelvis, as far up as the upper edge of the foramen thyroideum, and joining of the os pubis with the os ischium, from the thin tendinous membrane that covers the obturator internus and coccygeus muscles, from the spinous process of the ischium. From these origins all round the inside of the pelvis, its fibres run down like rays from a circumference to a center, to be inserted into the sphincter ani, acceleratores urinae, and anterior part of the two last bones of the os coccygis, surrounding the extremity of the rectum, neck of the bladder, prostate gland, and part of the vesiculæ seminales. Its fibres joining with those of its fellow, form a funnel-shaped hole that draws the rectum upwards after the evacuation of the fæces, and assists in shutting it. The levatores ani also sustain the contents of the pelvis, and assist in ejecting the semen, urine, and contents of the rectum, and perhaps, by pressing upon the veins, contribute greatly to the erection of the penis.

L. labii inferioris. Levator menti of Albinus. Incisivus inferior of Winslow. Elevator labii inferioris proprius of Douglas. A muscle of the mouth, situated below the lips: it arises from the lower jaw, at the roots of the alveoli of two incisor teeth and the cuspidatus, and is inserted into the under lip and skin of the chin.

L. labii superioris alæque nasi. Elevator labii superioris proprius of Douglas. Incisivus lateralis et pyramidalis of Winslow. A muscle of the mouth and lips, that raises the upper lip towards the orbit, and a little outwards; it serves also to draw the skin of the nose upwards and outwards, by which the nostril is di-

lated. It arises by two distinct origins; the first broad and fleshy from the external part of the orbital process of the superior maxillary bone, immediately above the foramen infra-orbitarium; the second from the nasal process of the superior maxillary bone, where it joins the os frontis. The first portion is inserted into the upper lip and orbicularis muscle, the second into the upper lip, and outer part of the ala nasi.

L. oculi. See **RECTUS SUPERIOR OCULI**.

L. palati. Levator palati molliis of Albinus.

Petro-salpingo-staphilinus, vel salpingo-staphilinus internus vulgo of Winslow. Salpingo-staphilinus of Valsalva. Pterigo-staphilinus externus vulgo, of Douglas. Sphæno-staphilinus of Cowper. A muscle situated between the lower jaw and the os hyoides laterally. It arises tendinous and fleshy from the extremity of the petrous portion of the temporal bone, where it is perforated by the Eustachian tube, and also from the membranous part of the same tube, and is inserted into the whole length of the velum pendulum palati, as far as the root of the uvula, and unites with its fellow. Its use is to draw the velum pendulum palati upwards and backwards, so as to shut the passage from the fauces into the mouth and nose.

L. palati molliis. See **LEVATOR PALATI**.

L. palpebræ superioris. Aperiens palpebrarum rectus. Aperitor oculi. A proper muscle of the upper eyelid, that opens the eye, by drawing the eyelid upwards. It arises from the upper part of the foramen opticum of the sphenoid bone, above the rectus superior oculi, near the trochlearis, and is inserted by a broad thin tendon into the cartilage that supports the upper eyelid.

L. parvus. See **TRANSVERSUS PERINÆI**.

L. scapulæ. A muscle situated on the posterior part of the neck, that pulls the scapula upwards, and a little forwards. This name, which was first given to it by Riolanus, has been adopted by Albinus. Douglas calls it elevator seu musculus patientiæ; and Winslow, angularis vulgo levator proprius. It is a long muscle, nearly two inches in breadth, and is situated obliquely under the anterior edge of the trapezius. It arises tendinous and fleshy from the transverse processes of the four, and sometimes five superior vertebrae coli, by so many distinct slips, which soon unite to form a muscle that runs obliquely downwards and outwards, and is inserted by a flat tendon into the upper angle of the scapula. Its use is to raise the scapula upwards and a little forwards.

LEUCANTHEMUM VULGARE (λευκάνθημον, from λευκος, white, and άνθος, a flower, so called from its white floret.) See **BELLIS MAJOR**.

LEUCAS or **LEUCADIA**, an island of the Ionian sea, now called St. Maura, near the coast of Epirus, famous for a promontory whence desponding lovers threw themselves into the sea. The word is derived from λευκος, white, on account of the whiteness of its rocks. Sappho had recourse to this leap, called Leu-

cates, to free herself from the violent passion which she entertained for Phaon. Apollo had a temple on the promontory, whence he is often called Leucadius.

LEUCATE, a town of France, in the department of Aude, 18 miles south of Narbonne. Lon. 3 g E. Lat. 43. 0 N.

LEUCE, a small island in the Euxine sea, between the mouths of the Danube and the Borysthenes. According to the poets, the souls of the ancient heroes were placed there as in the Elysian fields, where they enjoyed perpetual felicity. From that circumstance, it has often been called the island of the blessed, &c.

LEUCHTENBERG, a town of Germany, in the upper palatinate of Bavaria, seated on a mountain, near the river Erenmpt, 50 miles N. W. of Ratisbon. Lon. 12. 20 E. Lat. 49. 40 N.

LEUCIPPUS. Ancient writers have recorded many of this name. The following are the most celebrated—1. A philosopher of Abdera, about 428 years before Christ, disciple to Zeno. He was the first who invented the famous system of atoms and of a vacuum, which was afterwards more fully explained by Democritus and Epicurus. Many of his hypotheses have been adopted by the moderns, with advantage.—2. A brother of Tyndarus, king of Sparta, who married Philodice daughter of Inachus, by whom he had two daughters, Hilaira and Phœbe, known by the patronymic of Leucippides. They were carried away by their cousins Castor and Pollux, as they were going to celebrate their nuptials with Lynceus and Idas.—3. A son of Xanthus, descended from Bellerophon, who became enamoured of his sister, who yielded to him at the solicitation of her mother. This unnatural intrigue eventually proved the cause of the death of both.—4. A son of CEnomaus, who became enamoured of Daphne, and to obtain her confidence, disguised himself in a female dress, and attended his mistress as a companion. He gained the affections of Daphne by his obsequiousness and attention, but his artifice at last proved fatal, for when Daphne and her attendants were bathing in the Ladon, the sex of Leucippus was discovered, and he perished by the darts of the females.

LEUCITE, in mineralogy. See **SCORLUS**.

LEUCOJUM, great snow-drop, a genus of the monogynia order, in the hexandria class of plants, and in the natural method ranking under the ninth order, spathaceæ. Corol campanulate, sexpartite, segments increased at the points, stigma simple. The species are, 1. *L. vernum*, or spring leucojum, which has an oblong bulbous root, sending up a naked stalk, about a foot high, terminated by a spathe, protruding one or two white flowers, appearing in March. 2. *L. æstivum*, or summer leucojum; has a large oblong bulbous root, an upright stalk, 15 or 18 inches high, terminated by many white flowers in May. 3. *L. autumnale* has a large oblong bulbous root, narrow leaves, an upright stalk, terminated by white flowers in autumn,

4. *L. sumosum*, with flowers white within, purplish without.

LEUCOMA. (*leucoma*, λευκωμα, from λευκος, white.) A variety of the caligo cornea of Cullen's nosology. See CALIGO.

LEUCONYMPHÆA. (*leuconymphæa*, λευκονυμφαια, from λευκος, white, and νυμφαια, the water lily.) See NYMPHÆA ALBA.

LEUCOPHLEGMATICA. (*leucophlegmatica*, from λευκος, white, and φλεγμα, phlegm.) A term applied by the older medical writers to a dropsical habit of body.

LEUCOPTERA. In zoology, a genus of the class vermes, order infusoria. Worm invisible to the naked eye, every where ciliate. Eight species: four found in the waters or marshes of our own country.

1. *L. confictor*. Spherical, snubnake, with moveable intestines. Inhabits clear water; yellowish with dark edges, and filled with most minute molecules in perpetually violent agitation.

2. *L. cornuta*. Inversely conic, green, opaque. Inhabits the marshy grounds of our own country; body broad and truncate on the fore-part with a small spine on each side; the hind-part pellucid and pointed: sometimes it appears oval or kidney-shaped, and when the water which contains it evaporates, it breaks into molecular vesicles.

3. *L. nodulata*. Ovate-oblong, depressed, with a double row of tubercles. Found in the intestines of the lumbricus terrestris, and naïs littoralis, very pellucid, shining like silver, and propagated by a transverse division, oval when young, but more oblong when in age, truncate at the tip.

LEUCOPIPER. (*leucopiper*, λευκοπιπερ, from λευκος, white, and πιπερ, pepper.) See PIPER NIGRUM.

LEUCOPSIS. In zoology, a genus of the class insecta, order hymenoptera. Mouth horny with sharp jaws, the mandible thick and three-toothed at the tip; lip longer than the jaw, membranaceous, and emarginate at the tip; feelers four, short, equal, filiform; antennae short, clavate; thorax with a long lanceolate scale beneath, wings folded, stung reflected and concealed in a groove of the abdomen. Four species: three south of Europe, one Tranquebar.

LEUCORRHEA. (*leucorrhœa*, λευκορροια, from λευκος, white, and ρω, to flow.) Fluor albus. The whites. An increased secretion of white mucus from the vagina of women, arising from debility, and not from the venereal virus.

LEUCOSIA, a small island in the Tyrrhene sea. It received its name from one of the companions of Æneas, who was drowned there, or from one of the Sirens, who was thrown there by the sea. (*Strab. Ovid.*)

LEUCOTHOE, or **LEUCOTHEA,** the wife of Athamas, changed into a sea deity. (See IWO.) She was called Matura by the Romans:

—2. A daughter of king Orchamus, by Eury-nome. Apollo became enamoured of her, and to introduce himself to her, assumed the shape and features of her mother. Their happiness was complete, when Clytia, who was jealous of his amour, discovered the intrigue to her father, who ordered his daughter to be buried alive. The lover, unable to save her from death, sprinkled nectar and ambrosia on her tomb, which penetrating as far as the body, changed it into a beautiful tree, which bears the frankincense. (*Ovid.*)

LEUCITRA, a village of Boeotia, between Plataea and Thespiæ, famous for the victory which Epaminondas, the Theban general, obtained over the superior force of Cleombrotus, king of Sparta, on the 8th of July, B. C. 371. In this famous battle 4000 Spartans were killed, with their king Cleombrotus, and no more than 300 Thebans. From that time the Spartans lost the empire of Greece, which they had obtained for near 500 years.

LE'VEL. *s.* (French.) 1. The time of rising. 2. The concurrence of those who crowd round a man of power in a morning (*Dryden*).

LE'VEL *a* (læpel, Saxon.) 1. Even; not having one part higher than another (*Bentl.*). 2. Even with any thing else; in the same line or plane with any thing (*Tillotson*). 3. Having no gradations of superiority (*Bentley*).

To LE'VEL. *v. a.* (from the adjective.) 1. To make even, to free from inequalities. 2. To reduce to the same height with something else (*Dryden*). 3. To lay flat (*Raleigh*). 4. To bring to equality of condition (*D. of P.*). 5. To point in taking aim; to aim (*Dryd.*). 6. To direct to any end (*Swift*). 7. To suit; to proportion (*Dryden*).

To LE'VEL. *v. n.* 1. To aim at, to bring the gun or arrow to the same line with the mark (*Hooker*). 2. To conjecture, to attempt to guess (*Shakspeare*). 3. To be in the same direction with a mark (*Hudibras*). 4. To make attempts, to aim (*Shakspeare*). 5. To efface distinction or superiority.

LE'VEL. *s.* (from the adjective) 1. A plane, a surface without protuberances or inequalities (*Sandys*). 2. Rate, standard, customary height (*Sidney*). 3. Suitable or proportionate height (*Daniel*). 4. A state of equality (*Atterbury*). 5. An instrument whereby masons adjust their work (*Mason*). 6. Rule; plan; scheme: borrowed from the mechanic level (*Prior*). 7. The line of direction in which any misive weapon is aimed (*Wallar*). 8. The line in which the sight passes (*Pope*).

LEV'EL, an instrument used to make a line parallel to the horizon, and to continue it out at pleasure; and by this means to find the true level, or the difference of ascent or descent between two or more places, for conveying water, draining fens, &c.

There are several instruments, of different contrivance and matter, invented for the perfection of levelling, as may be seen in De la Hire's and Picard's treatises of Levelling, in Biron's treatise on Mathematical Instruments,

L E V E L.

also in the *Philos. Trans.* and the *Memoirs de l'Acad. &c.* But they may be reduced to the following kinds.

LEVEL (Water), that which shews the horizontal line by means of a surface of water or other fluid; founded on this principle, that water always places itself level or horizontal.

The most simple kind is made of a long wooden trough or canal, which being equally filled with water, its surface shews the line of level. And this is the chorobates of the ancients, described by Vitruvius, lib. viii. cap. 6.

The water-level is also made with two cups fitted to the two ends of a straight pipe, about an inch diameter, and three or four feet long, by means of which the water communicates from the one cup to the other; and this pipe being moveable on its stand by means of a ball and socket, when the two cups shew equally full of water, their two surfaces mark the line of level.

This instrument, instead of cups, may also be made with two short cylinders of glass three or four inches long, fastened to each extremity of the pipe with wax or mastic. The pipe is filled with common or coloured water, which shews itself through the cylinders, by means of which the line of level is determined, the height of the water, with respect to the centre of the earth, being always the same in both cylinders. This level, though very simple, is yet very commodious for levelling small distances. See the method of preparing and using a water-level, and a mercurial level, annexed to Davis's quadrant, for the same purpose, by Mr. Leigh, in *Philos. Trans.* vol. xl. 417, or *Abr.* viii. 362.

Where works of moderate extent are carried on, and where the perfect level of each stratum of materials is not an object of importance, the common bricklayer's level, made in the form of an inverted T, thus T, having a plumb suspended from the top, and received in an opening at the junction of the perpendicular with the horizontal piece, will answer well enough. The principle on which this acts, is, that as all weights have a tendency to gravitate towards the centre of the earth, so, as the plumb line is a true perpendicular, any line cutting that at right angles must be a horizontal line at the point of intersection.

LEVEL (Artillery-foot), is in form of a square, having its two legs or branches of an equal length, at a juncture whereof is a little hole, whence hangs a thread and plummet, playing on a perpendicular line in the middle of a quadrant. It is divided into twice forty-five degrees from the middle.

This instrument may be used on other occasions, by placing the ends of its two branches on a plane, for when the thread plays perpendicularly over the middle division of the quadrant, that plane is assuredly level. To use it in gunnery, place the two ends on the piece of artillery, which you may raise to any proposed height, by means of the plummet, whose thread will give the degree above the level.

LEVEL (Gunner's), consists of a long ruler,

in the middle whereof is fitted, at right angles, another somewhat stouter, furnished with a plum, met and index, in order to show the different degrees of elevation of pieces of artillery. This instrument has also a brass foot, to set upon cannons or mortars, so as when those pieces are horizontal, the instrument will be perpendicular. The foot of this instrument is to be placed on the piece to be elevated, in such a manner as that the point of the plummet may fall on the proper degree. this is what they call levelling the piece.

LEVEL (Mason's), is composed of three rules, so joined as to form an isosceles triangle, somewhat like a Roman A, at the vertex whereof is fastened a thread, from which hangs a plummet, that passes over a fiducial line, marked in the middle of the base, when the thing, to which the level is applied, is horizontal, but declines from the mark, when the thing is lower on one side than on the other.

LEVEL (Plumb or pendulum), that which shews the horizontal line by means of another line perpendicular to that described by a plummet or pendulum. This instrument consists of two legs or branches, joined together at right angles, whereof that which carries the thread and plummet is about a foot and a half long; the thread is hung towards the top of the branch. The middle of the branch where the thread passes is hollow, so that it may hang free every where, but towards the bottom, where there is a little blade of silver, whereon is drawn a line perpendicular to the telescope, the said cavity is covered by two pieces of brass, making as it were a kind of case, lest the wind should agitate the thread; for which reason the silver blade is covered with a glass to the end, that it may be seen when the thread and plummet ply upon the perpendicular. The telescope is fastened to the other branch of the instrument, and is about two feet long; having an hair placed horizontally across the focus of the object-glass, which determines the point of the level. The telescope must be fitted at right angles to the perpendicular. It has a ball and socket, by which it is fastened to the foot.

LEVEL (Air), that which shews the line of level by means of a bubble of air inclosed with some fluid in a glass tube of an indeterminate length and thickness, and having its two end hermetically sealed: an invention, it is said, of M. Thevenot. When the bubble fixes itself at a certain mark, made exactly in the middle of the tube, the case or ruler in which it is fixed is then level. When it is not level, the bubble will rise to one end.—This glass tube may be set in another of brass, having an aperture in the middle, where the bubble of air may be observed.—The liquor with which the tube is filled is oil of tartar, or aqua secunda; those not being liable to freeze as common water, nor to rarefaction and condensation as spirit of wine is.

The most complete air or spirit level, is that invented by the late truly scientific artist Jesse Ramden. The following description of one of his levels we transcribe from Gregory's

L E V E L.

Dictionary of Arts and Sciences. In Plate 94, A, B, D, fig. 7, are the three legs upon which it is placed, when shut up, they form one round rod, and are kept together by three rings: these legs are jointed to a brass frame E, on the top of which is a male screw, screwing into a female screw within the projection *a* of the plate F. Within the top of *a*, figs. 4 and 7, is a hemispherical cavity to contain the spherical ball, fig. 5: this ball has a male screw *d* on its top, which screws into a female screw *b*, fig. 6, in the plate G, fig. 7 and fig. 6, the ball is put up through an opening *c*, fig. 4, and screwed to the plate, fig. 6; so that the upper plate G can move in any direction within certain limits by the play of the ball in its socket, to confine the upper plate G when it is set in any direction, four screws, IIIIH, figs. 4 and 7, are employed, they work in tubes firmly fixed to the plate F, and are turned by their milled heads, the upper ends of these screws act against the under side of the plate, fig. 6, as shewn in fig. 7, so that when the plate G is required to be moved in any direction, it is done by screwing up one screw and screwing down the opposite till it is brought to the proper inclination; then by screwing up both together, the plate is firmly fixed. The ball, fig. 5, has a conical hole *f* through it, to receive an axis which is screwed fast to the bottom of the compass-box I, fig. 7, a screw screwed into the end of this axis prevents its being lifted out, and at the same time leaves it at liberty to turn round independent of the ball, fig. 5. On each side of the compass-box, I, is a bar KK, on the end of which are fixed two forked pieces IO, called the Y's (from their resemblance to that letter), carrying the telescope M. One of these (O) is capable of being raised or lowered by means of a milled-headed screw N, which works through a collar in the lower end of the tube *g*; the rest of the tube has a triangular hole through it, in which slides a bar *k*, which is part of the Y; O the female screw is cut within this bar, and the screw works into it, so that by turning the milled head one way, the Y is raised, and by reversing the motion, it is lowered. The axis which connects the compass-box and the other apparatus, has a collar upon it just above where it enters the ball, fig. 5, which is embraced by a clamp P, fig. 6, which is closed by a screw C, so as to hold the collar of the axis quite tight, and when the screw is turned back, its own elasticity opens it so as to allow the axis of the compass-box to turn round freely within it; on the opposite side of the clamp is a projecting arm *l*, carrying the nut *m* of the screw Q, which screw works in a stud *n*, fixed to the upper plate G, figs. 7 and 6. by this means, when G is loosened, the telescope can be turned quite round, but when it is fastened, it can only be moved by turning the screw Q. The level-tube Z is fastened to the under side of the telescope by a screw *g* at one end and a bar *r* at the other: the use of these are to adjust it so that it shall be exactly parallel to the axis of the telescope-tube. The level, as best ex-

plained in the section, fig. 1, is a tube of glass, nearly filled with spirits of wine, but so as to leave a bubble of air in it; if the tube is of exactly the same diameter in every part, the bubble will rest in the middle of the tube when it is level. In some of the best levels made by Ramsden, the inside of the tube is bent into a segment of a circle, 100 feet diameter, and the inside is ground, which causes the bubble to adhere together; if the tube is straight, it is liable to divide into several small ones. The internal parts of the telescope are explained in fig. 1: RR is the external tube of brass plate, within this slides another tube ss; it has two glasses *v*, *w*, screwed into the outer end, called object-glasses, and it has two divisions *x*, *y*, called diaphragm, with small holes in them; their use is to collect the prismatic rays with which the objects would otherwise be tinged; the tube ss has a rack *t* fixed nearly in the middle of it, which takes into a pinion on the axis of the milled head T, figs. 1 and 7; by turning this, the glasses *v*, *w*, can be moved nearly to, or farther from, the eye to adjust the focus; to the tube R at *v* are fixed the cross wires, whose intersection is exactly in the centre of the tube. The manner of fixing these is explained in fig. 3. A is a brass box, which fits into the end of the telescope-tube, and is held there by four small screws; within this box is placed a brass plate B, carrying the wires, which are fastened by screwing four screws down upon their ends; when the plate B is in the box, a ring D is screwed in upon it, which prevents its falling out, but at the same time leaves it at liberty to move about in the box; the sides of the box, and also the telescope-tube, has four rectangular holes in it, through which four screws are passed into the edges of the piece B, so as to hold it in any position: these screws come through the external tube, and have square heads, to be turned by a key, so as to adjust the interactions in the centre: the box A has a female screw in the front, into which is screwed the eye-piece W; 3 is the tube which is screwed to the telescope; within this slides a tube, containing two glasses 4, 5; by sliding the glasses in or out of the tube 3, they can be adjusted so as to adapt their focus to the cross wires. This eye-piece is convenient on account of its shortness, but as it reverses the objects, it is sometimes more convenient to use the eye-piece fig. 2 which is much longer, but does not reverse objects. *a* is the tube which is screwed to the telescope; within this slides another tube *bc*, having at one end a tube *dd*, containing two glasses *ef*, and a diaphragm *g*, and at the other end a tube *hh*, containing two glasses *il*, and a diaphragm: *m* is a cap screwed on to the end to prevent the tubes coming out. When the instrument is to be carried, the level is unscrewed from the legs and packed in a case; the legs are shut up and kept so by the rings, as before described. The manner of using this instrument is as follows: When the difference of level between any two places is required, the observer with the level goes to the highest of the two,

LEVELLING.

and his assistant goes to the lowest with the target, which is a long pole of wood with a groove in it, in which slides a small rod carrying a round piece of wood, called a sight, which is to be observed through the telescope: the observer opens the legs of the instrument, and sets them on the ground; the level is next screwed to them at E, as shewn in fig. 7; the telescope is then brought nearly to a level by the screws HHHH, as before described; the screw c is then turned so as to release the clamp P, fig. 6; and the telescope is turned about, so as to point to the target; the clamp P is then closed, the observer looks through the telescope, and by turning the nut T, the focus is adjusted. the screw Q is then turned till the cross wires are brought to coincide with the object, in an horizontal plane; he then takes his eye from the telescope, and works the screw N till he brings the bubble of air in the level-tube exactly in the middle, which shews that the telescope is perfectly horizontal; the observer then makes signals to the assistant to raise or lower the sight on the slider of the target, till it is brought to coincide with the intersection of the cross wire, which shews that the telescope and the sight of the target are on the same level; the height which the sight is from the ground where the target stands, deducted from the height the telescope stands from the ground, is the difference of level required.

LEVEL TOPPED, in botany. See FASTIGIATE.

LEVELLER. s. (from *level*.) 1 One who makes any thing even. 2 One who destroys superiority, one who endeavours to bring all to the same state of equality (*Collier*).

LEVELLING, the art or act of finding a line parallel to the horizon at one or more stations, to determine the height or depth of one place with respect to another; for laying out grounds even, regulating descents, draining morasses, conducting water, &c.

Two or more places are on a true level when they are equally distant from the centre of the earth. Also one place is higher than another, or out of level with it, when it is farther from the centre of the earth; and a line equally distant from that centre in all its points, is called the line of true level. Hence, because the earth is round, that line must be a curve, and make a part of the earth's circumference, or at least be parallel to it, or concentrical with it; as the line BCFG (Plate 93, fig. 10), which has all its points equally distant from A, the centre of the earth, considering it as a perfect globe.

But the line of sight BDE, &c. given by the operations of levels, is a tangent, or a right line perpendicular to the semidiameter of the earth at the point of contact B, rising always higher above the true line of level, the farther the distance is, is called the apparent line of level. Thus, CD is the height of the apparent level above the true level, at the distance BC or BD; also EF is the excess of height at F, and GH at G, &c. The difference, it is evi-

dent, is always equal to the excess of the secant of the arch of distance above the radius of the earth.

The common methods of levelling are sufficient for laying pavements of walks, or for conveying water to small distances, &c.: but in more extensive operations, as in levelling the bottoms of canals, which are to convey water to the distance of many miles, and such like, the difference between the true and the apparent level must be taken into the account.

Now the difference CD between the true and apparent level, at any distance BC or BD, may be found thus: By a well-known property of the circle, ($2AC + CD$). $BD : CD :: 2AC : BD$; or because the diameter of the earth is so great with respect to the line CD at all distances to which an operation of levelling commonly extends, that $2AC$ may be safely taken for $2AC + CD$ in that proportion without any sensible error, it will be $2AC : BD :: BD :$

CD, which therefore is $= \frac{BD^2}{2AC}$, or $\frac{BC^2}{2AC}$ nearly;

that is, the difference between the true and apparent level, is equal to the square of the distance between the places, divided by the diameter of the earth, and consequently it is always proportional to the square of the distance.

Now the diameter of the earth being nearly 7958 miles, if we first take $BC = 1$ mile, then the excess $\frac{BC^2}{2AC}$ becomes $\frac{1}{7958}$ of a mile, which is 7.962 inches, or almost eight inches, for the height of the apparent above the true level at the distance of one mile. Hence, proportioning the excesses in altitude according to the squares of the distances, the following table is obtained, shewing the height of the apparent above the true level for every 100 yards of distance on the one hand, and for every mile on the other.

Dist. or BC	Dist. of Level, or CD	Dist. or BC	Dist. of Level, or CD
Yards.	Inches.	Miles	Feet. Inc.
100	0 026	$\frac{1}{4}$	0 0 $\frac{1}{2}$
200	0 103	$\frac{1}{2}$	0 2
300	0 231	$\frac{3}{4}$	0 4 $\frac{1}{2}$
400	0 411	1	0 8
500	0 643	2	2 8
600	0 927	3	6 0
700	1 260	4	10 7
800	1 645	5	16 7
900	2 081	6	23 11
1000	2 570	7	32 6
1100	3 110	8	42 6
1200	3 701	9	53 9
1300	4 344	10	66 4
1400	5 038	11	80 3
1500	5 784	12	95 7
1600	6 580	13	112 2
1700	7 425	14	130 1

By means of this table of reductions, we can now level to almost any distance at one operation, which the ancients could not do but by a

LEVELLING.

great multitude; for, being unacquainted with the correction answering to any distance, they only levelled from one twenty yards to another, when they had occasion to continue the work to some considerable extent.

This table will answer several useful purposes. Thus, first, to find the height of the apparent level above the true, at any distance. If the given distance is in the table, the correction is found on the same line with it: thus at the distance of 1000 yards, the correction is 2.57, or two inches and a half nearly, and at the distance of 10 miles, it is 66 feet 4 inches. But if the exact distance is not found in the table, then multiply the square of the distance in yards by 2.57, and divide by 1,000,000, or cut off six places in the right for decimals, the rest are inches: or multiply the square of the distance in miles by 66 feet 4 inches, and divide by 100.

2dly, To find the extent of a visible horizon, or how far can be seen from any given height, on a level solid plane, &c. &c. Suppose the eye of a person, or the top of a ship's mast or sea-steeple be 6, 14, or 150 feet above the water, he will then see about 14 miles all a round. Or from the top of a cliff by the sea-side, the height of which is 66 feet, a person may see to the distance of near 10 miles on the surface of the sea. Also, from the top of a hill, or the height of a light-house, or such like, whose height is 130 feet, first comes into the view of an eye on board a ship, the table shows that the distance of the ship from it is fourteen miles, if the eye is at the surface of the water, but if the height of the eye in the ship is 80 feet, then the distance will be increased by near eleven miles, making in all about twenty-five miles in distance.

3dly, Suppose a spring to be on one side of a hill, and a house on an opposite hill, with a valley between them, and that the spring seen from the house appears by a levelling instrument to be on a level with the foundation of the house, when suppose is at a mile distance from it: then if the spring eight inches above the true level of the house, and this difference would be barely sufficient for the water to be brought in pipes from the spring to the house, the pipes being laid all the way in the ground.

4th, If the height or distance exceed the limits of the table, then, first, if the distance be given, divide it by 2, or by 3, or by 4, &c. till the quotient come within the distance in the table; then take out the height answering to the quotient, and multiply it by the square of the divisor, that is, by 4, or 9, or 16, &c. for the height required: so if the top of a hill is just seen at the distance of 40 miles, then 40 divided by 4 gives 10, to which in the table answer 66 feet, which being multiplied by 16, the square of 4, gives 1056 feet for the height of the hill. But when the height is given, divide it by one of these square numbers 4, 9, 16, 25, &c. till the quotient come within the limits of the table, and multiply the quotient by the square root of the divisor, that is by 2, or 3, or 4, or 5, &c. for the distance

sought: so when the top of the peak of Teneriffe, said to be almost three miles, or 15840 feet high, just comes into view at sea, divide 15840 by 225, or the square of 15, and the quotient is 70 nearly, to which in the table answers by proportion nearly 107 miles; then multiplying 107 by 15, gives 1605 miles and 7, for the distance of the hill.

All that has been previously stated has been said without any regard to the effect of refraction in elevating the apparent places of objects. But as the operation of refraction in incurvating the rays of light proceeding from objects near the horizon is very considerable, it can by no means be neglected, when the difference between the true and apparent level is estimated at considerable distances. It is now ascertained (see REFRACTION) that for horizontal refractions the radius of curvature of the curve of refraction is about seven times the radius of the earth, in consequence of which the distance at which an object can be seen by refraction is to the distance at which it could be seen without refraction nearly as 14 to 13, the refraction augmenting the distance at which an object can be seen by about a thirteenth of itself. By reason of this refraction, too, it happens, that it is necessary to diminish by $\frac{3}{4}$ of itself the height of the apparent above the true level, as given in the preceding table of reductions. Thus, at 1000 yards, the true difference of level when allowance is made for the effect of refraction, will be $2.570 - .367 = 2.203$ inches. At 150 miles it would be $32 - 4\frac{1}{2} = 27\frac{1}{2}$ inches, and so on.

Mr. Piron has given at the end of his *Arithmétique Hydraulique* a table computed on this principle, extending from 50 to 6000 French toises, and shewing, in three distinct columns, the difference between the true and apparent level, first without regarding refraction, next considering it, and then a column shewing the difference of the results. This table is almost entirely useless; yet the author of the article Levelling in the *Encyclopædia Britannica* has faithfully transcribed it without acknowledgment; and as it would seem, without being aware, that on account of the different ratios subsisting between the French toise and the radius of the earth, and six English feet and the same measure, the table as given in English is too inaccurate to be depended upon, even were it of use.

To find the height H of a mountain, its angle of apparent elevation (E), the arc A of a great circle of the earth included between the foot of the mountain and the place of the observer, and the apparent angle C made at the top of the mountain between the plumb-line and the apparent first place of the observer on the earth's surface, M. Lambert gave this theorem, R being the radius of the earth:

$$R + H = \frac{R \sin(90 + E - \frac{1}{2}A)}{\sin(C - \frac{1}{2}A)};$$

whence H is immediately found. Other formulae are deduced by M. Laplace for the same purpose; but they are too complex to be inserted here.

LEVELLING.

We must now give a few directions respecting the practice of levelling.

LEVELLING is either *simple* or *compound*. The former is when the level points are determined from one station, whether the level be fixed at one of the points or between them. Compound levelling is nothing more than a repetition of many simple operations.

An example of simple levelling is given in Pl. 95 fig. 1, where A B are the station points of the level; C D the two points ascertained. Let the height

	Feet.	Inches.
From A to C be	- 0	0 0
From B to D be	- 9	0 0

The difference - - - 3 0 0
shows that B is three feet lower than A.

If the station-points of the level are above the line of sight, as in fig. 2, and the distance from A to C be six feet, and from B to D nine feet, the difference will still be three feet which B is higher than A.

As an example of compound levelling, suppose it were required to know the difference of height between the point A on the river Zome, and N on the river Belum, fig. 3, (copied from M. le Febvre.) In this operation stakes should be driven down at A and N, exactly level with the surface of the water, and these stakes should be so fixed, that they may not be charged until the whole operation be finished. a plan of the ground between the two rivers should then be made, by which it will be discovered, that the shortest way between the rivers is by the dotted line AC, CH, HN; from whence also the number of stations necessary to be taken will be determined. The operator will also be enabled to distribute them properly according to the nature and situation of the ground. In the figure 12. stations are marked. Stakes ought then to be driven in at the limits of each station, as A, B, C, D, &c. They ought to be about two or three inches above the ground, and driven 18 inches into it. Stakes should also be driven in at each station of the instrument, as 1, 2, 3, 4, &c.

The operation may be begun in the following manner. Let the first station be at 1, equally distant from the two points A and B, which themselves are distant 166 yards. Write down then in one column the first limit A; in another, the number of feet, inches, and tenths: with the points of sight indicated on the station-staff at A, viz. 7. 6. 0. In the third column, the second limit B, in the fourth, the height indicated at the station-staff B, viz. 6. 0. 0. Lastly, in the fifth column, the distance from one station-staff to the other, which in this case is 166 yards. Remove now the level to the point marked 2, which is in the middle between B and C, the two places where the station-staves are to be held; observing that B, which was the second limit in the former operation, is the first in this. Then write down the observed heights as before; in the first column B; in the second 4. 6. 0, in the third C;

in the fourth 5. 6. 2; in the fifth 560, the distance between B and C.

It being impossible, on account of the inequality of the ground at the third station, to place the instrument in the middle between the two station-staves, find the most convenient point as at 3, then measure exactly how far this is from each station-staff, and you will find that from 3 to C is 160 yards; from 3 to D, 80 yards, and the remainder of the operation will be as in the preceding station.

In the fourth operation, we must endeavour to compensate for any error which might have happened in the last. Mark out, therefore, 80 yards from the station-staff D to the point 4, and 160 yards from 4 to E, and this must be carefully attended to, as by such compensations the work may be much facilitated. Proceed in the same manner with the eight remaining stations, observing to enter every thing in its proper column; and when the whole is finished, add the sums of each column together, and then subtract the lesser from the greater: the difference, which in the present case is 5. 4. 8. shows the ground at N to be thus much lower than the ground at A.

To obtain a section of this level, draw the dotted line *o o*, fig. 4. either above or below the plan, which may be taken for the level or horizontal line. Let fall then perpendiculars upon this line from all the station-points and places where the station-staves were fixed. Beginning now at A, set off 7 feet 6 inches upon the line from A to *a*. For the height of the level-point determined on the staff at this place, draw a line through *a* parallel to the dotted line *o o*, which will cut the third perpendicular at *b*, the second station-staff. Set off from this point downwards six feet to B, which shows the second limit of the first operation, and that the ground at B is one foot six inches higher than at A. place your instrument between these two lines at the height of the level line, and trace the ground according to its different heights. Now set off, on the second station-staff B, four feet six inches to C, the height determined by the level at the second station; and from C draw a line parallel to *o o*, which will cut the fifth perpendicular at *d*, the third station-staff. From this point set off 5 feet 6 inches $\frac{7}{8}$ downwards to C, which will be our second limit with respect to the preceding one, and the third with respect to the first. Then draw your instrument in the middle between B and C, and delineate the ground with its inequalities. Proceed in the same manner from station to station, till you arrive at the last N, and you will have the profile of the ground over which the level was taken.

This method answers very well where only a general profile of the different stations is required, but where it is necessary to have an exact detail of the ground between the limits, we must then go to work more particularly. Suppose, therefore, the level to have been taken from A to N by another route, but on more uniform

LEVELLING.

ground, in order to form a canal marked O, P, Q, R, S, T, U, X, Y. Draw at pleasure a line Z, Y, fig. 5. to represent the level, and regulate the rest; then let fall on this line perpendiculars to represent the staves at the limits of each station, taking care that they be fixed accurately at their respective distances from each other. The difference between the extreme limits, in this case, ought to be the same as in the former, viz. 5 feet 4 inches. Set off this measure upon the perpendicular at the first limit, and from *o*, prolonging the perpendicular, mark off at *a* the height determined at the first station-staff; then do the same with the second and third, and so on with the following, till this part of the work is finished: there remains then only to delineate in detail the ground between the station-staves, the distances in this example being assumed larger on account of the detail.

To obtain the section of the ground between O and P, place your instrument at one of the limits, as P, fixing it so that the cross hairs may answer to the point C; then look towards the first limit *o*, raising or depressing the vane till it coincides with the intersection of the cross hairs; and the line of sight from one point to the other will mark the level or horizontal line.

To set off the height of the brink of the river above the first limit, drive a stake down close to the ground at *a*, and place your station-staff upon it, observing where the hairs intersect the vane, which will be at 4 feet 10 inches, then, laying off upon the line *oa* the distance from the first to the last stake, let fall from thence a perpendicular, and set off thereon 4. 10. 0 to *a*, which gives the height at the first stake, or, which is the same, the height from the edge of the river above the surface of the water, as is evident from the section. Drive a second stake at *b*, in a line between the limits; place the station-staff upon this stake, and observe the height 4. 6 intersected by the cross hairs, the instrument still remaining in the same situation. Set off on the level-line the distance from the first stake *a* to the second *b*, and then let fall a perpendicular, and mark upon it 4. 6. to *b*, which gives the height of the ground at this place.

The small hollow *c* is marked out by driving down a third stake even with the ground, in the middle of it at *c*; but the exact distance of the second stake *b* from the third *c*, must be marked upon the level line: then let fall a perpendicular from *c*, and set off upon it 6. 8. 0, pointed out by the cross hairs on the staff, which determines the depth of the hollow, as appears from the figure. As the distances between the stakes are now very short, they can easily be marked by the operator, who can settle any little inequalities by a comparison with those already ascertained. Proceed thus with the other stations till you arrive at the last, and you will always obtain an accurate section of your work; by which it is easy to form a just estimation of the land to be dug away, in order

to form the canal, by adding the depth to be given to it.

Fig. 6. gives an example of compound levelling, where the situation is so steep and mountainous, that the staves cannot be placed at equal distances from the instrument, or where it is even impossible to make a reciprocal levelling from one station to the other. Thus suppose the point K to be the bottom of a bason where it is required to make a fountain, the reservoir being at A, so that, in order to know the height to which the jet d'eau will rise, it is necessary to know how high the point A is above K.

In great heights such as this, it will be necessary to proceed by small descents, as from A to D. The instrument must be adjusted with all possible care, and it will even be proper, in some part of the work, to use a smaller instrument. The following is a table of the different operations used in making this level, it having been taken from M. le Febure's practice.

	feet. in.		feet. in.	yds.
A	21 6	C	0 9	90
C	4 3	D	0 3	40
D	3 9	E	16 3	340

	95 0		106 9	2405

In this case only two levellings are made between A and D, though more would have been necessary; but they are omitted to avoid confusion. In the fourth station the height found was 16 feet 8 inches; but on account of the great length, it was requisite to reduce the apparent level to the true one, which is always necessary where the length is considerable. At the last limit we get the height from N to *o*; then from *o* to I, from I to K, fig. 7. &c.; all which added together, and then corrected for the curvature, gives 47 feet 3 inches. Now, by adding each column together, and subtracting one from the other, we have 51 feet 9 inches for the height which the point A is above the bottom of the bason, and which will cause the jet d'eau to rise about 45 feet. The general section of this operation is shown at fig. 7. 8. but an exact profile of the mountain is more difficult, as requiring many operations; though some of these might be obtained by measuring from the level line without moving the instrument.

The last example given by Mr. Adams is likewise from M. le Febure, and includes a length of near five German miles (25 of ours) in a straight line, and 9 or 10 (45 or 50 English) including the turnings and windings. In this the declivity of the river Haynox was measured from Lignebruk to Villebourg. The first operation was to drive stakes at several parts of the

LEV

river even with the water's edge; the first of which a little above the mills of Lignebruk showed the upper water-mark, and another showed the lower water-mark at the same mills. Two stakes above and below the mills of Mazurance, somewhat more than half way between Lignebruk and Villebourg, pointed out the difference between high and low water there, and formed likewise the third and fourth limits of the operation, while the stakes above and below the mills of Villebourg pointed out the difference between high and low water, and likewise formed the last limits of the operation.

These marks were all made at the edge of the water, exactly even with its surface, and all made at the different parts of the river nearly at the same instant of time. "The principal limits of the levelling (says Mr Adams) being now determined and fixed, it only remains to find the level between the limits, according to the methods already pointed out, using every advantage that may contribute to the success of the work, and at the same time avoiding all obstacles and difficulties that may retard or injure the operations. The first rule is always to take the shortest possible way from one limit to another, though this rule ought not to be followed if there are considerable obstacles in the way, as hills, woods, marshy ground, or if, by going aside, any advantage can be obtained."

In the present case it was found necessary to deviate very considerably from the general rule, in order to take in several ponds, the surfaces of which might have all been taken for a perfect level; and thus levels were frequently taken across the country for a considerable way. The difference of height between the mills of Lignebruk and Villebourg was at last found to be about 19 feet, indicating a descent of not quite a foot in a mile.

LEVELLING-STAVES, instruments used in levelling, serving to carry the marks to be observed, and at the same time to measure the height of those marks from the ground. They usually consist of two mahogany staves ten feet long, in two parts, that slide upon one another to about $5\frac{1}{2}$ feet, for the more portable carriage. They are divided into 1000 equal parts, and numbered at every tenth division, by 10, 20, 30, &c. to 1000; and on one side the feet and inches are also sometimes marked. A vane slides up and down upon each set of these staves, which by brass springs will stand at any part. These vanes are about 10 inches long and 4 inches broad; the breadth is first divided into three equal parts, the two extremes are painted white, the middle space divided again into three equal parts, which are less, the middle one of them is also painted white, and the two other parts black; and thus they are suited to all the common distances. These vanes have each a brass wire across a small square hole in the center, which serve to point out the height correctly, by coinciding with the horizontal wire of the telescope of the level.

For the method of levelling by means of

LEV

the barometer and thermometer, see **BAROMETER**.

LEVELNESS, *s.* (from *level*) 1. Evenness, equality of surface. 2. Equality with something else (*Peacem*).

LEVEN, *s.* (*levain*, French.) 1. Ferment, that which being mixed in bread makes it rise and ferment. 2. Any thing capable of changing the nature of a greater mass (*Wise*man).

LEVEN, a river of Dumbartonshire, in Scotland, which issues from Loch Lomond.

LEVEN (Loch), a beautiful lake in Kinross-shire, twelve miles in circumference, and somewhat of a circular form. It has several small islands, on one of which is a ruinous castle. Here the unfortunate Mary, queen of Scots, was confined by the confederate lords, after the murder of her husband lord Darnley, and her marriage with Bothwell; but she escaped in 1568 by the assistance of the brother of the governor of the castle. Another island, named St Serf's Isle, is said to have been a residence of the Pictish priests: it was afterwards the seat of a priory, of which some remains are to be seen. This lake produces trout of a peculiar excellence; of which great quantities, at certain seasons, are sent to the Edinburgh markets. In autumn, a singular species, called the gully trout, is here salted and dried for winter provision.

LEVER, a straight bar of iron or wood, &c, supposed to be inflexible, supported on a fulcrum or prop by a single point, about which all the parts are moveable.

The lever is the first of those simple machines called mechanical powers, as being the simplest of them all; and is chiefly used for raising great weights to small heights.

The lever is of three kinds. First the common sort, where the weight intended to be raised is at one end of it, our strength or another weight called the power is at the other end, and the prop or fulcrum is between them both. In stirring up the fire with a poker, we make use of the lever, the poker is the lever, it rests upon one of the bars of the grate as a prop, the incumbent fire is the weight to be overcome, and the pressure of the hand on the other end is the force or power. In this, as in all the other machines, we have only to increase the distance between the force and the prop, or to decrease the distance between the weight and the prop, to give the operator the greater power or effect. To this kind of lever may also be referred all scissars, pincers, snuffers, &c. The steel yard and the common balance are also levers of this kind.

In the lever of the second kind the prop is at one end, the force or power at the other, and the weight to be raised is between them. Thus, in raising a water-plug in the streets, the workman puts his iron bar or lever through the ring or hole of the plug, till the end of it reaches the ground on the other side; then making that the prop, he lifts the plug with his force or strength at the other end of the lever. In this lever too, the nearer the weight is to the prop, or the farther the power from the prop, the greater is the effect. To this second kind of lever may also be referred the oars and rudder of a boat, the masts of a

L E V E R.

ship, cutting knives fixed at one end, and doors whose hinges serve as a fulcrum.

In the lever of the third kind, the power acts between the weight and the prop, such as a ladder raised by a man some where between the two ends, to rear it against a wall, or a pair of tongs, &c.

It is by this kind of lever too that the muscular motions of animals are performed, the muscles being inserted much nearer to the centre of motion, than the point where is placed the centre of gravity of the weight to be raised; so that the power of the muscle is many times greater than the weight it is able to sustain. And in this third kind of lever, to produce a balance between the power and weight, the power or force must exceed the weight, in the same proportion as it is nearer the prop than the weight is; whereas in the other two kinds, the power is less than the weight, in the same proportion as its distance is greater, that is, universally, the power and weight are each of them reciprocally as their distance from the prop, as is demonstrated below.

Some authors make a fourth sort of what is called a braced lever; such as a hammer in drawing a nail, &c.

In all levers, the universal property is, that the effect of either the weight or the power, to turn the lever about the fulcrum, is directly as its intensity and its distance from the prop, whence it is deduced that if parallel forces acting perpendicularly upon a straight lever keep it in equilibrio, they will be to each other reciprocally, as the distances from the fulcrum at which they act.

As the fundamental property of the lever is one of the principal one lying at the basis of mechanical science, we shall extract from the "Retrospect of Philosophical Discoveries" a brief sketch of some of the chief demonstrations that have been published, with the leading objection, that have been urged against them.

The first we have who attempted it, at least whose demonstration has been handed down to us, was Archimedes. His demonstration is founded upon the supposition, that if a number of equal weights, or bodies be suspended from the arms of a lever, at equal distances from each other, their tendency to cause the lever to turn about its fulcrum will be the same as it would be if they were all united, and suspended from a point which is situated in the middle between all the points of suspension, and considered as the common centre of gravity of all the bodies. This supposition, however, is by no means self-evident, and therefore the investigation founded upon it has been rejected by succeeding mathematicians as imperfect.

The next demonstration of this general property, in point of time, was that given by Galileo, in his second dialogue on the resistance of solids. This demonstration for the straight lever is more simple and obvious than that of Archimedes, but as it depends upon the noted theorem concerning the common centre of gravity of two bodies, which itself needed demonstration, as it was only inferred from the general property of the lever, it was not without its objectors.

Mr. Huygens, in his *Miscellaneous Observations on Mechanics*, observes, that some mathematicians have endeavoured, by changing the form of Archimedes's demonstration, to render its defect less sensible, but without success. He then pro-

poses one of his own, in which he takes for granted that, when two equal bodies are suspended from the arms of a lever, that which is furthest from the fulcrum will have the greater effect in causing the lever to turn on its fulcrum. To this it has been objected, that it is resting the demonstration upon a fact that is to be proved by it; and even independent of this irregularity, on which we should not lay much stress, his demonstration is very tedious and prolix, and holds only when the arms of the lever are commensurable.

Maclaurin's demonstration, given in his *Account of Newton's Philosophy*, is also considered as imperfect; as he has inferred the truth of this general property from an inductive process, and has not extended it to the case where the arms of a lever are incommensurable.

The demonstration given by Mr. Landen, in his *Memoirs*, appears to be founded upon self-evident principles, and his reasoning upon them correct; but as the investigation is long and tedious, and includes several cases, it has been regarded as wanting a sufficient degree of simplicity to render it proper for an elementary treatise of mechanics.

Dr. Hamilton, in his *Essays*, after objecting to Newton's demonstration, as well as to several of those noticed above, proposes to supply the defects he had pointed out, by a demonstration of his own; which, however, depends upon this proposition, that when a body is kept in equilibrio by the action of three forces, they will be to each other as the three sides of a triangle parallel to their respective directions. With respect to this proposition, Mr. Vince, in the *Philosophical Transactions* for 1794, observes, "Now this is true, when the three forces act at any point of a body; whereas, considering the lever as the body, the three forces act at different points, and therefore, the principle, as applied by the author, is certainly not applicable. If in this demonstration we suppose a plain body, in which the three forces act, instead of simply a lever, then, the three forces being actually directed to the same point of the body, the body would be at rest. But in reasoning from this to the case of the lever, the same difficulties would arise, as in the proof of Sir I. Newton. But admitting that all other objections could be removed, the demonstration fails when any two of the forces are parallel. Another demonstration is founded upon this principle, that if two non-elastic bodies meet with equal quantities of motion, they will, after impact, continue at rest; and hence it is concluded, that if a lever which is in equilibrio be put in motion, the motions of the two bodies must be equal; and therefore the pressures of these bodies upon the lever at rest, to put it in motion, must be as their motions. Now this is comparing the effects of pressure and motion, the relation of the measures of which, or whether they admit of any relation, we are totally unacquainted with." Mr. Vince then proceeds to complete the demonstration of Archimedes, by proving the principles upon which it depends. However, we do not think that this demonstration yet possesses that high degree of clearness and simplicity which the learned professor seems to attribute to it.

Dr. Hutton, in his truly excellent *Mathematical Dictionary*, article *LEVER*, observes, that writers on mechanics commonly demonstrate the general property of the lever in a very absurd manner, viz. by supposing the contrary; that is,

LEVER.

they demonstrate that a body is at rest by supposing it to be in motion. He then adds, "I shall therefore give here a new and universal demonstration of the property, on the pure principles of rest and pressure, or force only." This new demonstration, however, is essentially the same in principle as Dr. Hamilton's (a circumstance with which we doubt not Dr. Hutton was unacquainted); and is, therefore, liable to the same objections.

D'Alembert, Prony, and Fonsenex, have likewise given demonstrations, but they cannot be regarded as free from objections, though we have not room to dilate upon them here.

For our own parts we have long been of opinion, that the demonstration of our illustrious countryman, sir Isaac Newton, is more simple, more obvious, and more satisfactory, than any other with which we are acquainted, we shall therefore here adopt from No. 82 of the Repertory of Arts and Manufactures an Essay by Dr Gregory, in which he presents Newton's demonstration in a shape rather different from that in which it was first exhibited in the Principia, and indeed from any in which it has been heretofore represented, that he may more readily show its application to the case of parallel forces acting on a straight lever (an application which it has been supposed it would not admit, except by a bare induction) and more easily defend it against the most plausible objections.

"Besides the knowledge of the celebrated theorem, of the parallelogram of forces and of statical composition and resolution, the demonstration of Newton requires the admission of only two principles, which may be stated in the form of lemma, thus:

"LEMMA 1. *In every system of an invariable form we may suppose powers or forces to be applied, without changing the effects, at any points whatever on the lines of their directions.*

"This proposition is so evident as to be adopted without either proof or illustration, by many writers on the theory of mechanic. Indeed, it must be very manifest that (admitting the convenience of application in all to be alike), if any body be acted upon by a force pushing against it by means of an inflexible bar, the effect will be the same upon the body at whatever point of the bar the force be exerted, the directions of the bar and of the force coinciding; and when the body is acted upon by a force drawing by a straight inextensible cord, the effect will be the same at whatever part of the cord the soliciting force acts: it being supposed in either case that the force is not employed in part in supporting the bar or cord. For, in the first case, at whatever point of the bar the thrusting force F acts, an equal and contrary force F' will destroy its effect; and in the second, at whatever point of the cord the pulling force p acts, an equal and opposite force p' will annihilate its effect.

"LEMMA 2. *Equal and contrary forces acting perpendicularly at the extremities of two equal arms of an angular lever (or two equal radii of a wheel), will prevent it from turning upon its fulcrum or centre of motion.*

"This is a legitimate deduction from the doctrine of moments, in which it is affirmed that the sum of the moments of forces which tend to produce rotation in one direction, is equal to the sum of the moments of forces which tend to produce rotation in a contrary direction, when the forces are in equilibrio. For the forces being equal, and the perpendicular distances of their directions from the fixed point being equal also, their pro-

ducts, that is to say, the moments, are equal likewise, and the equilibrium obtains.

"The truth of this may be made to flow from the proposition that the effects of forces, when estimated in given directions, are not altered by composition or resolution. Thus let FA, FB (Fig. 1 Pl. 96.) be the equal arms at the extremities A and B , of which the equal forces act in the contrary directions AP, BP , each tending to produce rotation about F as a centre: since, by the first lemma, the forces may be supposed to act at any points in their respective lines of direction, let them be conceived to act simultaneously at P , the point of concurrence of the directions, and let the effects of these forces be both estimated in the direction FP . Let the equal distances aP, bP , in the directions of the two forces represent the magnitudes of those forces estimated in their respective directions, then will $aP \cos. APF = a'P$, the reduced force aP , in the assumed direction FP , and $bP \cos. BPF = b'P$ the contrary force reduced to the same direction. But the triangles FAP, FBP , right angled at A and B , having the sides FA, FB , equal, and FP , common, are equal in all respects; consequently $FPA = FPB$, and $aP \cos. FPA = bP \cos. FPB$, or $a'P = b'P$. Hence it follows that the two forces represented by aP, bP , produces an equilibrium in the assumed direction FP ; and therefore, that the contrary equal forces acting at the extremities of the equal arms FA, FB , are in equilibrio; since it is a well known corollary of what has been stated at the commencement of this paragraph, that, if a system of equilibrated forces in one direction be reduced to any other, the forces will still be in equilibrio.

"In fact, it is only to satisfy the more scrupulous, that this lemma has been so long dwelt upon. Most students of the science of mechanics would be satisfied of its truth as soon as they saw that no reason could be assigned why one force should prevail over the other. Or we might say, nearly in the language of Mr. professor Vince, when explaining the demonstration originally given by Archimedes, the lemma rests 'upon the most self-evident principles,' which are, that 'equal forces acting similarly at equal distances, must produce equal effects; which is manifest from this consideration, that when all the circumstances in the cause are equal, the effects must be equal,' and equal mechanical effects produced in contrary senses must destroy each other's operation.

"The truth of the preceding lemmata being admitted, as I conceive they will generally be, without any hesitation, I proceed to exhibit and apply the demonstration of Newton, to the instances of bent and of straight levers (considered as divested of heaviness) in three propositions.

"PROP. 1. *Any two forces acting upon a bent lever in different directions, but in the same plane, will be in equilibrio, if they are to each other reciprocally as the perpendiculars let fall from the fulcrum upon their directions.*

"CASE 1. *When the forces act on different sides of the fulcrum.*

"Let the bent lever AFB (Fig. 2, Plate 96.) whose fulcrum is F , be conceived to form part of a plane ungravitating wheel, capable of being moved about F as a centre of motion. And let it be proposed to determine the ratio of two forces P, Q , acting at the extremities A, B of the lever, in the directions AP, BQ , and keeping the system in equilibrio. Upon BB' the direction of one of the forces demit from F the perpendicular FB' ,

LEVER.

and from centre F with the radius FB' describe an arc intersecting the direction AA' of the force P in the point A' : then, drawing the line FA' we may conceive FA' , FB' , to be equal radii of the plane ungravitating wheel, and, from the relation of the forces which secure the equilibrium when acting at A' and B' , may deduce the relation of the forces P and Q : for it is manifest, from the 2d lemma, that equal and contrary forces acting at the points A' , B' , in the tangential directions $A'A''$, $B'B''$, will annihilate each other's effects; while, from the first lemma it follows, that a force acting in the direction $A'B'$, will have the same effect at A' as at A , and another force acting in the direction BB' will have the same effect at B' as at B . Let the force P be represented by Aa , and the force Q by Bb ; make $A'a' = Aa$, and $B'b' = Bb$, and, producing the line FA' , complete the parallelogram of forces $f a''$. Now, the force $A'a'$ (keeping $B'b'$ in equilibrio) being decomposed into the two, $A'f$ in the direction FA , and $A'a''$ perpendicular to it, the latter only will have a tendency to produce rotation, or to disturb an equilibrium, the former being absorbed by the reaction of the fixed point F . But, by the second lemma, the force $A'a''$ is equal to $B'b'$, that is to Q , in the case of equilibrium: therefore, $P \cdot Q :: A'a'' : A'a'$. Also, the similar triangles $A'a'a''$, $A'Fb'$, give $A'a' : A'a'' :: A'F : (= FB') \cdot Fb'$; consequently (by equality,) $P \cdot Q :: FB : Fb$, or $\frac{P}{Q} = \frac{FB}{Fb}$; that is, the forces are reciprocally as the perpendiculars let fall from the fulcrum upon their respective directions. Q. E. D.

"CASE 2. When both the forces act on the same side of the fulcrum.

"In this case, referring to Fig. 3, instead of Fig. 2, the same letters being put to the corresponding parts in both, the reasoning will apply throughout, and the same conclusion will result: and, as the division of the subsequent propositions into two cases will be attended with similar circumstances, there will be no occasion to make this division formally, but merely to adapt two figures to each demonstration.

"PROP. II. If parallel forces, acting perpendicularly upon a straight lever, keep it in equilibrio, they will be to each other reciprocally, as the distances from the fulcrum at which they act.

"Here the same general supposition being allowed as at the commencement of the demonstration of the preceding proposition, let us suppose that the force Q measured by Bb in its own direction, is first balanced (lemma 2) by the equal force $A'a'$ (Fig. 4 and 5. Plate X) acting perpendicularly at the extremity of the arm $FA' = FB$, the direction $A'a'$ produced meeting the straight lever in the point A : then, making $Aa'' = A'a'$, the force Aa'' acting at A , will have the same efficacy (lemma 1.) in turning the system about F , as the force $A'a'$, acting at the point A' ; it will therefore be in equilibrio with the force $Bb = Q$ acting at B . Resolving the force Aa'' into the two $A'f$, Aa , the former has evidently no tendency to produce rotation about the fixed point F , the latter therefore (Aa) must maintain the equilibrium with the force Q acting at B , and will consequently be the measure of the force P . Now the similar triangles $a'Aa$, $A'FA'$ give $Aa : Aa'' :: FA' : FA$. But $Aa = P$, $Aa'' = Bb = Q$, and $FA' = FB$: so that the preceding analogy be-

comes $P : Q :: FB : FA$, or $\frac{P}{Q} = \frac{FB}{FA}$; that is, the forces are to each other reciprocally, as the distances from the fulcrum at which they act, Q. E. D.

"PROP. III. Any parallel forces acting upon a straight lever, will keep it in equilibrio, if those forces be to each other reciprocally as the distance from the fulcrum, measured on the lever, at which they act.

"Let AFB or BAF (Fig. 6 and 7, Plate X.) be the lever, F the fulcrum, and AA' BB' , the parallel directions in which the forces P and Q act, those directions being here supposed not perpendicular to the lever: then drawing the several lines as in the diagrams, the reasoning used in the demonstration of the first proposition will apply here throughout, the same letters being placed against the corresponding parts of figures, 2, 3, 6, and 7. Following then the steps of that demonstration, it will be seen (in figures 6 and 7.) that $P : Q :: FB' : Fb$: wherefore, since the similar triangles FBb' , FAf , give $FB' : Fb :: FB : FA$, we shall have $P : Q :: FB : FA$, or $\frac{P}{Q} = \frac{FB}{FA}$, whence the truth of this proposition likewise is manifest.

"As to the objections which have been urged by different mathematicians against Newton's demonstration of the property of the lever, they may be reduced to three principal ones, all of which will, I hope, be thought of little weight, when the preceding lemmata and propositions are duly considered.

"1st. It has been objected that the principle of equal forces acting perpendicularly at the extremities of equal arms, producing an equilibrium when they act in contrary direction, can by no means be admitted, since 'we are supposed to be totally ignorant of the effects of weights or of forces upon any lever.'

"To this it may be replied, that when, in the theory of mechanics, we attempt to investigate the properties of levers, there is no occasion to pre-suppose that we undertake this while we 'are totally ignorant of the effects of weights or of forces upon any lever': on the contrary, it may be fairly imagined that, previously to undertaking this inquiry, it has been ascertained, either by experiment or from reasoning, that equal forces acting similarly, though in contrary senses, upon equal arms of any lever, produce an equilibrium; and farther, that when equal forces act on the arms of a lever, that which is farthest from the fulcrum will prevail; for it is only some such preparatory knowledge that would in general induce a theorist to enquire what is the universal invariable law or relation which subsists between forces or weights acting upon a lever at any distances, or in any directions. Besides, every theorist must be supposed to come to this investigation prepared to acknowledge the truth of the second lemma, since he must have a previous acquaintance with the usual theorems relative to the composition and resolution of forces; and ought to be aware that the theorems are very confined in their utility whilst they are restricted to forces acting simultaneously upon a physical point; but that then only can they be of much essential service in the science of mechanics, when it has been shown, that if several forces acting at once upon different points of a body keep it in equilibrio, they are such as would balance when all act at one point, their directions continuing respect-

LEV

tively parallel; because by that extension the same may be applied to levers of any shape (as well as to other bodies) either supposing some levers to be divested of heaviness, or supposing them to be of gravity to be one of those employed in the equilibrated system. And this remark will suggest an answer to most of the minor objections.

"2dly. It has been objected, by Dr. Hamilton, that Newton's demonstration, though confessedly simple, 'depends on this supposition, that, when from the fulcrum of a lever several arms or radii issue out in different directions, all lying in the same vertical plane, a given weight will have the same power to turn the lever, from which ever arm it hangs, provided the distance of its line of direction from the fulcrum remains the same. Now, (the doctor observes) it must appear difficult to admit this supposition when we consider that the weight can exert its whole force to turn the lever only on that arm which is the shortest and is parallel to the horizon, and on which it acts perpendicularly, and that the forces which it exerts, or with which it acts perpendicularly, on any one of the oblique arms, must be inversely as the length of that arm, which is evident from the resolution of forces.'

"Now, if the consideration of forces in general be substituted for that of weights, which will no way affect the principle of Newton's demonstration, we shall thus get quit of the inadequate conceptions resulting from confining the attention to one kind of force only, and prepare the mind for the ready admission of our first lemma, which, in fact, removes this objection. Indeed it is not a little curious that Dr. Hamilton's own reasoning seems to contain a reply to the objection he advances: for it may easily be shewn that the equal forces Aa , $A'a'$, for example, (Fig. 2.) acting in the same directions upon the extremities A and A' of the arms FA , FA' , are inversely as these arms when estimated in directions perpendicular to them, and consequently, that each has the same tendency to produce rotation about the centre F . Thus Aa being equal to $A'a'$, and the triangles Aae , $A'a'e'$, right-angled at e and e' , we have $Ac : A'a' :: \sin a : \sin a'$. But FA and ea being parallel, we have $FAa = 180^\circ - a$, and consequently $\sin a' = \sin FAA'$, while $\sin d = \sin AA'F$, the line Ac cutting the two parallels FA' , $a'a'$, hence, it follows that $Ac : A'a' :: \sin FAA' : \sin AA'F$. Now in the triangle FAA' , we have $FA' : FA :: \sin FAA' : AA'F$, whence, by equality, $Ac : A'a' :: FA' : FA$; or, by making equal the products of the mean and extreme terms, there results $FA \cdot Ac = FA' \cdot A'a'$; these equal rectangles being the obvious measures of equal tendencies to produce rotation.

"3dly. It has been objected to Newton's demonstration that it wants universality, being inapplicable to the case of parallel forces acting upon a straight lever: this objection is removed by the second and third of the foregoing propositions.

"I might now restore the consideration of gravity (which has been hitherto excluded in the investigations) to the several bars issuing from the centre of the wheel; and show with what facility the preceding principles, combined with the known properties of the centre of gravity would contribute to the establishment of the various theorems appertaining to the different kinds of heavy levers, the pressure on their fulcrums, &c.: but this would draw us too far from the professed objects of this paper, which were to defend the principles adopted by Newton from objections, and to shew that they apply to straight as well as

to bent levers. I shall therefore conclude this essay with the remark, that the principles here laid down, by our illustrious philosopher, in the *Principia*, and in which they are so judiciously condensed, are so fortunate as to evince the preference of Newton's demonstration to any of the others mentioned in the beginning of this communication, and to shew that it may be accommodated to the case of straight levers, so as to furnish a proof more simple and natural than either that of Archimedes or of Galileo; I shall please myself with the reflection that this essay may be of some utility to those who are engaged in either the cultivation or promotion of an important branch of science."

(*Rep. of Arts, &c. No. 82.*)

LEVERET, in the sportsman's vocabulary, a hare during its first year, or while rising to its full growth.

LEVERPOOL. See **LIVERPOOL**.

LEVET. *s.* (from *lever*, French.) A blast on the trumpet (*Hudibras*).

LEVEROOK. *s.* (*lapepe*, Saxon.) This word is retained in Scotland, and denotes the lark (*Walton*).

LEVABLE. *a.* (from *levy*.) That may be levied (*Bacon*).

LEVIATHAN. *s.* (*לִוְיָתָן*) A water animal mentioned in the book of Job. By some imagined the crocodile, by others the whale. But the probability is that the description applies to some animal now extinct. See **LACERTA CROCODYLUS**.

To LEVIGATE *v. a.* (*lavigo*, Latin) 1. To rub or grind to an impalpable powder. 2. To mix till the liquor becomes smooth and uniform (*Arbutnol*).

LEVIGATION *s.* (from *levigate*.) The reducing of hard bodies into a subule powder, by grinding upon marble with a muller. See **PHARMACY**.

LEVISTICUM. (*levisticum*, from *levo*, to assuage; so called from the relief it gives in painful flatulencies). *Lovage*. The odour of this plant, *ligustrum levisticum* of Linnæus, (*ligustrum foliis multiplicibus, folioliis superne incis.* Class pentandria. Order digynia), is very strong and particularly ungrateful, its taste is warm and aromatic. It abounds with a yellowish gummy resinous juice, very much resembling opopanax. Its virtues are supposed to be similar to those of angelica and masterwort in expelling flatulencies, exciting sweat, and opening obstructions; whence it is chiefly used in hysterical disorders and uterine obstructions. The leaves eaten in salad are accounted emmenagogue. The root, which is less ungrateful than the leaves, is said to possess similar virtues, and may be employed in powder.

LEVITE, in a general sense, means all the descendants of Levi, among whom were the Jewish priests themselves, who, being descended from Aaron, were likewise of the race of Levi. In a more particular sense, Levite is used for an order of officers in that church, who were employed in performing the manual service of the temple. They were obedient to the priests in their ministration, and brought them wood, water, and other necessities for the sacrifice.—They sung and played upon instru-

ments in the temple and in other places. They applied themselves to the study of the law, and were the ordinary judges of the country, but always subordinate to the priests. Their subsistence was the tythes of corn, fruit, and cattle, throughout Israel; but the priests were entitled to a tenth of their tythes, by way of first-fruits to the Lord. Eight-and-forty cities were assigned for the residence of the Levites, of which the priests claimed thirteen, six whereof were chosen for cities of refuge. They were consecrated before they entered upon their ministry, by shaving their flesh, washing their clothes, and sprinkling with the water of expiation.

LEVITICAL. *a.* (from *levite*.) Belonging to the Levites, making part of the religion of the Jews (*Ayliffe*).

LEVITICUS, a canonical book of the Old Testament, being the third of the Pentateuch of Moses. thus called, because it contains principally the laws and regulations relating to the priests, the Levites, and sacrifices; for which reason the Hebrews call it the priests' law.

LEVITY. *s.* (*levitas*, Latin.) 1. Lightness: not heaviness (*Bent.*). 2. Inconstancy; changeableness (*Hooker*). 3. Unsteadiness; laxity of mind (*Mil.*) 4. Idle pleasure, vanity (*Calamy*). 5. Trifling gaiety, want of seriousness (*Att.*).

LEUK, a town of Swisserland, in the Valais, situated about a quarter of a league from the Rhone; the principal place of a diocesan; behind it is a lofty mountain, and on the sides are two brooks, which run into deep beds. It contains two churches, and a large palace of the bishops of Sion. Two leagues to the north are some celebrated baths, said to be beneficial in rheumatism, diseases of the skin, &c.: twenty miles E. Sion.

LEUSDEN (John), a celebrated philologer, born in 1624. He studied the learned languages and mathematics at Utrecht; and then went to Amsterdam, to converse with the rabbis, and perfect himself in the Hebrew tongue. After which he was professor of Hebrew at Utrecht, where he acquired a great reputation, and died in 1699. He wrote many valuable works; the principal of which are, 1. *Onomasticum Sacrum*, 8vo. 2. *Clavis Hebraica & Philologica Veteris Testamenti*, 4to. 3. *Novi Testamenti Clavis Græca, cum Annotationibus Philologicis*, 8vo. 4. *Compendium Biblicum Veteris Testamenti*, 8vo. 5. *Compendium Græcum Novi Testamenti*; the best edition of which is that of London, in 1668, 12mo. 6. *Philologus Hebræus*, 4to. 7. *Philologus Hebræo mixtus*, 4to. 8. *Philologus Hebræo-Græcus*, 4to. 9. *Notes on Jonas, Joel, Hosea, &c.* He also gave correct editions of several learned works.

LEUTKIRK, a free imperial town of Suabia, seated on a rivulet that falls into the Iller, 22 miles N.E. of Lindau. Lon. 10. 12 E. Lat. 47. 53 N.

LEUTMERITZ, a town of Bohemia, capital of a circle of the same name, with a bishop's see. It is seated on the Elbe, 30 miles N.W. of Prague, and 40 S.E. of Dresden. Lon. 14. 31 E. Lat. 50. 30 N.

LEUTMUR, a town of Bohemia, in the circle of Chrudim, erected into a bishopric in 1144, but the town having suffered greatly by the Hussites, the bishopric was suppressed. It is 22 miles E. of Chrudim, and 76 E. of Prague.

LEUWENHOEK (Antony), a celebrated Dutch philosopher, was born at Delft in 1632, and acquired a great reputation throughout all Europe, by his experiments and discoveries in Natural History, by means of the microscope. He particularly excelled in making glasses for microscopes and spectacles; and he was a member of most of the literary societies of Europe, to whom he sent many memoirs. Those in the Philosophical Transactions, and in the Paris Memoirs, extend through many volumes; the former were extracted, and published at Leyden, in 1722. He died in 1723, at 91 years of age.

To LEVY. *v. a.* (*lever*, French.) 1. To raise; to bring together men (*Davies*). 2. To raise money (*Clarendon*). 3. To raise war (*Mil.*).

LEVY. *v. s.* (from the verb.) 1. The act of raising money or men (*Addison*). 2. War raised (*Shakspeare*).

LEWARDEN, a populous and strong town of the United Provinces, capital of Friesland. The buildings, as well public as private, are magnificent. It has several canals in the streets, which are a great assistance to its trade; especially as they are continued not only to the sea, but to the most considerable towns in the province. It is 27 miles W. of Groningen, and 65 N. by E. of Amsterdam. Lon. 5. 32 E. Lat. 53. 11 N.

LEWD. *a.* (*læpebe*, Saxon.) 1. Lay; not clerical: obsolete (*Davies*). 2. Wicked; bad; dissolute (*Whitjft*). 3. Lustful; libidinous (*Shakspeare*).

LEWDLY. *ad.* (from *lewd*.) 1. Wickedly; naughtily (*Shak.*). 2. Libidiously; lustfully (*Dryden*).

LEWDNESS. *s.* (from *lewd*.) Lustful licentiousness (*Dryden*).

LEWDSTER. *s.* (from *lewd*.) A lecher; one given to criminal pleasures (*Shakspeare*).

LEWENSTEIN, a town of Franconia, capital of a county of the same name, with a fortress, 10 miles E. of Hailbron, and 30 N.N.E. of Stuttgard. Lon. 9. 38 E. Lat. 49. 18 N.

LEWENTZ, a town of Upper Hungary, in the county of Gran, and on a river of the same name, where the Turks were defeated in 1644. It is 25 miles N.E. of Gran. Lon. 18. 31 E. Lat. 48. 21 N.

LEWES, a borough in Sussex, with a market on Saturday. It contains six parish churches, and is seated on the Ouse, which is navigable here for barges. The assizes are sometimes held here; and it sends two members to parliament. Near this town was fought a battle in 1263, when Henry III. and his son prince Edward (afterward Edward I.) were made prisoners by the earl of Leicester. Lewis is situated at the edge of the South Downs, on the declivity of a hill, on which are the remains of an ancient castle. It is 30 miles E. of Chichester, and 49 S. of London. Lon. 0. 5 E. Lat. 50. 55 N.

LEX

LEWIS, one of the most considerable of the Western Islands of Scotland, which, being connected by a narrow isthmus with Harris, forms but one island, which is about 60 miles in length, and of considerable breadth toward the middle and north end. It is greatly intersected by arms of the sea, by which it may be said to be divided into five peninsulas. The country, in general, is wild, bleak, barren of wood, and little fitted for cultivation: the hills are covered with heath, which affords shelter for various sorts of game. The lakes and streams abound with salmon, large red trout, &c. and there are good fisheries on the coast, which is annually visited by millions of herring. So immense are the shoals of dog-fish which pursue the herrings, that their dorsal fins are sometimes seen like a thick bush of sedges above the water. Stornaway is the only town in Lewis. This island belongs to Ross-shire. There are several inferior isles and rocks comprehended under Inverness-shire. The whole lies 20 miles N.W. of the isle of Skye.

LEWISBURGH, a town of Northumberland county, in Pennsylvania, seated on the Susquehannah, 140 miles N.W. of Philadelphia.

LEWISTOWN, the county-town of Mifflin, in Pennsylvania, seated on the Juniatta, 150 miles W.N.W. of Philadelphia. Lon. 78. 13 W. Lat. 40. 35 N.

LEWISHAM, a village in Kent, on the river Ravensburn, five miles S.E. of London. The church is an elegant new edifice.

LEX, law. See **LAW**.

LEXICOGRAPHER. *s.* (λεξικων and γρῑφω) A writer of dictionaries, a hair-shirt dudge, that busies himself in tracing the original, and detailing the signification of words. (*Hall's*).

LEXICOGRAPHY. *s.* (λεξικων and γρῑφω) The art or practice of writing dictionaries.

LEXICON (λεξικων) the same with dictionary. The word is chiefly used in speaking of Greek dictionaries. It is derived from the Greek word λεξις, diction; of λεω, I speak. Thus we have Hederc's, Scapul's, Parkhurst's Lexicon, &c. See **DICTIONARY** and **ENCYCLOPEDIA**.

LEXINGTON, the capital of the state of Kentucky, and county of Fayette. Near this town are to be seen curious sepulchres, full of human skeletons, which were thus fabricated: first on the ground were laid large broad stones; on these were placed the bodies, separated from each other by broad stones, covered with others, which served as a basis for the next arrangement of bodies. In this order they are built, without mortar, growing still narrower to the height of a man. This method of burying appears to be totally different from that now practised by the Indians. In the neighbourhood also are remains of two ancient fortifications, with ditches and bastions; one containing about six acres of land, and the other nearly three. Pieces of earthen vessels have also been ploughed up near Lexington; a manufacture with which the Indians were never acquainted.

VOL. VI.

LEY

These, with the fortifications, and the sepulchres, have been urged as an argument, that this country was formerly inhabited by a people different from the present Indians, and further advanced than they in the arts of life; and Mr. Filson, in his account of this country, has advanced arguments to prove that these people were, in all probability, an ancient colony from Wales. Lexington stands at the head of the river Elkhorn, 470 miles W. of Washington. Lon. 85. 10 W. Lat. 38. 20 N.

LEXINGTON, a town of the state of Massachusetts, celebrated for being the place where hostilities commenced between the British troops and the Americans, in April, 1775. It is 12 miles N.W. of Boston.

LEXIPHARMICS. (from λεγω, to terminate, and φαρμακον, poison.) Antidotes: alexipharmics medicines which resist or destroy the power of poison.

LEXIPYRETICS. (from λεγω, to terminate, and πυρετος, a fever.) Febrifuges medicines that destroy or shorten the duration of fevers.

LEY. *s.* Ley, lee, lay, are all from the Saxon leax, a field or pasture (*Gibson*).

LEYDEN, a city of the United Provinces, in Holland, now called the kingdom of Holland, four miles and a half in circumference. It has eight gates, and contains 50 islands, and 145 bridges, the greatest part built of freestone. The principal church is a superb structure, whose high roof is supported by three rows of columns. There are several large hospitals, and a university, which has generally 200 students, though there are but two colleges; for the scholars board in the town, and have no dress to distinguish them. The school consists of a large pile of brick building, three stories high, in the uppermost of which the famous Elzevir had his printing-office. Adjoining to the school is the physic-garden, where the professor reads lectures in botany. The library contains curious manuscripts; and the theatre of anatomy is one of the finest in Europe. Here are manufactures of the best cloths and stuffs in Holland. Leyden is famous for the long siege it sustained in 1573, against the Spaniards. It is seated near the ancient bed of the Rhine, four miles E. of the German Ocean, and 20 S.W. of Amsterdam. Lon. 4. 33 E. Lat. 51. 10 N.

LEYDEN PHIAL, in electricity, is a glass phial or jar, coated both within and without with tin foil, or some other conducting substance, that it may be charged, and employed in a variety of useful and entertaining experiments. Or even flat glass, or any other shape, so coated and used, has also received the same denomination. Also a vacuum produced in such a jar, &c. has been named the Leyden vacuum.

The Leyden phial has been so called, because it is said that M. Cunæus, a native of Leyden, first contrived, about the close of the year 1745, to accumulate the electrical power in glass, and use it in this way. But Dr. Priestley asserts that

LEY

this discovery was first made by Von Kleist, dean of the cathedral in Camin, who on the 4th of November, 1745, sent an account of it to Dr. Lieberkuhn, at Berlin. See **ELECTRICITY**.

LEYSERA. In botany, a genus of the polygamia superflua order, in the syngenesia class of plants, and in the natural method ranking under the 49th order, compositæ. The receptacle is naked, the pappus paleaceous, that of the disc plumy; the calyx scarious. There are three species, shrubs of the Cape.

LEYTE, one of the Philippine Islands, about

LEY

40 leagues in length, and 95 in circumference. Its soil, on the E. side, is very fertile; but there are high mountains that intersect it nearly in the middle from E. to W, and occasion so great an alteration in the climate, that, when the inhabitants of one part of the island reap, the others sow; and they have two plentiful harvests in the year, to which the rivers descending from the mountains not a little contribute. The island contains 9000 inhabitants, who pay tribute to the Spaniards, in rice, wax, and quilts. Lon. 125, 0 E. Lat 11. 0 N.
